Abstract: Previous studies have shed light on the effects of the adoption of OHSAS (Occupational Health and Safety Assessment Series) 18001 certification on performance. One important factor that has been neglected so far is the adoption timing. The question of whether early OHSAS 18001 adopters achieve better financial performance than do late adopters (or vice versa) remains unanswered. Drawing on institutional theory, we develop hypotheses and then analyze the secondary longitudinal data of listed Chinese manufacturing firms by employing a rigorous event study approach and performing regressions. The results indicate that early adopters enjoy significantly greater performance gains than do late adopters. We find that early adopters of OHSAS 18001 certification realize additional financial performance from the second year to the fourth year after adoption, but late adopters only benefit in the preparation year. Moreover, early adoption is more favorable to firms with high labor intensity and low internationalization level. Thus, this study extends research in understanding the effects of OHSAS 18001 on financial performance and suggest new insights to the implementation of corporate social responsibility practices.

## Highlights

- The results indicate that early adopters enjoy significantly greater performance gains than do late adopters.
- We find that early adopters of OHSAS 18001 certification realize additional financial performance from the second year to the fourth year after adoption,
- Late adopters only benefit in the preparation year.
- Early adoption is more favorable to firms with high labor intensity and low internationalization level.

# OHSAS 18001 and Economic Sustainability: Effects of Adoption Timing and Firm Characteristics

## Abstract

Previous studies have shed light on the effects of the adoption of OHSAS (Occupational Health and Safety Assessment Series) 18001 certification on performance. One important factor that has been neglected so far is the adoption timing. The question of whether early OHSAS 18001 adopters achieve better financial performance than do late adopters (or vice versa) remains unanswered. Drawing on institutional theory, we develop hypotheses and then analyze the secondary longitudinal data of listed Chinese manufacturing firms by employing a rigorous event study approach and performing regressions. The results indicate that early adopters enjoy significantly greater performance gains than do late adopters. We find that early adopters of OHSAS 18001 certification realize additional financial performance from the second year to the fourth year after adoption, but late adopters only benefit in the preparation year. Moreover, early adoption is more favorable to firms with high labor intensity and low internationalization level. Thus, this study extends research in understanding the effects of OHSAS 18001 on financial performance and suggest new insights to the implementation of corporate social responsibility practices.

Keywords: OHSAS 18001, corporate social responsibility, adoption timing, institutional theory, event study

## 1. Introduction

In recent years, there has been increasing pressure from multiple stakeholders to manage occupational health and safety issues to improve health conditions at the workplace and reduce costs from work accidents (İnan et al., 2017). According to the Global Estimates of Occupational Accidents and Work-related Illnesses report (Hämäläinen et al., 2017), the estimated number of work-related deaths occurring annually across the countries rose from 2.33 million in 2014 to 2.78 million in 2017. Therefore, the adoption of OHSAS (Occupational Health and Safety Assessment Series) 18001 certification has been an important undertaking for many organizations and has contributed to achieving corporate social responsibility (CSR) (Godos-Díez, Fernández-Gago, & Martínez-Campillo, 2011; Zwetsloot, 2003)

Proponents of this certification suggest that it may improve working conditions and facilitate safety management, internal safety communication, and company image (Pheng and Pong, 2003; Karapetrovic and Casadesús, 2009; Nunhes et al., 2016; İnan et al., 2017). However, despite the widespread assumption that organizations benefit from OHSAS 18001 certification adoption, conflicting findings exist regarding its effects on financial performance. Some scholars have demonstrated the anticipated financial advantages (Fernándezmuñiz et al., 2009; Lo et al., 2014; Lafuente and Abad, 2018), while others have found no financial performance benefits associated with management certification (e.g., OHSAS 18001) (Lo et al., 2011).

Meanwhile, other research has revealed that although improvements in sales growth resulted from OHSAS 18001 adoption, these benefits did not translate into financial performance improvements (Fan and Lo, 2012). Some authors even found negative results due to some

1 specific assumptions, for example, customer pressure (Lo et al., 2011). Previous studies have  
2  
3 shed light on the effects of OHSAS 18001 certification adoption on financial performance, but  
4  
5 few studies have been devoted to the moderators of their relationship, with one exception (Lo et  
6  
7 al., 2014). One important factor that has been neglected so far is the adoption timing. Therefore,  
8  
9 the question of whether early OHSAS 18001 adopters achieve better effects in performance  
10  
11 compared with late adopters (or vice versa) remains unanswered. Although past studies have  
12  
13 focused on the effect of adoption timing for other certifications (e.g., ISO 9000 and ISO 14001),  
14  
15 we believe that OHSAS 18001 has its own characteristics that require separate attention.  
16  
17  
18  
19  
20  
21  
22

23 Despite the mixed results on the performance benefits of OHSAS 18001 certification, firms  
24  
25 continue to implement this standard (Ghahramani, 2016). In practice, the question that  
26  
27 managers increasingly face is not whether they should adopt a new certification but when they  
28  
29 should adopt it (Su et al., 2015). Early adopters enjoy certain first-mover advantages, such as  
30  
31 early access to limited information and brand equity derived from positive customer  
32  
33 perceptions of the firm (Jacobs et al., 2015). However, they may also face significant  
34  
35 uncertainties and have less knowledge on when to implement it. The decisions on when to  
36  
37 adopt OHSAS 18001 certification can significantly affect the firm's competitive standing and  
38  
39 create advantages or disadvantages over competitors.  
40  
41  
42  
43  
44  
45  
46  
47

48 In this study, we view OHSAS 18001 certification as an innovative CSR initiative, similar to  
49  
50 that of ISO 9000 and ISO 14000 (Ritchie and Melnyk, 2012). Referring to the literature  
51  
52 describing the diffusion of innovations in contrasting the motivations of early and late adopters  
53  
54 (e.g., Benner and Veloso, 2008; Russo, 2009; Jacobs et al., 2015) and the innovation adoption  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 curve provided by Rogers (2003), we believe that the benefits of OHSAS 18001 certification  
2  
3 may vary depending on when firms decide to adopt it—that is, the effectiveness of  
4  
5 implementation may be influenced by the adoption timing. On the other hand, drawing on  
6  
7 institutional theory, we propose that adoption of OHSAS 18001 certification by firms is  
8  
9 associated with higher performance benefits for early adopters and lower performance benefits  
10  
11 for late adopters. Further, we hypothesize that certain characteristics of a firm may enhance or  
12  
13 limit such benefits.  
14  
15  
16  
17  
18  
19  
20

21 Therefore, our study provides further insights on the financial benefits of adoption timing and  
22  
23 considers some contingencies that moderate these benefits. Specifically, this study seeks to  
24  
25 answer the following research questions (RQs):  
26  
27  
28  
29

- 30 • RQ1. How does the adoption timing influence the effects of OHSAS 18001 certification  
31 adoption on financial performance?  
32  
33
- 34 • RQ2. What factors affect the different financial performance of early versus late  
35  
36 OHSAS 18001 certification adopters?  
37  
38  
39  
40  
41

42 To answer the two questions, we consider 356 listed Chinese manufacturing firms between  
43  
44 2002 and 2013. We examine the data up to 2013 because the analysis requires data in year  $t+4$   
45  
46 (i.e., 2017) to perceive the firm's performance. We focus on China for three main reasons: (1)  
47  
48 The manufacturing sector is the largest and most important sector in the Chinese economy, and  
49  
50 China has become the largest manufacturer in the world (Zhang et al., 2014). (2) The general  
51  
52 stakeholders are interested in the labor conditions in Chinese factories (Kortelainen, 2010). (3)  
53  
54 Empirical evidence on the impact of OHSAS 18001 on Chinese firm performance is scant.  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 In this paper, we perform an event study analysis and compare changes in return on assets  
2  
3 (ROA) of early and late OHSAS 18001 adopters with those of a portfolio of non-OHSAS 18001  
4  
5 control firms. The results show that early adopters of OHSAS 18001 experience significantly  
6  
7 greater performance gains than do late adopters, suggesting that they may enjoy certain  
8  
9 first-mover advantages that produce superior financial outcomes. Further, this study also shows  
10  
11 that the advantages of early adopters tend to be moderated by certain characteristics of the firm.  
12  
13  
14 Namely, early adoption is more favorable for firms with high labor intensity and low  
15  
16 internationalization level.  
17  
18  
19  
20  
21  
22

23 This study contributes to the management literature in three ways. First, our results highlight  
24  
25 the importance of deciding when to adopt OHSAS 18001 certification. Second, the results  
26  
27 advance former first-mover advantages literature by pointing out the specific beneficial period,  
28  
29 that is, from the first year to the fourth year after the adoption. Third, we propose that certain  
30  
31 key characteristics of a firm amplify the benefits for early adopters more than for late adopters.  
32  
33  
34 The advantages accrue more significantly for early adopters under certain circumstances.  
35  
36  
37 Further, our study has significant managerial implications. First and foremost, we help  
38  
39 managers decide when to adopt the OHSAS 18001 certification by considering their firms'  
40  
41 characteristics. Second, the results may be a guideline for them to adopt other management  
42  
43 certifications.  
44  
45  
46  
47  
48  
49  
50

51 The remainder of the paper is structured as follows. In Section 2, we conduct a literature review  
52  
53 and then formulate hypotheses. Section 3 describes the dataset and the adopted methodology.  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 Section 4 presents the results, and Section 5 discusses the findings. Finally, conclusions are  
2  
3 provided in Section 6.

## 6 7 **2. Literature Review and Research Hypotheses** 8 9

### 10 *2.1. Early adopters versus late adopters* 11 12

13  
14 Although no previous paper has studied whether early OHSAS 18001 adopters realize better  
15 performance than do late adopters, the effect of adoption timing has been analyzed in a variety  
16 of other contexts, such as innovation practices, new market entry, new product development,  
17 adoption of a new information system or financial accounting standard, and mergers and  
18 acquisitions (Fosfuri et al., 2013; Zachary et al., 2015). We found 16 relevant papers in  
19 management-related journals that consider the effects of adoption timing of some major  
20 management practices (e.g., certifications such as ISO 9000 and ISO 14000, and well-known  
21 operation management practices such as Total Quality Management and Six Sigma) on  
22 performance.  
23  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35  
36  
37  
38  
39

40 These papers are summarized in Table 1. They are classified into three clusters according to the  
41 different viewpoints on the effect of adoption timing. Most research supports the notion that  
42 early adopters have first-mover advantages, and they tend to use institutional theory as the  
43 underpinning theoretical framework. However, research has not consistently borne out the  
44 first-mover advantages. For example, Jacobs et al. (2015) focus on Six Sigma adoption and find  
45 that late adopters enjoy significantly greater performance gains than do early adopters. A third  
46 viewpoint is that there is no guarantee that performance improvement belongs to early or late  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 adopters, while learning is a more important factor than timing in explaining the certification  
2 performance (Naveh et al., 2004).  
3  
4

5  
6  
7 In sum, the effect of adoption timing has been analyzed in a variety of contexts. However,  
8  
9 previous studies have shown conflicting results on the different financial performance of early  
10 versus late adopters. We think this may be due to the different characteristics of these  
11 certifications and practices. Some certifications are private standards, such as ISO 9000, whose  
12 primary benefit is expected to accrue for the firms that adopt them (Ni et al., 2016). Others are  
13 public standards, such as C-TPAT, whose primary benefits are for the public at large rather than  
14 for the firms that adopt them (Ni et al., 2016). Another process management practice, that is,  
15 Total Quality Management, can be regarded as an innovation practice that offers a definite  
16 economic payoff (Ritchie and Melnyk, 2012). Six Sigma, which typically requires major  
17 reassignments of tasks, may be expensive and disruptive to adopt (Jacobs et al., 2015). OHSAS  
18 18001 is similar to other externally certified management systems such as ISO 9000 and ISO  
19 14000; however, it differs from these other systems and may influence performance differently  
20 (Lo et al., 2014). One important difference is that ISO 9000 and ISO 14000 certifications are  
21 often driven by customer demand, while most firms have been managing safety issues for  
22 decades (Lo et al., 2014). Hence, considering the specificities of OHSAS 18001, caution is  
23 necessary to generalize the results of the aforementioned studies to this context.

## 2.2. *Early adopters versus late adopters of OHSAS 18001*

Institutional theory provides a useful lens to explain such first-mover advantages. The theory shows that there is a meaningful difference between early and late adopters of management practice because these two groups face dissimilar pressures from the environment, which may lead to different results of implementing the practice (Tolbert and Zucker, 1983; Dimaggio and Powell, 1983). The first movers adopt management practices because they react to normative pressure and are mainly interested in the internal efficiency gains of a practice (Iatridis et al., 2016). Normative pressures refer to societal expectations toward organizations to behave in accordance with societal norms, beliefs, and values (Schaefer, 2007). They may lead firms to accept that OHSAS 18001 certification is necessary to enhance their corporate reputation in the market (Prajogo et al., 2012). In this context, firms might adopt this certification, for example, as a statement of integrating occupational health and safety issues into their business strategy. In contrast, late adopters are more subject to coercive and mimetic motives (Iatridis et al., 2016). They are more prone to apply this practice symbolically or superficially, that is, without integrating the requirements of the standard in their own operations (Naveh and Marcus, 2004). In such cases, firms may not truly seek the spirit of continuous improvement and may not pursue all the opportunities for learning (Silva et al., 2017).

From this view, early adopters of OHSAS 18001 certification may enjoy greater benefits because they are aware of more opportunities for economic gain by adopting this certification and are free from coercive and mimetic pressure. They are more inclined to spare their efforts to commit to the practice's requirements and implement it substantially (Montiel and Husted,

1 2009). As a result, they adopt this certification on the basis of their unique social concerns and  
2  
3 obtain the benefits by showing their commitment to occupational health and safety issues  
4  
5  
6 before their competitors. It is instead reasonable to speculate that late adopters are motivated by  
7  
8  
9 legitimacy considerations rather than social concerns, and their adoption is more likely to be  
10  
11  
12 compromised.

13  
14  
15 Even though the later adopters are economically motivated, timing is a critical concern (Benner  
16  
17  
18 and Veloso, 2008) because late adopters of the certification only further increase homogeneity  
19  
20  
21 with the early adopters (Su et al., 2015). As most firms in an industry adopt a certification, it  
22  
23  
24 will be increasingly difficult to translate it into sustainable relative advantages of financial  
25  
26  
27 performance because most firms make the same improvements (Porter, 1996). Ritchie and  
28  
29  
30 Melnyk (2012) also propose that the financial benefits are greatest for those who adopt the  
31  
32  
33 innovation first because a greater number of firms implement similar generic practices later.  
34  
35  
36 Thus, although early adopters of innovation may have limited knowledge about a new practice,  
37  
38  
39 confront more challenges, and face greater uncertainties, we suggest that early adoption in  
40  
41  
42 OHSAS 18001 offers more first-mover advantages than those for late adopters.

43  
44 We develop the following hypothesis:

45  
46  
47 **Hypothesis 1.** The improved post-certification financial performance of early adopters of  
48  
49  
50 OHSAS 18001 certification is significantly greater than that of late adopters.  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 *2.3. Factors affecting adoption timing effects of OHSAS 18001*

2  
3  
4 In this part, we choose two factors that not only closely relate to the institutional environment of  
5  
6  
7 China but also may have an influence on the relationship between OHSAS 18001 adoption  
8  
9  
10 timing and financial performance.

11  
12  
13 2.3.1. Labor intensity

14  
15  
16  
17 Firms with high labor intensity have more variable and complex operations (Swink and Jacobs,  
18  
19  
20 2012). Exposure to more complex and mechanized production processes increases  
21  
22  
23 occupational risks in manufacturing businesses (Abad et al., 2013). Labor-intensive firms'  
24  
25  
26 production processes are often complicated and non-automated; therefore, these firms rely  
27  
28  
29 heavily on workers in their operations (Lo et al., 2014). As a production system becomes more  
30  
31  
32 dependent on people, the necessity for a formalized process to reduce labor accidents and  
33  
34  
35 minimize accident risks becomes increasingly important. Introducing OHSAS 18001  
36  
37  
38 certification can help labor-intensive firms better manage their safety production processes.  
39  
40  
41 However, for a low labor-intensive firm, there is less room for further improvement in the  
42  
43  
44 safety production processes because it has a higher level of automation. Hence, because of the  
45  
46  
47 characteristics and greater benefits of this certification, early adopters with high labor intensity  
48  
49  
50 are more suitable and likely to adopt it. They will also adapt and update their safety standards  
51  
52  
53 more frequently than will adopters with low labor intensity.

54  
55  
56 There is an additional factor favoring early adopters of OHSAS 18001 certification with high  
57  
58  
59 labor intensity. In some cases, OHSAS 18001 certification can be conditional for recruiting  
60  
61  
62 higher quality employees who are in high demand in the labor market (Santos et al., 2013)

1 because these workers have more power to bargain for better welfare and working conditions  
2  
3 (Cahuc et al., 2006). Thus, early adopters with high labor intensity may have more high-quality  
4  
5 employees. These human resources are vital in financial performance improvement.  
6  
7

8  
9  
10 Taken together, we suggest that early adopters with high labor intensity are more likely to  
11  
12 benefit from OHSAS 18001 certification than are early adopters with low labor intensity.  
13  
14

15 Hence, we develop the following hypothesis:  
16  
17

18  
19 **Hypothesis 2.** The differential financial performance associated with early adoption of OHSAS  
20  
21 18001 certification is greater for organizations with high labor intensity than for those with low  
22  
23 labor intensity.  
24  
25

### 26 27 28 2.3.2. Internationalization level 29 30

31  
32 Internationalization not only enables firms to leverage their existing resources across countries  
33  
34 (Kaleka, 2012) but also enhances firm capabilities through a learning-by-exporting process,  
35  
36 which means exporting firms may increase their knowledge base by learning from involvement  
37  
38 in foreign markets (Martins and Yang, 2009; Vendrell-Herrero et al., 2016). Firms with high  
39  
40 internationalization level have greater opportunity to learn because they are exposed to new and  
41  
42 different ideas from diverse national contexts and various social, cultural, and environmental  
43  
44 challenges (Ayuso et al., 2016). Participation in foreign markets can bring firms into contact  
45  
46 with international best practices on occupational health and safety issues, thereby helping to  
47  
48 foster new organizational capabilities to implement OHSAS 18001 certification.  
49  
50  
51  
52  
53  
54  
55  
56  
57

59  
60  
61  
62  
63  
64  
65

1 Early adopters with low internationalization level have fewer chances and resources to avail  
2  
3 themselves of emergent practices such as OHSAS 18001. In contrast, early adopters that have  
4  
5 high internationalization level can leverage knowledge acquired in different jurisdictions and  
6  
7 develop a set of best practices based on their collective learning (Ayuso et al., 2016). They can  
8  
9 take full advantage of codified adoption experiences from foreign organizations, consulting,  
10  
11 and other available knowledge stocks. For these reasons, we develop the following hypothesis:  
12  
13  
14  
15  
16  
17

18 **Hypothesis 3.** The differential financial performance associated with early adoption of OHSAS  
19  
20 18001 certification is greater for organizations with high internationalization level than for  
21  
22 those with low internationalization level.  
23  
24  
25  
26

### 27 **3. Research Method**

#### 28 *3.1. Dataset and sample*

29  
30  
31 We used data from the China Stock Market and Accounting Research (CSMAR) and the WIND  
32  
33 Economic Database, which are widely regarded as the most authoritative data sources in China  
34  
35 and have been used in recent studies (Sun et al., 2017). We focused on A-share market-listed  
36  
37 manufacturing companies in China on the Shanghai and Shenzhen Stock Exchanges<sup>1</sup>.  
38  
39  
40  
41  
42  
43  
44  
45  
46

47 As there is no publicly available database containing the full list of OHSAS-certified firms,  
48  
49 data on OHSAS 18001 certification were collected from four sources: a certification and  
50  
51 accreditation unified business information search platform (CNCA; <http://cx.cnca.cn/>),  
52  
53 official company websites, annual reports, and media reports. The CNCA platform, supported  
54  
55 by the Certification and Accreditation Administration of the People's Republic of China, has  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 been used in some recent certification-related studies (e.g., Wang et al. 2016; Lo et al. 2017).

2  
3 We conducted the research through a multi-step process. First, one member of the research  
4  
5  
6 team searched each of the 2172 listed manufacturing firms in the A-share market on the CNCA  
7  
8  
9 search platform and recorded the certification year. Second, a different team member  
10  
11  
12 randomly chose several companies to check the results. Third, for firms that were not found  
13  
14 on the CNCA platform, we examined their official websites and their annual reports and  
15  
16  
17 entered their names (together with a set of keywords related to OHSAS certification) in the  
18  
19  
20 Baidu search engine (i.e., the top search engine in China). If there was still no information on  
21  
22  
23 OHSAS 18001 certification, this firm was considered a non-adopter. OHSAS 18001  
24  
25  
26 certification is a facility-specific certification; thus, a firm with multiple facilities may obtain  
27  
28  
29 multiple certifications. We followed the practice of Lo et al. (2014) and focused only on the  
30  
31 first OHSAS 18001 certification.

32  
33  
34 Out of the 2172 listed manufacturing firms, 844 firms had obtained OHSAS 18001  
35  
36  
37 certification between 2000 and 2013. Of the 844 sample firms, we dropped 488 firms that had  
38  
39  
40 insufficient financial data in the period of OHSAS 18001 certification because, for example,  
41  
42  
43 they had obtained certification prior to listing on the stock exchange. Finally, 356 firms were  
44  
45  
46 included in our analysis.

47  
48  
49 The frequency of OHSAS 18001 adoption by year is presented in Table 2. We matched them to  
50  
51  
52 the widely cited innovation adoption curve provided by Rogers (2003), which categorizes  
53  
54  
55 subjects into innovators (2.5%), early adopters (13.5%), early majority (34%), late majority  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 (34%), and laggards (16%). We then further re-categorized the five groups into two types: early  
2  
3 (innovators, early adopters, and early majority) and late adopters (late majority and laggards).  
4  
5

6  
7 **Insert Table 2 Here**  
8  
9

10  
11 *3.2. Event study*  
12

13  
14 We used an event study method recommended by Barber and Lyon (1996) and Jacobs et al.  
15  
16 (2015) regarding the timeframe to measure the OHSAS 18001 certification effects on financial  
17  
18 performance. We defined the event year (year t) as the year when the firm first acquired the  
19  
20 certification and year t-2 as the base year. In this study, we measured the abnormal performance  
21  
22 over the 5 years from year t-2 to year t+3. We focused on ROA, which is calculated as operating  
23  
24 income/total assets, as the dependent variable. As with Lo et al. (2014), we then matched the  
25  
26 sampled firms with a set of control firms by matching the industry<sup>2</sup>, firm size (calculated as the  
27  
28 natural logarithm of the total assets, 50–200%), and ROA (90–110%) in year t-2.  
29  
30  
31  
32  
33  
34  
35  
36  
37

38 During the matching process, we excluded 65 observations from the 356 that could not be  
39  
40 matched with any non-certification firms or had only one firm to match (following Lo et al.,  
41  
42 2014); eventually, 291 firms remained (early adopters: 145; late adopters: 146). On average,  
43  
44 each sample firm was matched with 3.2 control firms, allowing us to minimize performance  
45  
46 fluctuations that might occur in a particular control firm. Next, we performed two  
47  
48 non-parametric tests for the two subsamples separately: the Wilcoxon signed ranks (WSR) test  
49  
50 and the sign test. We also reported the results of the parametric *t*-test to further confirm our  
51  
52 findings.  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 3.3. Ordinary least squares regression  
2  
3

4 To further test Hypothesis 1, we used the ordinary least squares (OLS) methodology adopted by  
5 other studies (e.g., Jacobs et al., 2015).  
6  
7

8  
9  
10 We used the abnormal ROA as the outcome, which was obtained from the analysis made in the  
11 previous paragraph. *Early* had a value of 1 if firms were OHSAS-certified in 2010 or earlier  
12 and a value of 0 if the firms were certified in 2011 or later. Labor intensity (LI) was measured  
13 as the ratio of a firm's employee number to its total sales (Swink and Jacobs, 2012).  
14  
15  
16  
17  
18

19 Internationalization level (Int) was measured as the ratio of foreign sales to total sales and  
20 indicates the extent to which a firm's business comes from foreign versus domestic markets  
21 (Chakrabarty and Wang, 2012).  
22  
23  
24  
25  
26  
27  
28

29 To ensure the rigor of our model, we included five control variables in the analysis. First,  
30 because more profitable firms may have more resources to achieve higher profitability in the  
31 future, we controlled their ROA ( $PP_k$ ). Second, because larger firms may have more resources,  
32 they may also have more difficulty coordinating employees when implementing OHSAS 18001  
33 (Lo et al., 2014). Hence, we controlled the firm size ( $FSize_k$ ). Third, one industry-level control  
34 variable was also included. We used the mean number of total assets in the same sector in year  
35  $t$  ( $ISize_{kh}$ ) as the industry-level control variable. Fourth, adopting OHSAS 18001 certification  
36 can be regarded as one of the tools used to facilitate the achievement of corporate social  
37 responsibility ( ) goals, and has become a significant element of the CSR effort (Mežinska et al.,  
38 2015). If the firm already has CSR reporting, it may exert positive effects on the  
39 implementation of occupational health and safety management practices. Thus, we also  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 controlled whether the firm already had CSR reporting before OHSAS 18001 certification.

2  
3 CSR was coded as 1 if firms had CSR reporting before certified OHSAS 18001; otherwise, we  
4  
5 coded it as 0. Fifth, OHSAS 18001 relies on its strong compatibility with ISO 9001 and ISO  
6  
7 14001 management systems, so we also controlled the two ISO certification experiences by  
8  
9 considering them dummy variables, indicating whether the firm had received ISO 9001 or ISO  
10  
11 14001 certification during the same event study period (Lo et al., 2014). The dummy variable  
12  
13 was coded 0 for firms without ISO 9001/14001 and 1 for firms with ISO 9001/14001. We then  
14  
15 summed them up to form the *ISO experience<sub>k</sub>*. The adoption years of ISO 9000 and ISO  
16  
17 14000 certifications were obtained in the same way as OHSAS 18001 certification. CSR  
18  
19 reporting data were collected from CSMAR, and the remaining data were from WIND.  
20  
21

22 Hence, combining the hypothesized variables with the control factors yields the following  
23  
24 model 1 to further test Hypothesis 1:  
25  
26

$$\begin{aligned} \text{Model 1: } AP_k = & \beta_0 + \beta_1(Early) + \beta_2(PP_k) + \beta_3(FSize_k) + \beta_4(ISize_{kh}) + \beta_5(CSR_k) + \\ & \beta_6(ISO\ experience_k) + \beta_7(LI_k) + \beta_8(Int_k) + e_k \end{aligned}$$

27  
28  
29 To test the certification adoption period differential impacts of the contextual factors proposed  
30  
31 in Hypotheses 2 and 3, we used the interaction terms between the factors and the *Early* adoption  
32  
33 variable. The expanded model 2 is:  
34  
35

$$\begin{aligned} \text{Model 2: } AP_k = & \beta_0 + \beta_1(Early) + \beta_2(PP_k) + \beta_3(FSize_k) + \beta_4(ISize_{kh}) + \beta_5(CSR_k) + \\ & \beta_6(ISO\ experience_k) + \beta_7(LI_k) + \beta_8(LI_k) \cdot Early + \beta_9(Int_k) + \beta_{10}(Int_k) \cdot Early + e_k \end{aligned}$$

1 where  $AP_k$  denotes the abnormal performance from t-2 to t+3,  $k$  refers to the  $k$ th sample firm,  
2  
3 and  $h$  refers to the  $h$ th industry in which the  $k$ th firm operates.  
4  
5

6  
7 **4. Results**  
8  
9

10  
11 *4.1. Impact of OHSAS 18001 adoption timing on financial performance*  
12  
13

14 Table 3 presents the results for abnormal changes in ROA in single-year and multi-year periods  
15 for the early adopters and late adopters. Because our base year to establish control firms is year  
16 t-2, we present the five yearly changes in abnormal ROA starting with the change from year t-2  
17 to t-1 and continue through the change from year t+2 to t+3. For aggregate measures, we  
18 compute the changes in abnormal ROA for four multiple-year periods: from year t-2 to t+3, t-1  
19 to t+3, t to t+3, and t+1 to t+3. To consider the multiple-testing problem, the false discovery rate  
20 methodology by Benjamini and Hochberg (1995) is applied.  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34

35 First, we consider the results of single-year abnormal changes in ROA. For early adopters, the  
36 changes are significantly positive from year t-2 to t-1, from t+1 to t+2, and from t+2 to t+3,  
37 while the significantly positive results for late adopters only appear from year t-1 to t. The  
38 evidence suggests that late adopters of OHSAS certification experience significant benefits  
39 from pre-adoption efforts. However, early adopters experience significant benefits 1 year after  
40 adoption.  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50

51 Next, we focus on the results for the multiple-year periods. For early adopters, the abnormal  
52 changes in ROA are all significantly positive during the four multiple-year periods. In contrast,  
53 none is significant for late adopters.  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 In summary, the results show that OHSAS certification generates significantly greater positive  
2 effects on ROA for early adopters compared with late adopters, which provides support for  
3  
4  
5  
6 Hypothesis 1.  
7

8  
9  
10 **Insert Table 3 Here**  
11

#### 12 13 *4.2. Additional tests* 14

15  
16  
17 To determine whether the benefits of OHSAS 180001 certification adoption timing endure in  
18  
19  
20 the longer term (e.g., t+4), we conducted the same event study again. We can see from Table 4  
21  
22  
23 that tests for late adopters still are not significant to t+4 under the false discovery rate  
24  
25  
26 (Benjamini and Hochberg, 1995). In addition, the early adoption advantages do not appear up to  
27  
28  
29 the fourth year after adoption. These results clearly show that financial performance for early  
30  
31  
32 adopters cannot always stay ahead in the long run.  
33

34  
35 **Insert Table 4 Here**  
36

#### 37 38 39 *4.3. Relating timing effects of OHSAS certification to firm characteristics* 40

41  
42  
43 Tables 5 provides descriptive statistics and correlation of the variables in a regression analysis.  
44  
45  
46 Table 6 presents the estimated standardized regression coefficients for the two models. First,  
47  
48  
49 we focus on the results for model 1 to observe the main effects. The  $F$ -value is 4.052,  
50  
51  
52 significant at the 1% level, and the adjusted  $R^2$  is 7.8%. As hypothesized, the coefficient for  
53  
54  
55 Early is significantly positive (at the 1% level), which further indicates that OHSAS 18001  
56  
57  
58 certification adoption benefits are greater for early adopters.  
59

60

**Insert Table 6 Here**

The moderating effect of the two variables (labor intensity and internationalization level) can be observed from model 2. The simple effect of labor intensity is negative and insignificant, while the interaction coefficient with Early is positive and significant (at the 10% level). This result indicates that early-adopting firms with high labor intensity experience greater performance impacts from OHSAS 18001 certification than do early-adopting firms with low labor intensity, but the improved performance of early versus late adopters is significantly greater for high labor intensity firms than for low labor intensity firms. Hypothesis 2 is therefore supported by our findings.

The simple effect of internationalization level is positive and insignificant, while its interaction with Early is negative and significant (at the 5% level). These coefficients indicate that the improved performance of early versus late adopters is greater for firms with low internationalization level. Hypothesis 3 is therefore not supported by our findings. These results are further supported by the plots in Fig. 1.

**Insert Fig. 1 Here**

**5. Discussion**

*5.1. Early OHSAS 18001 adopters versus late adopters*

Lo et al. (2014) only consider adoption timing as a control variable. Our research builds on their study and goes one step further by exploring the effects of adoption timing on financial performance. Our findings suggest that institutional theory provides a useful theoretical

1 framework to explain adoption timing outcomes for OHSAS 18001 certification. The ultimate  
2  
3 performance improvement belongs to the early adopters because they implement a practice that  
4  
5 fits their needs, which they believe to be the correct course of action. Late adopters implement  
6  
7 the practice because others do so, which reduces the employees' motivation to use OHSAS  
8  
9 18001 in practice. The misdirected reasons for OHSAS 18001 certification adoption lead to a  
10  
11 lack of benefits for late adopters (Yeung et al., 2003).  
12  
13  
14  
15  
16  
17

18 Our results are consistent with the previous findings of Benner and Veloso (2008) and Russo  
19  
20 (2009), in which first-mover advantages exist in certification adoption. Further, our study  
21  
22 highlights how the adoption timing influences the effects of certification adoption on financial  
23  
24 performance. Specifically, early adopters of OHSAS 18001 certification realize greater  
25  
26 financial performance at least 1 year after certification adoption, but late adopters benefit in the  
27  
28 preparation year. Additionally, the early adoption advantages for this certification last until  $t+3$ ,  
29  
30 and the benefits disappear in the year  $t+4$ .  
31  
32  
33  
34  
35  
36  
37

38 A potential explanation may be that early adopters face a critical challenge because they have  
39  
40 limited or no knowledge about the characteristics and benefits of a practice (Meyer et al., 2009);  
41  
42 thus, they enter a weak institutional context with high information asymmetries and increased  
43  
44 costs of doing business (Ritchie and Melnyk, 2012). Confronted with these challenges, they  
45  
46 continuously optimize the implementation process and strive to learn. Hence, the financial  
47  
48 performance gain is not significant in the first year after adoption because they are still in the  
49  
50 initial exploratory stage. As time passes, they come to understand such practices and develop  
51  
52 new capabilities suitable for coping with related problems. In this stage, the financial benefits  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 appear gradually. However, the early adopters' experience can be easily transferred to other  
2  
3 firms (Benner and Veloso, 2008). It is not easy for early adopters to achieve long-term  
4  
5 competitive advantages.  
6

7  
8  
9  
10 Late adopters, as Jacobs et al. (2015) suggest, can use the experiences of others, often captured  
11  
12 in an existing knowledge infrastructure, to design more efficient implementation processes.  
13  
14 Thus, in the preparation year (1 year before adoption), they may have obvious improvement in  
15  
16 financial performance. However, process innovation, such as OHSAS 18001, may be more  
17  
18 difficult to copy because it tends to be hidden within the organization rather than discernible  
19  
20 through reverse engineering (Naveh et al., 2004). Late adopters may face some internal or  
21  
22 external difficulties in the following years, which they need to manage themselves. Further,  
23  
24 their adoption comes from extrinsic motivation; thus, they do not want to resolve these  
25  
26 problems in a radical way. This behavior is reflected in the financial performance, which does  
27  
28 not significantly improve for late adopters after adoption.  
29  
30  
31  
32  
33  
34  
35  
36  
37

38 Although Wang et al. (2016) and Iatridis et al. (2016) also support the first-mover advantages in  
39  
40 certifiable management standard adoption, they take three standards (ISO 9001, ISO 14001,  
41  
42 and OHSAS 18001) into account simultaneously. This type of analysis is based on a  
43  
44 precondition that firms are likely to exhibit similar patterns of behavior when implementing all  
45  
46 of these standards. If this assumption does not stand, the results are invalidated.

### 53 *5.2. Firm characteristics affecting the benefits of OHSAS 18001 early adopters*

54  
55  
56

57 The related papers (Table 1) that we mentioned that analyze the adoption timing are affected by  
58  
59 either the internal (e.g., resources and dynamic capability) or the external (e.g., institution)  
60  
61

1 factors of a firm. Our study considers the internal and external factors at the same time. The  
2  
3 external factors (e.g., dissimilar pressure from the institutional environment) are used to explain  
4  
5  
6 the first-mover advantages, while internal factors are identified (e.g., labor intensity and  
7  
8  
9 internationalization level) that may amplify or reduce the potential advantages of early  
10  
11 adoption.  
12

### 15 5.2.1. Labor intensity

19 Consistent with Hypothesis 2, the results suggest that positive labor intensity does have a  
20  
21 synergistic effect on performance with early adoption (see Fig. 1a). As we discussed before, the  
22  
23 workforce of labor-intensive firms is vulnerable to workplace injuries. Protecting employees  
24  
25 from injuries is one of the priorities for the management. OHSAS 18001 is designed to enable  
26  
27 organizations to control occupational health and safety risks and improve their performance  
28  
29 (Rajaprasad and Chalapathi, 2015). The increased number of workers who are injured or die  
30  
31 affects the mood and motivation of the whole workforce negatively, which leads to qualitative  
32  
33 and quantitative decreases in production (Uysal and Kesim, 2015). Hence, labor-intensive firms  
34  
35 adopting the certification early standardize the production process earlier than do late adopters  
36  
37 to reduce unsafe practices for employees. Especially China, which was a labor-abundant and  
38  
39 low-cost developing country a decade ago, attracts many foreign firms to produce  
40  
41 labor-intensive products in mainland China, and these firms transport the products back to their  
42  
43 home countries (Liu et al., 2004; Buckley et al., 2007). Under such circumstances, firms with  
44  
45 high labor intensity that have adopted OHSAS 18001 certification may better meet the  
46  
47 standards of foreign firms, which leads to more orders and improves the financial performance  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 of these Chinese firms. However, from the 2010s onwards, the number of young workers in the  
2  
3 labor force ceased to rise and has now fallen (Thoburn, 2017). Moreover, in the institutional  
4  
5 environment during this time, China's FDI strategy has moved away from mature  
6  
7 labor-intensive industries toward higher technology industries (Thoburn, 2017). As a result, the  
8  
9 labor costs are no longer as inexpensive as before, so many foreign firms transfer the  
10  
11 labor-intensive work to even lower labor cost markets, such as Vietnam or Bangladesh. In this  
12  
13 case, Chinese firms with OHSAS 18001 certification gain fewer advantages than those without,  
14  
15 especially high labor intensity industries.  
16  
17  
18  
19  
20  
21  
22

23 In contrast, for late adopters, firms with low labor intensity benefit more than do firms with  
24  
25 high labor intensity. One explanation may be that low labor intensity indicates an advanced  
26  
27 stage of mechanization. By learning from others' experiences, late adopters with low labor  
28  
29 intensity can continually adjust their traditional behaviors to adapt to the new certification more  
30  
31 easily than can those with high labor intensity. However, high labor intensity may reduce  
32  
33 managerial inefficiency (Tzelepis et al., 2006). The result in Fig. 1b shows that the slope for the  
34  
35 high labor intensity line is greater than that for low labor intensity, which means that labor  
36  
37 intensity amplifies the benefits of OHSAS 18001 certification between early and late adopters.  
38  
39  
40  
41  
42  
43  
44  
45

#### 46 5.2.2. Internationalization level

47  
48  
49

50 Although we propose that the internationalization level may amplify the advantages of early  
51  
52 adopters, the empirical analysis shows the opposite. We can see from Fig. 1b that for early  
53  
54 adopters, firms with low internationalization level benefit more than do those with high  
55  
56 internationalization level, while firms with high internationalization level demonstrate the  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 advantages for late adopters. We believe one of the explanations is that in China, economic  
2  
3 activities and business operations are mainly controlled by the government, so the state's  
4  
5 regulatory regimes exert considerable influence on the firms (Li and Ding, 2013). In terms of  
6  
7 internationalization, governments in China actively encourage and support domestic firms in  
8  
9 moving abroad through policies and regulations (Luo et al., 2010). In the past, the  
10  
11 internationalization strategy taken by many Chinese firms might have been a response to  
12  
13 institutional pressure from the Chinese government rather than actual economic rationales (Li  
14  
15 and Ding, 2013). Further, firms in developing countries such as China tend to lack international  
16  
17 experience, competitive technologies, and international market knowledge, which results in  
18  
19 them gaining fewer resources and fewer competitive advantages than those of firms in  
20  
21 developed markets (Xiao et al., 2013). In addition, most firms in the early period export  
22  
23 low-tech and low-priced products to foreign markets, which brings minimal profit in return  
24  
25 (Xiao et al., 2013). Hence, the firms that adopt OHSAS 18001 certification early not only must  
26  
27 spend money on their workers but also have to attempt to adapt to international market rules.  
28  
29  
30 Internationalization increases the environmental complexity and adds more competition to  
31  
32 firms. A Chinese firm with the certification does not necessarily have an advantage because  
33  
34 many firms also adopt this certification in international markets. The certification may be  
35  
36 helpful when they enter a new market, but the overall effects are poorer than those for low  
37  
38 internationalization level firms.  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53

54 On the contrary, firms that focus on the domestic market have some advantages. The Chinese  
55  
56 government issued the first OHSMS requirements as part of the national standards in 2001,  
57  
58 which were formally implemented in 2002. After this year, firms in China began to adopt this  
59  
60  
61  
62  
63  
64  
65

1 certification. In the first few years of development of OHSAS 18001 in China, few firms  
2  
3 adopted it. Hence, firms that focused on adopting OHSAS 18001 had advantages over their  
4  
5 competitors. However, after 10 years of development, the requirements established by the  
6  
7 Chinese government underwent a major adjustment in 2011. The new version emphasized the  
8  
9 importance of ‘health’, proposed new requirements for occupational health and safety planning,  
10  
11 and made the requirements more compatible to quality and environment management systems.  
12  
13 This change prompted different types of enterprises to adjust their occupational health and  
14  
15 safety management systems. Thereafter, an increasing number of firms adopted OHSAS 18001  
16  
17 in the domestic market, and competitive advantages in the domestic market weakened  
18  
19 gradually. Thus, as Elango et al. (2013) point out, firms in the early stages of entry into a  
20  
21 foreign market may lack knowledge, but late adopters with high internationalization level may  
22  
23 be exposed to know-how and technologies not available in domestic markets by frequently  
24  
25 interacting with foreign agents, customers, suppliers, competitors, or collaborators (Salomon  
26  
27 and Shaver, 2005; Dimitratos et al., 2014). Hence, such experience can help internationalized  
28  
29 firms further implement occupational health and safety practices in a better way.

## 43 Conclusions

44  
45  
46 This study extends existing knowledge on OHSAS 18001 certification by exploring two  
47  
48 questions that have been under-explored in prior studies. We examine how adoption timing  
49  
50 influences the effects of OHSAS 18001 certification adoption on financial performance and  
51  
52 how some contextual factors affect the different financial performance of early versus late  
53  
54 OHSAS 18001 certification adopters.  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 Our empirical analyses support the hypothesis—grounded in institutional theory—that early  
2  
3 adopters of OHSAS 18001 certification perform better financially than do late adopters. The  
4  
5 first-mover advantages appear at least 1 year after certification adoption; 2 years after adoption,  
6  
7 the advantages become more significant, while after 4 years of adoption, the advantages  
8  
9 disappear. Further, the benefits of early adoption in  $t-2$  to  $t+3$  can be amplified or reduced  
10  
11 depending on the firm’s characteristics. Specifically, early adopters tend to experience greater  
12  
13 differential financial performance gains when they have high labor intensity and low  
14  
15 internationalization level.  
16  
17  
18  
19  
20  
21  
22

#### 23 Contribution to theory 24

25  
26  
27 First, we highlight the importance of deciding when to adopt OHSAS 18001 certification.  
28  
29 Scholars have studied the safety and financial performance benefits of implementing OHSAS  
30  
31 18001 certification; however, they have not explored the importance of deciding when to  
32  
33 implement it by comparing the performance changes between early and late adopters. Given  
34  
35 that this certification seeks to achieve a certain degree of isomorphism between firms, the  
36  
37 timing decision is crucial. By incorporating a time dimension into the analysis, ours is the first  
38  
39 study to show that early adopters of OHSAS 18001 obtain more performance benefits than do  
40  
41 late adopters. This study thus echoes the suggestion of Aguinis and Glavas (2012) that  
42  
43 highlights the importance of explaining under what conditions the relationship between a CSR  
44  
45 practice and its outcomes change.  
46  
47  
48  
49  
50  
51  
52

53  
54  
55  
56 Second, we extend previous literature on the effects of adoption timing of other certifications  
57  
58 (e.g., ISO 9001 and ISO 14001) by indicating the time periods when the first-mover advantages  
59  
60  
61  
62

1 are more significant. We find that early adopters of OHSAS 18001 certification gain additional  
2  
3 financial performance at least 1 year after certification adoption and that the advantages  
4  
5 disappear after 4 years, but late adopters only benefit in the preparation year. These findings are  
6  
7 significantly richer and different from those of other adoption timing studies (e.g., Wang et al.  
8  
9 2016; Iatridis et al., 2016).  
10  
11  
12  
13  
14

15 Third, we also discuss some key characteristics of a firm that may affect the benefits for early  
16  
17 adopters in comparison with late adopters. Specifically, early adopters tend to experience  
18  
19 greater differential financial performance gains if they have high labor intensity and low  
20  
21 internationalization level. First-mover advantages that benefit early adopters more tend to  
22  
23 dominate financial performance outcomes in these circumstances. To the best of our  
24  
25 knowledge, our study may be the first to explore the moderators that affect the relationship  
26  
27 between adoption timing and financial benefits gleaned from this certification adoption.  
28  
29  
30  
31  
32  
33  
34

### 35 5.3. Contribution to practice 36 37 38

39 Our research also contributes to management practice. Managers often deliberate when to adopt  
40  
41 a new certification such as OHSAS 18001. Our research addresses this question and suggests  
42  
43 that early adopters capture more lasting financial benefits than do late adopters, while late  
44  
45 adopters benefit only for a short time. When to adopt OHSAS 18001 certification depends on  
46  
47 the managers' willingness to gain short-term or long-term interest. Managers should also  
48  
49 consider their firms' labor intensity and internationalization level when making decisions.  
50  
51  
52  
53  
54  
55  
56 These factors may provide important insights for practitioners to identify and exploit their  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 motivational advantages. Further, our results can also serve as a guideline for firms to adopt  
2  
3 other certifications that improve their CSR.  
4  
5

6  
7 *5.4. Limitations and future research*  
8  
9

10 The results of our study should be viewed in light of some limitations. First, we only explore  
11  
12 certain internal and external (institutional) factors of an organization. Other external factors  
13  
14 may also be important, such as environmental munificence, environmental dynamism (Goll and  
15  
16 Rasheed, 2004), industry innovativeness (Mackelprang et al., 2015), and industry  
17  
18 competitiveness (Lo et al., 2013). Second, we include only listed Chinese manufacturing firms  
19  
20 in our sample. Caution is necessary to generalize the findings to non-Chinese manufacturing  
21  
22 firms. Therefore, we recommend that future studies include certified firms from a broader range  
23  
24 of countries and conduct cross-country comparisons.  
25
