

Vitamin D concentration and lateral cerebral ventricle volume in older adults

Submitted by Emmanuel Lemoine on Wed, 04/22/2015 - 16:42

Titre	Vitamin D concentration and lateral cerebral ventricle volume in older adults
Type de publication	Article de revue
Auteur	Annweiler, Cédric [1], Montero-Odasso, Manuel [2], Hachinski, V. [3], Seshadri, S. [4], Bartha, R. [5], Beauchet, Olivier [6]
Editeur	Wiley-VCH Verlag
Type	Article scientifique dans une revue à comité de lecture
Année	2013
Langue	Anglais
Date	2013
Numéro	2
Pagination	267-276
Volume	57
Titre de la revue	Molecular Nutrition & Food Research
ISSN	1613-4125
Mots-clés	25-hydroxyvitamin D [7], alzheimer-disease [8], amyloid-beta [9], cerebrospinal-fluid [10], cognitive function [11], d deficiency [12], lateral cerebral ventricle [13], mri measures [14], multiple-sclerosis [15], nerve growth-factor [16], neurodegeneration [17], neuroendocrinology [18], nutrient biomarker patterns [19], older adults [20], Vitamin D [21]
Résumé en anglais	<p>Scope Vitamin D deficiency is associated with an enlargement of the lateral cerebral ventricles in rodents. The effect of low serum 25-hydroxyvitamin D (25OHD) on lateral cerebral ventricle volume has not been studied yet in humans. The purpose of this cross-sectional study was to determine whether vitamin D deficiency was associated with greater lateral cerebral ventricle volume in older adults. Methods and results Ninety-two Caucasian community-dwellers with no clinical hydrocephalus (mean, 72.2 +/- 6.2 years; 46.7% female) were divided into two groups according to serum 25OHD concentration (deficiency <= 50 nmol/L; normal > 50 nmol/L). Cerebral ventricular volume was quantified using semi-automated software from three-dimensional T1-weighted MRI. Age, gender, body mass index, blood pressure, education level, Mini-Mental State Examination, white matter lesions, and serum calcium concentrations were used as covariates. There was an inverse linear association between 25OHD concentration and ventricular volume ($p = 0.049$). Compared to individuals with normal 25OHD, those with 25OHD deficiency ($n = 33$) had 28% larger lateral ventricles (46.9 +/- 26.8 mL versus 36.6 +/- 16.4 mL, $p = 0.026$). Vitamin D deficiency was associated with an increase in ventricular volume (adjusted beta = 16.55, $p = 0.023$). The ventricular enlargement involved ventricle bodies ($p = 0.025$) but not temporal horns ($p = 0.112$). Conclusion Serum 25OHD deficiency was associated with larger lateral cerebral ventricles. These findings provide a scientific base for vitamin D replacement trials.</p>
