

Executive functions in clinical and preclinical Alzheimer's disease

Submitted by Emmanuel Lemoine on Wed, 04/22/2015 - 16:40

Titre	Executive functions in clinical and preclinical Alzheimer's disease
Type de publication	Article de revue
Auteur	Allain, Philippe [1], Etcharry-Bouyx, Frédérique [2], Verny, Christophe [3]
Editeur	Elsevier Masson
Type	Article scientifique dans une revue à comité de lecture
Année	2013
Langue	Anglais
Date	2013
Pagination	695-708
Volume	169
Titre de la revue	Revue Neurologique
ISSN	0035-3787

Résumé en anglais

Executive functions is an umbrella term describing a wide range of higher order processes that allow the flexible modification of thought and behaviour in response to changing cognitive or environmental contexts. Impairment of executive functions is common in neurodegenerative disorders such as Alzheimer's disease. These deficits negatively affect everyday activities and hamper the ability to cope with other cognitive or behavioural disorders. In this paper, we propose a synthesis of the knowledge on executive impairments in clinical and preclinical Alzheimer's disease, mostly leaning on the current studies made in this domain. We made some propositions for neuropsychological assessment of executive functions in preclinical and clinical phases of Alzheimer's disease. We hope that this overview will provide a useful insight into an area that is still insufficiently explored in the field of the neuropsychology of Alzheimer's disease.
