

Performance of a New Method of Multicomponent Images Segmentation in the Presence of Noise

Submitted by Emmanuel Lemoine on Thu, 01/30/2014 - 14:36

Titre	Performance of a New Method of Multicomponent Images Segmentation in the Presence of Noise
Type de publication	Article de revue
Auteur	Ouattara, Sié [1], Asseu, Olivier [2], Clément, Alain [3], Vigouroux, Bertrand [4]
Editeur	Scientific Research Publishing
Type	Article scientifique dans une revue à comité de lecture
Année	2011
Langue	Anglais
Date	2011
Numéro	11
Pagination	1082 - 1089
Volume	3
Titre de la revue	Engineering
ISSN	1947-3931
Mots-clés	Additional Noise [5], Correlated Noise [6], Gaussian Noise [7], Multicomponent Images [8], n-D Compact Histogram [9], segmentation [10], Uniform Noise [11]
Résumé en anglais	Any undesirable signal limiting to a degree or another the integrity and the intelligibility of a useful signal can be considered as noise. In the general rule, the good performance of a system is assured only if the level of power of the useful signal exceeds by several orders of magnitude that of the noise (signal to noise of a several tens of decibels). However certain elaborate methods of treatment allow working with very low signal to noise ratio in an optimal way any a priori knowledge available on the signal useful to interpret. In this work, we evaluate the robustness of the noise on a new method of multicomponent image segmentation developed recently. Two types of additional noises are considered, which are the Gaussian noise and the uniform noise, with varying correlation between the different components (or planes) of the image. Quantitative results show the influence of the noise level on the segmentation method.
