

Isomerization of azobenzene and the enhancement of dynamic heterogeneities in molecular glass formers

Submitted by Emmanuel Lemoine on Mon, 06/02/2014 - 18:30

Titre	Isomerization of azobenzene and the enhancement of dynamic heterogeneities in molecular glass formers
Type de publication	Article de revue
Auteur	Teboul, Victor [1], Accary, J.B. [2], Chrysos, Michel [3]
Pays	Etats-Unis
Editeur	American Physical Society
Type	Article scientifique dans une revue à comité de lecture
Année	2013
Langue	Anglais
Date	03/2013
Numéro	3
Pagination	032309
Volume	87
Titre de la revue	Physical Review E
ISSN	1539-3755
Mots-clés	containing polymers [4], correlated motion [5], diffusion [6], field [7], highly supercooled liquids [8], photoisomerization [9], Simulations [10], Time [11], trans-azobenzene [12], transitions [13]
Résumé en anglais	Prompted by recent findings [Teboul, Saiddine, and Nunzi, Phys. Rev. Lett. 103, 265701 (2009); Orsi et al., Phys. Rev. E 82, 031804 (2010)] that the isomerization of few azobenzene molecules dispersed in a glass former greatly enhances the dynamic heterogeneity (DH) of the medium, we raise the issue as to whether the isomerization process gives rise to additional DHs or whether instead it stimulates the mechanisms at the origin of the thermal DHs, accelerating them in time. To this end, molecular dynamics simulations are made to study the much insightful four-point susceptibility, dynamic facilitation, and Van Hove correlation functions both when the isomerization is activated and when it is artificially switched off. Our results do not rule out any of the two scenarios as a possible cause for the enhancement of DHs upon switching on the isomerization process, but clearly show that the second one is by far the dominant mechanism in the dynamics of the supercooled liquid.
