1-Butyl-3-methylimidazolium tribromido(triphenylphosphane- κP)nickelate(II) butan-1-ol hemisolvate

Tim Peppel^{a*} and Martin Köckerling^b

^aLeibniz-Institut für Katalyse e.V. (LIKAT), Heterogene Photokatalyse, Albert-Einstein-Str. 29a, D-18059 Rostock, Germany, and ^bUniversität Rostock, Institut für Chemie, Anorganische Festkörperchemie, Albert-Einstein-Str. 3a, D-18059 Rostock, Germany. *Correspondence e-mail: tim.peppel@catalysis.de

The solvated title salt, $(C_8H_{15}N_2)[NiBr_3(P(C_6H_5)_3)] \cdot 0.5C_4H_{10}O$, was obtained in the form of single crystals directly from the reaction mixture. The molecular structure consists of separated 1-butyl-3-methylimidazolium cations, tribromido(triphenylphosphane)nickelate(II) anions and half a solvent molecule of 1-butanol, all connected *via* multiple hydrogen contacts to form a three-dimensional network. The co-crystallized 1-butanol molecule is disordered and adopts two orientations. The central C–C bonds of both orientations are located on an inversion centre (Wyckoff site 2b of space group $P2_1/n$). Thereby, each orientation has again two orientations with the OH group being located either on one or the other side of the C_4 alkyl chain. The dried solvent-free compound exhibits a relatively low melting point (m.p. = 412 K).

Structure description

Nickel(II) complexes exhibiting pseudo-tetrahedral symmetry $[NiX_3L]^-$ [X : halide, L : neutral ligand, *e.g.* $P(C_6H_5)_3$] have been thoroughly characterized for more than 50 years by means of magnetic investigations, UV-vis and far-infrared spectroscopy, NMR and EPR as well as Mössbauer spectroscopy (Figgis *et al.*, 1966; Bradbury *et al.*, 1967; Fischer & Horrocks, 1968; Erich *et al.*, 1969; Gerloch *et al.*, 1981; Desrochers *et al.*, 2006). In addition, complexes bearing the $[NiBr_3P(C_6H_5)_3]^-$ anion have been investigated as suitable precatalysts for the generation of Ni-NHC complexes (NHC: *N*-heterocyclic carbene) in catalytic processes, *e.g.* selective cross-coupling reactions (Xu *et al.*, 2013; Poulsen *et al.*, 2014; Zhang *et al.*, 2015). Single-crystal structure determinations of complexes with the general formula (*cation*) $[NiBr_3P(C_6H_5)_3]$ are known for the following cations: $[As(C_6H_5)_4]^+$ (Hanton & Raithby, 1980), $(DiPIm)^+$ (DiPIm: 1,3-diisopropylimidazolium; Xu *et al.*, 2013), $(DiPPPhIm)^+$ (DiPPPhIm: 1,3-bis(2,6-diisopropylphenyl)-

yl)imidazolium; Xu *et al.*, 2013), and (EMIm)⁺ (EMIm: 1-ethyl-3-methylimidazolium; Peppel *et al.*, 2013). We report here the synthesis and crystal structure of (BMIm)⁺·[NiBr₃(P(C₆H₅)₃)]⁻·0.5(C₄H₁₀O) (BMIm⁺ is 1-butyl-3-methylimidazolium).

The asymmetric unit of the title compound consists of one 1-butyl-3-methylimidazolium cation and one tribromido(triphenylphosphane)nickelate(II) anion (Fig. 1). An additional highly distorted half molecule of 1-butanol is incorporated in the crystal structure. Together with weak C—H \cdots Br contacts involving the anion, the OH function of the solvent molecule forms hydrogen bonds to the N atom of the cation, building up an extended three-dimensional hydrogen-bonded network (Table 1). The co-crystallized 1-butanol molecule adopts two orientations. The central C—C bonds of both orientations are located on the inversion centre whereby each orientation has again two orientations with the OH group being located either on one or the other side of the C₄ alkyl chain. All bond lengths and angles within the cation as well as the complex anion are in the expected ranges (Peppel *et al.*, 2013). The coordination environment around the Ni^{II} atom is pseudo-tetrahedral with

Br—Ni—Br angles ranging from 109.95 (2) to 117.94 (2) $^\circ$, and Br—Ni—P angles ranging from 102.76 (2) to 106.26 (2) $^\circ$. The packing of the molecular entities is depicted in Fig. 2.

Synthesis and crystallization

The title compound was obtained as blue crystals in multi-gram scale from 1-butyl-3-methylimidazolium bromide, triphenylphosphane and anhydrous nickel(II) bromide in boiling 1-butanol (Peppel *et al.*, 2013). 1-Butyl-3-methylimidazolium bromide (1.0 g, 4.6 mmol) and triphenylphosphane (1.2 g, 4.6 mmol) were dissolved in 20 ml of 1-butanol in a Schlenk tube. This solution was added in one portion to a vigorously stirred, nearly boiling suspension of NiBr₂ (1.0 g, 4.6 mmol) in 30 ml of 1-butanol. The resulting green precipitate was completely dissolved by heating up the suspension to the boiling point of the solvent. The hot solution was cooled down to 277 K overnight in a refrigerator. The resulting blue crystals were filtered off, washed thoroughly with diethyl ether and dried in vacuum at ambient conditions (2.5 g, 78%).

Analytic data for C₂₆H₃₀Br₃N₂P: m.p. 412 K, elemental analysis % (calc.): C 42.61 (44.62); H 4.28 (4.32); N 4.18 (4.00).

Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. Several low-angle reflections were omitted in the structure refinement because their intensities were affected by the beam stop. The centre of the co-crystallized 1-butanol molecule is located on the Wyckoff site 2b of space group P₂₁/n. It is disordered with two different orientations, which were refined using a split arrangement with the sum of occupational factors being fixed to full occu-

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
