

Modification of glassy carbon electrodes by 4-chloromethylphenyl units and d-glucosaminic acid

Submitted by Emmanuel Lemoine on Tue, 02/04/2014 - 16:13

Titre	Modification of glassy carbon electrodes by 4-chloromethylphenyl units and d-glucosaminic acid
Type de publication	Article de revue
Auteur	Gautier, Christelle [1], Ghodbane, Ouassim [2], Wayner, Danial D-M [3], Bélanger, Daniel [4]
Type	Article scientifique dans une revue à comité de lecture
Année	2009
Langue	Anglais
Date	2009/11
Numéro	26
Pagination	6327 - 6334
Volume	54
Titre de la revue	Electrochimica Acta
ISSN	0013-4686
Mots-clés	d-Glucosaminic acid [5], Diazonium [6], Ferrocene [7], Glassy carbon electrode [8], Surface modification [9]
Résumé en anglais	The present work is dealing with the attachment of d-glucosaminic acid (D-GA) on glassy carbon electrode by two different methods. Firstly, the electrode was modified by chloromethylphenyl groups by reduction of 4-chloromethylphenyldiazonium cations followed by the nucleophilic substitution of the chlorine by the amine functionality of D-GA and secondly by the direct immobilization of the amine terminated molecule. The generality of the nucleophilic substitution reaction and the direct immobilization of an amine were also demonstrated with reactants bearing an electroactive ferrocene moiety; 4-nitrophenylferrocene (NFc) and 4-ferrocenylaniline (FcA). The surfaces modified with FcA and NFc were investigated by cyclic voltammetry, and the D-GA modified electrodes were characterized by X-ray photoelectron spectroscopy. A preliminary evaluation of the efficiency of these surface modifiers to prevent protein adsorption was realized by scanning electron microscopy.
