Myocardial infarction (MI) is the leading cause of mortality worldwide. Direct reprogramming of cardiac fibroblasts into induced cardiomyocytes (iCMs) represents a new promising strategy for cardiac regeneration [1]. In this work, we demonstrated that non-viral transient transfection of human adult cardiac fibroblasts (AHCFs) with four miRNAs (miRcombo: miR-1, 133, 208, 499 [2]) is able to reprogram AHCFs into iCMs, and reprogramming efficiency is further enhanced by a 3D culture environment. Novel lipoplexes were also designed for safer and efficient miRNA delivery [3,4].

This project received funding from the European Research Council under the European Union's Horizon 2020 research and innovation programme grant agreement N°-772168.
