Titre	Hybridization-induced interfacial changes detected by non-Faradaic impedimetric measurements compared to Faradaic approach
Type de publication	Article de revue
Auteur	Gautier, Christelle [1], Esnault, Charles [2], Cougnon, Charles [3], Pilard, Jean-François [4], Casse, Nathalie [5], Chénais, Benoît [6]
Editeur	Elsevier Masson
Type	Article scientifique dans une revue à comité de lecture
Année	2007
Langue	Anglais
Date	Jan-12-2007
Numéro	2
Pagination	227-233
Volume	610
Titre de la revue	Journal of Electroanalytical Chemistry
ISSN	15726657
Mots-clés	DNA sensor [7], Electrochemical impedance spectroscopy [8], Label-free detection [9], Polythiophene [10]
Résumé en anglais	A biosensor for direct label-free DNA detection based on a polythiophene matrix is investigated by electrochemical impedance spectroscopy (EIS). Impedimetric experiments are performed with and without redox probe in solution. The non-Faradaic impedance measurements reveal two relaxation processes located at 50 Hz and 5 kHz, respectively. The first relaxation process, located at low frequencies, allows to detect biorecognition events by measuring the phase angle decrease, in accordance with a hindrance of the polaronic conduction. The second relaxation process, located at 5 kHz and originating from DNA modification, seems to increase with the length of the target sequence. These results suggest that this loaded support provides a platform for impedimetric detection of hybridization at high frequencies, leading to less time-consuming detection procedure. For a better understanding, results obtained in non-Faradaic mode are compared with Faradaic approach.
