

## Optical and structural characterization of thin films containing metallophthalocyanine chlorides

Submitted by Bouchta Sahraoui on Tue, 05/26/2015 - 11:48

Titre	Optical and structural characterization of thin films containing metallophthalocyanine chlorides
Type de publication	Article de revue
Auteur	Zawadzka, Anna [1], Karakas, Asli [2], Płóciennik, P. [3], Szatkowski, J. [4], Łukasiak, Z. [5], Kapceoglu, A. [6], Ceylan, Y. [7], Sahraoui, Bouchta [8]
Editeur	Elsevier
Type	Article scientifique dans une revue à comité de lecture
Année	2015
Langue	Anglais
Pagination	116 - 126
Volume	112
Titre de la revue	Dyes and Pigments
ISSN	0143-7208
Mots-clés	Nanostructural metallophthalocyanine thin films [9]
Résumé en anglais	<p>Abstract The structural and optical investigation of thin films containing aluminum and gallium phthalocyanine chlorides is presented. The films were fabricated by Physical Vapor Deposition technique onto quartz substrates and annealed after fabrication in an ambient atmosphere for 24 h at the temperature equal to 150 °C or 250 °C. The experimental results and theoretical calculation of the Third Harmonic Generation process are reported. The third order nonlinear optical properties are expected and can be more or less accurately predicted due to the assembly of the molecules and theoretical calculations of the frequency-dependent dipole polarizabilities, third hyperpolarizabilities, third order susceptibilities, frontier and second frontier molecular orbitals. These parameters were used to understand the relationship of optical properties with the molecular structures. We found that the annealing process causes formation of nanostructures and the value of the third order optical susceptibility makes these materials interesting for future nonlinear optical applications.</p>
