## 7-Methoxy-2-phenylchroman-4-one

Agata Piaskowska,\* Maciej Hodorowicz and Wojciech Nitek

Faculty of Chemistry, Jagiellonian University, Ingardena 3, 30-060 Krakow, Poland  
Correspondence e-mail: agata.piaskowska@uj.edu.pl

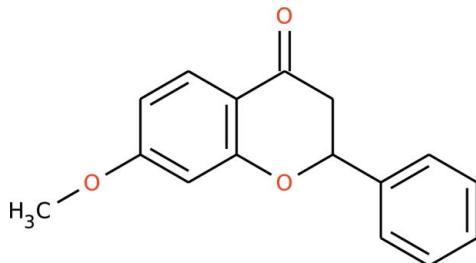

Received 7 October 2012; accepted 15 January 2013

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.086;  $wR$  factor = 0.280; data-to-parameter ratio = 16.4.

In the title compound,  $\text{C}_{16}\text{H}_{14}\text{O}_3$ , the ring O atom and the two adjacent non-fused C atoms, as well as the attached phenyl ring, exhibit static disorder [occupancy ratio 0.559 (12): 0.441 (12)]. The crystal packing features  $\pi-\pi$  [centroid-centroid distance = 3.912 (1)  $\text{\AA}$ ] and  $\text{C}-\text{H}\cdots\pi$  interactions.

## 7-Methoxy-2-phenylchroman-4-one

**Agata Piaskowska, Maciej Hodorowicz and Wojciech Nitek**

### S1. Comment

Flavanones are of interest because of their anticancer effect as the aromatase inhibitors. By competing with androgens for binding with aromatase these compounds prevent the hydroxylation of C18 androgens to aromatic C19 estrogenic steroids (Hong & Chen, 2006). This suppresses the overexpression of aromatase in breast cancer (Pouget *et al.*, 2001).

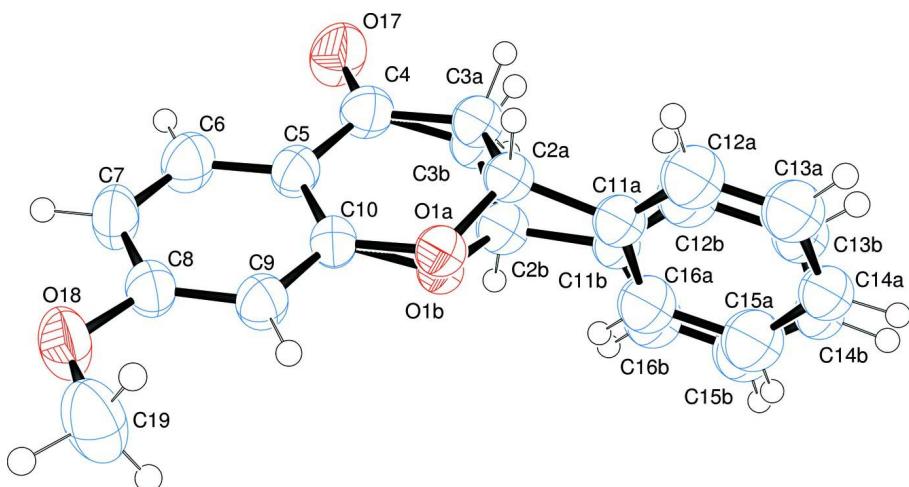

The heterocyclic ring contains O1, C2 and C3 atoms exhibiting static disorder. This disorder is propagated into the attached phenyl. The dihedral angle between the C5—C10 aromatic ring plane and the phenyl ring plane is 88.6 (1) $^{\circ}$  for the major disorder component (C11A—C16A) and 87.3 (1) $^{\circ}$  for the minor component (C11B—C16B). The structure is stabilized by  $\pi$ — $\pi$  and C—H $\cdots$  $\pi$  interactions (Table 1). The C5—C10 ring displays a  $\pi$ — $\pi$  interaction with the C5<sup>i</sup>—C10<sup>i</sup> ring (Fig. 2 b) with a perpendicular distance of 3.543 (1) Å, a centroid-to-centroid distance of 3.912 (1) Å and a slippage of 1.658 Å [symmetry code: (i) 1 -  $x$ , - $y$ , - $z$ ]. There are three types of C—H $\cdots$  $\pi$  interactions: C13A—H13A $\cdots$ Cg4<sup>i</sup> (C13B—13B $\cdots$ Cg4<sup>i</sup> in the minor disorder component), C19—H19B $\cdots$ Cg4<sup>ii</sup> (Fig. 2a) and C15B—H15B $\cdots$ Cg3<sup>iii</sup> (Fig. 2 a) [symmetry codes: (i) - $x$ ,  $y$ +1/2, 1/2- $z$ , (ii) 1 -  $x$ , 1 -  $y$ , - $z$ , (iii)  $x$  - 1,  $y$ ,  $z$ ]. The first interaction falls into type III X—H $\cdots$ pi interactions while the rest can be classified as type I according to Malone and coworkers (Malone *et al.* (1997)).

### S2. Experimental

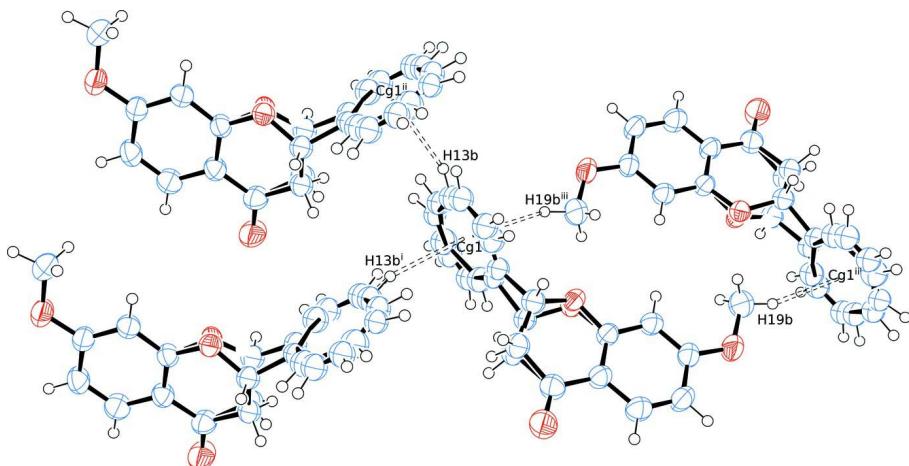

The title compound was purchased from Sigma-Aldrich and used without further purification. Single crystals were obtained by slow evaporation of MeOH solution.

### S3. Refinement

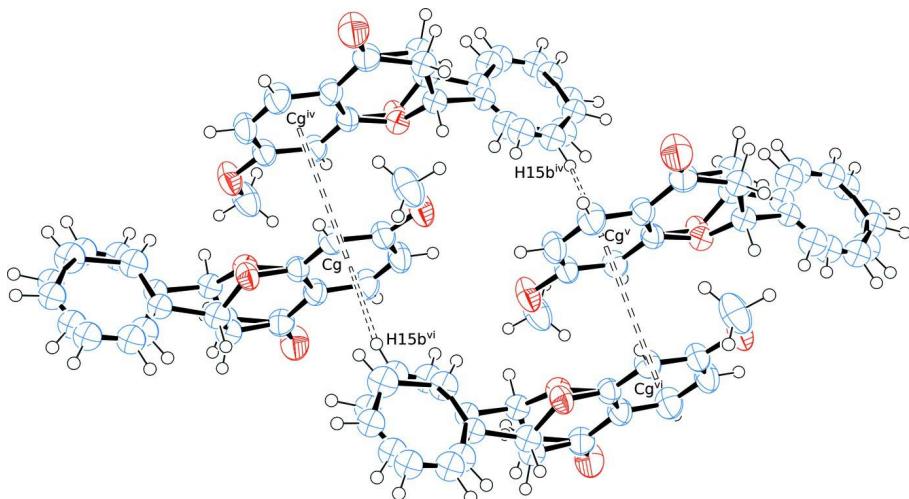

All hydrogen atom positions were observed in difference Fourier map. Nevertheless, in the refinement procedure the hydrogen atoms were positioned geometrically and refined using a riding model (including free rotation about the C—C bond for CH<sub>3</sub> groups), with C—H = 0.93—0.96 Å (C—H = 0.97 Å for CH<sub>2</sub> groups, 0.96 Å for CH<sub>3</sub> groups, and 0.93 Å for aromatic CH) and with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for methyl groups and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for all other H atoms. Disordered non-H atoms were refined with isotropic displacement parameters.

**Figure 1**

ORTEP-3 (Farrugia, 2012) drawing of the title compound with labels. Displacement ellipsoids of non-H atoms drawn at 30% probability level.

**Figure 2**

C—H···π and interactions in the crystal packing. Thermal ellipsoids are drawn at the 30% probability level. [Symmetry codes: (i)  $-x, y-\frac{1}{2}, \frac{1}{2}-z$ , (ii)  $-x, y+\frac{1}{2}, \frac{1}{2}-z$ , (iii)  $1-x, 1-y, -z$ .]

**Figure 3**

$\pi-\pi$  interactions in the crystal packing. Thermal ellipsoids are drawn at the 30% probability level. [Symmetry codes: (iv) 1 -  $x$ , - $y$ , - $z$ , (v) 2 -  $x$ , - $y$ , - $z$ , (vi)  $x + 1$ ,  $y$ ,  $z$ .]

map  
Hydrogen site location: inferred from  
neighbouring sites  
H-atom parameters constrained

$$w = 1/[\sigma^2(F_o^2) + (0.1433P)^2 + 0.4478P]$$

where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} < 0.001$

$$\Delta\rho_{\max} = 0.65 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.35 \text{ e } \text{\AA}^{-3}$$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg3, Cg4 and Cg5 are the centroid of the C5–C10, C11A–C16A and C11B–C16B rings, respectively.
