

Updates on the Epidemiology of Dermatophyte Infections

Submitted by Emmanuel Lemoine on Thu, 10/16/2014 - 14:06

Titre Updates on the Epidemiology of Dermatophyte Infections

Type de publication Article de revue

Auteur Seebacher, Claus [1], Bouchara, Jean-Philippe [2], Mignon, Bernard [3]

Editeur Springer Verlag

Type Article scientifique dans une revue à comité de lecture

Année 2008

Langue Anglais

Date 2008/11/01

Numéro 5-6

Pagination 335 - 352

Volume 166

Titre de la revue Mycopathologia

ISSN 1573-0832

Mots-clés Dermatophyte spectrum [4], Epidemiology [5], Medical Microbiology [6], Microbial Ecology [7], Microbiology [8], Onychomycosis [9], Plant Sciences [10], Tinea capitis [11], Tinea pedis [12]

Résumé en anglais The spectrum of dermatophytes isolated from skin lesions had changed in last 70 years. Before the Second World War in Germany, *Microsporum audouinii* and *Epidermophyton floccosum* ranked the first, whereas *Trichophyton rubrum* is the most common dermatophyte since the fifties of last century, accounting for 80–90% of the strains, followed by *T. mentagrophytes*. This evolution is typical for Central and North Europe and it needs to be connected with the increase in the incidence of tinea pedis. In contrast, in Southern Europe and in Arabic countries, zoophilic dermatophytes, such as *Microsporum canis* or *Trichophyton verrucosum*, are the most frequently isolated. In Europe, especially in Mediterranean countries, the incidence of *M. canis* infection has strongly increased during the recent years and this dermatophyte is now the most prevalent in tinea capitis in children. An analysis of the frequency and distribution of tinea pedis in different occupations and leisure-time activities as well as the routes of infection are reported. The spreading of this disease in most developed countries of the world represents a considerable economic problem, since it was accompanied by a parallel increase in the frequency of onychomycosis which implies, as tinea pedis, large financial charges. In poor developing countries, mycoses appear endemically, primarily with children, and their treatment often fails because of the lack of efficient antifungals. The particular epidemiological situations of dermatophytoses and the pathogenic spectrum of dermatophytes are examined at the example of numerous countries.
