## DECLARATION

I declare that this thesis entitled “Parameter Tuning of Sliding Mode Controller using Multi-Objective Particle Swarm Optimization in Electro-Hydraulic Actuator System” is the result of my own research except as cited in the references. The thesis has not been accepted for any degree and is not concurrently submitted in the candidature of any other degree.

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

## APPROVAL

I hereby declare that I have read this thesis and in my opinion this thesis is sufficient in terms of scope and quality for the award of Master of Science in Electrical Engineering.

Signature : .....

Supervisor's Name : Associate Professor Dr. Rozaimi Ghazali

Date : .....

اونيورسيتي تيكنيكل مليسيا ملاك

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

## DEDICATION

To my supervisors,

Associate Professor Dr. Rozaimi Ghazali  
Associate Professor Dr. Chong Shin Horng

To my beloved father and mother  
Mr. Chai Ah Min and Mrs. Jong Nyong Kian

To my supportive siblings,  
Chai Tsae Nyuk, Jonathan Lee Sze Chun  
Chai Lien Chiew  
Chai Cheen Shun

To all my lab mates and friends,

Lastly, to all the people who have helped me throughout the journey.

I would not have finished this project without all of you.

Thank you for all the supports and love.

UNIVERSITI TEKNIKAL MALAYSIA MELAKA

## ABSTRACT

Electro-Hydraulic Actuator (EHA) system is very popular and widely applied in the modern industry applications. This is because of its advantages on the high force to weight ratio, accurate positioning with fast motion and capability in generating large torque. Due to its increasing trends in modern applications, the research to control the EHA system has attract the attentions of many researchers around the world. However, the nonlinear characteristics in the dynamics of the EHA system such as internal leakage have make it difficult to control and hard to produce an accurate output such as position, force, and speed that are required in different applications. Internal leakage existed in the servo valve can degrade the overall performance of the EHA system. Commonly, a control system either open-loop or closed-loop is the key to overcome the aforementioned issue, where researchers had proposed many types of control strategies across the years ranging from classical to advanced controller to control the nonlinear EHA system so that it can suit into different industry applications. In this research, Sliding Mode Controller (SMC) is designed and proposed for the positioning control of the established EHA system. To obtain the optimum performance of the EHA system, Multi-Objective Particle Swarm Optimization (MOPSO) is implemented to the SMC to achieve the highest position output performance with least overshoot and steady-state error. In order to verify the effectiveness of the proposed SMC with MOPSO strategy, comparison study has been implemented to Proportional Integral Derivative (PID) and SMC controllers with conventional Particle Swarm Optimization (PSO) technique. The simulation results show that the proposed control strategy is able to improve the overshoot percentage of the EHA system by 99.78% and 99.64% as compared to the PSO-PID controller and PSO-SMC respectively. Robustness tests show the proposed control strategy achieved least overshoot percentage in all simulation case studies including the mass, pressure and internal leakage variations.

**PENALAAAN PARAMETER PENGAWAL RAGAM GELANGSAR  
MENGUNAKAN PENGOPTIMUMAN PENGUMPULAN ZARAH PELBAGAI  
OBJEKTIF DI DALAM SISTEM PENGGERAK ELEKTRO-HIDRAULIK**

**ABSTRAK**

*Sistem Penggerak Elektro-Hidraulik (EHA) sangat popular dan banyak digunakan dalam aplikasi industri moden. Ini kerana kelebihannya pada nisbah daya tinggi kepada berat, kedudukan yang tepat dengan gerakan pantas dan keupayaan dalam menghasilkan daya kilas yang besar. Oleh kerana aliran dalam aplikasi moden yang semakin meningkat, penyelidikan untuk mengawal sistem EHA telah menarik perhatian banyak penyelidik di seluruh dunia. Walau bagaimanapun, ciri-ciri tidak lurus dalam dinamik sistem EHA seperti kebocoran dalaman menjadikannya sukar dikawal dan sukar menghasilkan keluaran yang tepat seperti kedudukan, daya, dan kelajuan yang diperlukan dalam aplikasi yang berbeza. Kebocoran dalaman yang terdapat pada injap servo dapat menurunkan prestasi keseluruhan sistem EHA. Pada kebiasaannya, sistem kawalan sama ada gelung terbuka atau gelung tertutup adalah kunci untuk mengatasi masalah yang disebutkan di atas, di mana para penyelidik telah mencadangkan banyak jenis strategi kawalan selama bertahun-tahun dari pengawal klasik hingga lanjutan untuk mengawal sistem EHA yang tidak lurus supaya sesuai digunakan dalam aplikasi industri yang berbeza. Dalam penyelidikan ini, Pengawal Ragam Gelangsar (SMC) telah direkabentuk dan dicadangkan untuk mengawal kedudukan sistem EHA yang telah dibangunkan. Untuk mendapatkan prestasi sistem EHA yang optimum, Pengoptimuman Pengumpulan Zarah Pelbagai Objektif (MOPSO) telah dilaksanakan kepada SMC untuk mencapai prestasi yang tertinggi dengan peratusan terlajak dan ralat keadaan mantap yang paling rendah. Untuk mengesahkan keberkesanan SMC yang dicadangkan dengan strategi MOPSO, kajian perbandingan telah dilaksanakan kepada Pengawal Kadaran-Kamiran-Terbitan (PID) dan SMC dengan teknik Pengoptimuman Pengumpulan Zarah (PSO) konvensional. Hasil simulasi menunjukkan bahawa strategi kawalan yang dicadangkan dapat menambahbaikkan peratusan terlajak sistem EHA sebanyak 99.78% dan 99.64% berbanding pengawal PSO-PID dan PSO-SMC. Ujian ketegapan menunjukkan strategi kawalan yang dicadangkan telah mencapai peratusan terlajak yang paling sedikit dalam semua kes kajian simulasi termasuk variasi jisim, tekanan dan kebocoran dalaman.*

## ACKNOWLEDGEMENTS

First and foremost, I would like to take this opportunity to express my most sincere acknowledgement to my supervisor, Assoc. Prof. Dr. Rozaimi bin Ghazali for his essential supervision, support and encouragement towards the completion of this research and thesis. Not forgotten, my deepest gratitude to my co-supervisor, Assoc. Prof. Dr. Chong Shin Horng for her advice and suggestions during the research. All their guidances and recommendations have provided me with an insightful view of the development of this study.

Special thanks to Fundamental Research Grant Scheme (FRGS) Grant No: FRGS/1/2017/TK04/FKE-CeRIA/F00333, Centre for Robotics and Industrial Automation (CeRIA), and Ministry of Higher Education (MOHE) for the financial and technical supports. Particularly, I would like to express my greatest gratitude to my fellow research members: Mr. Chong Chee Soon, Mr. Keek Joe Siang, Mr. James Too Jing Wei, technicians: Mr. Syed Aliff bin Syed Ariffin, Mr. Mohd Syakrani bin Akhbar, senior officers: Mdm. Normalisza Binti Mustapa, Mdm. Norizah Binti Mat, and Mdm. Nur Hasriha Binti Mohamad for their kindy assistances and efforts in all the laboratory and analysis works towards the completion of this research.

Finally, special thanks to my beloved father, mother, and all my siblings for their moral and financial support in completing this master degree. Lastly, thank you to everyone who had been associated directly or indirectly through the journey to get the award of Master of Science in Electrical Engineering.

## LIST OF SYMBOLS

$A_n, B_n, C_n$	–	Nominal system parameters obtained from the system identification
$A_p$	–	Difference between the piston rod area and the piston area
$B_L$	–	Viscous damping ratio
$B_m$	–	Bulk modulus
$c1, c2$	–	Acceleration constants
$dim$	–	Number of the dimensions
$e$	–	Error of the EHA system
$F$	–	Force produce by the piston in the electrohydraulic cylinder
$G_{BEST}$	–	Global best
$I$	–	Current
$IAE$	–	Integral Absolute Error
$iter$	–	Current iteration
$K$	–	Gain of the servo valve
$k$	–	Leakage coefficient
$K_{ex}$	–	Exterior leak coefficient
$K_{in}$	–	Interior leak coefficient
$K_L$	–	Stiffness of the spring
$k_s$	–	Positive constant
$lb$	–	Lower boundary of the searching space
$L_{sv}$	–	Inductance of the servo valve coil

$maxiter$	–	Total number of the iteration
$M_L$	–	Mass of the load
$N$	–	Number of random particles
$n$	–	Order of the EHA system
$OS$	–	Overshoot Percentage
$P_A$	–	Pressure in chamber A
$P_B$	–	Pressure in chamber B
$P_{BEST}$	–	Personal best
$P_R$	–	Tank way pressure
$P_S$	–	Pump pressure
$q_a$	–	Exterior leaking flow rate in the hydraulic cylinder
$Q_A$	–	Volume flow rate of the hydraulic fluid from the electrohydraulic servo valve to the electrohydraulic cylinder
$q_{ab}$	–	Interior leaking flow rate in the hydraulic cylinder
$q_b$	–	Exterior leaking flow rate in the hydraulic cylinder
$Q_B$	–	Volume flow rate of the hydraulic fluid from the electrohydraulic cylinder back to the electrohydraulic servo valve
$q_{ba}$	–	Interior leaking flow rate in the hydraulic cylinder
$rand$	–	Random number between 0 and 1 generated by using MATLAB
$R_{sv}$	–	Resistance of the servo valve coil
$s$	–	Sliding surface of the sliding mode controller
$u$	–	Voltage
$ub$	–	Upper boundary of the searching space
$u_{eq}$	–	SMC switching control signal
$u_{smc}$	–	SMC control signal

$u_{sw}$	–	SMC equivalent control signal
$V$	–	Current velocity of the particles
$V_A$	–	Volume of the hydraulic fluid in chamber A
$V_B$	–	Volume of the hydraulic fluid in chamber B
$V_{line}$	–	Volume of the pipeline
$V_{new}$	–	Updated velocity of the particles
$w$	–	Inertia weight
$w_{max}$	–	Upper limit for the inertia weight
$w_{min}$	–	Lower limit for the inertia weight
$X$	–	Population of particles
$x_0$	–	Flow rate of the hydraulic fluid leakage in a leaking electrohydraulic servo valve
$X_{new}$	–	Updated position of the particles
$x_p$	–	Displacement of the piston in the hydraulic cylinder
$x_r$	–	Desired piston displacement
$x_s$	–	Total stroke of the hydraulic cylinder
$x_{sv}$	–	Spool displacement of the servo valve coil
$\alpha$	–	Weight combination between two objective functions
$\beta$	–	Weight combination between two objective functions
$\lambda$	–	Positive constant
$\xi_{sv}$	–	Damping ratio of the servo valve coil
$\varphi$	–	Boundary of the hyperbolic tangent function
$\omega_{sv}$	–	Natural frequency of the servo valve coil

# CHAPTER 1

## INTRODUCTION

### 1.1 Introduction to electro-hydraulic actuator system

The word “hydraulics” originates from the Greek word (hydraulikos), which means the study of liquids at rest and in motion (Das et al., 2013). A hydraulic system is a technology that converts the pressurized fluid into kinetic energy and produces a motion such as pushing, pressing, clamping and lifting. Electro-Hydraulic Actuator (EHA) system is a combination of the hydraulic system and the electrical system. The pressurized fluid flows from the pump to the electro-hydraulic servo valve, which controlled using the electrical signal and then to the hydraulic cylinder to produce the necessary movement designed by the engineer.

EHA system involves in most science and engineering disciplines due to its advantages over other actuators such as pneumatic and an electric motor which have the same function. Truong et al. (2019) emphasized that the electro-hydraulic actuator system is a good choice to replace both electric and pneumatic actuators due to its high stiffness and high power to weight ratio. The EHA system can produce large torque and force output which has been proven by a French mathematician Blaise Pascal using Pascal’s law. The high power to weight ratio in a hydraulic system has made it played an indispensable role in this modern era of advanced technology.

Recently, it was reported that the global hydraulic cylinder market size was valued at USD 13.4 Billion in 2020 and is expected growth to USD 15.8 Billion by 2025

(MarketsandMarkets, 2020). It shows that the EHA system is widely implemented in various applications and has huge potential in the future.

The exclusive elements and advantages in EHA system have made it very popular in many advanced technology applications (Guo et al., 2015a; Shen et al., 2019), such as manufacturing industries, robotic manipulator, aerospace technologies, construction vehicles and medical applications (Yoon et al., 2019).

In manufacturing industries, the EHA system is used to perform heavy-duty machinery works such as bending, clamping, pressing, and lifting. Salloom and Abdulqader (2016) have implemented the EHA system in a hydraulic press for different thickness of copper alloy. In automotive industries, Yoon and Sun (2016) applied the EHA system in a camless engine valve actuator. Another study on active car suspension by Wang et al. (2017a) applied the EHA system in the car suspension system to transmit the torque and force between the frame and wheel.

In recent aerospace technology, almost all aircraft uses the fly-by-wire in their flight control system. The pilot sends electrical signals through the flight control system to the hydraulic actuators to move the respective part of the aircraft such as rudders and the ailerons (Garg et al., 2013). An electro-hydraulic control loading system of a flight simulator is proposed to guarantee robust stability and improve the force tracking accuracy (Zhao et al., 2016). Another study on robotic manipulators, EHA has been applied in robotic manipulator joints to perform different tasks such as push recovery and stair climbing (Semini et al., 2017).

Furthermore, Wang et al. (2018b) proposed a novel electro-hydraulic flow matching (EHFM) steering system into wheel loader to reduce the energy consumption of the load sensing system. A similar application in construction vehicle by Ge et al. (2017), EHA is applied in a hydraulic excavator. The energy consumption characteristic of the electro-
