Abstract

A stratified random bottom trawl survey on Flemish Cap was carried out from 12 July to 9 August 2021. Following the same procedures as in previous years, the area surveyed extends up to depths of 800 fathoms (1460 meters) and 181 fishing stations were planned. The survey was carried out by the R/V *Vizconde de Eza* with the usual survey gear (*Lofoten*). A total of 181 valid hauls were made, 120 up to 730 meters depth and 61 up to 1460 meters. Survey results are presented, including abundance indices of the main commercial species and age distributions for cod, redfish, American plaice, Greenland halibut, roughhead grenadier, squid and shrimp. The general indexes for this year are estimated taken into account the traditional swept area (strata 1-19, up to depths of 730 m.) and the total area surveyed (strata 1-34, up to depths of 1460 m.).

Introduction

The survey on Flemish Cap was carried out on board R/V *Vizconde de Eza* in 2021. A total of 181 valid bottom trawls were made up to a depth of 1460 m (800 fathoms) (Figure 1). The survey covered all strata of the bank adequately with the exception of the strata corresponding with the Beothuk knoll (35-39 strata) in the Southwest of the bank and the strata 26 and 27 in the Southeast. In this Figure we can observe the closed areas for Vulnerable Marine Ecosystems. Although the closed areas are tried to be avoided during the survey, sometimes this is impossible due to the lack of trawled zones. Take into account that new closed areas were set in September 2021 by the NAFO Commission (Areas 7a, 11a, 14a and 14b). A synoptic sheet of the survey with vessel and gear characteristics is shown in Table 1. This was the 34th survey of the series initiated by the EU in 1988. All years, the survey has had a stratified random design following NAFO specifications (Doubleday, 1981). In 2021, the survey was slightly later in July than usual due to the COVID restrictions. Dates, vessel, number of valid tows (including the number of valid tows until 700 m in brackets since 2002) and dates of the survey each year were:

Year	Vessel	Valid tows	Dates	Year	Vessel	Valid tows	Dates
1988	Cornide de Saavedra	115	08/07 - 22/07	2005	Vizconde de Eza	176 (117)	01/07 - 21/08
1989	Cyros	116	12/07 - 01/08	2006	Vizconde de Eza	179 (115)	01/07 - 26/07
1990	Ignat Pavlyuchenkov	113	18/07 - 06/08	2007	Vizconde de Eza	174 (117)	23/06 - 19/07

	Cornide de Saavedra	61**	23/07 - 02/08				

() valid tows carried out in depths lesser than 400 fathoms

** calibration tows

Material and Methods

As last years, the R/V *Vizconde de Eza* carried out the survey following the same procedures as in previous years, the same bottom trawl net *Lofoten*, with a cod-end mesh size of 35 mm, as well as all other details of its use (Vazquez *et al.*, 2014).

Results

Biomass of the main species during the survey estimated by swept area method (tons) are:

Survey	Cod	American plaice	Redfish	Greenland halibut	Roughhead grenadier	Squid	Shrimp

Values for surveys before 2003, when R/V *Cornide de Saavedra* was used, are transformed to their equivalences for R/V *Vizconde de Eza* following the accepted calibration among the two vessels (González Troncoso and Casas, 2005). From 2004 onwards, abundances are calculated for 19 shallowest strata covering the bank up to 730 m deep, as it was done in previous years, and for 32 strata up to 1460 m deep.

These survey indices are also presented in Table 2, and even they belong to different species and pelagic vs. demersal character and the transformation to the new scale (since 2003 the R/V *Cornide de Saavedra* was substituted by the R/V *Vizconde de Eza*) only was carried out for the main species, a global index is presented for each year, which minimum occurred in 2001. The composition of the species in 2021 is similar to that found in the beginning of the series: cod at high levels, shrimp residual, redfish fluctuating around 150-300 kt. and grenadiers and Greenland halibut (<730m) at low levels. Greenland halibut biomass index (<1400m) increased in 2017 next to historic maximums, decreasing since then. Everything seems to point to a return to the situation found at the beginning of the EU survey series, and prior to the changes induced by the collapse of cod in the late 90's. American plaice biomass has increased since 2014 and it seems to show signs of recovery, being the 2021 value the highest of the series since 1991.

Cod

Mean catch per haul and biomass by strata with standard errors are presented in Table 3. These indices are compared with results of previous surveys in Table 5. Total biomass calculated by the swept area method and compared with Russian survey results are:

Year	EU (1)	Russia: (2)	(3)	Year	EU (1)	Russia: (2)	(3)

2001	2,695	784	-	2021		51,501	tons
2002	2,496	694	-				

1) Biomass estimated from bottom trawl survey. **2)** Biomass estimated from bottom trawl survey (Kiseleva and Vaskov 1994; Kiseleva 1996, 1997; Vaskov and Igashov, 2003). **3)** Biomass estimated of bottom trawlable plus pelagic biomass (Borovkov *et al.* 1993; Kiseleva and Vaskov 1994).

Table 4 shows the length distribution of this stock. Table 6 presents the 2021 ALKs, and Table 7 the abundance at age by stratum.

Distribution of survey catches in the last four surveys is presented in Figure 2. Evolution of biomass and abundance are illustrated in Figure 3. The abundance at age along the series is presented in Table 8 and Figure 5.

The 1992 to 2003 year-classes failed almost completely. The abundances of 2004-2008 years classes were higher than in previous 12 years. The abundance of the 2010 year-class was the highest of the series, and the 2009 and 2011 ones were also high. The 2012-2018 year-classes failed according to current results at age 1 and the 2019-2021 years classes seems to be better than in recent years but it remains still at low level (Figure 4). Two individuals of 6 and 7 cm appeared during the survey, corresponding to age 0.

After the historic maximum in biomass in 2014, the biomass has decreased successively and it is now slightly below the average of the whole period. The abundance had a peak in 2011 due to the very high recruitment, and since then has decreased, indicating an increase in older ages and a fail in recruitment. After a low biomass in 2019, in the level of the 2008 one, the biomass increased in 2020 but decreased again in 2021.

American plaice

Mean catch per haul and biomass by strata with standard errors are presented in Table 9. Survey biomass, as calculated by the swept area method, is compared with results of previous surveys in Table 11. This biomass is compared with Russian survey results in the following table:

Year	EU	Russia (1)	Year	EU	Russia (1)	Year	EU	Russia (1)
1983		8,900	1996		4,098	2009		1,442
1984		7,500	1997		3,026	2010		2,446
1985		7,800	1998		3,437	2011		4,084
1986		20,200	1999		2,585	2012		4,491
1987		9,300	2000		1,606	2013		3,698
1988	16,046	6,500	2001		2,404	2014		3,800
1989	14,047	5,000	2002		2,049	2015		3,821
1990	11,983	1,200	2003		2,286 548	2016		4,325
1991	10,087	14,400	2004		3,525 1,398	2017		7,475
1992	8,656	1,200	2005		2,760	2018		6,109
1993	7,861	2,700	2006		1,691	2019		7,654
1994	8,227		2007		1,053	2020		7,752
1995	6,785	ton	2008		1,766	ton		9,372 ton

1) Rikhter *et al.* 1991; Borovkov *et al.* 1992, 1993, 1994; Vaskov and Igashov, 2003.

Table 10 shows the length distribution and Tables 12 and 13 the age-length key and the abundances at age by stratum respectively (no updated since 2020). Figure 5 shows the distribution of the survey catches in the last four surveys. The abundance at age along the series is shown in Table 14. Also, the evolution of survey biomass and abundance along the series is presented in Figure 6. Figure 7 shows the age distribution over the years.

Fish aged 6 or more roughly correspond with fishable biomass. Results indicate two periods for recruitment, and a change from an upper abundance level to a lower one. The 1991 year-class was the first weak cohort. The 2006 year-class is the more abundant since 1991, but its abundance is only intermediate. Recruitment for later year-classes seems to be weaker; too weak for a quick recovery of the stock. Figure 7 illustrates the lack of recruitment that occurred for many years, and how most recent year-classes are weaker than those at the beginning of the series. The biomass and abundance were more or less stable from 2011 to 2016, showing an upward trend since 2017 reaching in 2021 the maximum values since 1991.

The ALKs for American plaice since 2021 are not available yet due to lack of time, so the indices by age are presented only until year 2018. The length distribution doesn't indicate a change with regards to previous years.

Redfish

All redfish catches were classified by species. The group name *juvenile* contains those individuals of small size for which routine classification was not possible. The 15 cm maximum length is a good reference for this group, but it has been never used as a criterion. The skill required to identify the species increased over time, so the group *juvenile* is not a uniform defined group, but it is maintained for practical reasons.

Mean catch per standard haul and biomass by strata with the standard errors are presented in Tables 15, 19, 23 and 27 for *Sebastes norvegicus*, *S. mentella*, *S. fasciatus* and the *juvenile* group respectively. The following table shows the total biomass (tons) by year in the traditional strata (<730 m.).

Year	<i>Sebastes</i>	<i>Sebastes spp.</i>			Total
	<i>norvegicus</i>	<i>mentella</i>	<i>fasciatus</i>	<i>juvenile</i>	
1988	18,229		170,102		188,331

2021	15,723	78,212	51,733	3,246	148,914

Tables 16-18, 20-22, 24-26 show the age length key, length frequency and the abundance at age by stratum for the three species of redfish respectively. Catches per haul distributions and biomass of the three species and juveniles are presented in the Figure 8 and 9 respectively. Table 28 shows the length frequency of the juveniles. ALKs, and so the numbers at age, are not yet available for these species in 2021 due to lack of time.

Greenland halibut

Mean catch per standard haul and the estimated biomass by strata with their standard errors are presented in Table 29. These indices are compared with results of previous surveys in Table 30. The following table summarises the total biomass in tons by year in depths <730 m. (1988-2021) and in depths up to 1460 m. (2004-2021).

Year	EU < 730 m.	Year	EU < 730 m.	EU < 1460 m.
1988	6,926	2004	12,292	28,343
1989	4,472	2005	11,698	21,515
1990	5,799	2006	11,706	24,357
1991	8,169	2007	13,040	31,723
1992	8,728	2008	11,995	39,614
1993	6,529	2009	7,775	36,047
1994	8,037	2010	6,299	26,739
1995	10,875	2011	6,713	32,257
1996	11,594	2012	4,291	23,505
1997	16,098	2013	2,799	23,391
1998	24,229	2014	5,168	29,288
1999	21,207	2015	6,577	58,180
2000	16,959	2016	6,139	34,642
2001	13,872	2017	7,632	52,237
2002	12,100	2018	5,578	36,482
2003	6,214	2019	5,496	20,673
		2020	6,649	16,194
		2021	5,872	19,969

Age-length keys and length frequency are presented in Tables 31 and 32 respectively. Frequency at age by stratum for 2021 is presented. Catch per haul distribution for the last four surveys is presented in Figure 10. Figure 11 shows the estimated biomass with their standard error and numbers by year. The abundance at age along the series is shown in Table 34. Figure 12 shows the age distribution by year in the EU Flemish Cap surveys. The 2017 biomass and abundance indices until 1430 m are the second highest of the series, after the 2015 values. The 2020 biomass to 1400m is the lowest value in the historical series, since 2004. The 2017 age 1 numbers were the highest since 2004.

Roughhead grenadier (*Macrourus berglax*)

Mean catch per standard haul and estimated biomass by strata with their standard errors are presented in Table 35. These indices are compared with results of previous surveys in Table 36. The following table summarises the total biomass in tons by year:

Year	EU < 730 m.	Year	EU < 730 m.	EU < 1460 m.
1988	2,009	2004	3,597	17,185
1989	871	2005	2,387	12,560
1990	852	2006	3,933	11,336
1991	1,335	2007	1,367	7,271
1992	1,577	2008	2,961	12,138
1993	3,021	2009	781	7,303
1994	1,975	2010	1,403	9,092
1995	1,558	2011	729	8,800
1996	1,362	2012	612	5,477
1997	1,197	2013	807	4,298
1998	1,691	2014	399	4,111
1999	1,250	2015	478	3,702
2000	1,047	2016	373	3,836
2001	2,079	2017	616	5,141
2002	1,211	2018	625	4,375
2003	2,348	2019	590	6,500
		2020	624	4,037
		2021	699	3,964

Age-length keys and length frequency are presented in Tables 37 and 38. Frequency at age by strata is presented in Table 39. Catch per haul distribution is presented in Figure 13. Figure 14 shows the estimated biomass with their standard error and numbers by year. The abundance at age along the series is shown in Table 40. Figure 15 shows the age distribution by year in the EU Flemish Cap surveys. Biomass and abundance have been stable in the last years at low levels.

Squid

Some indices of the squid (*Illex illecebrosus*) are presented. Total biomass and abundance are presented in Table 41. The biomass is presented by stratum and year. The 1988-2002 indices were transformed for the R/V *Cornide de Saavedra* to the R/V *Vizconde de Eza* level (González-Troncoso, 2016). Catch per haul distribution for the last four surveys is presented in Figure 16. The indices could be seen in Figure 17. Not all the years squid is present in the survey, and the indices show a high variability.

Shrimp

Casas J.M. (2021) presented detailed results.

Table 1. Technical data of the 2021 survey.

Procedure	Specification
Vessel	R/V <i>Vizconde de Eza</i>
GT	1 400 t
Power	1 800 HP
Mean trawling speed	3.0 -3.5 knots
Trawling time	30 minutes effective time
Fishing gear	type <i>Lofoten</i>
footrope / handrope	31.20 / 17.70 m
footgear	27 steel bobbins of 35 cm
vertical opening	3.0 m (MARPORT)
warps	100 meters, 45 mm, 200 Kg/100m
trawl doors	polyvalent, 850 Kg
wire length	2 × depth echo sounder (m.) + 250.
mesh size in cod-end	35 mm
Type of survey	Stratified sampling
Station selection procedure	Random
Criterion to change position of a selected tow	- Unsuitable bottom for trawling according to ecosounder register. - Information on gear damage from previous surveys.
Criterion to reject data from tow	- tears in cod-end - severe tears in the gear - less than 20 minutes tow - bad behaviour of the gear
Daily period for fishing	6.30 to 18:30 hours
Species for sampling	All fish, cephalopods, shrimp and invertebrates
Species for age determination	Cod, American plaice, redfish (<i>Sebastes sp.</i>), Greenland halibut and Roughhead grenadier (<i>Macrourus berglax</i>).
