

Genetic diversity and taxonomic aspects of wild carrot in France

Submitted by Séverine Gagné on Tue, 03/24/2015 - 16:53

Titre	Genetic diversity and taxonomic aspects of wild carrot in France
Type de publication	Communication
Type	Conférence invitée
Année	2014
Date du colloque	17-19/09/2015
Titre du colloque	Carrot and other Apiaceae International Symposium
Auteur	Geoffriau, Emmanuel [1], Reduron, Jean-Pierre [2], Maghraoui, Mohamed [3], Jourdan, Matthieu [4], Chaput-Bardy, Audrey [5], Delage, Alain [6], Huet, Sébastien [7], Dubois-Laurent, Cécile [8], Le Clerc, Valérie [9], Peltier, Didier [10], Briard, Mathilde [11]
Pays	France
Ville	Angers
Résumé en anglais	If in France, genetic resources of cultivated carrot are well studied and preserved, the wild compartment of the species remains unknown and underutilized, while there are many populations of wild carrot on the French territory. Several collecting missions were undertaken from 2009 to 2013 to identify and collect populations, particularly in coastal areas, in continental France and Corsica. More than a hundred populations were collected, with a good distribution throughout the territory, and eleven taxa were identified. The status of these taxa is variable, with some very common and others underrepresented or specific to a given area. Morphological and molecular studies are developed in order to improve the knowledge of taxonomy and diversity. The study conducted with microsatellite markers showed a high genetic diversity at the intra-and inter-populations levels. The overall results show that the Mediterranean coast and Corsica exhibit a particularly high diversity. The work confirms the specific interest of some populations and the taxonomic separation into 2 subgroups carota and gummifer in <i>Daucus carota</i> L. This study will allow developing a strategy for management of genetic resources and their valorisation in breeding.
