

Liquid metal facilities to investigate thermal-hydraulics and behaviour of materials up to sodium boiling

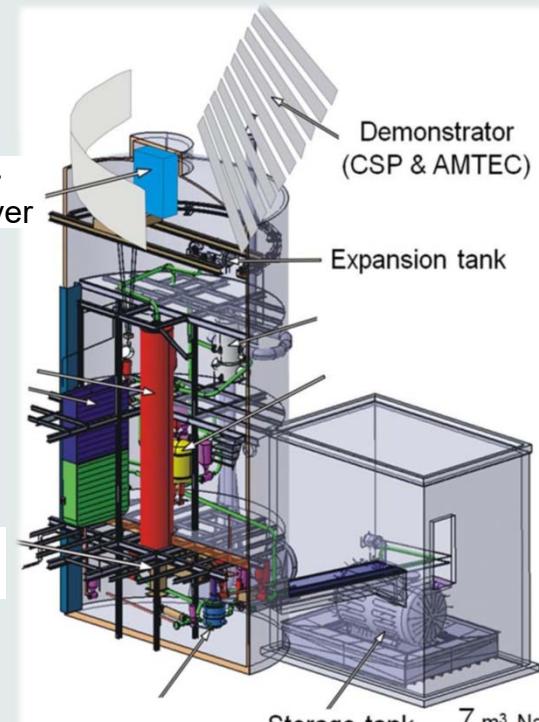

A. Onea, W. Hering, J. Fuchs, Th. Schaub, A. Weisenburger, R. Stieglitz

Karlsruhe Institute of Technology

Institute for Neutron Physics and Reactor Technology

Na – Facilities: Operating, Qualifying, Preparation, Design

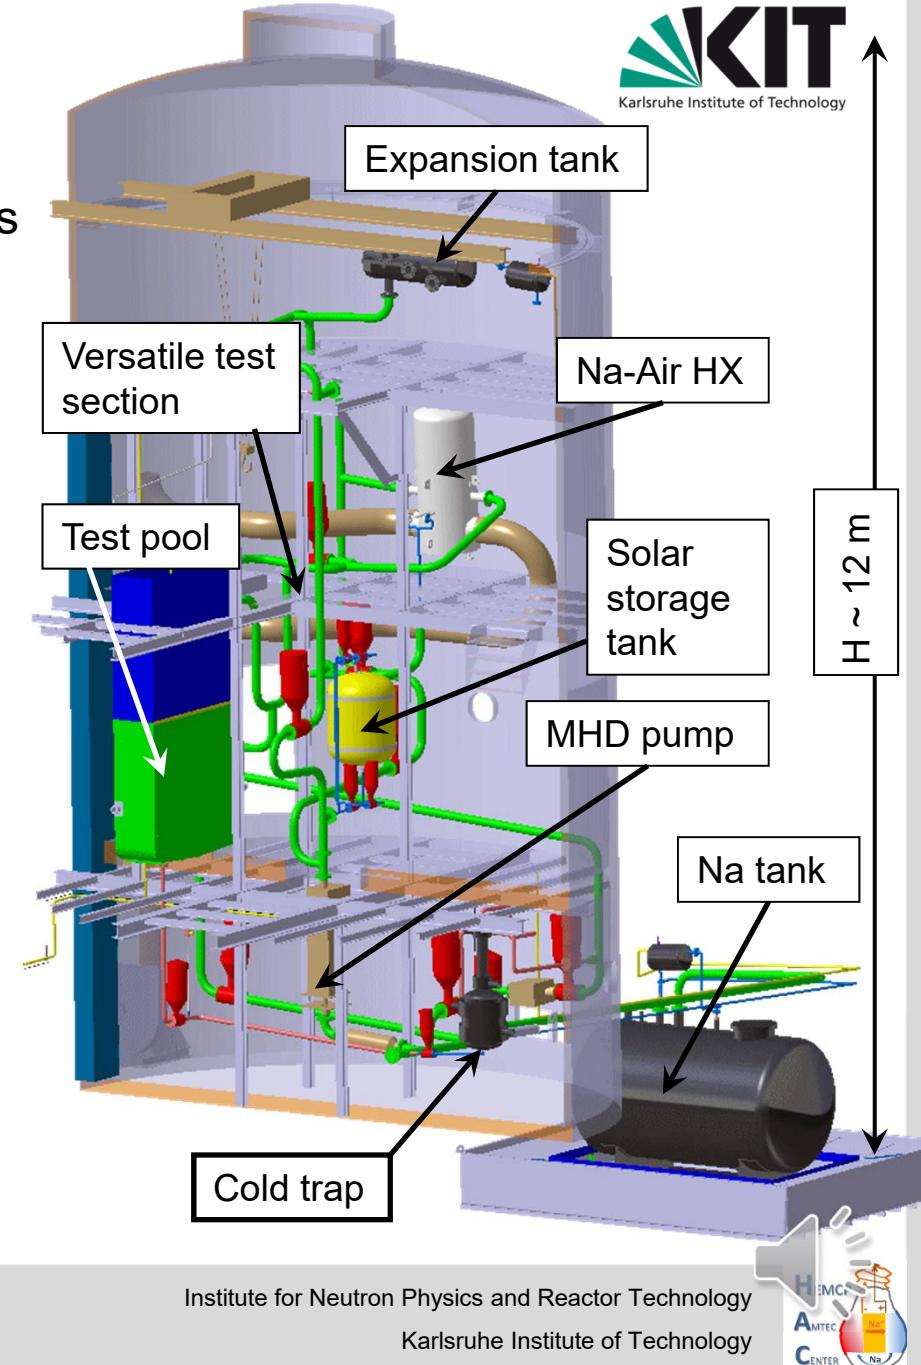

Basic physics (Electro-chemistry)	System level (Materials)	Medium Scale / Demonstrator
AMTEC ATEFA →   	<p>„Energy“ - materials SOLTEC 1_{AWP} – 2_{IHM}</p>   <p>← CORTINA_{AWP}</p>	<p>Thermal storage: KASOLA facility</p> 

KIT-INR – Overview liquid metal facilities

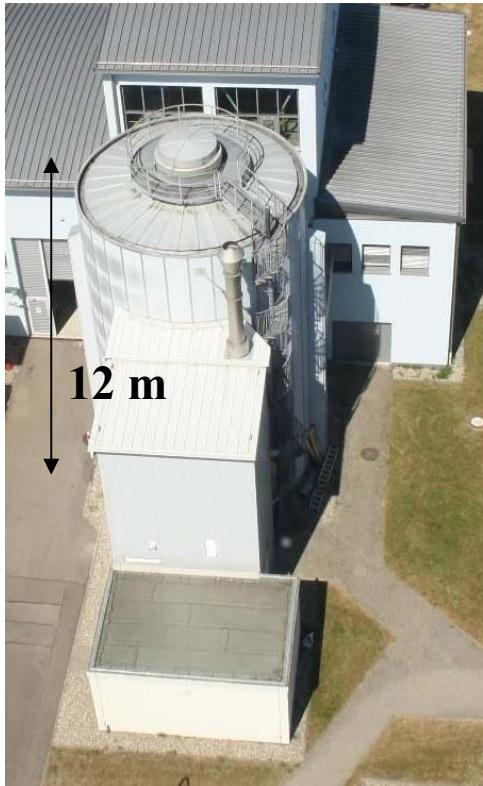

Facility (start Op.)	Purpose	Size	Power [kW]	Fluid (Vol)	Range [K]	Remarks
NECEX	Long term chemical compatibility/corrosion tests of steels	SET	~ 2	NaK	< 780	
NaKWET (2017)	Test of wetting of different surface structures and materials	SET	~ 2	NaK	< 630	
DITEFA (2017)	Qualification of instrumentation and flow diagnostics, education	small	< 2	GaInSn	< 320	
ATEFA (2017)	AMTEC test stand for single cell development	small	~ 2	Na ~ 4 l	< 1300	
SOLTEC 1 (2022)	8-shape loop for long term tests up to 1000 K, low cycle fatigue	small	~ 40	Na ~ 14 l	< 1000	Material/parts qualification
SOLTEC 2 (2018)	8-shape loop for long term tests up to 1000 K, fast transients	small	~ 40	Na ~ 14 l	< 1000	Material qualification
SOLTEC 3 (2022)	Single loop for long term tests up to 1000 K, receiver and AMTEC	small	~ 40	Na ~ 10 l	< 1225	Material/parts qualification
KASOLA (2018)	Large scale experimental infrastructure with three test ports	Mid-size	~ 400	Na, ca. 7000 l	< 820	Multipurpose NuSAFE, CSP,..
KARIFA (2022)	Small scale experimental facility for Na boiling tests	Small	~ 2	Na, ~ 2 l	< 1225	Na boiling

KASOLA facility (1)

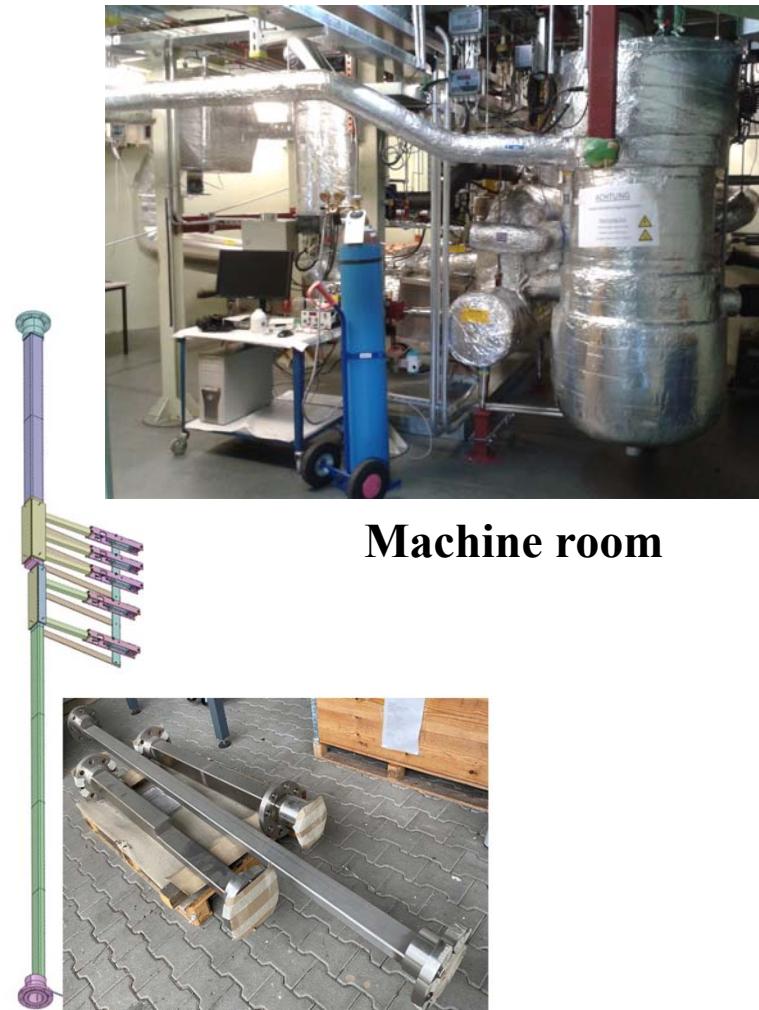

- KArlsruhe SOdium LABoratory contributes to safety oriented EU-programs: ENSII+, SESAME, ESFR_smart
- Total electric power: ~ 2 MW
- Sodium temperature range: 150°-550°C
- Sodium maximum flow rate: 150 m³/h
- Test-section: up to 6 m long
- Sodium amount: 7m³
- Backbone of KIT-sodium infrastructure (Na-storage, purification, distribution)
- Component and safety tests under real conditions
- Qualification of CFD and system codes

KASOLA facility (2)

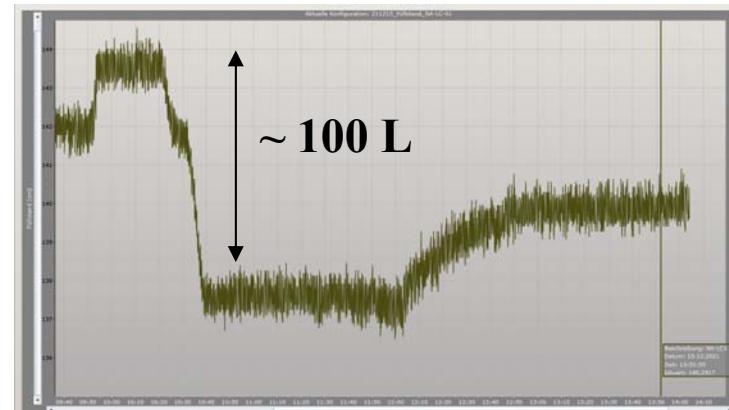

KASOLA buildings
(aerial view)

KASOLA facility (3)

**Na pressure level
(storage tank)**

Na level (storage tank)

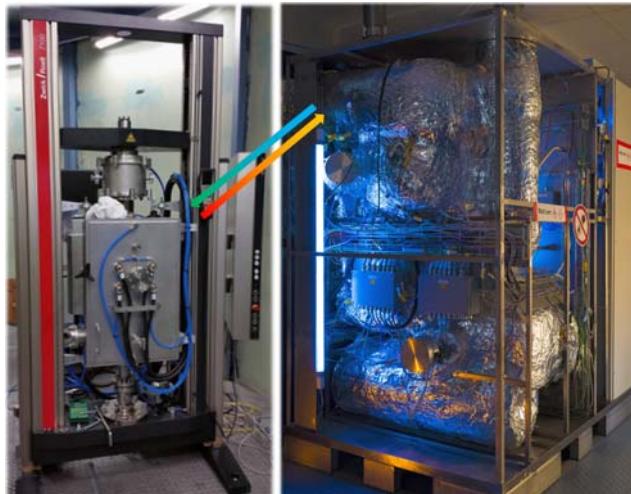

Na temperature level

SOLTEC – SOdium Loop to TEst materials and Corrosion

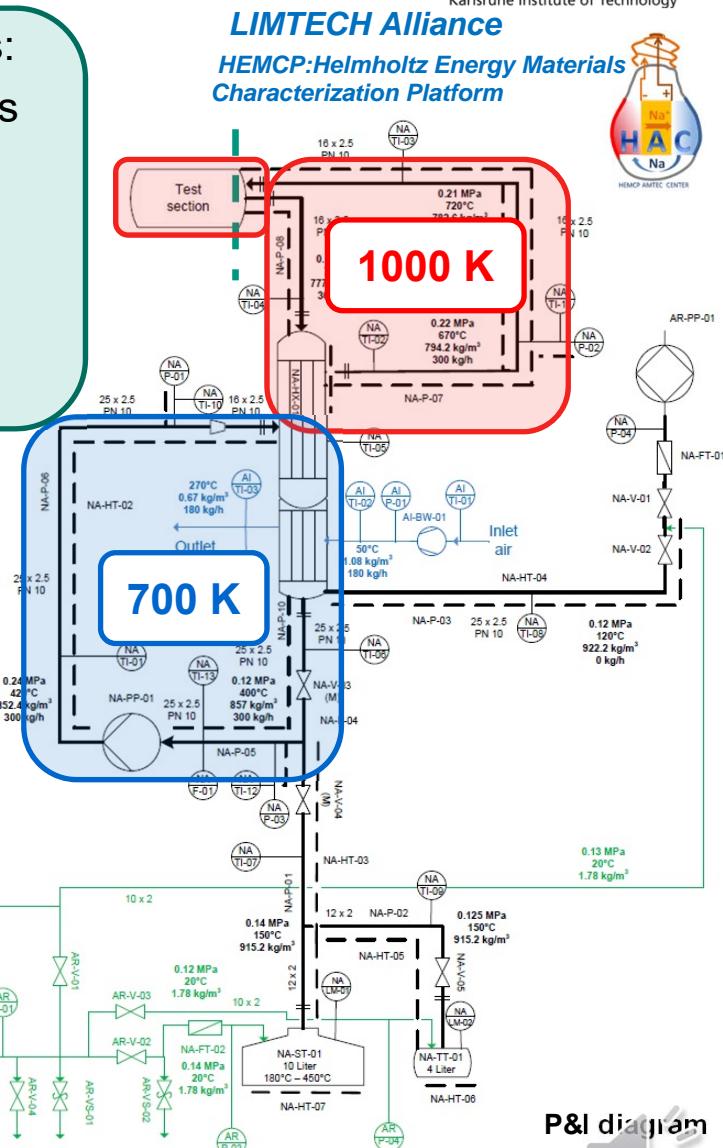

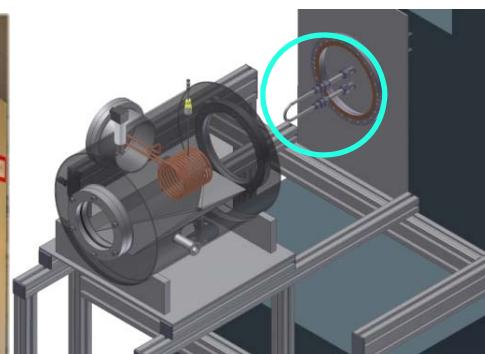

- Material qualification for high temperature applications:
- SOLTEC-1: Creep fatigue tests of innovative materials in hot Na (**unique**)
- SOLTEC-2: Corrosion/erosion tests for new steels
- SOLTEC-SOLAM: Long term tests for new thermoelectrical converters
- Set into operation: Mid 2018

Test sections:

Traction facility

Material test chamber

SOLTEC - Technical data

- Mass flow rate: 300 kg/h
 - S1: 4.8 m/s in test sample
 - S2: 1.0 m/s in test sample ($Re = 28600$, 300°C)
- Temperature: cold loop 450°C; hot loop 720°C, SOLTEC-3 SOLAM: 950°C
- Na inventory: ~ 14 L
- Max. pressure: 3.5 bar g
- Compact configuration: $1.2 \times 1.6 \times 1.9 \text{ m}^3$
- Main components:
 - Na-pump (3kW permanent magnet pump)
 - 7.5 kW Na-air HX & 27 kW Na-Na heat recuperator,
 - Storage tank (15 L) = expansion tank (particular feature)
 - 6.7 kW HT heater

LIMTECH Alliance

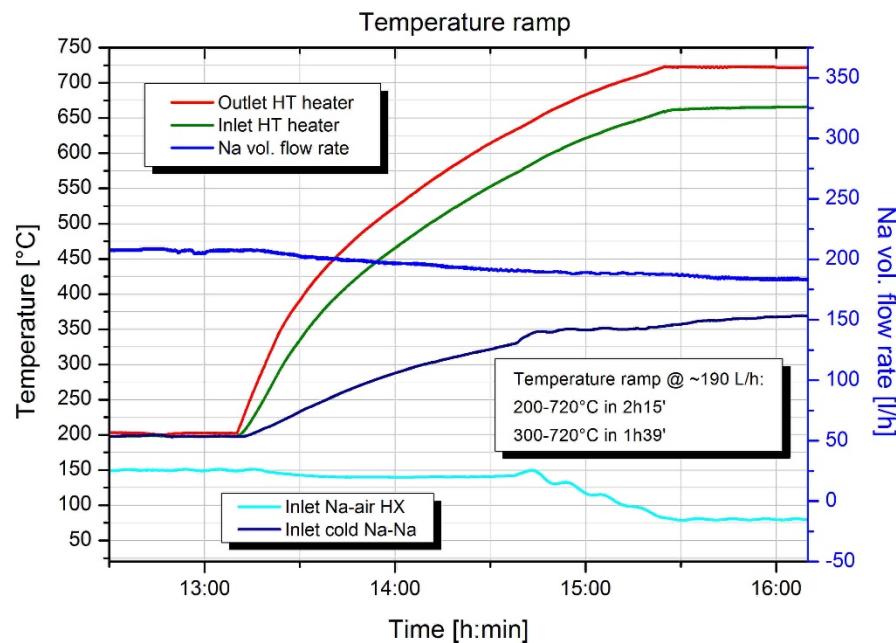

HEMCP:Helmholtz Energy Materials
Characterization Platform

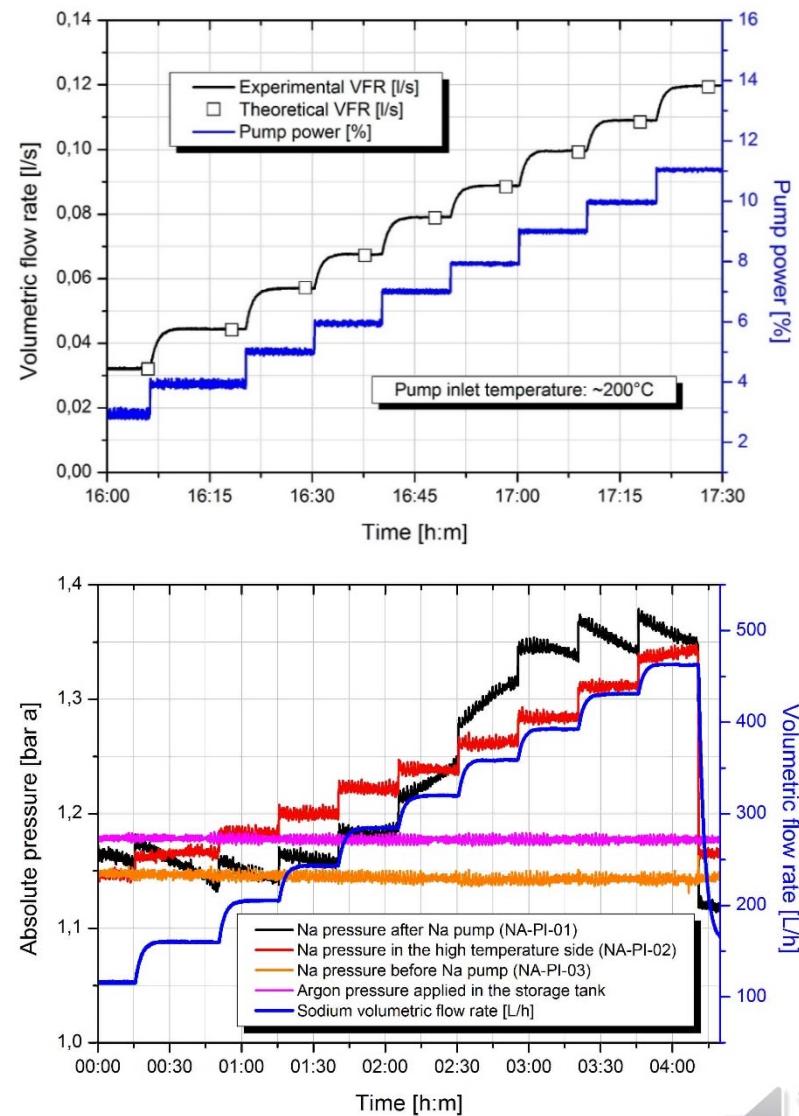

SOLTEC-2

Manufacturing: SAAS GmbH, SOWEC GmbH

SOLTEC – Experimental data

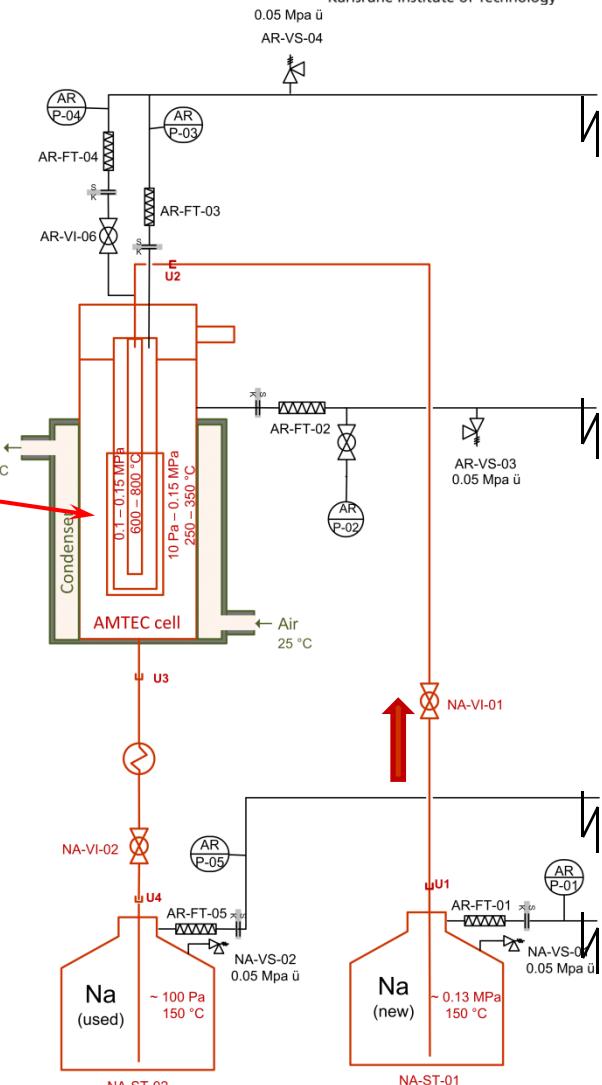

- Temperature ramp @ 190 L/h
 - 200 – 720°C in 2h 15'
 - 300 – 720°C in 1h 39'

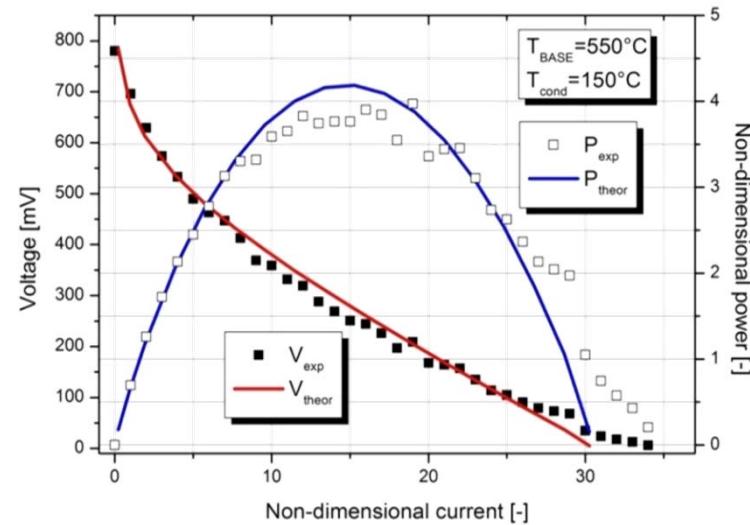

AMTEC TEST Facility (ATEFA) *

- AMTEC: Alkali-Metal Thermal-to-Electric Converter
- Ar pressurized induced Na flow
- Temperature range:
 - Loop: up to 300°C
 - Test cell: up to 1000°C
- Na flow rate determined by gravity and electrical power of the cell
- Na inventory: ~ 4 L
- Max. overpressure: 0.5 bar
- Compact configuration:
 $0.6 \times 0.9 \times 2.0 \text{ m}^3$
- Main components:
 - Two storage tanks (~ 4,5 l)
 - Air cooled AMTEC test cell with inner heater

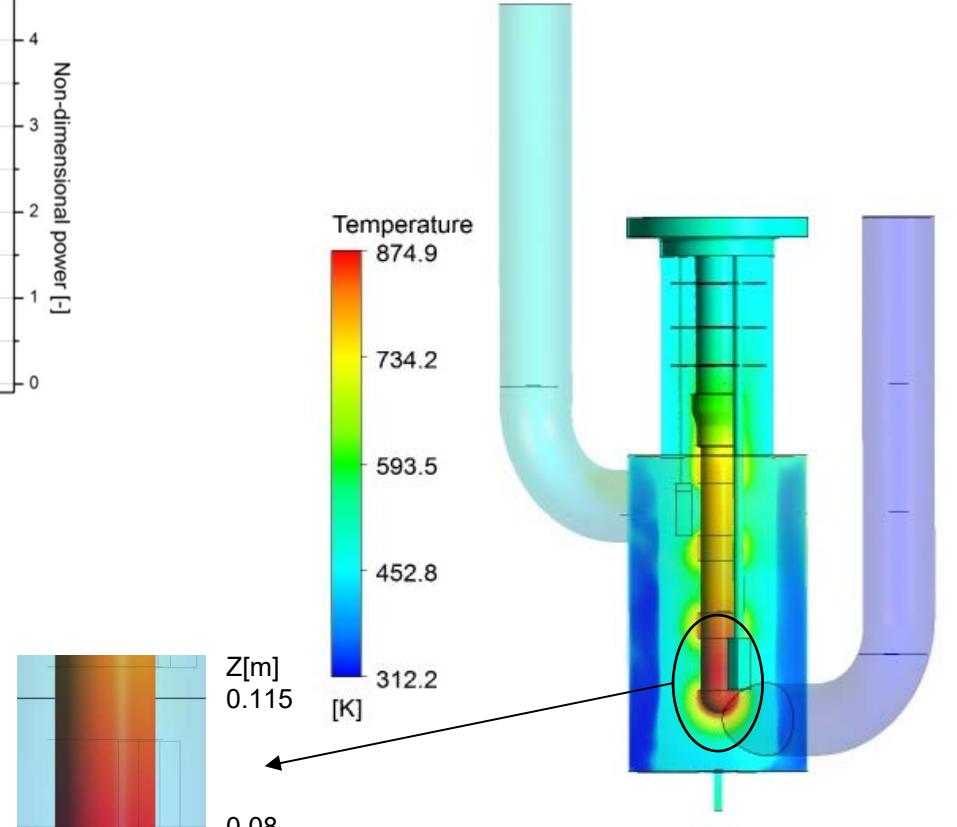

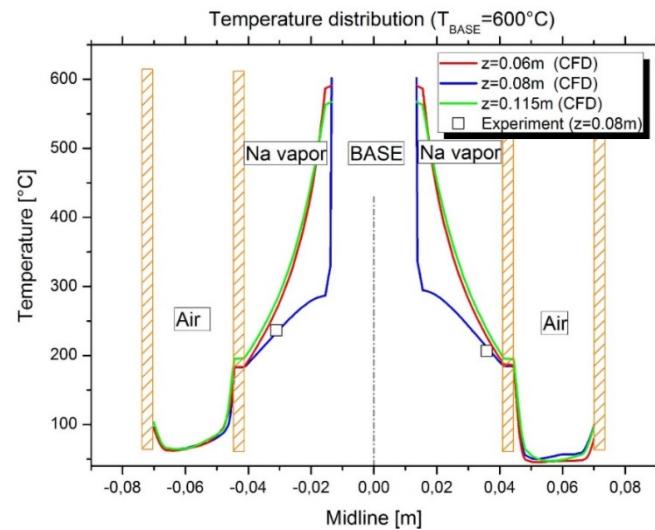

* N. Diez., PhD Thesis, 2013

ATEFA – Experimental and numerical data

AMTEC characteristic line

$T_{base} = 600^\circ\text{C}$

* A. Onea, PAMIR 11, 2010

Experimental tests of Na transport by capillarity

- Test of passive sodium transport in porous structures by capillarity
- Sample: powder sintered stainless steel (AISI 316L)
 - Porosity: 42 %
 - Pores: 20µm
 - 2 samples: 70 x 10 mm²

Experimental mockup

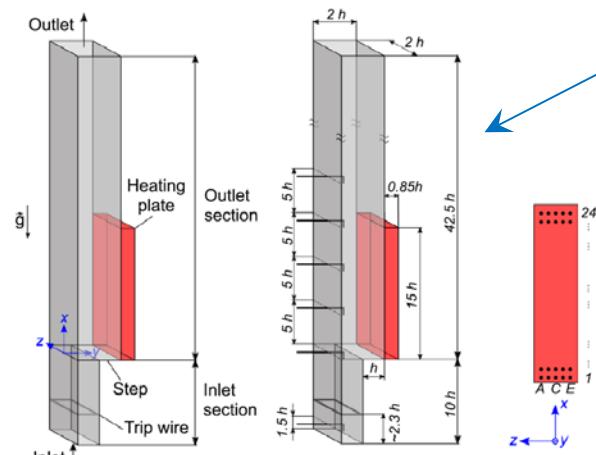

Sample before (left) and after (right) insertion in hot Na bath

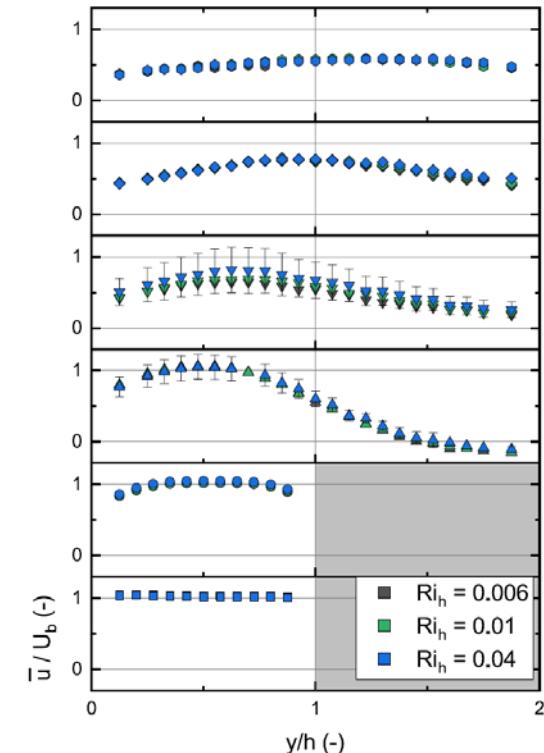

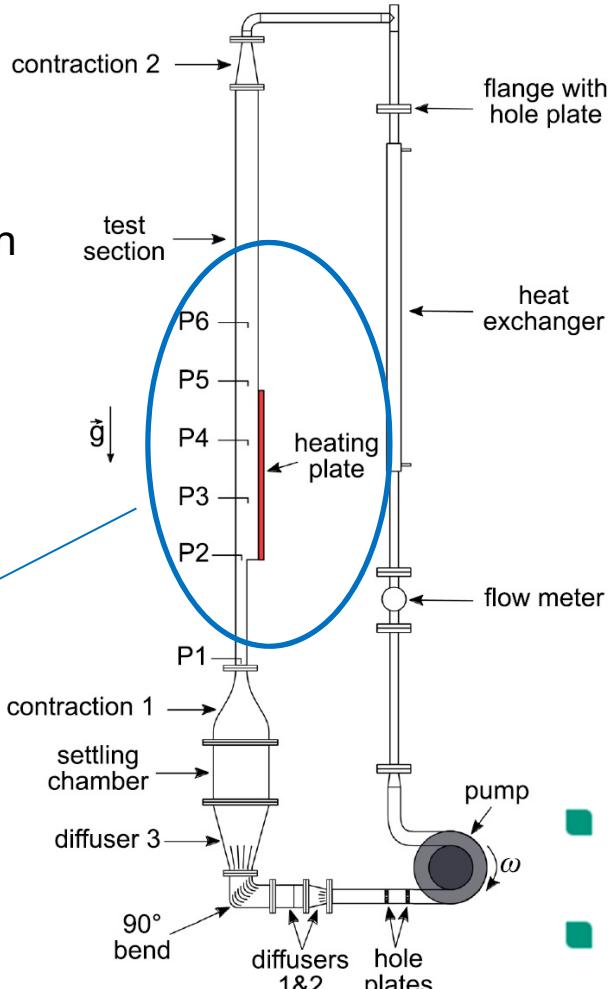

Mass [g]	Sample with inner TE channel	Sample without inner channel
Before experiment	58.87	57.712
After experiment	62.418	61.532
Mass gain	3.55 (~80% filling)	3.82 (~84% filling)

DITEFA *

- Test of backward facing step geometry
- Fluid: eutectic alloy GaInSn ($\text{Pr} \sim 0.03$)
- Forced and mixed convection regimes ($Ri_h < 0.3$)
- $Re: 3800-76000$
- $Ri_h: 0.0028 - 1.14$

Backward facing step test section

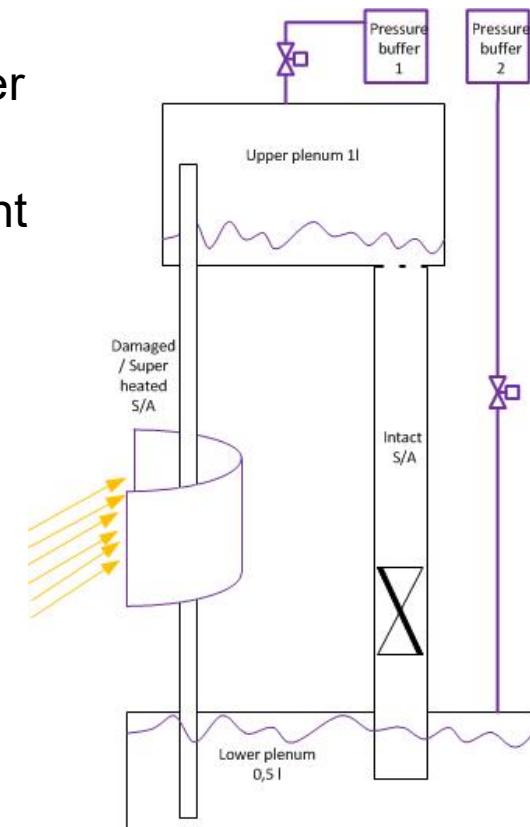

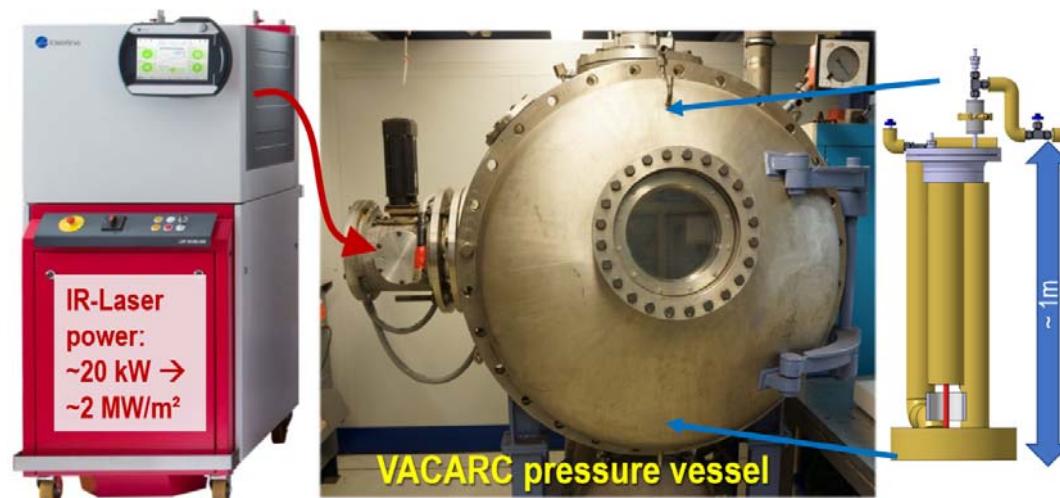

Vel. distribution $Re \sim 20000$

- Re independent vel. profiles ($10000 \leq Re_h \leq 30000$)
- Qualification of new permanent magnet probes

* Th. Schaub, Exp. Fluids, 2021

KARIFA – Karlsruhe Receiver test Facility

- Local Na boiling and dry-out experiments in single tubes
 - Detection of bubble formation & movement
 - Bubble collapse in upper plenum
 - Qualification of materials/components under power densities of 0,5 – 3 MW/m²
 - Heat pipe tests for DEMO divertor cooling segment
- 20 kW IR-laser beam

Conclusions

- KASOLA family -> large spectrum of sodium facilities to cover applications from basic physics (few liter Na) up to medium scale demonstrators (tonnes of Na)
- Wide temperature range, from RT (GaInSn) up to $\sim 1000^{\circ}\text{C}$ (Na)
- KASOLA facility ready for component tests with respect to core safety (flow transitions, passive shut down system)
- DITEFA and ATEFA adequate for education & training
- Robust safety concept, proven during last years of operation with no incident to be reported
- Successful qualification of new instrumentation sensor developed to measure turbulence quantities
- Code family used: TRACE, SAS-SFR, ANSYS CFX

Thank you for your attention!
