

Caveolin-1 deficiency alters plasma lipid and lipoprotein profiles in mice.

Submitted by Soazig Le Lay on Tue, 01/27/2015 - 10:34

Titre	Caveolin-1 deficiency alters plasma lipid and lipoprotein profiles in mice.
Type de publication	Article de revue
Auteur	Heimerl, Susanne [1], Liebisch, Gerhard [2], Le Lay, Soazig [3], Böttcher, Alfred [4], Wiesner, Philipp [5], Lindtner, Silke [6], Kurzchalia, Teymuras V [7], Simons, Kai [8], Schmitz, Gerd [9]
Editeur	Elsevier
Type	Article scientifique dans une revue � comit� de lecture
Ann�e	2008
Langue	Anglais
Date	2008 Mar 21
Num�ro	4
Pagination	826-33
Volume	367
Titre de la revue	Biochemical and Biophysical Research Communications
ISSN	1090-2104
Mots-cl�s	Animals [10], Caveolin 1 [11], Dietary Fats [12], Fasting [13], Lipid Metabolism [14], Lipids [15], Lipoproteins [16], Mice [17], Mice, Inbred C57BL [18], Mice, Knockout [19], Postprandial Period [20]
R�sum� en anglais	<p>Caveolae are specialized membrane microdomains formed as the result of local accumulation of cholesterol, glycosphingolipids, and the structural protein caveolin-1 (Cav-1). To further elucidate the role of Cav-1 in lipid homeostasis in vivo, we analyzed fasting and post-prandial plasma from Cav-1 deficient mice on low or on high fat diet. In total plasma analysis, an increase in ceramide and hexosylceramide was observed. In cholesteryl ester (CE), we found an increased saturated+monounsaturated/polyunsaturated fatty acid ratio in fasting plasma of low fat fed Cav-1(-/-) mice with increased proportions of CE16:1, CE18:1, CE20:3, and decreased proportions of CE18:2 and CE22:6. Under high fat diet HDL-CE, free cholesterol and pre-beta-HDL were increased accompanied by a shift from slow to fast migrating alpha-HDL and expansion of apoE containing HDL. Our results demonstrate a significant role of Cav-1 in HDL-cholesterol metabolism and may reflect a variety of Cav-1 functions including modulation of ACAT activity and SR-BI function.</p>
