**Abstract**

Greenland halibut (*Reinhardtius hippoglossoides*), American plaice (*Hippoglossoides platessoides*) and Atlantic cod (*Gadus morhua*) indices from the bottom trawl survey that Spain carries out in Spring since 1995 in Div. 3NO of the NAFO Regulatory Area are presented. Biomass, stratified mean catches and mean number per tow for the three species are presented since 1997, year in which the survey extended the depth strata. Mean catch per tow, length distribution and age distribution are presented for the last five years (2014-2018). Greenland halibut biomass and abundance estimates presented a decreasing trend since 1999, cut in 2007-2009 with a high increase. In 2011 the biomass drops under the 2008 value, being stable since then until 2014 with a slight increase in 2015-2018 comprising a big increase in 2017, reaching the maximum of the series. In last years it can be seen a presence of juveniles, mainly in 2004, but the greatest lengths have failed, although in 2009 there is a quite good presence of individuals of ages 6-7 and in 2010 between 5-7. In 2011-2018 the presence of all ages is poor, although in 2015-2016 an increase in the range of the length can be seen with regards to last years. For American plaice we can see a stable trend from 1999 to 2015, reaching a maximum of mean catch and number in 2006, and a severe decline since 2016. The greatest recruitment in the presented series occurred in 2004 and we can follow their mode along the years. No good recruitments were seen since then. The 2016 ALK for American plaice was not sexed. The 2017 and 2018 ALKs for American plaice are not available yet, so the 2016 ALK was used. In last years the level of all the ages is low. For Atlantic cod, it can be seen a low biomass until 2008, being higher and variable since then, reaching a historical maximum in 2014. From 2015, biomass decreased reaching in 2018 poor values at the level of the 2006 biomass. In 2007-2008 the youngest length classes were much over the rest of the length classes. With the 2006 cohort the series reaches the maximum number of its historical values at five years in 2011. There have been no good recruitments since 2009, although in 2015 and 2016 a discrete presence of individuals of age 1 can be seen.

**Material and Methods**

Since 1995, Spain carries out a Spring-Summer survey in the NAFO Regulatory Area of Div. 3NO. From 1995 to 2000, the survey was conducted on board the C/V *Playa de Menduña* with a net trawl type *Pedreira*. In 2001 this vessel was replaced by the R/V *Vizconde de Eza*, using a trawl net type *Campelen*. For more details about the technical specifications of the surveys, see Walsh *et al.*, 2001 and González Troncoso *et al.*, 2004.

The catch of each haul was sorted and weighted into species and a sample of each species was taken in order to measure the length distribution. For Greenland halibut, American plaice and Atlantic cod each individual of the sample was measured to the total length to the nearest lower cm. As in 1995 and 1996 only depth less than 1000 m was surveyed, these years are not representative for these species, so only data from 1997 are presented. We present the total annual indices of biomass and abundance for the period 1997-2018.

The number of valid tows, the depth strata covered and the dates of the survey series (1997-2018) are presented in Table 1. Table 2 shows the swept area and number of hauls by stratum for the last five years (2014-2018). To know the results of the rest of the years, see González-Troncoso *et al.*, 2014.

For each species, we present all the transformed indices until 2000 and no-transformed from 2002 to 2018. In 2001 there are data transformed from the former vessel with original data from the new vessel. To know more about the transformation, see González-Troncoso *et al.*, 2005 and González-Troncoso *et al.*, 2006. We present the mean catch, the length distribution in number by sex and year; and the mean numbers with their mean length and mean weight by age for the years 2014-2018. To see the results of the rest of the years, see González-Troncoso *et al.*, 2014. For American plaice 2017 and 2018 ALKs are not available yet. For informative purposes, the 2016 ALK was used over the length distribution of 2017 and 2018 and the resulted numbers are shown here.

Figure 1 presents the maps with the distribution of the catches of the three species during the 2018 Spanish 3NO survey.

## Results

### Greenland halibut

The Greenland halibut stock in Subarea 2 and Div. 3KLMNO is considered to be part of a biological stock complex, which includes Subareas 0 and 1. Abundance and biomass indices were available from research vessel surveys by Canada in Div. 2J+3KLMNO (1978-2017), EU in Div. 3M (1988-2017), EU-Spain in Div. 3NO (1997-2017) and EU-Spain in Div. 3L (2003-2017). In 2003 the Fisheries Commission implemented a fifteen years rebuilding plan for this stock, establishing progressively decreasing TACs. The STACFIS estimated catches in 2004-2010 have exceeded the rebuilding plan TACs by 30% on average, despite reductions in fishing effort.

In 2010, Fisheries Commission implemented a survey-based harvest control rule to generate annual TACs over at least 2011-2014. These surveys provide coverage of the majority of the spatial distribution of the stock and the area from which the majority of catches are taken. In 2013 Fisheries Commission extended this management approach to set the TACs for 2015 – 2017 but did not apply the HCR in 2017, rather setting the TAC equal to the 2016 TAC. The TAC in 2018 is based on the HCR adopted in 2017. Catch exceeded the TAC in every year from 2004 to 2014 but was similar to the TAC in 2015 through 2017. Over 1995-2007, indices from the majority of the surveys generally provided a consistent signal in stock biomass. These surveys provide coverage of the majority of the spatial distribution of the stock and the area from which the majority of catches are taken. Over 1995-2007, indices from the majority of the surveys generally provided a consistent signal in stock biomass (Fig. 20.7). Results since 2007 show greater divergence which complicates interpretation of overall status. Since 2014 there is a clear divergence with the surveys in the NRA (including 3M) increased to well above their time series averages while the Canadian surveys have been lower than their respective time series average. The overall trend since 2007 is unclear, but the 3 of 4 surveys that start in the mid 1990s, are only about 70% of their average in 2016 (NAFO, 2018).

### **Mean catches and Biomass**

Table 3 shows the mean catches and their variance per haul and year for Greenland halibut during the period 2014-2018. Biomass per stratum for the same period is presented in Table 4. Annual total biomass, as their corresponding biomass at ages 5+ and 10+, and mean catch per tow with the total variance per year are presented in Table 5 for years 1997-2018. In Figure 2, we compare the mean catch per tow with the mean number per town. Figure 3 presents the biomass per swept area per stratum and their total variance per year,

as the 5+ and 10+ biomass. In Table 6, we present the length-weight relationship parameters  $a$  and  $b$  for 2014-2018.

Greenland halibut total biomass increased from 1997 to 1999 and then decreased until 2002, reaching the lowest value of the whole time-series. From 2002 to 2007, it maintained almost constant values at low levels. It increased in 2009 and in 2010, and after decreasing in 2011 to a half of the 2010 value, it has maintained stable at higher values than before 2008, with a slight increase in 2015-2018 comprising a big increase in 2017, reaching the maximum of the series. The biomass 5+ has had the same trend as the total biomass with a marked increase from 2008, being 2017 the highest values of the series. Since 2007, 5+ biomass has represented more than 90% of total biomass, being 99% in 2015. In the case of the 10+ biomass, it has increased since 2006 onwards, reaching the maximum value of the time-series in 2017. Since 2012, 10+ biomass has represented more than 20% of total biomass. Despite of this, with respect to the mean number per tow, although in the 2008-2010 period there was a substantial increase in the numbers, this increase is not as the increase in mean catch, reaching the level of the 2001 numbers per town, but still far of the values of the first years of our series. Without the peak of 2009 and 2010, the numbers had been stable since 2002. A high increase occurred in 2017, but the level is still below the first years of the series.

### **Length Distribution**

Table 7 presents the mean number per tow by sex and year for 1997-2018. Table 8 shows this index by length, sex and year, with the number of samples in which there were length measures, the total number of individuals measured in these samples, the sampled catch and the range of lengths met, as the total catch of this species and the total hauls made in the survey, for years 2014-2018. In Figures 4 and 5 we can follow the evolution along the years. We can follow a mode since 1997 until 2001, but since then no high new values appear. The highest recruitments were in 1997, 2001 and 2004. In 2006 and 2007 the small individuals (around 12-14 cm, corresponding to 1 year of age) are the mode of the length distribution range, but all the length ranges were poor. The same occurred in 2011 and in 2017, with a mode in lengths 14-15, that corresponds to age 1. In 2009, 2010, 2017 and 2018 an increase in number for lengths between 38-52 cm (ages 5-7) can be seen. It seems that the high increase in the biomass in 2009-2010 was due to the higher presence of these length classes, while at the beginning of the series the presence of juveniles was stronger. From 2012 the presence of all the length classes has been poor, although a slight increase in the range of the length can be seen for years 2015 and 2016.

### **Age numbers**

We present the mean number by age, sex and year in Table 9 for 2013-2017, and the total by year (for the entire series) in Figure 6. Individuals between 0 and 20 years were caught in the period 1997-2018 and since 2002 more number of younger individuals has been caught. It can be due to the change of gear and/or vessel. We can follow three conspicuous cohorts in our series, the 1994-1996 cohorts (ages 1, 2 and 3 in 1997). Cohorts from following years seem to be weaker than those ones, but more constant. 2001-2003 cohorts appear to be quite strong, as we can see in recent years, particularly 2002 one, and these cohorts seem to be present in year 2008 (ages 5 to 7) and in 2009 (ages 6 to 8). In 2010 the mode of the ages is between 5 and 7 years, which can imply that the cohorts of years 2004 and 2005 could be better than it can be seen in the graph. Over 2014-2017 the mode is at 7 years old, and 6 years old in 2018. Age 1 represents around 10% of the total numbers in 2015 and 2016 and more than 15% in 2017 and 2018.

### **Mean length and mean weight at age**

Mean length and weight at age by sex for 2014-2018 are presented in Tables 10 and 11, and for the entire series in Figures 7 and 8. The greatest ages increased their mean length and weight until 2003, and fell in the youngest individuals. In 2012-2016 the mean length and weight were more or less constant, with a decrease since then. The total mean length and the total mean weight have increased slightly since 2006 onwards.

### **American plaice**

There was no directed fishing of American plaice in 1994 and there has been a moratorium since 1995. Even under moratorium, catches increased substantially from 1995 to 2003 and then decreased. Biomass and SSB

are low compared to historic levels. SSB declined to the lowest estimated level in 1994 and 1995. It has increased since then but still remains very low. Recruitment has been low since the late 1980, but Canadian surveys indicate a large number of pre-recruits in Div. 3L in recent years. Current estimates of fishing mortality are low (NAFO, 2018).

### **Mean catches and Biomass**

American plaice mean catches and SD by stratum are presented in Table 12 for 2014-2018. Biomass for stratum for the same period is presented in Table 13.

The annual entire time series (1997-2018) of biomass and stratified mean catches with their SD estimates for American plaice are presented in Table 14 and in Figures 9 and 10. Estimated parameters  $a$  and  $b$  values of length-weight distribution are presented in Table 15 for 2014-2018.

The American plaice indices show a general increasing trend along the years, agree with the results from the Canadian surveys. Biomass increased from a depressed value in 1997 to 2000. Since then, it has had a stable trend with a minimum in 2002 and maximum values in 2006 and 2008, showing a severe decline in 2016-2018.

### **Length Distribution**

Table 16 shows the mean number per tow by sex and year for 1997-2017, and Table 17 the same index by length for 2013-2017, besides the sampled size and catch. Figures 11 and 12 show length distribution by sex and year for the entire period. Between years 2000 and 2004 we can follow a mode that then disappeared; probably the 1998 year-class. In 2004 there is a great presence of juveniles (8 cm) and in 2005 the mode appears around 14 cm, following with a mode of around 20 cm in 2006, 24 in 2007, 26 in 2008 and 28 in 2009. This mode can be seen around 30 cm in 2010, 32 cm in 2011 and 34 cm in 2012, but the mode length in those years is 28, as in 2009. In 2014, there is a mode around 28 cm, it can be follow in 2015 around 30 cm, and in 2016, with very few individuals, around 32 cm. In 2008 and 2010 there is a quite good presence of juveniles (individuals of 10-12 cm in 2008 and 12 cm in 2010) that does not appear in 2011-2013. A discrete occurrence of individuals of 12-20 cm appears in 2015, but not in 2016 and 2017.

### **Age numbers**

The 2016 ALK for American plaice was not sexed; just the total ALK was used. The 2017 and 2018 ALKs for American plaice are not available yet, so the 2016 ALK was used in order to get the age distribution from the length distribution in that year. We present the mean number per tow at age by sex and by year from 2014 to 2018 in Table 18 and the total by year (1997-2018) in Figure 13. The ALK used for all years is the 3N Canadian one. We can follow a cohort without problems since the year 2000, starting in individuals of 2 years old (1998 cohort), reaching 17 year old in 2015 (almost disappeared); a second cohort, weaker, can be followed since 1999, starting in 2 years old (1997 cohort). Another cohort from the year 2002 (one year old in 2003), can be followed until 2016, reaching 14 years old, although it failed at 5 years old and is almost disappeared in 2018. And the 2003 cohort (one year in 2004) is a very strong cohort, reaching in 2008 five years old and the largest number in the whole series, and in 2015 twelve years old. In 2015-2018 the maximum is in 7 years old. Since 2016 the level of all the ages has been being low.

### **Mean length and mean weight**

Mean length and weight at age by sex for 2014-2018 are presented in Tables 19 and 20, and shown in Figures 14 and 15, for 1997-2018. The mean length is more or less stable in all ages, at least since 2002. The same occurs with the mean weight, although with more variations. The major variations appear in the oldest ages studied: 12+ years old individuals.

## Biomass and biomass by Division

As part of some biological studies, the biomass and the abundance by age has been separated by Division. Age distribution by age can be seen in Table 21, and in Table 22 and Figure 16 the total biomass and abundance by Division. The majority of the abundance and biomass come from Division 3N.

### Atlantic cod

Atlantic cod in Divisions 3NO has been under moratorium to directed fishing since 1994. According to the NAFO Scientific Council, the stock of Atlantic cod in Divisions 3NO declined dramatically during the mid-1980s. The spawning biomass increased noticeably between 2010 and 2015 but has subsequently declined and the 2018 estimate of 18,537 t represents only 31% of  $B_{lim}$  (60,000 t). The 2006 year class remains relatively strong and at age 12 in 2018 makes up more than half of the estimated SSB. Subsequent year classes are much weaker, suggesting that the medium-term prospects for the stock are not good. Fishing mortality values over the past decade have been low and well below  $F_{lim}$  (0.3) (NAFO, 2018).

## Mean Catches and Biomass

Atlantic cod mean catches and SD by stratum are presented in Table 23 for 2014-2018. Biomass by stratum and year are presented in Table 24 for the same period.

The entire time series (1997-2018) of biomass and stratified mean catches with their SD estimates for Atlantic cod are presented in Table 25 and Figures 17 and 18. Estimated parameters  $a$  and  $b$  values of length-weight relationship are presented in Table 26 for 2014-2018.

Biomass of cod presents poor values between 1997 and 2005 with some fluctuations and a great deviation due to a few hauls in which the presence of that species was very high (e.g., 2001). Between 2006 and 2014 an increasing trend in the biomass of this species can be seen. Although the 2006 increase is above all for a single catch of almost 2 tons, in general the catches of Atlantic cod in the survey of 2006 were over the mean. In 2008 a quite high increase is shown, and in this case there is no haul with very high catches (the maximum was 585.5 kg). Since then the biomass has increased to values well above the years before, reaching the maximum of the series in 2014 after a decrease in 2012 and 2013, decreasing again since then. From 2015, biomass decreased reaching in 2018 poor values at the level of the 2006 biomass.

## Length Distribution

Table 27 presents the mean number per tow by year for 1997-2018 and this index by length for the period 2014-2018 can be seen in Table 28, besides the sampled size and its catch. Figures 19 and 20 show the length distribution by year (1997-2018). The modal values used to be very low before 2006 except in 2001, and in general all lengths presence was very low, even it is very difficult to follow the modal values. In 2001 we had a good presence of individuals between 36 and 58 cm. From 2006 a series of great modal values along the length distribution can be seen. In 2006 there were two modes in the length distribution, one around 30 cm and another one around 40 cm. There was no good recruitment until 2004, in which the individuals between 12 and 16 cm correspond to the greatest presence in the series, and in 2005 between 24 and 32, with a new mode between 12 and 16 cm, as in last year. In 2007 the youngest lengths dominated the length range, with the highest mode in the lengths 12-16, that are between 2 and 4 times the abundance of the 48 cm length class, the following mode. In 2008-2015 we can follow the evolution of these lengths. In 2015 the mode is in 36 cm, with a discrete presence of individuals of lengths 6-8 cm. It must be note that, although the biomass has decrease from 2014 to 2015, the mean number is almost the same in both years, probably due to the presence of the smallest individuals. Since 2016 mean number per town sharply decreased, and modal values were very low. The mode in 2018 is between 34 and 38 cm.

## Age numbers

The mean number per tow at age and year (2014-2018) is presented in Table 29 and the total by year (1997-2018) in Figure 21. In accordance with the length distribution, until 2006, the numbers are too low to follow any cohort. But between 2006 and 2008 there are three good cohorts that can be followed (2005-2007 cohorts). With the 2006 cohort the series reaches the maximum number of its historical values at five years in 2011. But it seems that no new good recruitments have occurred since 2009, although in 2015 and 2016 a discrete presence of individuals of age 1 can be seen.

### **Mean length and mean weight**

Mean length and weight at age by sex over time are presented in Tables 30 and 31 (2014-2018), and shown in Figures 22 and 23 (1997-2018). For the central ages, the mean length and the mean weight seem to be more or less stable. That does not occur in the oldest ages, with the two parameters very scattered. The total mean length and mean weight presented no trend until 2006, increasing since then until 2014, decreasing afterwards.

### **Acknowledges**

The data used in this paper have been funded by the EU through the European Maritime and Fisheries Fund (EMFF) within the National Program of collection, management and use of data in the fisheries sector and support for scientific advice regarding the Common Fisheries Policy.

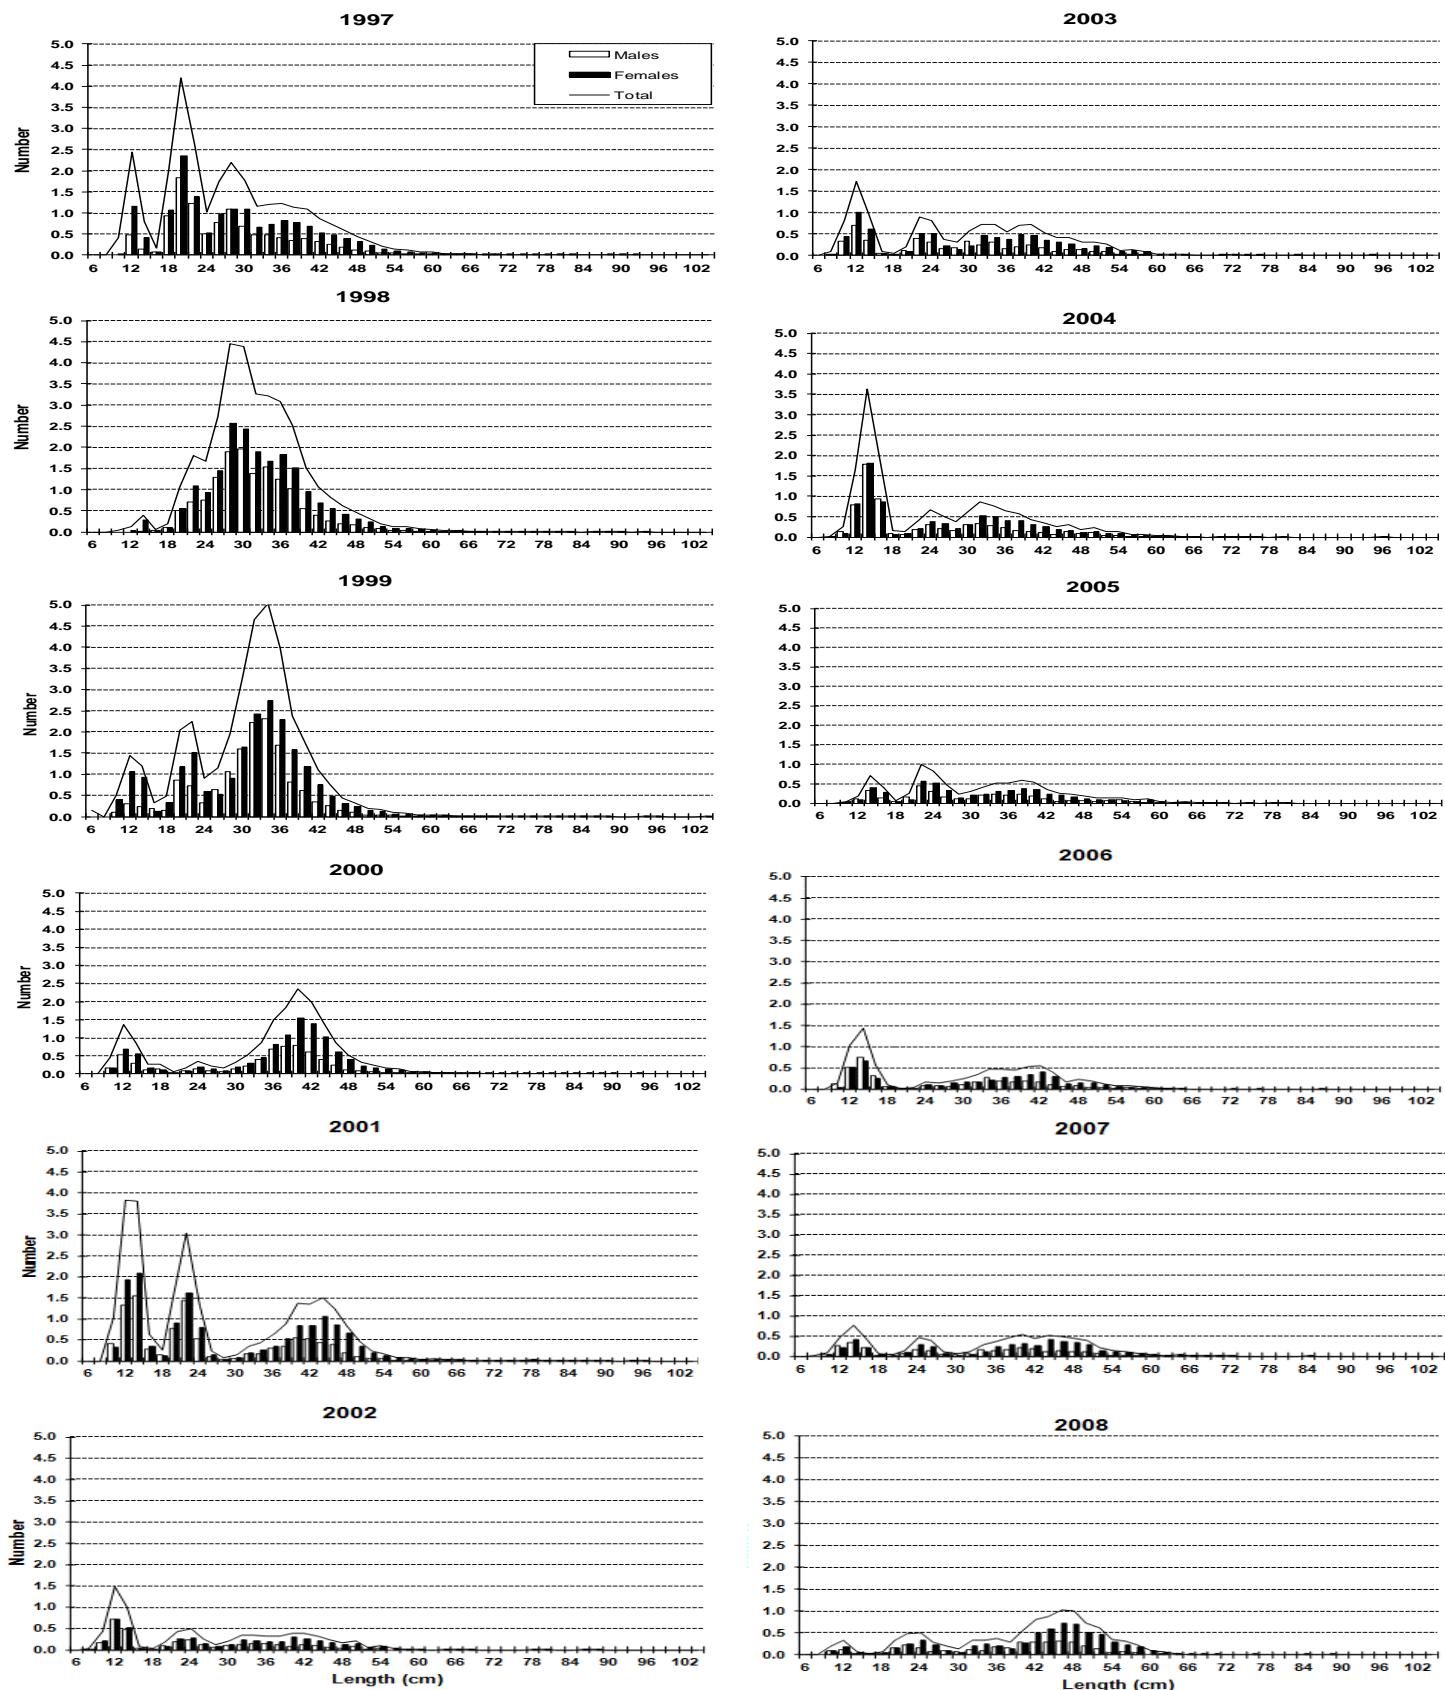

**Figure 1.** Position of the hauls and the catch of Greenland halibut, American plaice and Atlantic cod during the 2018 Spanish 3NO survey. Note that the scale is different in the three graphs.

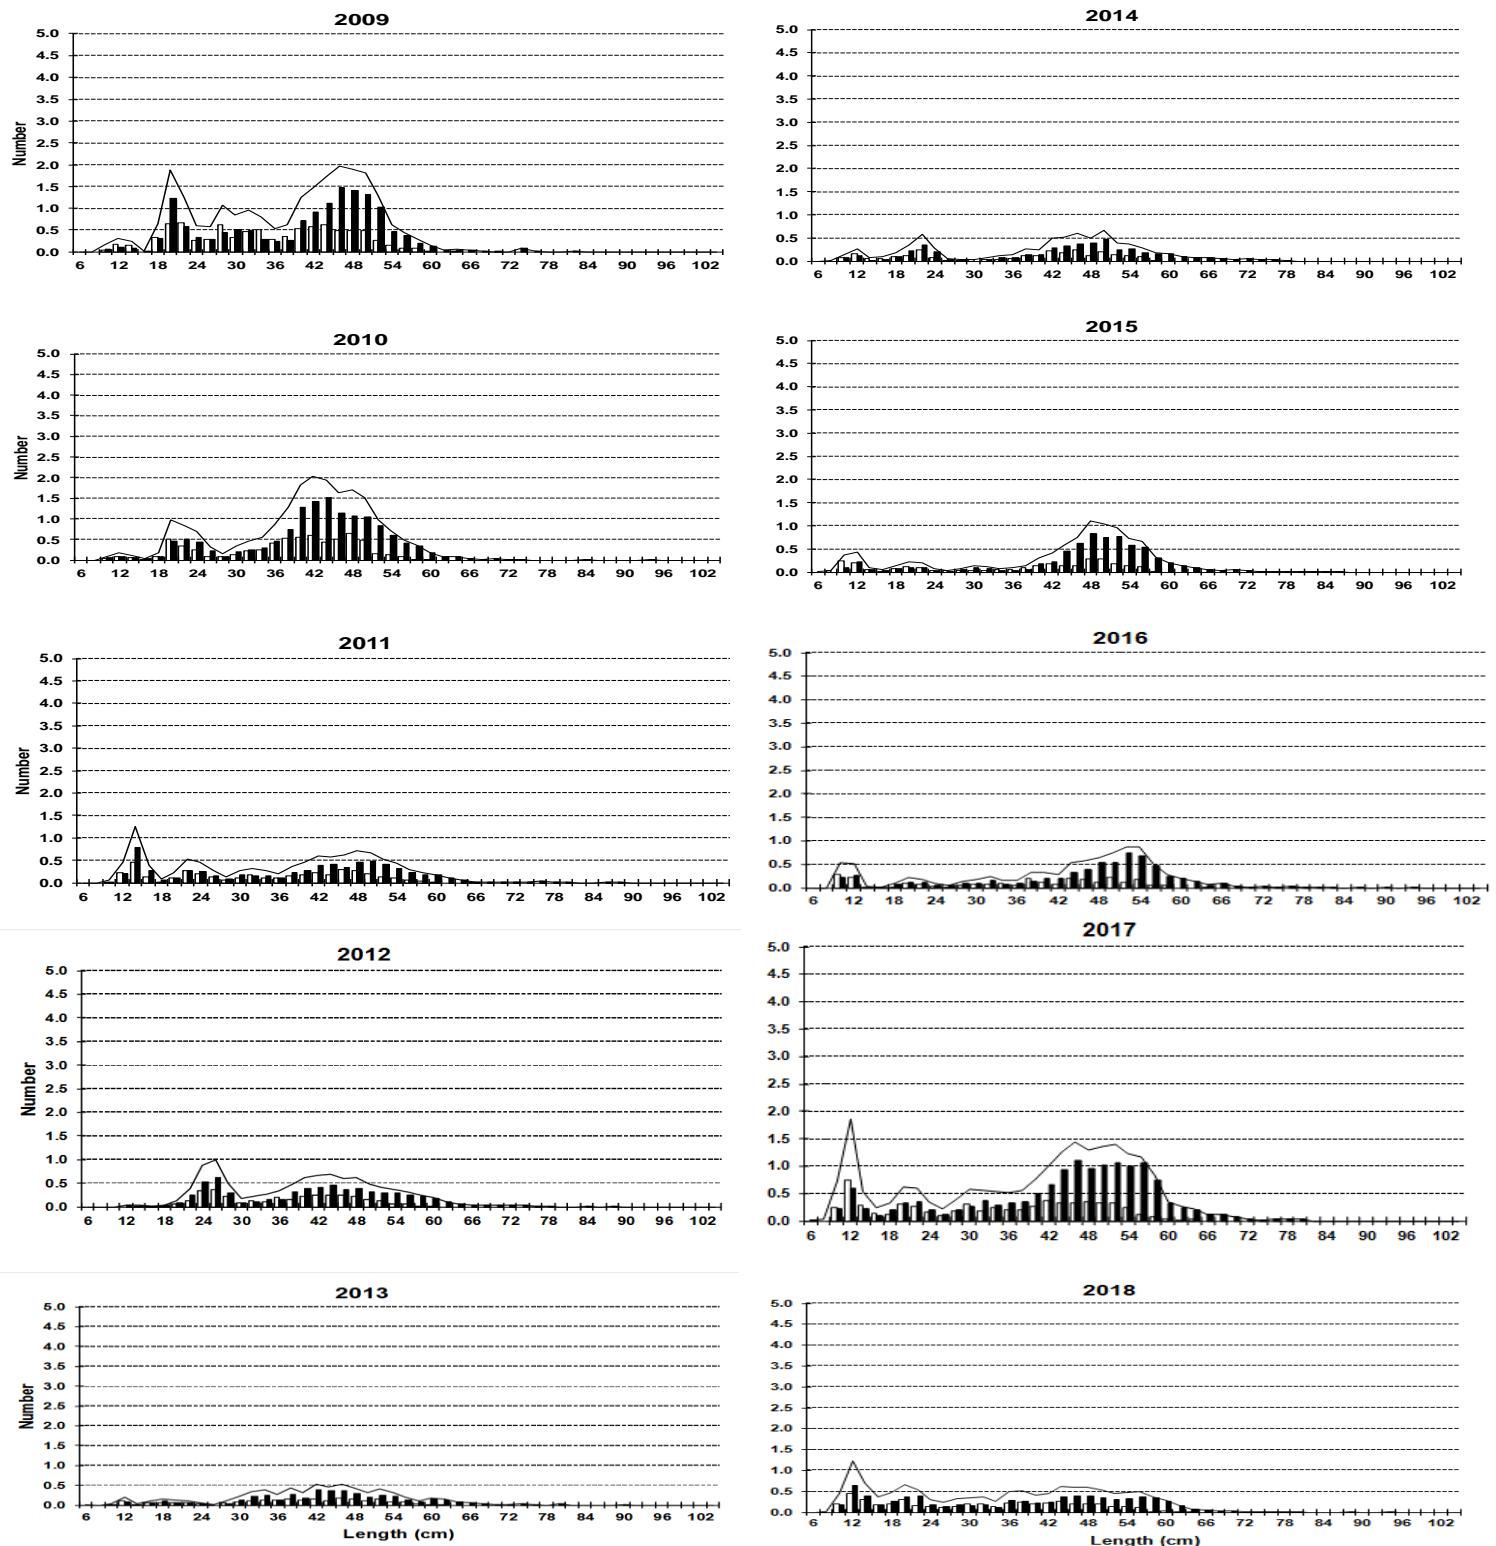

**Figure 2.** Greenland halibut stratified mean catches in Kg and  $\pm$ SD by year and mean number by year. Spanish Spring surveys in NAFO Div. 3NO: 1997-2018.

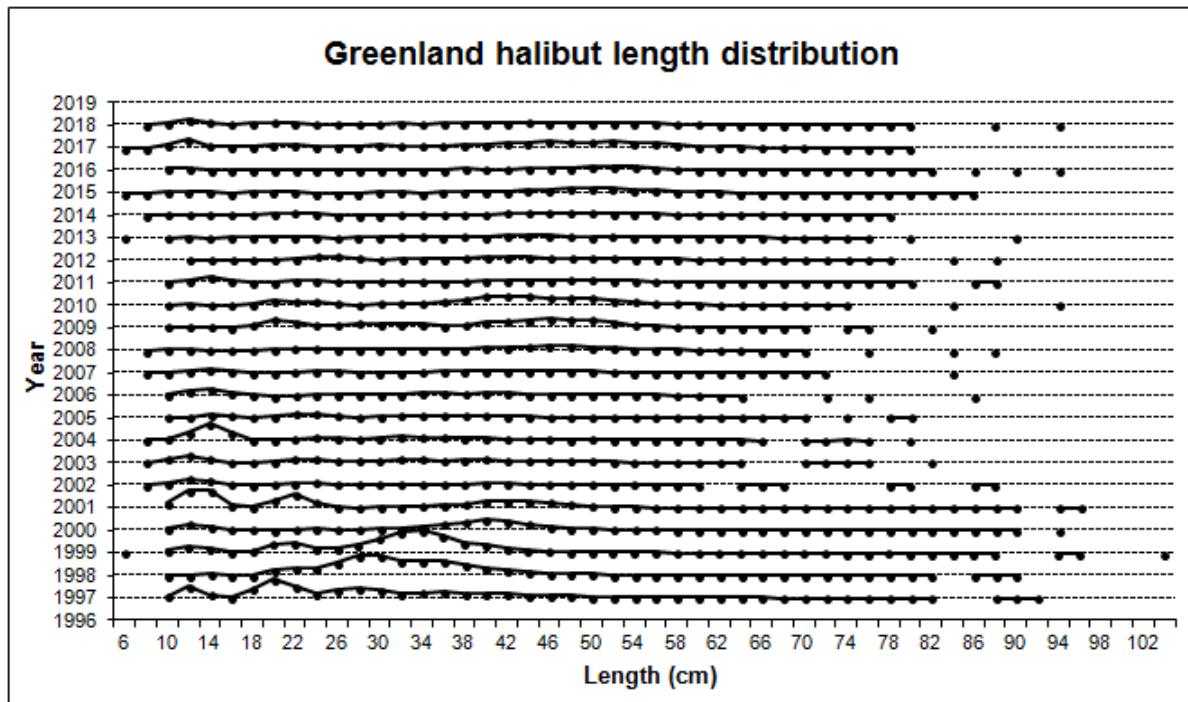

**Figure 3.** Greenland halibut biomass calculated by the swept area method in tons and  $\pm$ SD by year. Spanish Spring surveys in NAFO Div. 3NO: 1997-2018.

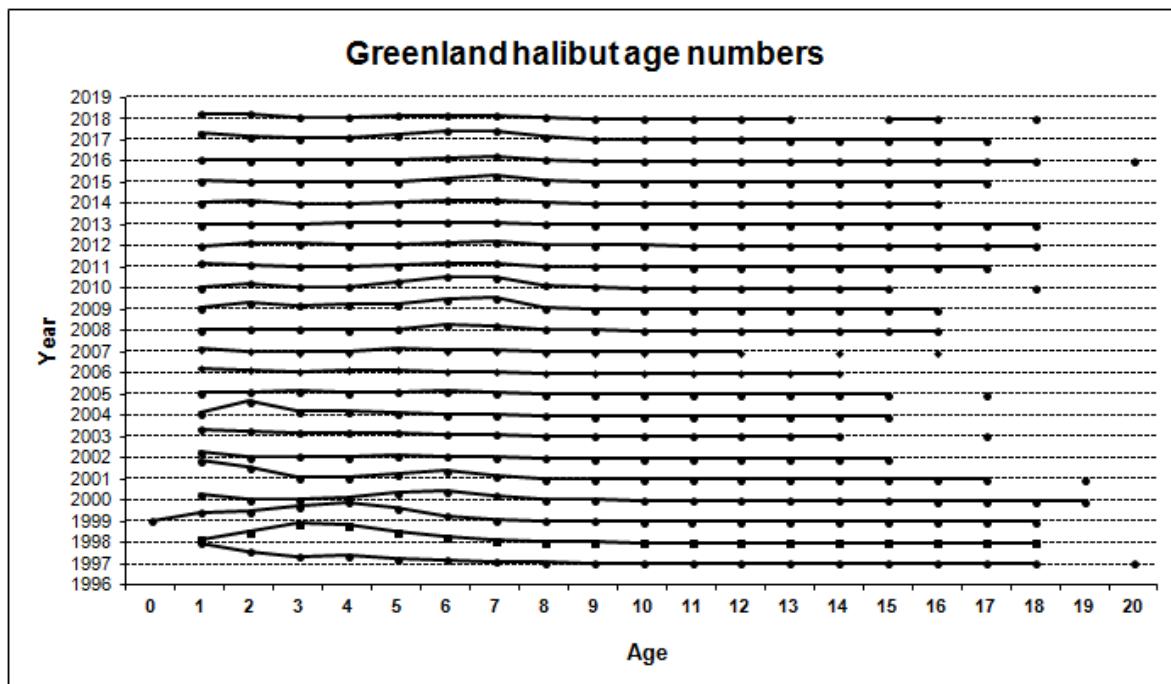

**Figure 4.** Greenland halibut length distribution (cm) on NAFO 3NO: 1997-2018. Mean catches per tow number. Data from 2014 to 2018 are in Table 8; data for 1997-2013 can be seen in SCR Doc 14/005.

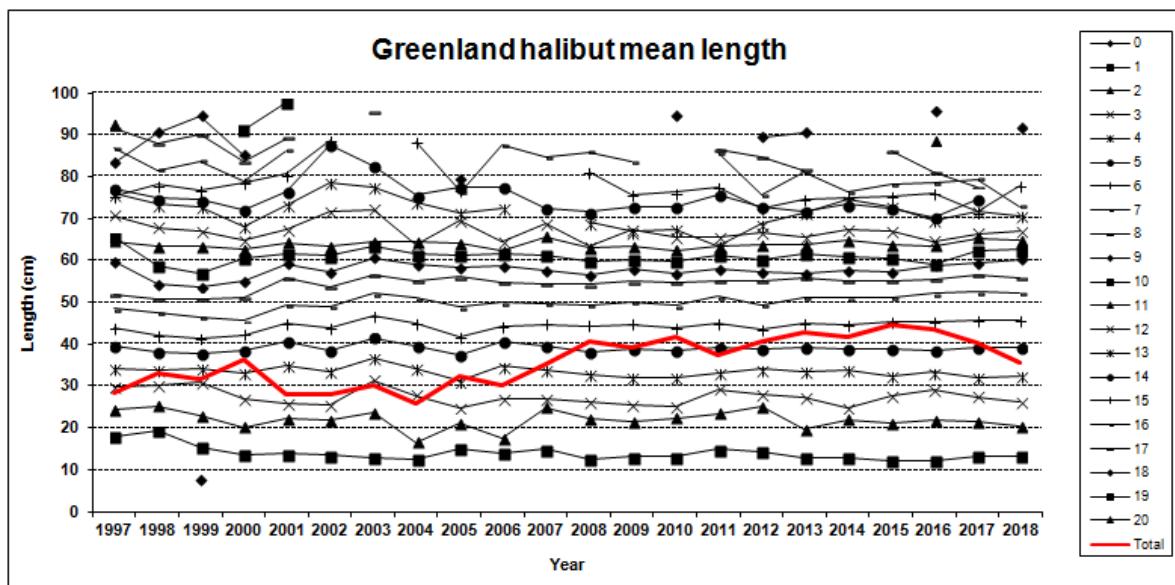

**Figure 4 (cont.).** Greenland halibut length distribution (cm) on NAFO 3NO: 1997-2018. Mean catches per tow number. Data from 2014 to 2018 are in Table 8; data for 1997-2013 can be seen in SCR Doc 14/005.

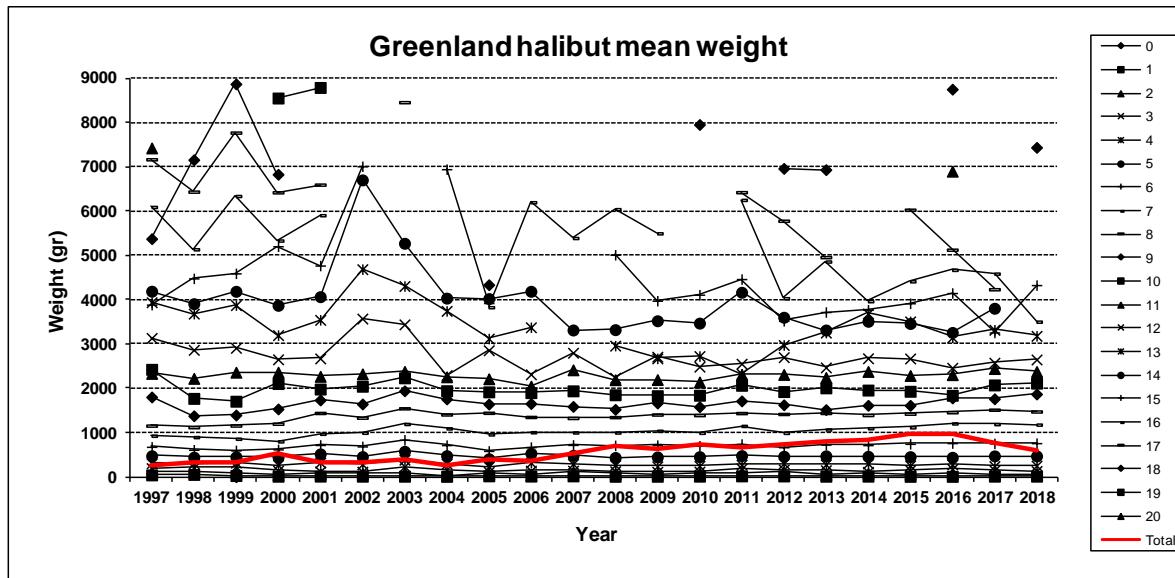

**Figure 5.** Greenland halibut mean number per tow by length (cm) on NAFO 3NO: 1997-2018. Data from 2014 to 2018 are in Table 8; data for 1997-2013 can be seen in SCR Doc 14/005.

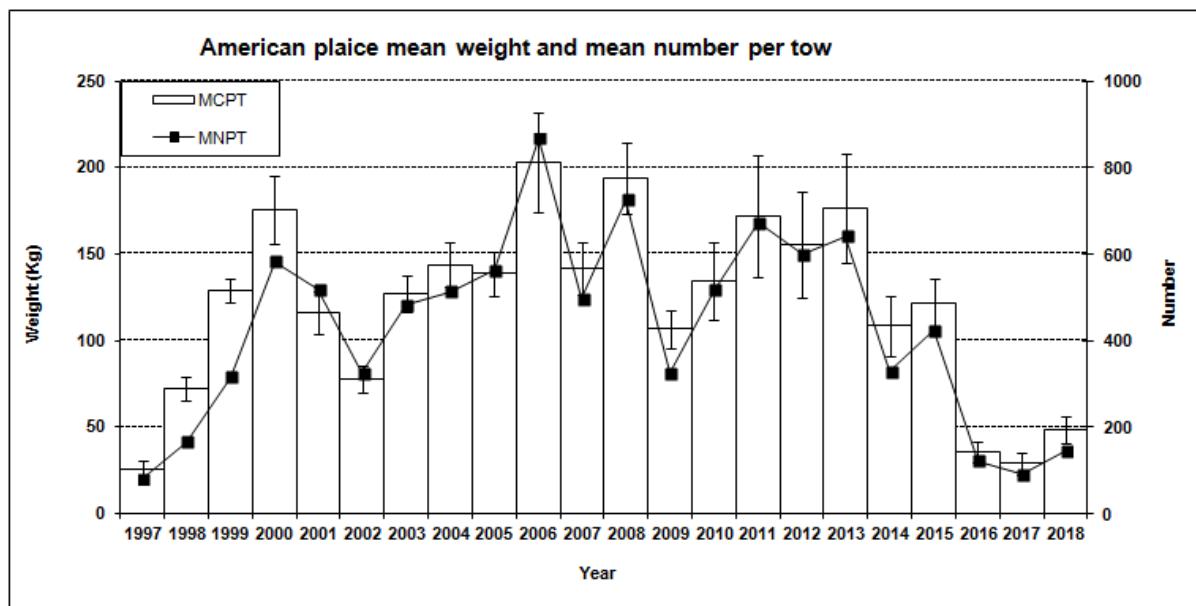

**Figure 6.** Greenland halibut mean numbers per tow by age on NAFO 3NO: 1997-2018. Data from 2014 to 2018 are in Table 9; data for 1997-2013 can be seen in SCR Doc 14/005.

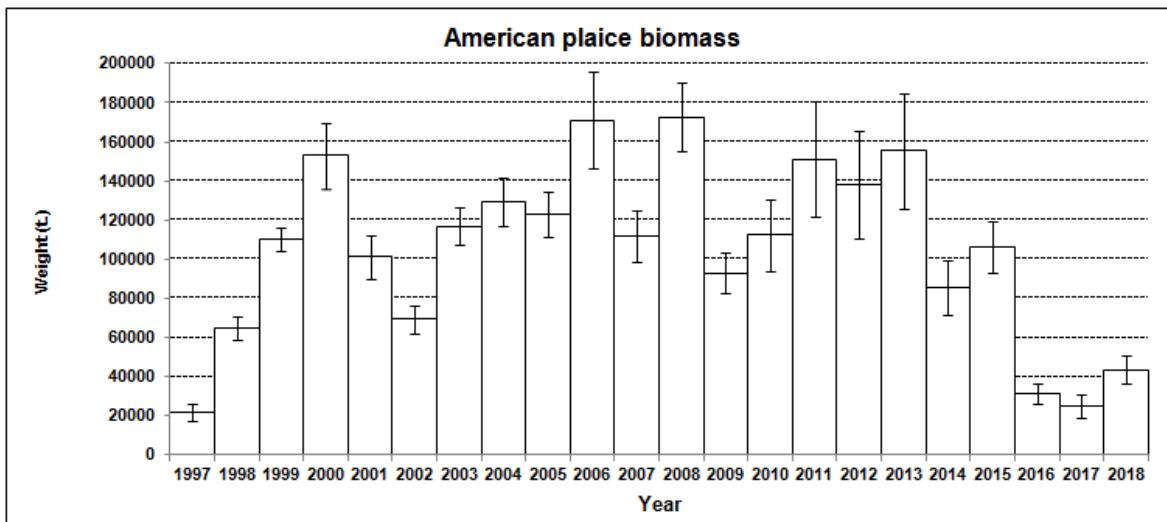

**Figure 7.** Greenland halibut mean length (cm) at age on NAFO 3NO: 1997-2018. Data from 2014 to 2018 are in Table 10; data for 1997-2013 can be seen in SCR Doc 14/005.

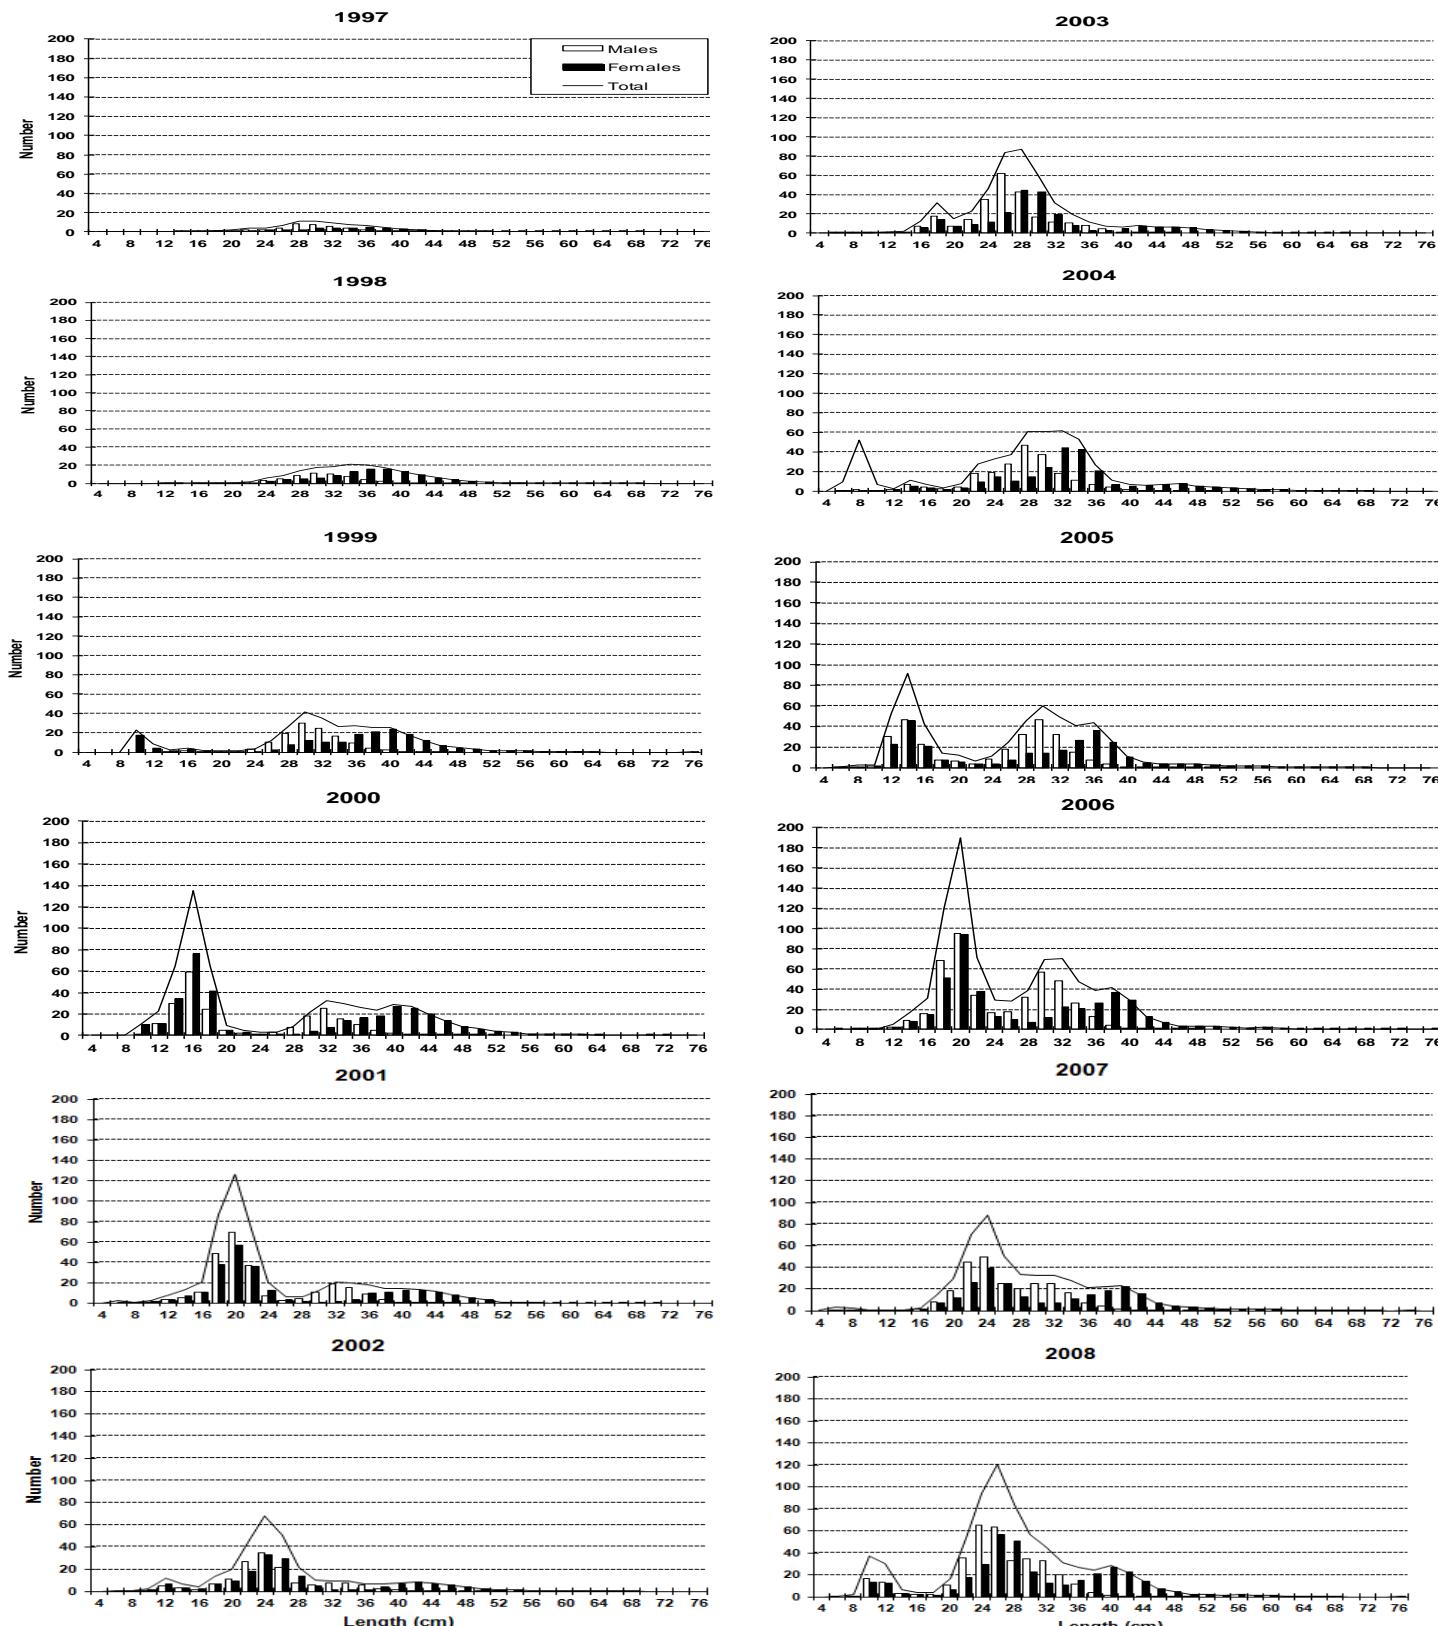

**Figure 8.** Greenland halibut mean weight (gr) at age on NAFO 3NO: 1997-2018. Data from 2014 to 2018 are in Table 11; data for 1997-2013 can be seen in SCR Doc 14/005.

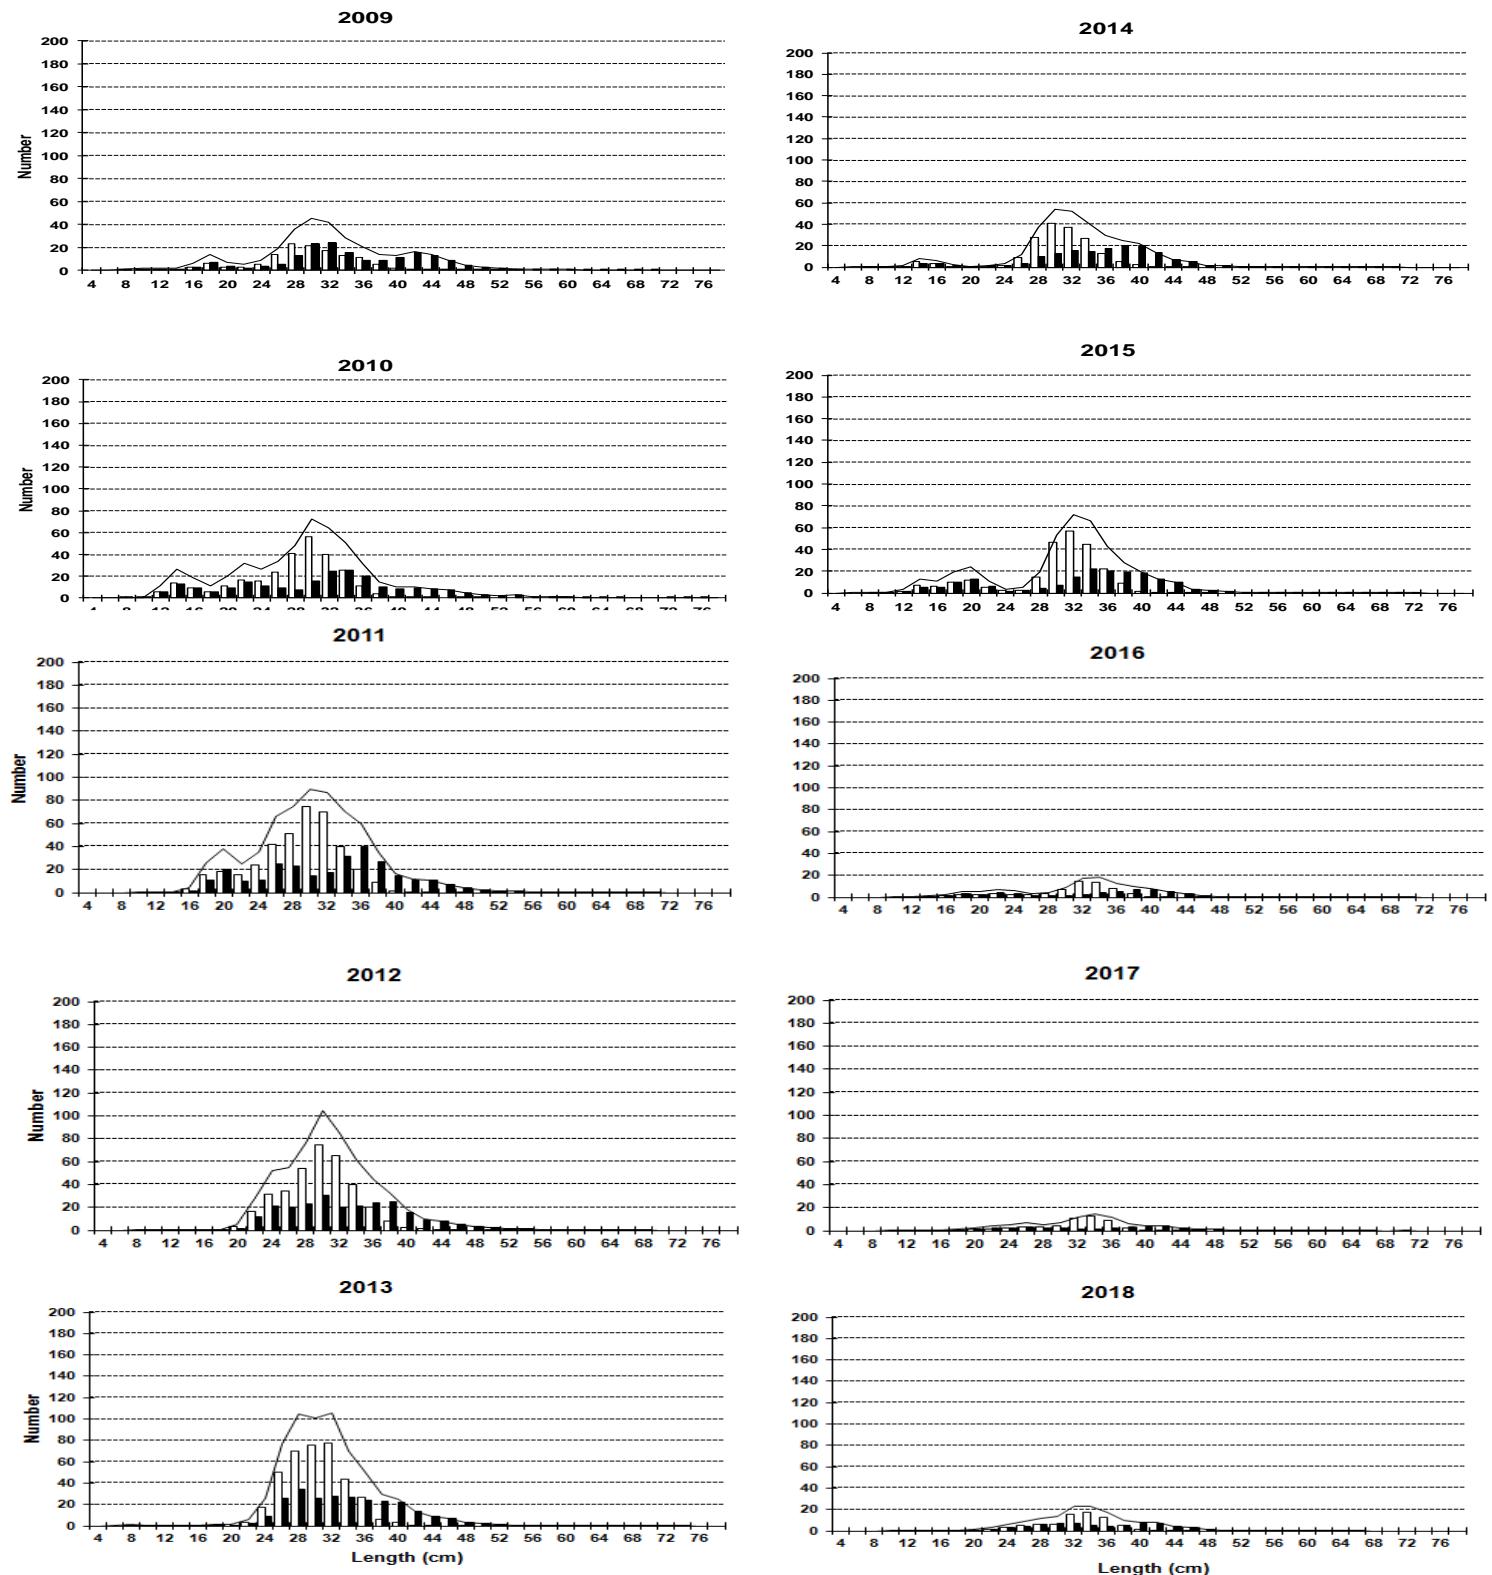

**Figure 9.** American plaice stratified mean catches in Kg and  $\pm$ SD by year and mean number by year. Spanish Spring surveys in NAFO Div. 3NO: 1997-2018.

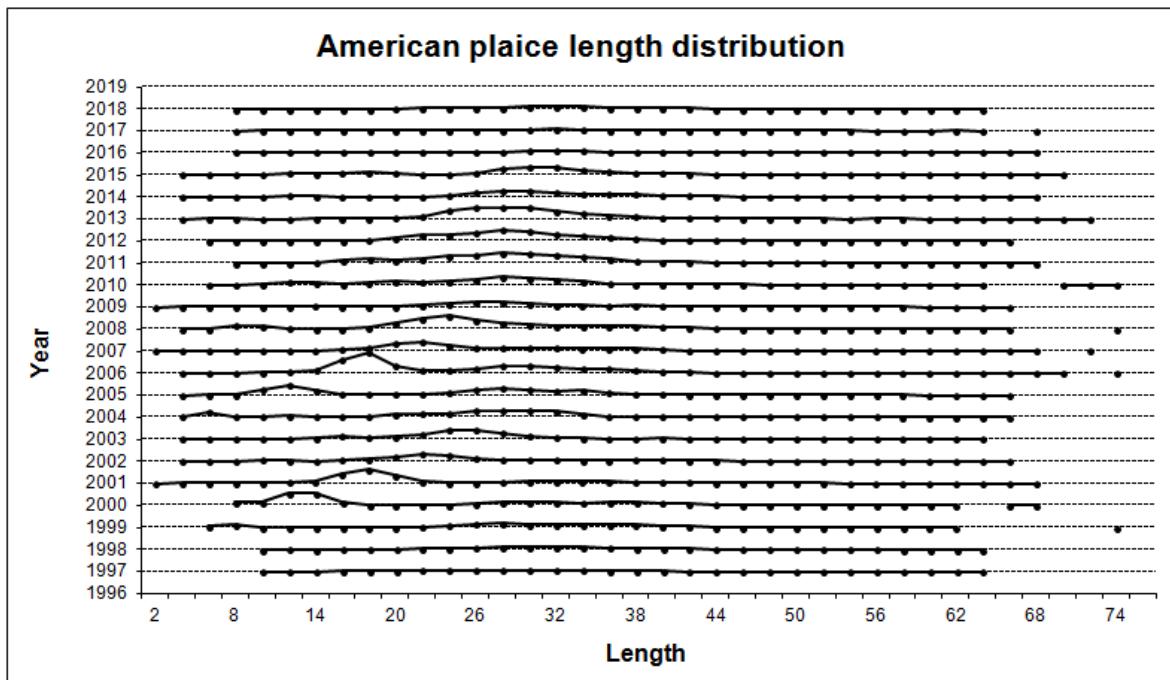

**Figure 10.** American plaice biomass calculated by the swept method in tons and  $\pm$ SD by year. Spanish Spring surveys in NAFO Div. 3NO: 1997-2018.

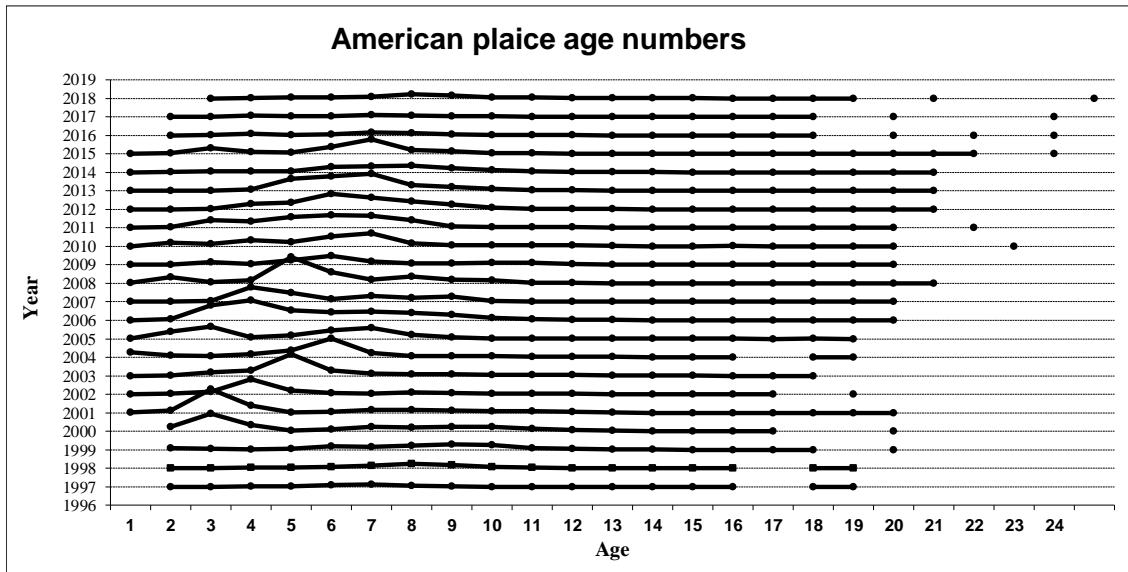

**Figure 11.** American plaice length distribution (cm) on NAFO 3NO: 1997-2018. Mean catches per tow number. Data from 2014 to 2018 are in Table 17; data for 1997-2013 can be seen in SCR Doc 14/005.

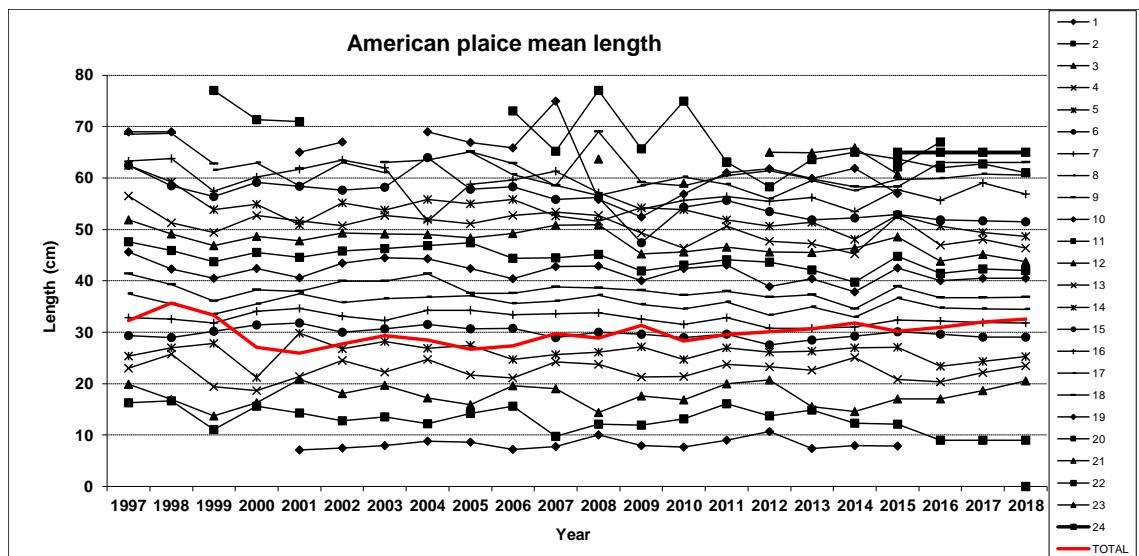

**Figure 11 (cont.).** American plaice length distribution (cm) on NAFO 3NO: 1997-2018. Mean catches per tow number. Data from 2014 to 2018 are in Table 17; data for 1997-2013 can be seen in SCR Doc 14/005.

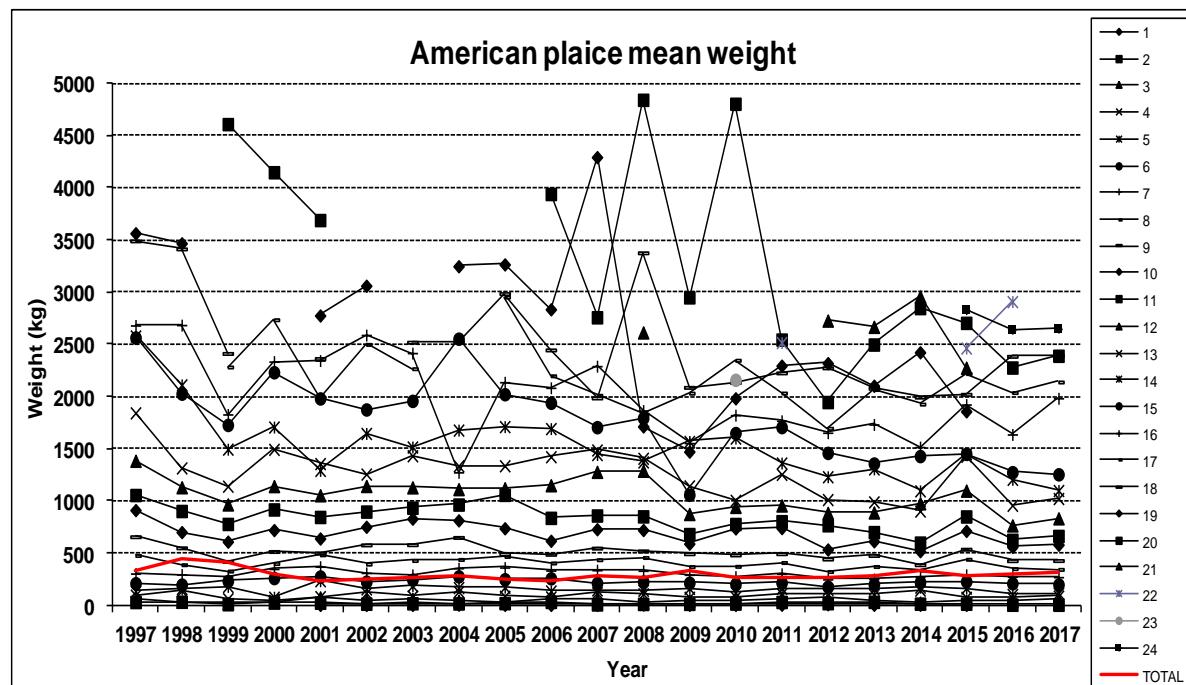

**Figure 12.** American plaice mean catches per tow by length (cm) on NAFO 3NO: 1997-2018. Data from 2014 to 2018 are in Table 17; data for 1997-2013 can be seen in SCR Doc 14/005.

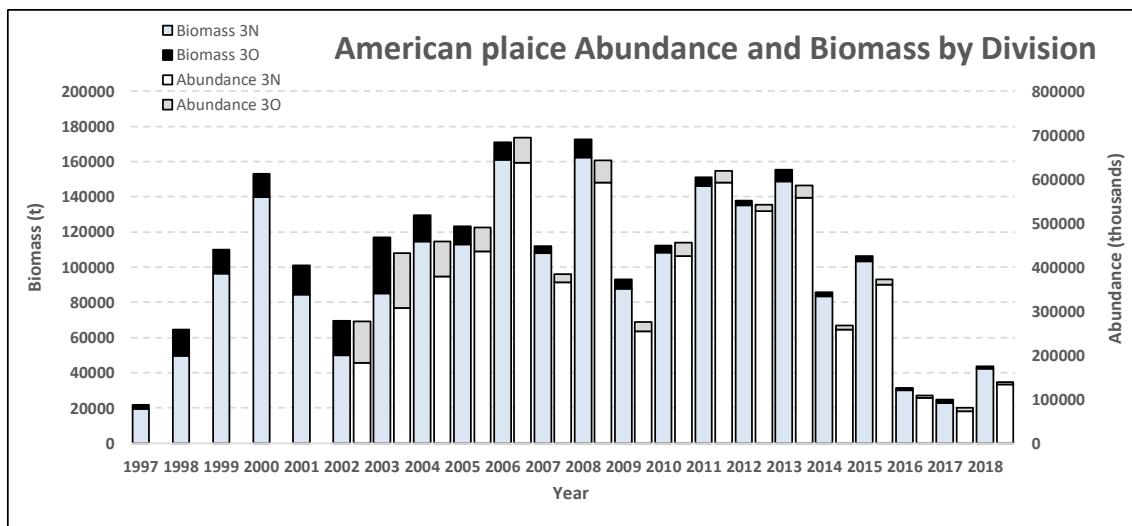

**Figure 13.** American plaice mean catches per tow by age on NAFO 3NO: 1997-2018. Data from 2014 to 2018 are in Table 18; data for 1997-2013 can be seen in SCR Doc 14/05. The 2016 ALK was not sexed. The 2017 and 2018 ALKs are not available yet, so the 2016 ALK was used.

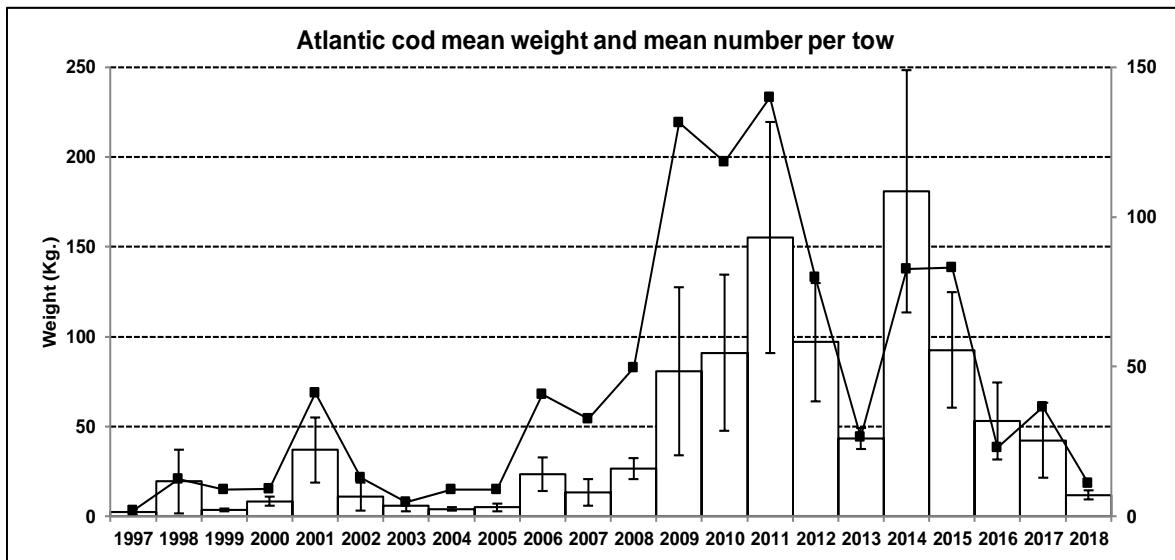

**Figure 14.** American plaice mean length (cm) at age on NAFO 3NO: 1997-2018. Data from 2014 to 2018 are in Table 19; data for 1997-2013 can be seen in SCR Doc 14/05. The 2016 ALK was not sexed. The 2017 and 2018 ALKs are not available yet, so the 2016 ALK was used.

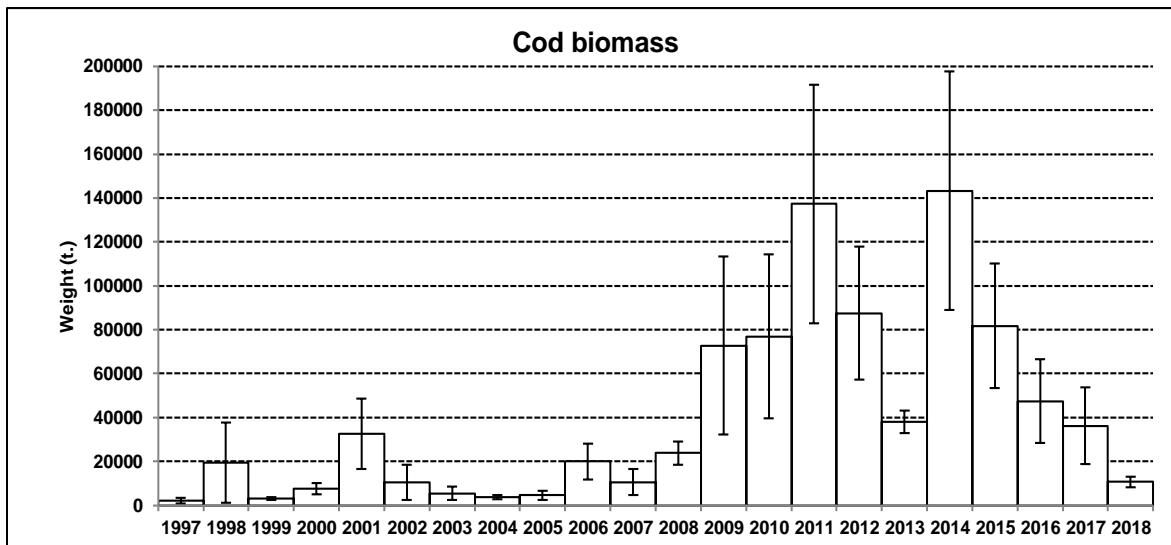

**Figure 15.** American plaice mean weight (gr) at age on NAFO 3NO: 1997-2018. Data from 2014 to 2018 are in Table 20; data for 1997-2013 can be seen in SCR Doc 14/05. The 2016 ALK was not sexed. The 2017 and 2018 ALKs are not available yet, so the 2016 ALK was used.

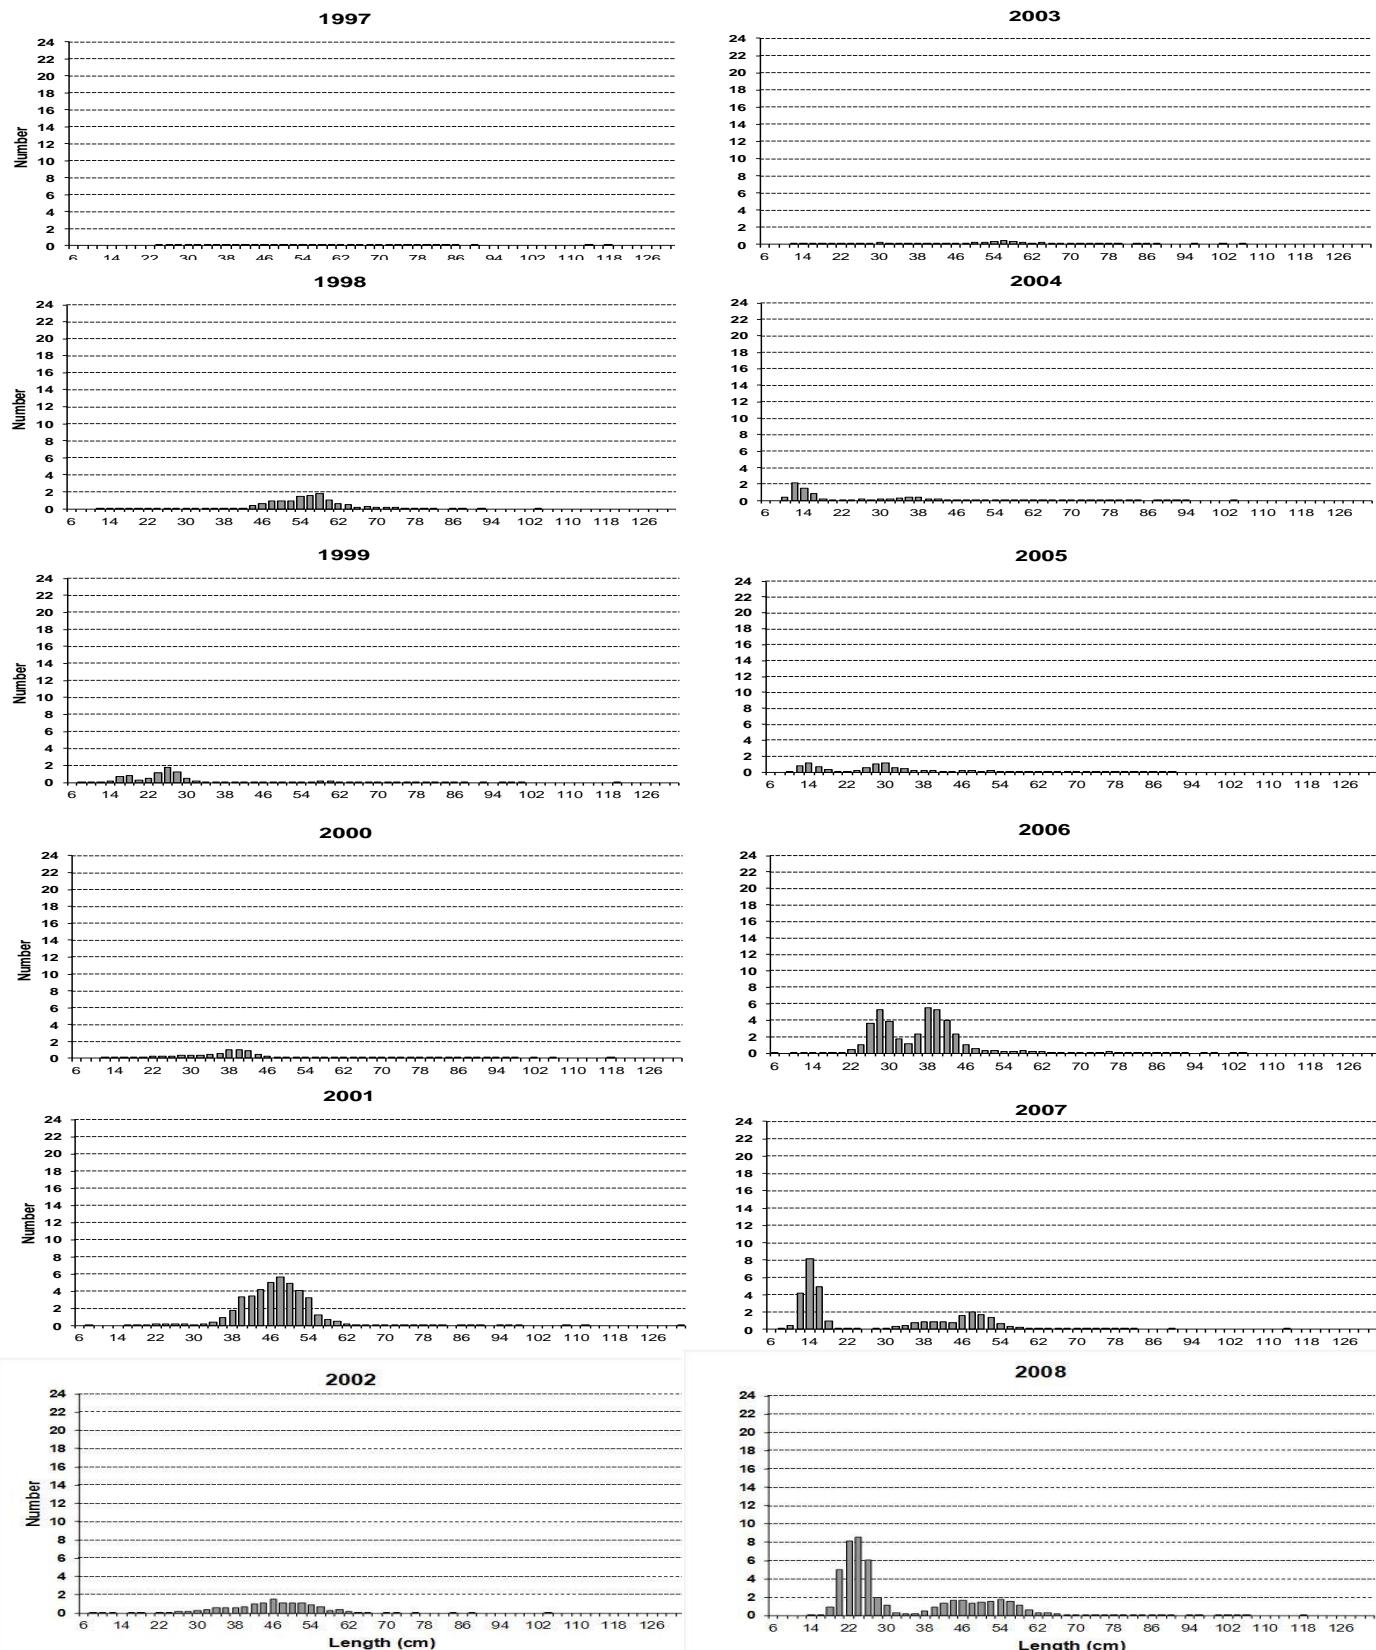

**Figure 16.** American plaice total biomass (tons) and abundance (thousands) by Division and year.

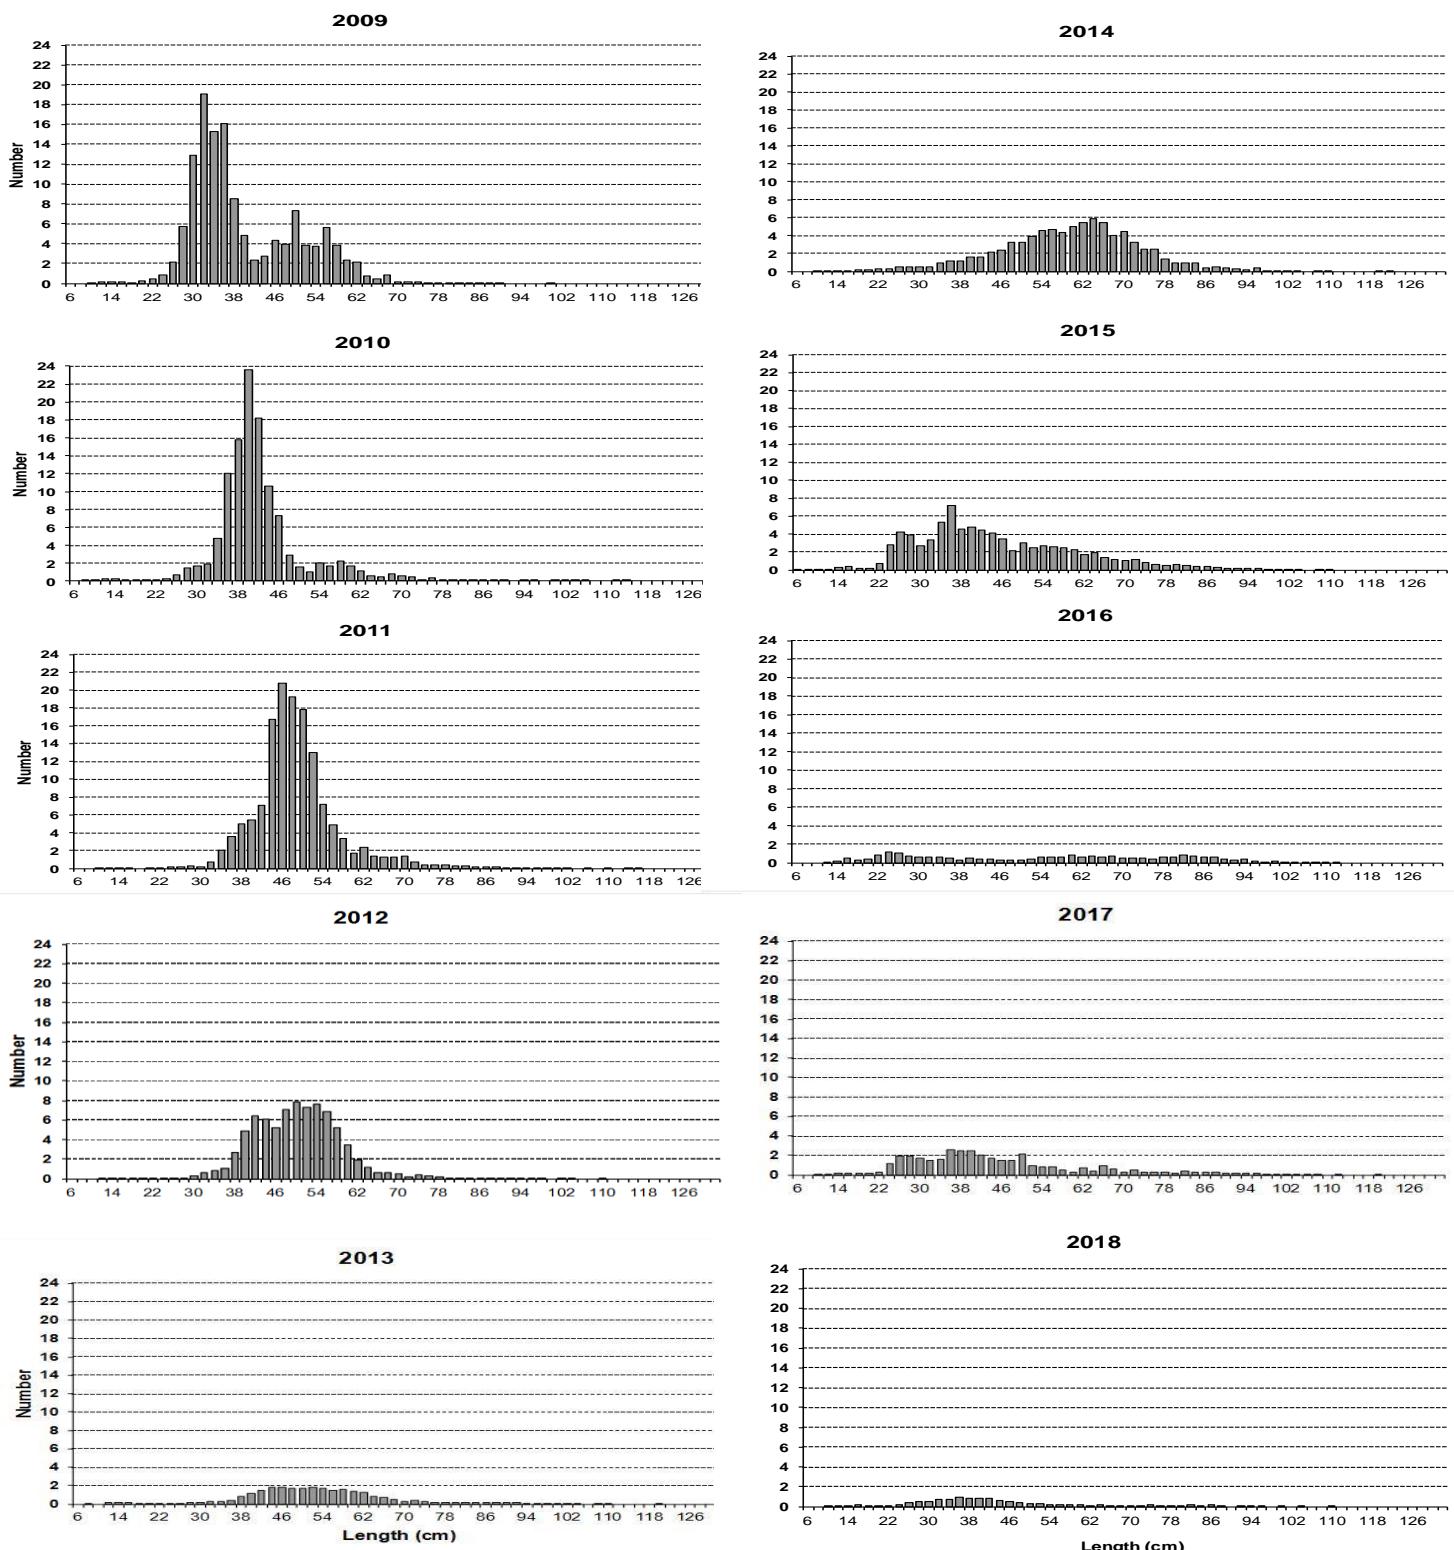

**Figure 17.** Atlantic cod stratified mean catches in Kg and  $\pm$ SD by year and mean number by year. Spanish Spring surveys in NAFO Div. 3NO: 1997-2018.

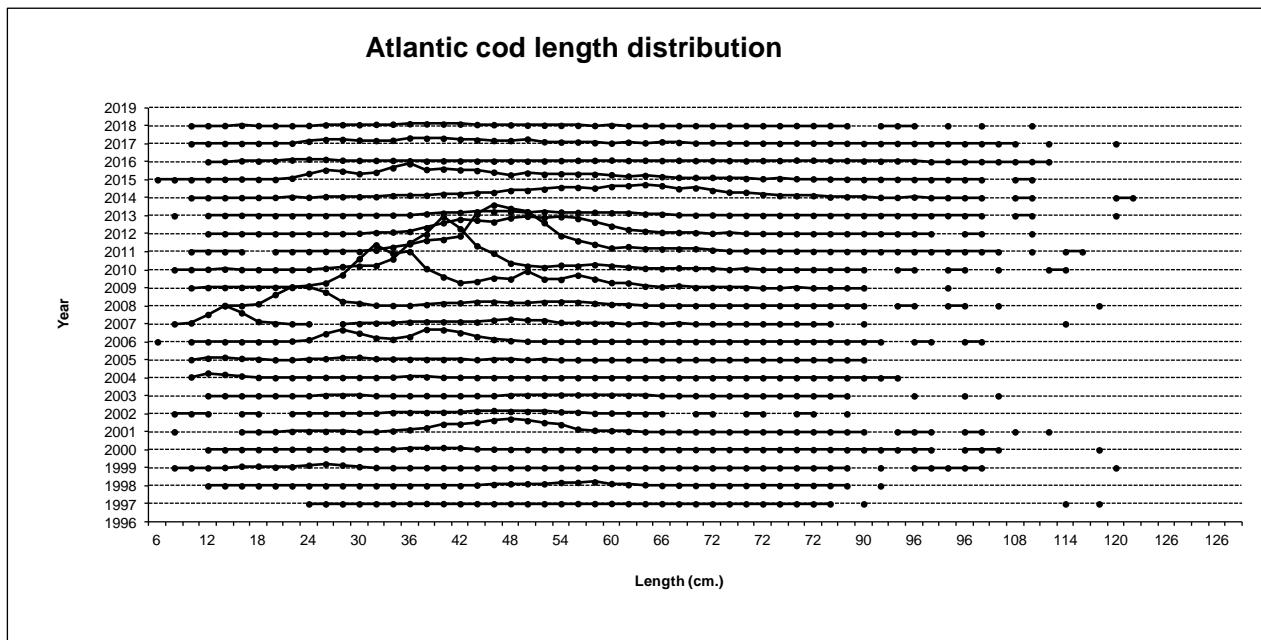

**Figure 18.** Atlantic cod biomass calculated by the swept method in tons and  $\pm$ SD by year. Spanish Spring surveys in NAFO Div. 3NO: 1997-2018.

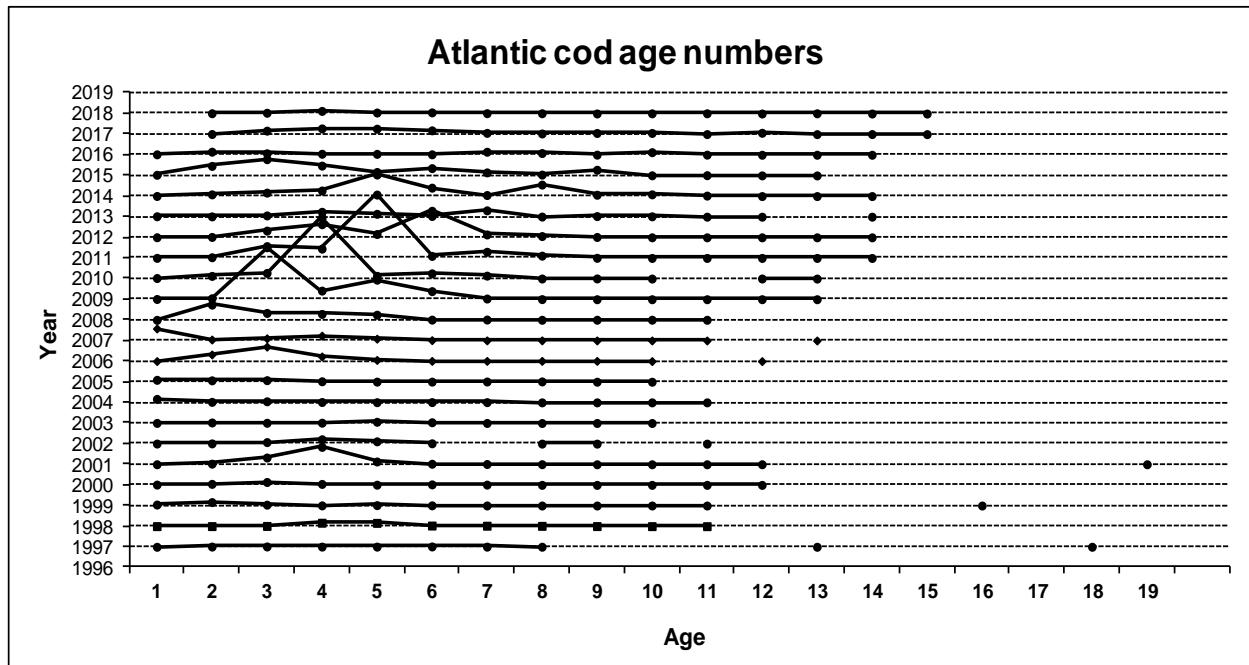

**Figure 19.** Atlantic cod length distribution (cm) on NAFO 3NO: 1997-2018. Mean catches per tow number. Data from 2014 to 2018 are in Table 28; data for 1997-2013 can be seen in SCR Doc 14/005

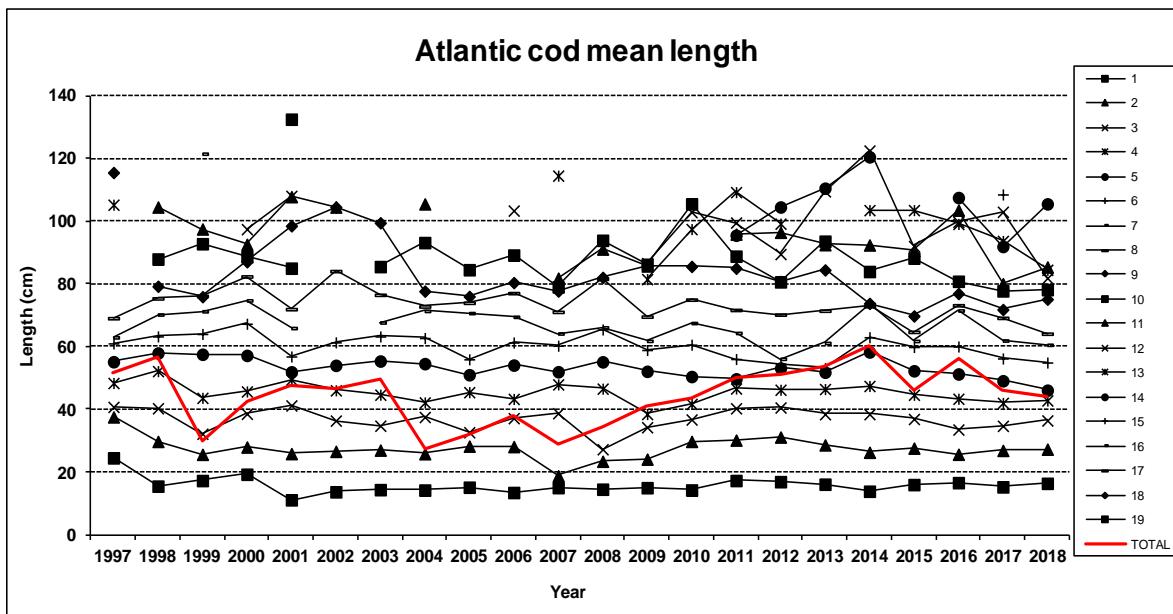

**Figure 19 (cont.).** Atlantic cod length distribution (cm) on NAFO 3NO: 1997-2018. Mean catches per tow number. Data from 2014 to 2018 are in Table 28; data for 1997-2013 can be seen in SCR Doc 14/005.

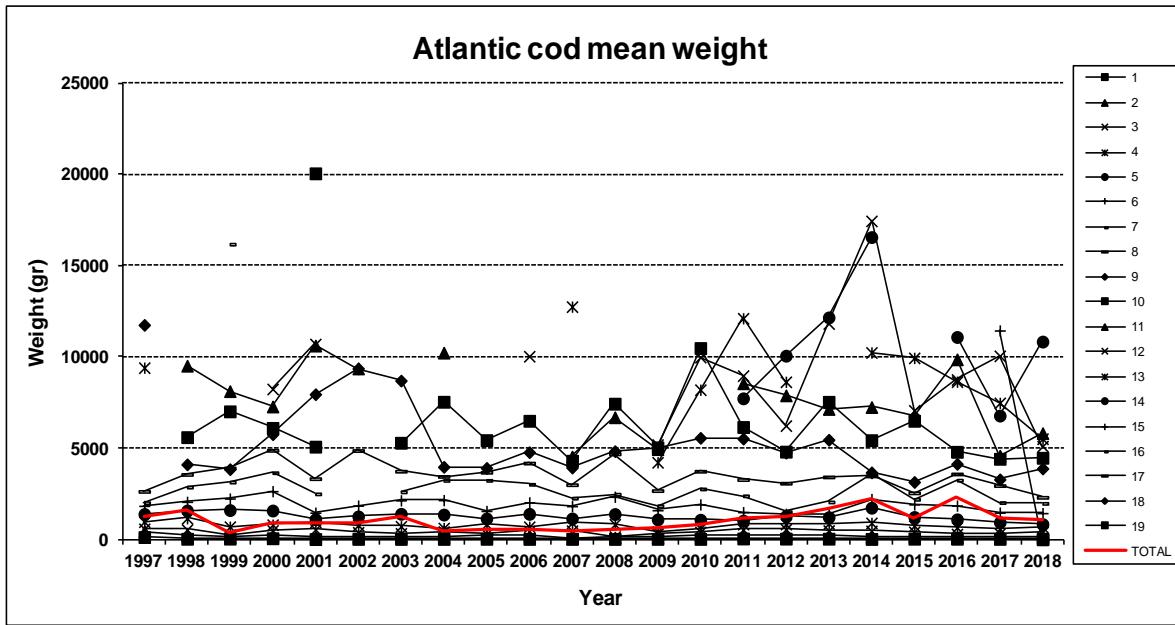

**Figure 20.** Atlantic cod stratified mean catches in Kg and  $\pm$ SD by year and mean number by year. Spanish Spring surveys in NAFO Div. 3NO: 1997-2018. Data from 2014 to 2018 are in Table 28; data for 1997-2013 can be seen in SCR Doc 14/005.

**Figure 21.** Atlantic cod biomass calculated by the swept method in tons and  $\pm$ SD by year. Spanish Spring surveys in NAFO Div. 3NO: 1997-2018. Data from 2014 to 2018 are in Table 29; data for 1997-2013 can be seen in SCR Doc 14/005.

**Figure 22.** Atlantic cod mean length (cm) at age on NAFO 3NO: 1997-2018. Ages from 1 to 19. Data from 2014 to 2018 are in Table 30; data for 1997-2013 can be seen in SCR Doc 14/005.

**Figure 23.** Atlantic cod mean weight (gr) at age on NAFO 3NO: 1997-2018. Ages from 1 to 19. Data from 2014 to 2018 are in Table 31; data for 1997-2013 can be seen in SCR Doc 14/005.
