1.-Introduction and justification

In May 2009 we started with an exciting new avenue in our population study of Black-tailed godwits *Limosa limosa limosa*: satellite transmitters were implanted in 15 godwits that were breeding in SW Fryslân, allowing us follow these individuals during their journeys from the Dutch breeding grounds to their wintering areas in West Africa and probably South Iberia. Black-tailed Godwits are long distance migrants that are thought to be able to cover the 5000 km stretch to West Africa in one flight. To achieve this performance, aerodynamics of the body is probably important and therefore we assessed that supplying them with a GPS-backpack would be too costly in terms of energy expenditure. Implanting transmitters might tackle this problem and could be a good alternative for a middle-sized wader as has been shown before in Bar-tailed godwits, crossing the Pacific with internal transmitters. The American team that carried out this project was invited to come over last year to do the same in our birds.

The first of 15 tagged birds migrated south in the first week of June but the majority departed between 15 and 26 June and the last bird left The Netherlands only in the beginning of August. Migration patterns differed a lot between individuals. Three individuals went straight

from The Netherlands to West-Africa in approximately 3,5 days at an average speed of about 70 km/h. Four made a short 8-10 days stopover in the Mediterranean before moving on. One individual stayed there for a month but at least 3 godwits did not migrate to Africa at all! We found out though that these individuals were not as exceptional as one might suspect since a count in Doñana (NP) in southern Spain revealed more than 8000 birds by the end of November.

Figure 1: Migration patterns of all 15 individuals

2.-Specific aims

The aim of this project is to gain better insight in flyway and stop-over sites (France, Iberia) of this endangered migratory meadow bird species and to establish if and in what numbers Black-tailed Godwits winter in Doñana. The satellite tagging in 2009 and five years of winter counts has learnt us that Black-tailed Godwit (BTG) do winter in S-Iberia but we have no clue to what extent. Counts in November 2009 in Doñana showed that up to at least 14.500 BTG might be present at time but we think that they will be a mix of the *islandica* and *limosa* subspecies. Since quite a lot of birds from both subspecies have been colour ringed in the last decade, it should be possible to answer this question by ring readings of colour marked Black-tailed Godwit.

3.-Potential contributions of this project to nature conservation

The Black-Tailed Godwit has a widespread but discontinuous distribution in the Palaearctic, extending from Iceland across northern Europe to western Siberia. In Europe the most important breeding range is from The Netherlands to Russia (van de Kam et al., 2004). The species increased during the 20th century through Europe, but in recent decades it is suffering a strong population decline and has been classified as Near-threatened by the UICN Red List of Threatened Species (UICN 2008). There are three subspecies described (Höglund *et al.* 2009), but only two occur in Europe. *Limosa limosa limosa* the nominate race is breeding from Western Europe to central Asia and Russia and *L. l. islandica* breeds mainly in Iceland. *Limosa l. melanuroides* breeds in Asia east of the Ob River. The Western European population of the nominate race mainly winters in freshwater habitats (especially rice fields) in West Africa and in Iberia, and the *islandica* subspecies winters in coastal wetlands in Western Europe as far south as Iberia and Morocco. Both subspecies have widely diverging population trajectories. The nominate race in Western Europe shows a steep decline in the last decades (Gill *et al.* 2007). By contrast, the Icelandic population *L. l. islandica* did increase in the same time period (Gunnarsson *et al.* 2005). From yearly censuses in Doñana National and Natural Park (Figure 2; <http://www-rbd.ebd.csic.es/Seguimiento/mediobiologico.htm>) it is known that at least 45.000 individuals stop in Doñana for feeding and resting, but also there are individuals spending the winter as we know from satellite-tagged individuals (RUG, unpubl. data). There is information about the other stopover areas in Iberia e.g. the Tagus and Sado estuaries (Portugal) and in the Extremadura (Spain) (Groen *et al.* 2006, Kuijper *et al.* 2006, Lourenço *et al.* 2010a, b, c), but there is a lack of information about how many individuals of the nominate race stop in Doñana and which habitat type they use.

Our main question: Is Doñana a stop-over site for migrating Black-tailed Godwits on their way to West Africa or is it a wintering terminal? This survey will give us the significance of Doñana on the migratory flyway of Black-tailed Godwit and will provide essential information for the conservation plan of this threatened species in Europe.

Endless ricefields at Isla Major but no Black-tailed Godwits foraging on the ploughed fields by the end of November 2010.

4.- Fieldwork report

17 November 2010

Weather: rain till 15.00, no wind, 15°C, moderate visibility.

We were based at Huerta Tejada, about 10 km west of Isla Mayor, a field station of Estación Biológica de Doñana in the middle of the Coto de Doñana Natural Park.

In the morning we visited the area around the field station, along the road to the Jose Antonio Valverde visitor centre and headed north on the banks of the salt marsh of Caño del Guadiamar. The saltmarshes along the road to the visitor centre were dried out and we saw no waders but the Caño del Guadiamar held water but no godwits were present although 3000 godwits should have been present in October. The few rice fields we saw inland were ideal for godwits: ploughed and with shallow water but again no godwits.

In the afternoon we visited the rice fields south of Isla Mayor and the Cantarita rice fields. There were plenty of good rice fields and some were ploughed the very moment when we were there. Despite that and the fact that hunting raptors were abundant and were disturbing large flocks of ducks and other waders (mainly Dunlin) we saw no godwits. Even though we had to stick to the main tracks in the rice fields, we were pretty confident that we did not overlook any large flocks, if they would have been present.

18 November 2010

Weather: sunny all day, 18° C, good visibility.

In the morning we visited the lagoon SE of El Rocío. There was a group of 100 BTG present, foraging in shallow water. Most of them were too far away to see any colour rings but a small group was foraging close to the road. In this group we saw a ringed bird, with a year class ring from 2006, ringed in SW Friesland, The Netherlands.

In the afternoon we went to the Odiel Marshes near Huelva, a complex of salt pans and salt marshes. When we arrived it was high tide and hardly any waders could be seen from the main road. We went all the way to the tip of the peninsula and on the way back the water had dropped and several wader species were seen but no Black-tailed Godwits.

On the way back to Huerta Tejada we visited again the lagoon at El Rocío. There were still about 100 godwits present and we managed to find 2 colour ringed birds from Friesland, The Netherlands. Unfortunately it was getting dark before we could read the full combination.

The lagoon of El Rocio, many waders but only a hundred Black- tailed Godwits

19 November 2010

Weather: cloudy in morning, in afternoon sunny and 18° C, good visibility but heat haze

We visited the Veta la Palma fish farm all day with Ruben Rodriguez and Jose Luis Arroyo of the Monitoring group in Doñana Reserve. We readily found a flock of 800 and later several big flocks mounting up to 15.000 birds in total, staying in belly-deep water most of the time in dense flocks. The majority of these birds was in 1 big fish pond of about 800 x 1200 m.

Godwits were all day in dense flocks in large ponds at the fish farm

Occasionally they made short flights and started foraging for several hours. Birds seemed to look for prey in the top layer of the mud. We could not see where they foraged on but they appeared to be quite successful. The nearby rice fields seemed to be perfect for foraging too but on the way to and out of the fish farm we did not see any birds on these fields nor any flocks coming in or going out of the fish farm. We therefore think they might stay all day in the fish farm ponds and mud flats. Foraging birds gave us the opportunity to check them for colour rings. At the end of the day we had managed to read 15 individual colour codes: 12 of them were from the University of Groningen program (the Netherlands), 1 probably from an other “old” Dutch scheme and 2 birds from the French scheme (La Rochelle University). This suggests that the majority of these birds will be of the *limosa* nominate subspecies. One of the birds was seen in 2005 in December in Donana as well. Two other birds made long stopovers in Algarve, Portugal till the end of the September. It could be that these birds move to Donana in autumn to winter.

20 November 2010

Weather: rainy till 16.00, clouded, poor visibility during heavy rain

Today we checked Veta la Palma again with Jordi Figuerola of the EBD. The same flock of BTG was still present at the same location but much closer and in shallow water. In the afternoon a part of the flock moved to the neighbouring pond. Therefore we could read a lot of colour rings, including 39 from the RUG program and more than 10 of other programs, including the French, Extremadura and German scheme. Like yesterday all colour ringed birds were probably of the nominate race although we saw 1 islandica male, still in full breeding plumage. Birds were foraging and resting as described yesterday. Veta la Palma is a private area and birds are not disturbed by farmers or hunters and shallow water is always available and predictable, unlike the natural ponds and salt marshes in Doñana NP where water is scarce in dry winters.

21 November 2010

Weather: sunny, 16° C, windy, good visibility

In the morning we checked Dehesa de Abajo, a reserve just north of Donana where godwits and ruffs are seen in late summer. No godwits were found today but big numbers of Avocets and stilts were present. In the afternoon we went back to Veta la Palma and found at least 20 new colour-ringed godwits. Birds were still at the same location (gabeta G3 and G4) in the same numbers. No obvious islandica birds were found. Although we stayed till dusk, we did not see any birds arriving or leaving, suggesting that the birds spend all day in the same ponds for foraging and roosting.

22 November 2010

Weather: sunny, 19° C, good visibility

We were this morning at the Marismas del Odiel in Huelva again. There we met Jose M. Sayago, ornithologist at this protected site that took us around the Reserve and showed us where the godwits normally are. Although we checked the entire area, we only found 5 BTG. Sayago explained us that a few days ago one of the dikes broke through and the level of the water was now too high for BTG and others waders. He told us that normally at this time of the year 2.500 BTG are present in this area. Afterwards we went to the Lagoons close to Palos de la Frontera in the Entero Domingo Rubio, where BTG and others waders are normally present in July and August. However, the level of the water was here too high as well. Sayago was very

cooperative and is going to send us colour ring observations in the future. On the way back, we checked the Rocio Lagoon again. We found 75 BTG but no colour rings.

Salt is an important product from the Marismas the Odiel

23 November 2010

Weather: grey, clouded, 12° C, raining after 14:00, at 16:00 end because of poor visibility we stopped monitoring.

Today we went to Veta la Palma again. We found a big flock close to the road and we had plenty opportunity to read rings. We managed to read 41 combinations but had to stop around 16:00 because of the rain. Despite that, we found today another 15 new birds of the RUG program adding up to 76 individuals in total. Given the fact that we find so many new birds every day, we may conclude that we still have not seen all colour ringed birds in this flock.

24 November 2010

Weather: very foggy, no visibility, 17° C

Due to the fog we could not do any observations on godwits today.

5.-Results and Conclusions

During our expedition to Donana NP, we found Black-tailed Godwits at 2 locations: the lagoon east of El Rocío and the Veta la Palma fish farm south of Isla Mayor. At El Rocío we never saw more than 100 birds but at Veta la Palma, there was a flock of about 15000 birds constantly present. These birds only used a very small part of this immense fish pond complex, and mainly stayed all day in an area of 800 x 2500 m. During the day they spent several hours foraging and seemed to be quite successful although we could not find out where they were feeding on.

We tried to approach the birds with care to get close enough to read the colour rings. Sometimes birds were up to their belly in the water but if they were foraging we could most of the time check the legs for rings. In total, we managed to read 140 colour ring combinations of 109 different individuals of 5 different schemes (Table 1).

We also took samples to estimate the colour ring density and found out that 1 in every 110 birds was colour ringed (n=4969 birds checked for rings). Based on these sightings we can conclude that only Black-tailed Godwits of the *limosa* subspecies were present at our study site and no individuals (or only very small numbers) of the *islandica* subspecies. In the appendix you can find the life histories of all birds of the RUG scheme. We will send the observations of the birds of the other schemes to the coordinators of these projects.

Scheme	Country	Number of individuals	Number of sightings
University of Groningen	Netherlands	76	101
University of Badajoz	Spain	6	6
NABU	Germany	2	2
Wageningen University	Netherlands	7	8
La Rochelle University	France	18	23
Total		109	140

Table 1: *Number of sightings and individuals per scheme*

On the basis of the sightings we only found the nominate species *limosa*. This is very intriguing because in November they are supposed to winter in West-Africa (Zwarts et al., 2009). Although there was some evidence, based on colour ring observations, that some birds might spend the winter in southern Iberia, the numbers we found in Donana represent, as far as

we know, the largest winter concentration of the nominate subspecies ever recorded in Europe. We did expect to find a majority of the *islandica* subspecies, because they are known to winter in Iberia in salt marshes and saltpans (Alves et al., 2010), whereas the nominate normally prefers fresh water. The fact that approximately 10 % of the NW European population might winter in Europe has implications for the protection of this vulnerable species. It would be very interesting to figure out if there are differences in annual survival, timing of migration and breeding success of birds staying in Europe and Africa. One can easily imagine that flying all the way to Africa involves more risks (like hunting, diseases, high energy expenditure) than staying half way on the wintering route in a well protected area as Coto Doñana with colder winters.

From December onwards, birds start returning from Africa and the maximum is reached in December (Fig. 2 <http://www-rbd.ebd.csic.es/Seguimiento/mediobiologico.htm>). It is very well possible that at other times of the year a mix of both the nominate and the *islandica* subspecies is present but that would be an interesting topic for future research as well.

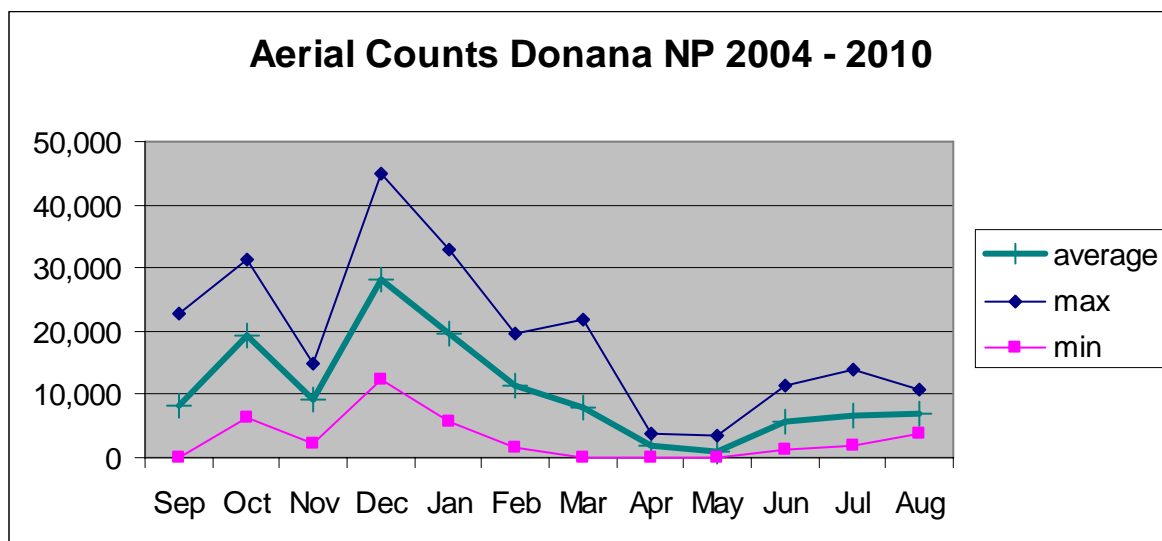

Figure 2: Aerial counts of Black-tailed godwits in Coto Donana 2004-2010. (<http://www-rbd.ebd.csic.es/Seguimiento/mediobiologico.htm>)

5.-Acknowledgements

We would like to thank our colleagues of the Estacion Biologica Donana for their permission to do research on Black-tailed Godwit in Veta de la Palma and other parts of the national and natural park. We also thank them and the people at Huerta Tejada for their hospitality and the use of the accommodation. In particular thanks to Jordi Figuerola, José Luis

Arroyo, Rubén Rodríguez for guiding us at Veta la Palma and the staff of the fish farm at Veta la Palma for allowing us to do our research; thanks to José Manuel Sayago for showing us the Marismas del Odiel. We are grateful to Mr. Paul Cook for his financial support and the Global Flyway Network and University of Groningen for their support to organize this expedition.
