Résumé en anglais	The optical spectrum of a $\kappa$ -phase organic conductor is thoroughly analyzed for the example of $\kappa$ -(BEDT-TTF) <sub>2</sub> Cu[N(CN) <sub>2</sub> ]Br <sub>0.85</sub> Cl <sub>0.15</sub> in order to identify its various contributions. It is shown how the complex spectra can be decomposed using different approaches; the intradimer and interdimer contributions are discussed. In particular the fingerprints of electronic correlations in these spectra are considered.
