

Measurement of epidermal moisture content by magnetic resonance imaging: assessment of a hydration cream

Submitted by Florence Franconi on Tue, 12/02/2014 - 14:11

Titre	Measurement of epidermal moisture content by magnetic resonance imaging: assessment of a hydration cream
Type de publication	Article de revue
Auteur	Franconi, Florence [1], Akoka, S [2], Guesnet, J [3], Baret, J M [4], Dersigny, D [5], Breda, B [6], Muller, C [7], Beau, P [8]
Editeur	Wiley
Type	Article scientifique dans une revue à comité de lecture
Année	1995
Langue	Anglais
Date	1995 Jun
Pagination	913-7
Volume	132
Titre de la revue	British Journal of Dermatology
ISSN	0007-0963
Mots-clés	Administration, Cutaneous [9], Adult [10], Body Water [11], Cosmetics [12], Humans [13], Magnetic Resonance Imaging [14], Skin [15], Wrist [16]
Résumé en anglais	The moisture content of the epidermis was measured by magnetic resonance imaging (MRI), using transverse relaxation time. The spatial resolution was 86 microns, allowing a quantitative, accurate and localized determination of variations in epidermal hydration. The wrists of 15 volunteers were studied before and after application of a hydration cream. Results showed an increase of 15% of epidermal T2 after application of the cream. Moisture content curves varied according to different degrees of skin dryness. This study demonstrates that MRI is a useful tool in evaluation of epidermal hydration.
