

XPS Study of the Band Alignment at the Interface ITO/CuI

Submitted by Christian Bernède on Thu, 06/04/2015 - 20:52

Titre XPS Study of the Band Alignment at the Interface ITO/CuI

Type de publication Article de revue

Auteur Bernède, Jean Christian [1], Cattin, Linda [2], Predeep, Padmanabhan [3]

Type Article scientifique dans une revue à comité de lecture

Année 2014

Langue Anglais

Date january 2014

Numéro 1

Pagination 2-10

Volume 1

Titre de la revue Technology Letters

ISSN 2348-8131

The band alignment at the interface of an ITO/CuI heterojunction is studied by X-ray photoelectron spectroscopy (XPS). The measurements have been performed on samples obtained under the same experimental conditions as those used to achieve organic photovoltaic cells. The CuI upper layer was 3 nm thick. The semidirect XPS technique used to measure the band offsets allows us to estimate the band discontinuities at the interface ITO/CuI: $\Delta E_V = 2.10$ eV and $\Delta E_C = 1.56$ eV. This band alignment induces an increase of the work function of the anode when the structure ITO/CuI is used as electrode in organic solar cells for instance. As a matter of fact, the measurement, by means of a Kelvin probe, of the work function of the structures ITO/CuI, shows that it is significantly higher than that of ITO alone: 5.2 eV and 4.8 eV.
