Laporan Akhir Projek Penyelidikan Jangka Pendek  
Final Report Of Short Term Research Project

Komen Jawatankuasa Penyelidikan Pusat Pengajian/Pusat  
Comments by the Research Committees of Schools/Centres

This project has been completed successfully and all study objectives achieved. The output of the research include a number of medical developments (including a ventilator) by Dr. Anuar Ahmad, a presentation at the Annual Scientific Meeting Malaysian Society of Anesthesiology 2008 and won the Young Investigator Award.

A manuscript was also been submitted to the British Journal of Anaesthesia.

The report has been independently assessed and approved by the PJJ research committee.

## Lampiran

### **TITLE:**

A comparative study of target controlled infusion (TCI) and manual controlled infusion (MCI) of propofol for sedation in severe traumatic brain-injured patient

### **ABSTRACT**

**Background.** The aims of this study are to compare TCI with MCI propofol as sedation in severe traumatic brain-injured (TBI) patients.

**Methods.** Post emergency craniotomy for severe TBI patients ( $n = 50$ ), were randomly assigned to receive propofol sedation over 24 hours using two modes of infusion: TCI versus MCI ( $n = 25$  in each groups). Sedation was monitored using bispectral index (BIS) monitor and sedation agitation scale (SAS). TCI was titrated between  $0.2\text{--}2.0 \mu\text{g ml}^{-1}$  and MCI was between  $0.3\text{--}4.0 \text{ mg kg}^{-1} \text{ h}^{-1}$  to achieve sedative state at BIS 60-70 and SAS 2-3. Mean arterial pressure (MAP), heart rate (HR), intracranial pressure (ICP), cerebral perfusion pressure (CPP), time taken and volume used to achieve BIS 70, total volume of propofol over 24 hours and recovery time to BIS 90 were recorded.

**Results.** TCI achieved BIS 70 significantly faster than MCI ( $6.3 \pm 2.9 \text{ min}$  vs.  $19.7 \pm 7.0 \text{ min}$ ). Total volume of propofol at BIS 70 was significantly less in TCI ( $12.0 \pm 2.9 \text{ ml}$  vs.  $17.8 \pm 4.3 \text{ ml}$ ). Recovery time to BIS 90 was also significantly faster in TCI ( $24.4 \pm 11.5 \text{ min}$  vs.  $57.3 \pm 19.9 \text{ min}$ ). TCI showed significantly lower in HR and ICP trends over 24 hours. CPP trends were significantly higher in TCI. There were no significant differences in MAP and total volume over 24 hours.

**Conclusions.** TCI modes had more advantages for propofol sedation in TBI by providing faster onset and offset of sedation and better in controlling ICP and CPP.

**Keywords:** anaesthetic i.v., propofol; anaesthetic techniques, computer-assisted continuous infusion; equipment, infusion pump.

## **ABSTRAK**

### **Latar belakang:**

Sasaran kajian ini adalah untuk membandingkan teknik aliran kawalan kepekatan sasaran (AKKS) dengan teknik aliran kawalan secara manual (AKM) dalam pelalian menggunakan ubat propofol di kalangan pesakit yang mengalami kecederaan otak yang teruk akibat trauma.

### **Metodologi:**

Pesakit kecederaan otak yang teruk akibat trauma yang telah ~~telah~~ selesai pembedahan kecemasan ( $n = 50$ ), di bahagikan secara rawak untuk menerima ubat pelalian propofol selama 24 jam menggunakan 2 teknik infusi: AKKS dan AKM ( $n = 25$  bagi setiap kumpulan). Tahap pelalian di awasi menggunakan mesin pengawasan "bispectral index" (BIS) dan skala tahap pelalian dan keresahan (STPK). AKKS di beri dalam julat  $0.2\text{-}2.0 \mu\text{g ml}^{-1}$  dan AKM di beri dalam julat  $0.3\text{-}4.0 \text{ mg kg}^{-1} \text{ h}^{-1}$  untuk mencapai tahap BIS 60-70 and STPK 2-3. Tekanan darah (TK), denyutan jantung (DJ), tekanan di dalam tempurung otak (TTO), tekanan pengairan darah dalam otak (TPDO), tempoh di ambil serta isipadu ubat propofol digunakan untuk mencapai BIS 70, isipadu keseluruhan ubat propofol selama 24 jam dan tempoh pemulihan untuk mencapai BIS 90, telah direkodkan

### **Keputusan:**

Teknik AKKS mencapai BIS 70 lebih cepat berbanding dengan AKM ( $6.3 \pm 2.9$  min berbanding  $19.7 \pm 7.0$  min). Isipadu ubat propofol digunakan untuk mencapai BIS 70 lebih rendah bagi AKKS ( $12.0 \pm 2.9 \text{ ml}$  berbanding  $17.8 \pm 4.3 \text{ ml}$ ). Tempoh pemulihan untuk mencapai BIS 90 juga lebih cepat bagi AKKS ( $24.4 \pm 11.5$  min berbanding  $57.3 \pm 19.9$  min). AKKS menunjukkan perubahan DJ dan TTO yang lebih rendah sepanjang 24 jam. Tiada perbezaan yang signifikan dalam TK serta isipadu keseluruhan ubat propofol selama 24 jam.

### **Kesimpulan:**

Teknik AKKS mempunyai lebih kelebihan untuk pelalian ubat propofol di kalangan pesakit kecederaan otak yang teruk akibat trauma dengan memberikan kesan pelalian serta kesan pemulihan dari pelalian lebih cepat berbanding teknik AKM. Di samping itu ia juga lebih baik dalam mengawal TTO serta TPDO.
