## AGRADECIMIENTOS

En primer lugar, doy gracias a Dios por darme las habilidades y los medios para alcanzar mi objetivo, que en algún momento inició como un sueño y ahora es una realidad.

A mi esposa Anne, quien ha sido mi apoyo constante y me ha acompañado con su amor y paciencia en este camino.

A mi hija, por ser mi motor e inspiración para salir adelante.

Y a la UNAD, la Escuela de Ciencias Básicas, Tecnología e Ingeniería con toda su red de tutores, quienes me han brindado su apoyo y conocimiento durante el desarrollo de mi carrera.

A todos ellos, ¡gracias!

## GLOSARIO

**CCNP:** *Cisco Certified Network Professional*, por sus siglas en inglés, es una certificación de Cisco en temas de switching, routing, tecnología inalámbrica y temas de seguridad. (Cisco, 2010).

**CISCO:** Cisco Systems es una empresa global con sede en San José, California, Estados Unidos, principalmente dedicada a la fabricación, venta, mantenimiento y consultoría de equipos de telecomunicaciones (Wikipedia, 2022).

**CONMUTACIÓN:** En las redes de comunicaciones, forma de establecer un camino entre dos puntos, un transmisor y un receptor a través de nodos o equipos de transmisión. La conmutación permite la entrega de la señal desde el origen hasta el destino requerido. (EcuRed, 2022).

**ELECTRÓNICA:** La electrónica es una rama de la física aplicada que comprende la física, la ingeniería, la tecnología y las aplicaciones que tratan con la emisión, el flujo y el control de los electrones —u otras partículas cargadas eléctricamente— en el vacío y la materia. [...] trata con circuitos eléctricos que involucran componentes eléctricos activos como tubos de vacío, transistores, diodos, circuitos integrados, optoelectrónica y sensores, asociados con componentes eléctricos pasivos y tecnologías de interconexión. (Wikipedia, 2022)

**ENRUTAMIENTO:** El enrutamiento es el proceso de reenviar paquetes entre redes, siempre buscando la mejor ruta (la más corta). Para encontrar esa ruta más óptima, se debe tener en cuenta la tabla de enrutamiento y algunos otros parámetros como la métrica, la distancia administrativa, el ancho de banda, entre otros. (El Taller del Bit, s.f.)

**REDES:** Una red de computadoras (también llamada red de ordenadores o red informática) es un conjunto de equipos nodos y software conectados entre sí por medio de dispositivos físicos que envían y reciben impulsos eléctricos, ondas electromagnéticas o cualquier otro medio para el transporte de datos, con la finalidad de compartir información, recursos y ofrecer servicios. (Tanenbaum, 2003).

## RESUMEN

El presente trabajo, a través de varios escenarios y pasos, tiene como objetivo construir una red y realizar la configuración básica de los dispositivos y el direccionamiento de las interfaces empleando protocolos de STP y de configuración VLAN, propios de una red convergente.

Se emplean comandos IOS de configuración avanzada para configurar VRF y las rutas estáticas en ambientes LAN y WAN y, estos escenarios son evaluados para garantizar el correcto funcionamiento, los estados de enlace y condiciones de seguridad, para identificar problemas en la conmutación y el enrutamiento para lograr un desempeño eficiente y una adecuada conectividad de la red.

Al finalizar todos los pasos, se pretende dar acceso a los dispositivos que pertenecen a las diferentes VLAN sin comunicarse entre ellas, con lo que se valida la efectividad de la configuración multi-VRF de la red.

**Palabras Clave:** CISCO, CCNP, Conmutación, Enrutamiento, Redes, Electrónica.

## ABSTRACT

This paper, through several scenarios and steps, aims to build a network and perform the basic configuration of devices and routing of interfaces using STP and VLAN configuration protocols, typical of a convergent network.

Advanced configuration IOS commands are used to configure VRF and static routes in LAN and WAN settings, and these scenarios are evaluated to ensure correct operation, link status and security conditions, to identify problems in switching and routing for efficient performance and proper network connectivity.

At the end of all the steps, it is intended to give access to the devices belonging to the different VLANs without communicating between them, thus validating the effectiveness of the multi-VRF configuration of the network.

**Keywords:** CISCO, CCNP, Routing, Switching, Networking, Electronics.

## INTRODUCCIÓN

El presente documento hace parte de la evaluación del Diplomado de Profundización CISCO CCNP, bajo la modalidad de “proyecto aplicado”. A través de escenarios con características y requerimientos específicos se busca realizar la configuración multi-VRF de una red con dos tipos de usuarios, “generales” y “especiales” quienes, al concluir el ejercicio deberán tener accesibilidad de extremo a extremo, pero no comunicación entre ambos grupos.

Para lo anterior, con los escenarios propuestos en la guía de actividades, se desarrollan las siguientes partes, (1) topología de la red y configuración de los ajustes básicos del dispositivo y el direccionamiento de la interfaz; (2) Configuración VRF y rutas estáticas; (3) configuración de capa 2; y, (4) configuración de seguridad.

Finalmente, se detalla el paso a paso desarrollado en cada una de las etapas, acompañado de comandos como ping, tracer, show ip route, entre otros, que evidencian la verificación de conectividad.

Como se mencionó al inicio, el desarrollo de esta actividad permite evidenciar el aprendizaje adquirido a lo largo del Diplomado, cuyo énfasis se centra en temas de switching, enrutamiento, tecnología inalámbrica y temas de seguridad.

## DESARROLLO ESCENARIO

## CONCLUSIONES

Se alcanzaron los objetivos propuestos en el desarrollo de la actividad, mediante la construcción de la red y la configuración básica de cada dispositivo, junto con el direccionamiento de las interfaces.

Se realizó la configuración de las VRF y las rutas estáticas y se comprobó su adecuado funcionamiento, junto con la configuración de Capa 2 y la seguridad.

Finalmente, se validó el acceso de los dispositivos de diferentes VLAN *sin* comunicación entre redes, con lo que se comprobó la efectividad de la configuración multi-VRF de la red.

Lo anterior no solo permitió la transferencia del conocimiento teórico a la práctica, y evidencia lo aprendido durante el diplomado, sino que valida la importancia de comprender cómo operan las subredes y los beneficios de administrar dominios de broadcast independientes, en múltiples escenarios al interior de una red jerárquica convergente.
