

Photoelectrical Behaviour of DNA:PEDT-PSS Functionalised Films

Submitted by Emmanuel Lemoine on Mon, 06/02/2014 - 18:19

Titre	Photoelectrical Behaviour of DNA:PEDT-PSS Functionalised Films
Type de publication	Communication
Type	Communication avec actes dans un congrès
Année	2010
Langue	Anglais
Titre du colloque	14th International Symposium Ultrafast Phenomena in Semiconductors
Titre des actes ou de la revue	Acta Physica Polonica A
Numéro	2
Volume	119
Pagination	151-153
Auteur	Kažukauskas, Vaidotas [1], Pranaitis, Mindaugas [2], Krupka, Oksana [3], Sahraoui, Bouchta [4]
ISBN	0587-4246
Mots-clés	carrier [5], charge-transport [6], Conductivity [7], DNA [8], spectroscopy [9], thin-films [10]
Résumé en anglais	We report investigations of functionalized DNA:PEDT-PSS films. The thermal activation energy of the conductivity near the room temperature was about 0.033 eV. The weak carrier trapping was identified by the thermally stimulated current method, proving the fast recombination of light-generated carriers. A "bistable" photoconductivity below the room temperature was evidenced upon the white light excitation. By cooling the samples down to 145-155 K the photoconduction was small. Below this temperature sudden increase of the photoconductivity was observed. Meanwhile by heating the photosensitivity remained enhanced up to 235-245 K. The slow relaxations of the current after the light excitation took place, the time constant of which reached several hundreds of seconds. Such phenomenon could presumably be attributed to the light-induced changes of the sample material morphology and/or associated variation of carrier transport conditions.
Notes	Date du colloque : 02/2010
