

Resolution of chronic hepatitis Delta after 1 year of combined therapy with pegylated interferon, tenofovir and emtricitabine

Submitted by Emmanuel Lemoine on Fri, 07/18/2014 - 09:42

Titre	Resolution of chronic hepatitis Delta after 1 year of combined therapy with pegylated interferon, tenofovir and emtricitabine
Type de publication	Article de revue
Auteur	Mansour, Wael [1], Ducancelle, Alexandra [2], Le Gal, Frédéric [3], Le Guillou-Guillemette, Hélène [4], Abgueguen, Pierre [5], Pivert, Adeline [6], Calès, Paul [7], Gordien, Emmanuel [8], Lunel-Fabiani, Françoise [9]
Editeur	Elsevier
Type	Article scientifique dans une revue à comité de lecture
Année	2010
Langue	Anglais
Date	2010/01
Numéro	1
Pagination	97 - 99
Volume	47
Titre de la revue	Journal of Clinical Virology
ISSN	1386-6532
Mots-clés	Chronic hepatitis Delta [10], Pegylated interferon [11], Seroconversion anti-HBs [12], Tenofovir disoproxil fumarate [13]
Résumé en anglais	<p>Background Hepatitis Delta virus (HDV) Infection has a worldwide distribution, with approximately 20 millions infected persons. Interferon (IFN) is the only approved drug for the treatment of HDV infection which is still a difficult to treat disease.</p> <p>Objectives To report a successful treatment of a patient with a chronic severe hepatitis Delta using combination therapy with Pegylated interferon (PegIFN), Tenofovir disoproxil fumarate (TDF) and Emtricitabine (FTC).</p> <p>Study Design The patient, a 47 years -old male patient, originating from Dagestan (East Asia), suffered of chronic hepatitis Delta infection. The patient was HBsAg, HBeAg, and anti-Delta Ab (IgG) positive. Serum HBV-DNA level was elevated (more than 9 logUI/mL). Serum HDV-RNA level was up to 5.6 log (copies/ml). Genotypes HBV/D and HDV-1 were demonstrated. The liver histology revealed chronic active hepatitis (Metavir score: A2F2).</p> <p>The treatment was started with PegIFN (180 µg/week) for two months and then TDF (300 mg/day) (combined later with FTC) was added.</p> <p>Results Sustained response was obtained after 10 months of treatment and was accompanied by the clearance of serum hepatitis B virus surface antigen with seroconversion to anti-HBs.</p> <p>Conclusion This case report suggests that Delta infection may co-exist with high replicative HBV infection and that combination therapy with PegIFN and nucleoside/tide analogues seems to be more effective than IFN alone. Given that only a single case is reported, further studies including more patients are warranted.</p>
