Charity opens doors to Innovation Apartment for Stoke Gifford's older people
By Vix Shepherd
Residents from Frenchay, Stoke Gifford and surrounding areas are being invited to visit a new innovation apartment which has opened at Stoke Gifford Retirement Village. The apartment will showcase the use of assistive technologies, including Pepper the robot, and will demonstrate how smart devices can support independent living for longer.

1. The problem – the ethics of interdisciplinary research

- Interdisciplinary research is suggested as an answer for **societal challenges**
- But what KIND of interdisciplinary research
- And how do we assess and evaluate it
- How do researchers (and others) make the difficult decisions identified by Will
 - Going beyond ethics frameworks

An Updated Round Up of Ethical Principles of Robotics and AI

This blogpost is an updated round up of the various sets of ethical principles of robotics and AI that have been proposed to date, ordered by date of first publication.

I previously listed [principles published before December 2017 here](#); this blogpost appends those principles drafted since January 2018 (plus one in October 2017 I had missed). The principles are listed here (in full or abridged) with links, notes and references but without critique.

Scroll down to the next horizontal line for the updates.

If there any (prominent) ones I've missed please let me know.

Asimov's three laws of Robotics (1950)

1. A robot may not injure a human being or, through inaction, allow a human being to come to harm.
2. A robot must obey the orders given it by human beings except where such orders would conflict with the First Law.
3. A robot must protect its own existence as long as such protection does not conflict with the First or Second Laws.

I have included these to explicitly acknowledge, firstly, that Asimov undoubtedly established the principle that robots (and by extension AIs) should be governed by principles, and secondly that many subsequent principles have been drafted as a direct response. The three laws first appeared in Asimov's short story Runaround [1]. [This wikipedia article](#) provides a very good account of the three laws and their many (fictional) extensions.

Murphy and Wood's three laws of Responsible Robotics (2009)

n > 20

O'Donovan, C. (2020) *Explicitly ethical standards for robotics*. Brighton, UK.

Available at: <https://www.sussex.ac.uk/webteam/gateway/file.php?name=odonovan-2019-robotics-standards-210210.pdf&site=25>.

2. What's at stake in this problem

- **Technology as treatment**
 - neglects the voices, values and interests of a wide range of people and communities
- Innovation policy tends to narrowly focus on **inducing acceptance**
- But **technology can be steered** in different directions
 - and the benefits distributed to a variety of people and communities (Weber and Rohracher 2012; Stirling 2009).

3.1 From *ethics* to *politics* of interdisciplinary research

- Robots from BRL shape society – society also shapes robots at BRL (co-production)
 - How this happens is a matter of politics
- Three ways we can think about the politics of interdisciplinary research for robotics and ai
 - **Interdisciplinarity reach** (wide vs narrow) Kelly 1996
 - **Discourses and logics of interdisciplinarity** Barry et al. 2008
 - **Capabilities for research** O'Donovan et al. forthcoming

3.2 Capabilities for interdisciplinary research

- The capability to *do* research and *be* a researcher (focus on human agency/well-being)
- Capabilities required / cultivated during interdisciplinary research. For example:
 - Cognitive capabilities such as expert disciplinary knowledge
 - To manage a research team
 - for pluralism
 - To collaborate
 - To be humble
 - To be reflexive
 - To build democratic struggle (!?!?)

-  EMAIL PROFILE
-  VIEW STANFORD-ONLY PROFILE

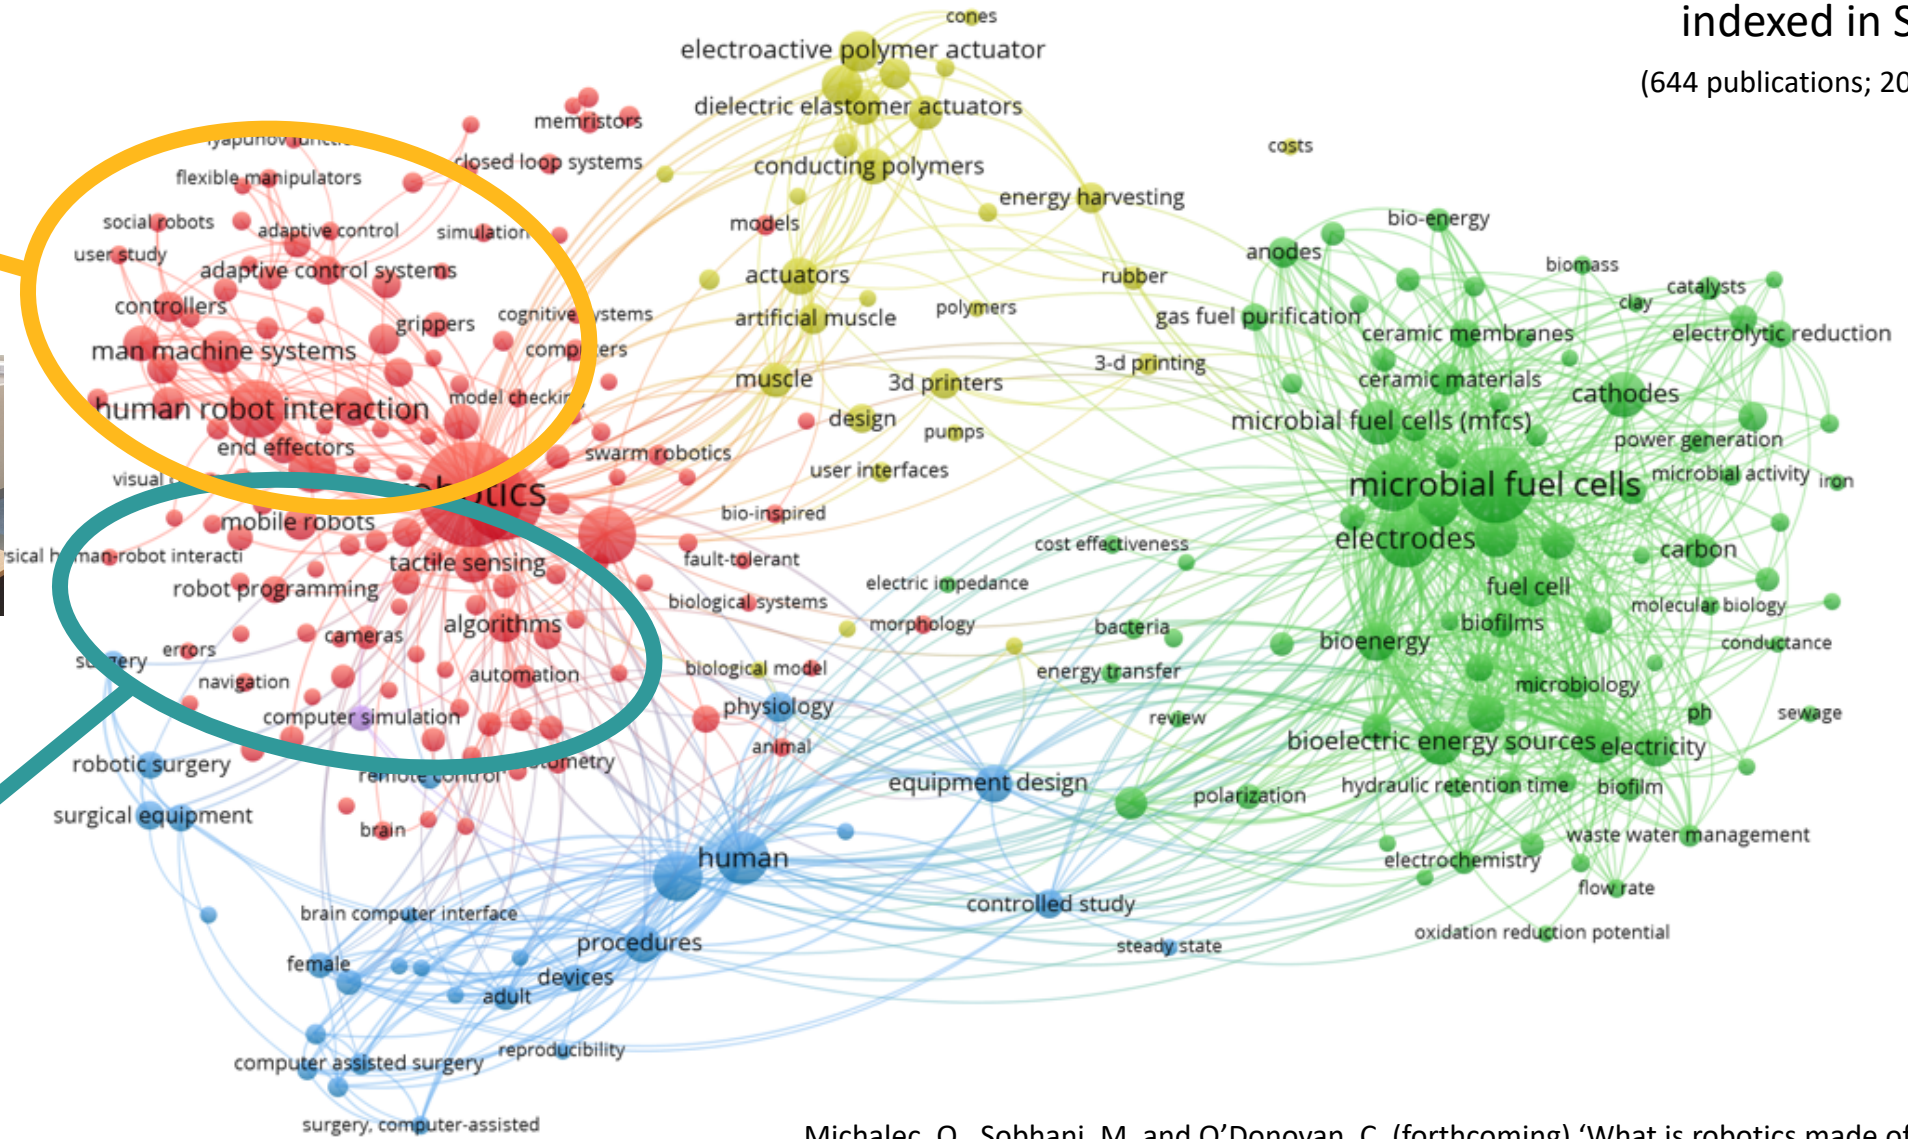

4. Locating capabilities at BRL

Bibliometric research profile illustrating most prominent key words represented in BRL publications indexed in Scopus (644 publications; 2004-2020)

Assistive living robotics

Self-driving vehicles

Michalec, O., Sobhani, M. and O'Donovan, C. (forthcoming) 'What is robotics made of? The politics of interdisciplinary robotics research'.

5. Assessing capabilities at BRL

	Assisted Living robotics	Driverless vehicles (CCAV projects)
Societal challenge	Maintaining care for more elderly Current and future labour shortages	Mobility for the future Road safety
Scope of interdisciplinary research	Wide - Expert researchers, civil society organizations, users may sometimes ask research questions	Medium - Multi rather than interdisciplinary; Users are typically subjects of research
Logics of interdisciplinary research	Innovation as crisis response ; Market creation; Interdisciplinarity as accountability	Testing innovation (governance of emergent technology); Market growth
Capabilities noted	Capabilities to broaden participation in research; Infrastructure maintenance Interdisciplinary network building ; Capabilities to build a diverse network of regional stakeholders	Accelerate innovation (steer innovation); Capabilities to work with large consortia ; Capabilities to draw in internal resource Capabilities to win CCAV funds (Large consortia are blunt instruments – more precise steering required) (Reflexivity; accountability; democracy)

6. Some implications: from societal challenges to societal collaboration

- Putting practices before principles of AI research
 - Applicable for doctoral training, curricula design, research mgmt
- Steering the direction of research
 - funders, government, civil society, communities
- Capability mapping: framework for ethics/values from ground up
- Emphasizing **care (not treatment) in capabilities for grand challenges:**
 - Attention to neglected things and devalued doings (e.g. carers and cleaners)
 - Both means and ends of methods matter
 - Knowledge AND values
 - Recognise the inherent uncertainty technology introduces

Thanks for staying with it

SCALINGS

SCALING UP
CO-CREATION

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No. 788359

Post script: cultivating human capabilities for care

- Many possible configurations of people, knowledge and things
- Capabilities for care help locate, assess and address tensions and choices between:
 - Strong emergence of new public management ideal which comes with a logic of **clear cut choices** VS the need to allow more open-ended processes which follow a **logic of care**
 - Between the ideal of **focused and controlled futures** VS the fact that we need to understand the future as more open for exploration involving a **variety of visions**
 - Between the focus on **invited participation**
 - **Ready made technoscientific futures** VS the reality of context dependent, **ever changing futures-in-the-making**
 - Between the strong imaginary of a community of **homogenous values** VS a reality of a growing **diversity of values**, each asking for a voice
 - Between normatively pre-established assessment structures VS more open valuing processes

Care

- Attention to neglected things and devalued doings (e.g. carers and cleaners)
- Means and ends of methods considered
- Knowledge AND values considered
- Recognise the inherent uncertainty technology introduces
