Titre	Manipulation of the Open-Circuit Voltage of Organic Solar Cells by Desymmetrization of the Structure of Acceptor-Donor-Acceptor Molecules
Type de publication	Article de revue
Auteur	Demeter, Dora [1], Rousseau, Theodulf [2], Leriche, Philippe [3], Cauchy, Thomas [4], Po, Riccardo [5], Roncali, Jean [6]
Editeur	Wiley-VCH Verlag
Type	Article scientifique dans une revue à comité de lecture
Année	2011
Langue	Anglais
Date	11/2011
Numéro	22
Pagination	4379-4387
Volume	21
Titre de la revue	Advanced Functional Materials
ISSN	1616-301X
Mots-clés	curves [7], Design [8], Efficiency [9], interfaces [10], internal charge-transfer [11], oligothiophenes [12], orientation [13], photovoltaic cells [14], pi-conjugated systems [15], semiconductors [16]
Résumé en anglais	The synthesis of acceptordonoracceptor (ADA) molecules based on a septithiophene chain with terminal electron acceptor groups is reported. Using a dicyanovinyl-(DCV) substituted molecule as reference, another symmetrical ADA donor containing thiobarbituric (TB) groups is synthesized and these two acceptor groups are combined to produce the unsymmetrical ADA compound. The electronic properties of the donors are analyzed by cyclic voltammetry and UV-Vis absorption spectroscopy and their photovoltaic properties are characterized on bilayer planar heterojunction cells that include spun-cast donor films and vacuum-deposited C60 as acceptor. Optical and electrochemical data show that replacement of DCV by TB leads to a small increase of the HOMO level and to a larger decrease of the LUMO, which result in a reduced band-gap. The desymmetrized compound presents the lowest oxidation potential in solution but the highest oxidation onset in the solid state, which leads to a significant increase of the open-circuit voltage of the resulting solar cells.
