

Characterization of a dual-affinity nitrate transporter MtNRT1.3 in the model legume *Medicago truncatula*

Submitted by Elisabeth Planchet on Tue, 03/24/2015 - 16:16

Titre	Characterization of a dual-affinity nitrate transporter MtNRT1.3 in the model legume <i>Medicago truncatula</i>
Type de publication	Article de revue
Auteur	Morère-Le Paven, Marie-Christine [1], Viau, Laure [2], Hamon, Alain [3], Vandecasteele, Céline [4], Pellizzaro, Anthoni [5], Bourdin, Céline [6], Laffont, Carole [7], Lapiéd, Bruno [8], Lepetit, Marc [9], Frugier, Florian [10], Legros, Christian [11], Limami, Anis M. [12]
Editeur	Oxford University Press (OUP)
Type	Article scientifique dans une revue à comité de lecture
Année	2011
Langue	Anglais
Date	2011 Nov
Numéro	15
Pagination	5595-5605
Volume	62
Titre de la revue	Journal of Experimental Botany
ISSN	1460-2431
Mots-clés	Anion Transport Proteins [13], Gene Expression Regulation, Plant [14], <i>Medicago truncatula</i> [15], Nitrates [16], Plant Proteins [17], Plant Roots [18]
Résumé en anglais	<p>Primary root growth in the absence or presence of exogenous NO₃⁻ was studied by a quantitative genetic approach in a recombinant inbred line (RIL) population of <i>Medicago truncatula</i>. A quantitative trait locus (QTL) on chromosome 5 appeared to be particularly relevant because it was seen in both N-free medium (LOD score 5.7; R²=13.7) and medium supplied with NO₃⁻ (LOD score, 9.5; R²=21.1) which indicates that it would be independent of the general nutritional status. Due to its localization exactly at the peak of this QTL, the putative NRT1-NO₃⁻ transporter (Medtr5g093170.1), closely related to Arabidopsis AtNRT1.3, a putative low-affinity nitrate transporter, appeared to be a significant candidate involved in the control of primary root growth and NO₃⁻ sensing. Functional characterization in <i>Xenopus</i> oocytes using both electrophysiological and ¹⁵N-NO₃⁻ uptake approaches showed that Medtr5g093170.1, named MtNRT1.3, encodes a dual-affinity NO₃⁻ transporter similar to the AtNRT1.1 'transceptor' in Arabidopsis. MtNRT1.3 expression is developmentally regulated in roots, with increasing expression after completion of germination in N-free medium. In contrast to members of the NRT1 superfamily characterized so far, MtNRT1.3 is environmentally up-regulated by the absence of NO₃⁻ and down-regulated by the addition of the ion to the roots. Split-root experiments showed that the increased expression stimulated by the absence of NO₃⁻ was not the result of a systemic signalling of plant N status. The results suggest that MtNRT1.3 is involved in the response to N limitation, which increases the ability of the plant to acquire NO₃⁻ under N-limiting conditions.</p>
