Titre Synthesis and reactivity of silylated tetrathiafulvalenes

Type de publication Article de revue

Auteur Hameau, Aurélien [1], Guyon, Fabrice [2], Knorr, Michael [3], Däschlein, Christian [4], Strohmann, Carsten [5], Avarvari, Narcis [6]

Type Article scientifique dans une revue à comité de lecture

Année 2008

Langue Anglais

Date 2008

Numéro 36

Pagination 4866 - 4876

Titre de la revue Dalton Transactions

ISSN 1477-9226 / 1477-9234

Résumé en anglais Novel organosilylated tetrathiafulvalenes (TTFs) possessing Si-H or Si-Si bonds have been synthesised. The crystal structures of several derivatives have been determined by X-ray diffraction, including that of dimeric (Si₂Me₄)(TTF)₂ (11) incorporating a diatomic SiMe₂-SiMe₂ linker. Cyclic voltammetry measurements in all cases show two oxidation waves. DFT calculations were performed to rationalize the absence of an electronic communication between the two TTF moieties of 11 through the disilanyl spacer. The reactivity of the Si-H bond has been exploited to prepare the dinuclear complex [{Ru(CO)₄}₂{μ-(Me₂Si)₄TTF}] (14), starting from Ru₃(CO)₁₂ and TTF(SiMe₂H)₄ (1). Treatment of 14 with 2 equiv. of PPh₃ or dppm results in selective substitution of a CO ligand trans to a SiMe₂ group to afford mer-[{Ru(PPh₃)(CO)₃}₂{μ-(Me₂Si)₄TTF}] (13) and mer-[{Ru(CO)₃}₂(η₁-dppm){μ-(Me₂Si)₄TTF}] (16). Attempts to transform the Si-H bonds of some TTF(SiMe₂H)_n (n = 1, 2) into Si-O functions using stoichiometric amounts of water in the presence of tris(dibenzylideneacetone)dipalladium(0) were unsuccessful. Quantitative cleavage of the CTTF-Si bond was observed instead of formation of TTF-based-siloxanes. Essays of catalytic bis-silylation of phenylacetylene with 11 and TTF(SiMe₂-SiMe₃) (9) in the presence of Pd(OAc)₂/1,1,3,3-tetramethylbutylisocyanide failed. Again, cleavage of the CTTF-Si bond was noticed.
