

Association between vitamin D deficiency and long hospital stay in geriatric acute care unit: results from a pilot cohort study

Submitted by Emmanuel Lemoine on Wed, 04/22/2015 - 16:44

Titre	Association between vitamin D deficiency and long hospital stay in geriatric acute care unit: results from a pilot cohort study
Type de publication	Article de revue
Auteur	Beauchet, Olivier [1], Launay, C. P [2], Maunoury, F. [3], de Decker, Laure [4], Fantino, Bruno [5], Annweiler, Cédric [6]
Type	Article scientifique dans une revue à comité de lecture
Année	2013
Langue	Anglais
Date	2013
Numéro	1
Pagination	107-109
Volume	25
Titre de la revue	Aging Clinical and Experimental Research
ISSN	1594-0667
Mots-clés	hospital stay [7], hypovitaminosis d [8], Inpatients [9], older inpatients [10], older-adults [11], Vitamin D Deficiency [12]
Résumé en anglais	Finding a biomarker of long length-of-stay (LOS) would provide a simple solution to target frail older inpatients at such risk. The aim of this study was to determine whether serum 25-hydroxyvitamin D (25OHD) deficiency, defined as serum concentration <25 nmol/L, was associated with long LOS among inpatients admitted to a geriatric acute care unit. Three hundred and six older inpatients (mean age 84.6 +/- 6.4 years, 61.8 % women) were consecutively included in this longitudinal prospective cohort study. Patients were separated into two groups according to LOS tertiles: highest tertile (>= 14 days; n = 120) versus the other two tertiles combined (<14 days; n = 186). Serum 25OHD deficiency (58.3 vs. 38.7 %, P = 0.001) and the prevalence of male gender (58.3 vs. 28.5 %, P < 0.001) were higher among inpatients with the highest LOS compared with those with lower LOS. Serum 25OHD deficiency [odds ratio (OR) = 2.22, P = 0.001 for unadjusted model; OR = 1.87, P = 0.012 for fully adjusted model] and male gender (OR = 2.87, P < 0.001 for unadjusted model; OR = 2.64, P = 0.001 for full model) were associated with a high LOS. Vitamin D deficiency and male gender were risk factors for a long LOS in this pilot study. Using these risk factors to identify inpatients at risk of long LOS may be helpful in adapting early care plans, and thus improving inpatients' health and shortening LOS.
