

# Extended Fe-4 butterfly complexes: theoretical analysis of magnetic properties and magnetostructural maps

Submitted by Emmanuel Lemoine on Thu, 02/06/2014 - 11:10

Titre	Extended Fe-4 butterfly complexes: theoretical analysis of magnetic properties and magnetostructural maps
Type de publication	Article de revue
Auteur	Gomez-Coca, S. [1], Cauchy, Thomas [2], Ruiz, E. [3]
Editeur	Royal Society of Chemistry
Type	Article scientifique dans une revue à comité de lecture
Année	2010
Langue	Anglais
Numéro	20
Pagination	4832-4837
Volume	39
Titre de la revue	Dalton Transactions
ISSN	1477-9226
Mots-clés	basis-sets [4], binuclear complexes [5], crystal-structure [6], density-functional calculations [7], exchange coupling-constants [8], iron(iii) cluster [9], polynuclear complexes [10], single-molecule magnets [11], tetrานuclear iron complex [12], transition-metal-complexes [13]
Résumé en anglais	The inclusion of additional metal atoms in Fe-4 butterfly complexes drastically modifies their magnetic properties. Exchange interactions of a Fe4Y2 complex have been calculated using theoretical methods based on density functional theory. The calculated values are in good agreement with experimental data showing that the change in the nature of bridging ligands induces a dramatic decrease of the antiferromagnetic wing-body interaction while the body-body interaction between the two central iron atoms is ferromagnetic. Finally, we propose a new tool to facilitate the understanding of the magnetic properties in polynuclear iron complexes. Magnetostructural maps allow us to correlate the calculated exchange coupling constants with metal-metal distances for the dinuclear or polynuclear iron complexes that we have studied.
