Résumé en anglais	Cu(I)-catalyzed Huisgen-Meldal-Sharpless type dipolar 'click' reactions between azido-tetrathiafulvalene derivatives and ethynylferrocene yield the first examples of ferrocenyl-1,2,3-triazolyl-tetrathiafulvalene assemblies ( <b>4a</b> , <b>4b</b> ). The electrochemical behavior of <b>4a</b> and <b>4b</b> , which integrate two distinctive redox probes, has been investigated, and their binding ability for various transition-metal cations has been studied by cyclic voltammetry. The contribution of the triazolyl ring in the guest binding process is illustrated by the specific electrochemical recognition of Zn <sup>2+</sup> by receptor <b>4b</b> .
