**FRAMING THE FAMILY OF TWO-DIMENSIONAL PLANES**  
**IN FIVE-DIMENSIONAL SPACE**

The paper discusses the invariant framing of a family  $S_q$  of two-dimensional planes in five-dimensional equiaffine space  $A_5$  at all admissible values:  $2 \leq q \leq 8$ . This framing is built by movable maximal frame, which is completely interpreted both analytically and geometrically. The main signs and terms correspond to the conventional ones, while all the functions are assumed to be analytical.

**ALGORITHM TO SOLVE THE PROBLEMS OF THEORY OF**  
**ELASTIC STRENGTH AND TOUGHNESS BY VARIATIONAL-**  
**DIFFERENCE METHOD. PART I**

The paper presents numerical procedure to define two- and three-dimensional elasto-plastic stress-strained state of a solid deformable body using variational-difference method implementing Lagrange variation principle by the method of finite differences. The physical parities are assumed to be as in the theory of small elastic-plastic strains, while the geometric parities are taken as Cauchy equations. The physical nonlinear problem is solved by the method of variable parameters of elasticity. The sample problems of deformation of axially symmetric body of ogival shape and cylindrical quadrant give the comparison of direct and iterative methods of solving the system of linear algebraic equations of high order, which is the result of usage of necessary condition of an extremum of grid analogue of a functional of a full potential energy of the system.

**PHOTO-BIRTH OF  $\eta$ -MESONS ON PROTONS IN**  
**RESONANCE FIELD OF ENERGY**

The results of precise measuring cross-sections T-asymmetry of  $\gamma p \rightarrow \eta p$  process near reaction threshold as well as the results of measuring the  $\Sigma$ -asymmetry and  $d\sigma/d\Omega$  of this process were used in the paper to develop isobaric model of  $\gamma p \rightarrow \eta p$  process. The model includes eleven nucleonic resonances:  $S_{11}(1535)$ ,  $S_{11}(1650)$ ,  $P_{11}(1440)$ ,  $P_{13}(1720)$ ,  $D_{13}(1520)$ ,  $D_{15}(1675)$ ,  $F_{15}(1680)$ ,  $F_{17}(1990)$ ,  $G_{17}(2190)$ ,  $G_{19}(2250)$ ,  $H_{19}(2220)$  and a background of nucleonic pole and  $t$ -channel contribution into amplitude of vector mesons. To describe experimental dependence of full cross-sections on photon energy both  $S_{11}(1535)$  and  $S_{11}(1650)$  resonances are necessary. The calculated differential and full cross-sections as well as  $\Sigma$ -asymmetry of  $\gamma p \rightarrow \eta p$  process agrees well with experimental data at photon energy up to 2 GeV. At the energies higher than 2 GeV the amplitude of the process essentially depends on contributions of  $\rho$ - and  $\omega$ -mesons, the relation of which to nucleons is still uncertain. Variants of different  $t$ -channel expansions of the model into the area of high energy are considered.

**COMPONENTS OF EXPLOSIVE COMPOUNDS**

Mathematical simulation were used to evaluate the composition of multi-component plasma by the methods of thermodynamic analysis. Experimental research of physico-chemical processes ongoing in multi-component plasma flow (for example under interaction of air low-temperature plasma with refractory materials and explosive compounds) needs initial information of such plasma systems. To know what components can be generated due to ongoing processes in plasma is very important for mass-spectrometry studying the composition of multi-component plasma.

**CONDITIONS OF EXCITATION SINE WAVE SELF-OSCILLATIONS IN RC-GENERATORS**

Incorrect statements, discrepancies and obviously erroneous statements are in the literature on electronics by consideration of questions of excitation and generating sine wave self-oscillations in electronic circuits. In particular, amplitude balance and phase balance are considered as the conditions of sine oscillations in the circuits. The incorrectness of these statements is caused by a number of the reasons. Under these conditions oscillation has already constant amplitude. The feedback transfer factor can be determined only when feedback loop elements (the amplifier and a frequency-dependent circuit) are steady at disconnection of a loop. In some real circuits under given conditions the sine wave self-oscillations are not excited. Exact performance of amplitude balance and phase balance without transfer factor – voltage relationship also does not guarantee a stationary mode. Conditions of self-oscillations are offered to be formulated in terms of zero of the characteristic equation of oscillatory system of the generator.

**ANALYSIS OF PARAMETRIC TECHNIQUES TO STABILIZE THE VOLTAGE OF SWITCH-MODE PULSE CONVERTERS**

In the paper a back, boost and back-boost of switch-mode pulse converters are observed. Three feedback control modes are surveyed: at a constant value of period, at a constant value of pause and at a constant value of pulse. The block-diagrams of control systems implementing these modes are presented. Expression and graphs of relative magnitudes at LF and HF of output ripple are shown. It is shown, that the greatest efficiency of suppression LF input ripple, with other things being equal, is ensured with the mode of constant pause, and the other two give practically the same results. The simulation results of theoretical calculations by the SW package OrcAD 9.2 are presented.

**INDUCTIVE DIVIDERS OF THE VOLTAGE WITH SIMMETRYING WINDING**

A sharp increase of gain error takes place with increasing the frequency in inductive dividers of the voltage (IDV), made by ten-wire plait on ferromagnetic core, due to non-equality of shunt capacities. IDV with simmetrying winding (SW) can essentially decrease the frequency error (5 times and more). IDV is a combination of binary divider and five-section windings, the sequential connection of which make up decade winding. This leads to equalization of shunt capacities and therefore the working frequency band of IDV with SW is spreading out.

**ENERGETIC PARAMETERS OF HIGH-VOLTAGE INDUCTOR  
DISK GENERATOR**

Ozonators for purification of water and air, lasers and other kinds of electrophysical equipment needs high-voltage supply (up to  $10^4$  V) at frequencies  $10^2...10^3$  Hz. The authors have considered the possibility of manufacturing and effective application of the inductor disk generator having the given characteristics for the consumers supply. The working model of high-voltage generator has been developed, mathematical model has been built and a set of investigations has been carried out to determine optimal ratio of the generator parameters and energetic characteristics under operating conditions. Simulation of the energetic characteristics of the inductor generator allowed to obtain the power voltage and the frequency required for supplying the ozonators unit and other kinds of electrophysical equipment.

**TRENDS IN MODERN EDUCATION AND THE PROBLEM OF  
INTEGRAL DEVELOPMENT OF A PERSON**

The problems development of modern education have become extremely actual under condition of forming information society. The ongoing change of basics of social-cultural pattern of the world put the problem of survival in unstable and bifurcational cultural space. This change defines the culture of education in a whole, the main purpose of which has become the education of a man to be able to orient in crisis situations, to be creative under cultural abnormal conditions and having experience to work with different types of thinking and with ideas of different cultures, to be ready for poly-cultural dialogue. Realization of such ideas in educational system means the tendency stating the value and dignity of a human, change of educational paradigm from the system "human-world" to the system "human-world-human Ego".

**NOOSPHERE CONCEPT OF V.I. VERNADSKY AND  
MODERN ECOLOGICAL KNOWLEDGE**

The difficulty of modern ecological situation, sharpened contradiction among people and nature demands to know more about philosophical and natural scientific works of such scientists as V.I. Vernadsky. Genesis of noosphere and its connection with biosphere were examined in his works. There are two big systems, which interplay, supplement and explain each other. The substrata, where the sphere of mind was born (noosphere), is a biosphere. Homo sapiens must keep the environment, where he was born. But nowadays the arising conditions result in such solution of the problems of co-evolution among people and nature has (from the one hand) scientific and (from the other hand) moral component. Becoming a new geological force, a man in his activity must base on the scientific thought at first and to develop such strategy of his attitude to biosphere, which can keep human civilization.
