Titre	Thiamethoxam, a poor agonist of nicotinic acetylcholine receptors expressed on isolated cell bodies, acts as a full agonist at cockroach cercal afferent/giant interneuron synapses
Type de publication	Article de revue
Auteur	Thany, Steeve Hervé [1]
Editeur	Elsevier
Type	Article scientifique dans une revue à comité de lecture
Année	2011
Langue	Anglais
Date	2011 Mar
Pagination	587-92
Volume	60
Titre de la revue	Neuropharmacology
ISSN	1873-7064
Mots-clés	Animals [2], Cockroaches [3], Male [4], Neurons [5], Nicotinic Agonists [6], Nitro Compounds [7], Oxazines [8], Receptors, Nicotinic [9], Synapses [10], Synaptic Transmission [11], Thiazoles [12]
Résumé en anglais	<p>Thiamethoxam (TMX) is a second-generation neonicotinoid which is known to induce toxic effects on insects and mammals. Recently, it has been proposed that TMX is a poor agonist of insect nicotinic acetylcholine receptors (nAChRs) on isolated cell bodies. Here, we have studied its effect on synaptic transmission. Our results demonstrate that TMX acts as an agonist of nAChRs expressed on cockroach cercal afferent giant/interneuron synapses as bath applications of TMX induce a strong reversible depolarization of the sixth abdominal ganglion. This response was reduced by the nicotinic antagonists mecamylamine and methyllicaconitine, but was insensitive to d-tubocurarine. Interestingly, TMX-induced depolarization was partially reduced by the muscarinic antagonist atropine, suggesting that TMX could bind to a 'mixed nicotinic/muscarinic' receptor. Compared to previous studies, we proposed that TMX is able to act as agonist of insect nAChRs expressed at cercal afferent/giant interneuron synapses. Moreover, our results suggest that nAChRs expressed on synaptic ganglion are distinct to nAChRs expressed on isolated cell bodies and that synaptic receptors have higher affinity to TMX resulting to a depolarization of postsynaptic nicotinic receptors.</p>
