Résumé en anglais	<p><i>Acinetobacter baumannii</i> is an emerging multidrug-resistant (MDR) pathogen that is responsible for community- and hospital-acquired infections that are difficult to control and treat [1]. With increasing antimicrobial resistance to carbapenems, colistin is often the treatment of last resort, however colistin-resistant clinical isolates have already been reported. Since therapeutic options are very limited or absent in some cases of infection with pandrug-resistant bacteria, there is an urgent need to find new antibiotic strategies.</p>
