

The tris formulation of Fluorouracil is more cardiotoxic than the sodium-salt formulations

Submitted by Laurent Lemaire on Mon, 12/01/2014 - 15:50

Titre	The tris formulation of Fluorouracil is more cardiotoxic than the sodium-salt formulations
Type de publication	Article de revue
Auteur	Lemaire, Laurent [1], Malet-Martino, Marie C. [2], Martino, Robert [3], Deforni, M [4], Lasserre, B [5]
Editeur	Spandidos Publications
Type	Article scientifique dans une revue à comité de lecture
Année	1994
Langue	Anglais
Date	1994
Pagination	173-4
Volume	1
Section	1
Titre de la revue	Oncol Rep
ISSN	1021-335X
Résumé en anglais	<p>The cardiotoxicity of 5-fluorouracil (FU) was attributed to degradation compounds present in the injected vials, fluoroacetaldehyde (Facet) and fluoromalonaldehydic acid (FMald). FU-NaOH vials were much less cardiotoxic than FU-Tris vials on the isolated perfused rabbit heart model since Facet and FMald are stored in stable depot forms in FU-Tris vials whereas, in FU-NaOH vials, they are extensively transformed. Cardiotoxic fluoroacetate (FAG), coming from Facet metabolization, was found in urine of patients, with a ratio FAC /FU catabolites 10-30 fold lower in patients treated with FU-NaOH than in those treated with FU-Tris.</p>
