

Recording of EEG during fMRI experiments: patient safety

Submitted by Florence Franconi on Tue, 12/02/2014 - 14:22

Titre	Recording of EEG during fMRI experiments: patient safety
Type de publication	Article de revue
Auteur	Lemieux, L [1], Allen, P J [2], Franconi, Florence [3], Symms, M R [4], Fish, D R [5]
Editeur	Wiley
Type	Article scientifique dans une revue à comité de lecture
Année	1997
Langue	Anglais
Date	1997 Dec
Pagination	943-52
Volume	38
Titre de la revue	Magnetic Resonance in Medicine
ISSN	0740-3194
Mots-clés	Electroencephalography [6], Electromagnetic Fields [7], Humans [8], Magnetic Resonance Imaging [9], Models, Theoretical [10], Safety [11], temperature [12]
Résumé en anglais	<p>The acquisition of electroencephalograms (EEG) during functional magnetic resonance imaging (fMRI) experiments raises important practical issues of patient safety. The presence of electrical wires connected to the patient in rapidly changing magnetic fields results in currents flowing through the patient due to induced electromotive forces (EMF), by three possible mechanisms: fixed loop in rapidly changing gradient fields; fixed loop in a RF electromagnetic field; moving loop in the static magnetic field. RF-induced EMFs were identified as the most important potential hazard. We calculated the minimum value of current-limiting resistance to be fitted in each EEG electrode lead for a representative worst case loop, and measured RF magnetic field intensity and heating in a specific type of current-limiting resistors. The results show that electrode resistance should be $>$ or $= 13 \text{ k}(\omega)$ for our setup. The methodology presented is general and can be useful for other centers.</p>
