1990 Fiscal Year Final Research Report Summary

The Sensitivity Test for Human Urinary Tract Malignancies Making of use of the Chick Embryo Method using Chorioallantoic Membrane

Research Project

Project/Area Number

01570882

Research Category

Grant-in-Aid for General Scientific Research (C)

Allocation Type

Single-year Grants

Research Field

Urology

Research Institution

Kanazawa university

Principal Investigator

UCHIBAYASHI Tadao Kanazawa University Department of Urology, 医学部・附属病院, 講師 (90151894)

Co-Investigator(Kenkyū-buntansha)

UEKI Osamu Kanazawa University Department of Urology, 医学部附属病院, 助手 (10223447)

Project Period (FY)

1989 - 1990

Keywords

Sensitivity test / Urinary tract malignancies / Chick embryo method / MTT method / Molecular biology

Research Abstract

In sensitivity tests of chemotherapy alone, hyperthermia alone, or a combination of the two against human urinary tract malignancies making use of the chick embryo method using chorioallantoic membrane, measurement of the weight of the tumor mass was considered to be an effective method of evaluating the antitumor effect. However, in cases in which a large part of the tumor is necrotic, this evaluation method did not provide reliable results. At present, using the the MTT method, more accurate quantitative results have been obtained. As a sensitivity test for metastatic tumors using continuously cultured cell lines, DNA is extracted from the metastatic organs of a fertilized chick embryo, specific DNA amplification and immuno-electro-phoresis are performed, and the DNA content is measured. By this method, it was shown that is possible to quantitatively evaluate the anti-tumor effect of various treatment methods.
