13 **Abstract**  
14  
15

16 **Purpose:** Because food waste is a serious problem today, society is currently aiming for  
17 more responsible consumption to minimize it, as defined in the 12<sup>th</sup> goal of the United  
18 Nations Sustainable Development Goals. This study examines whether an informative  
19 initiative can help to raise university students' awareness of food waste consequences.  
20  
21  
22

23 **Design/methodology/approach:** The initiative consisted of explaining the problem of  
24 food waste to students of two marketing subject modules within Economics and Business  
25 Administration degrees, and asking them to participate in an activity in which they  
26 analyzed their own behavior. To assess its impact, two questionnaires about the students'  
27 food waste behaviors were administered, before and after the initiative, adopting an  
28 experimental design.  
29  
30  
31  
32

33 **Findings:** The results show that the information and awareness activities were successful,  
34 since, after the initiative, the students were more aware about the food waste problem and  
35 its consequences and were more critical of their behavior regarding the management of  
36 leftovers at home.  
37  
38  
39

40 **Research limitations/implications:** In spite of some circumstances under which the  
41 study was conducted (the COVID-19 pandemic and the lockdown), the practical and  
42 social implications are relevant.  
43  
44

45 **Practical implications:** This study offers some interesting practical implications for  
46 educational institutions that want to inform and train students in more responsible  
47 consumption behavior. It shows that an initiative in which students are involved, like  
48 collecting data about food waste, in their homes with a diary, and informative sessions  
49 can be useful to increase students' awareness of food waste to behave in a more  
50 sustainable way.  
51  
52  
53  
54

55 **Social Implications:** These findings may be of interest to academics for designing  
56 initiatives that try to train and educate young people in making more responsible personal  
57 and professional decisions.  
58  
59  
60

**Originality/value:** The study analyzes the impact of an awareness-raising initiative about food waste in higher education, which is a relatively neglected topic in the literature.

**Keywords:** Food waste initiative, Sustainable Development Goals, Social marketing, Awareness activities, Higher education.

## 1. Introduction

Universities should help society to face the challenges of more responsible use of available resources, more effective waste management, and greater respect for the natural environment. This contribution forms part of one of the United Nations Sustainable Development Goals (SDGs, 12<sup>th</sup>) (United Nations, 2020). Therefore, the promotion of economic, social and environmental sustainability, including the reduction of food waste, should be one of the main functions of higher education (Sibbel, 2009).

Food waste is one of the environmental challenges to work on from university (Filho et al. 2021). Almost a third of the world's food production is wasted or lost along the supply chain, and most food waste occurs at the consumption stage. As a more fundamental solution to the problem of food waste, some studies have proposed initiatives to inform consumers and raise their awareness of more responsible management and handling of food (Young *et al.*, 2017; Principato *et al.*, 2015).

In this context, initiatives to curb food waste are abundant and varied, internationally, nationally and locally, and have been aimed at all segments of the population, including young people and students (Larrán et al., 2016). Some of these initiatives seek to encourage consumers to reuse and share leftovers (Morone et al., 2018) and consume only what is necessary (Kim et al., 2020; Young et al., 2018). Nevertheless, studies of the effectiveness of different preventive communication initiatives are scarce. This type of

1  
2  
3 information would be of great help in verifying the impact of these initiatives on  
4  
5 consumer behavior.  
6  
7

8 To reduce this gap, this paper analyzes the degree of success of an awareness-raising  
9  
10 initiative about food waste carried out with undergraduate students. It is important to  
11  
12 analyze the influence of this type of initiative on behavior, with young people in  
13  
14 particular, because although they tend to show high levels of environmental concern, they  
15  
16 tend to waste more food than older generations (Ilakovac *et al.*, 2020; Principato *et al.*,  
17  
18 2015). The university context is therefore ideal for the development of our activity and  
19  
20 the achievement of our objective, which is to answer the following research question:  
21  
22  
23

24  
25 **RQ:** Are university food waste initiatives a useful tool to raise the students' awareness  
26  
27 and change their behavior?  
28  
29

30 This paper contributes to deeper knowledge about the usefulness of informative nudges  
31  
32 for raising awareness about food waste, a relatively neglected topic in the academic  
33  
34 literature (Pinto *et al.*, 2018; Schanes *et al.*, 2018). It provides a good example of positive  
35  
36 action to address the important problem of food waste and the procedure of our initiative  
37  
38 can also contribute as a basis for the design of future academic interventions, combining  
39  
40 information activities about food waste and its consequences with key tips on how to  
41  
42 avoid it.  
43  
44  
45

46  
47 The study is structured in six sections. Section 2 justifies the importance of the chosen  
48  
49 topic in light of the scarcity of similar teaching initiatives in the literature. Section 3 sets  
50  
51 out the methodology used. Section 4 presents the results. And, sections 5 and 6 draw the  
52  
53 discussion, main implications and conclusions from the findings.  
54  
55  
56  
57  
58  
59  
60

## 2. Initiatives in Higher Education to Raise Awareness of Food Waste

Food waste has been defined as “*food loss that occurs in the retail and final consumption stages and its generation is related to the retailers and consumers’ behavior*” (Parfitt *et al.*, 2010, p. 3065).

Within these stages where food waste occurs, research indicates that young people contribute more to food waste than any other age group (Mallinson *et al.*, 2016; Principato, *et al.*, 2015). A study confirmed that young people (under 35 years) are among the consumer groups that waste the most food (MAPAMA, 2018). Given that young people will shape the future scenario on food waste, it is necessary to increase their awareness of more responsible behavior in that area.

The literature on food waste has become more prominent in the last two decades. Most studies have focused on analyzing consumers’ awareness of food waste and the factors that influence their behavior (Schanes *et al.*, 2018; Stancu *et al.*, 2016; Visschers *et al.*, 2016; Principato *et al.*, 2015). It has been observed that consumers are unaware of most of the consequences of food waste (Principato *et al.*, 2015); they underestimate the cost of wasting a lettuce leaf or a piece of meat because they place little value on food (Mallinson *et al.*, 2016). These findings have led to a particular emphasis on the need to raise young consumer awareness about the problem of food waste.

Relatively few initiatives have tried to promote more responsible behaviors in relation to food waste among students at different stages of education, especially in universities (Filho *et al.*, 2021; Feijoo and Moreira, 2020; Ahmed *et al.*, 2018; Maher and Burkhart, 2017). Within these institutions, there is concern about the prevention and reduction of food waste in their canteens. But greater involvement between students, staff and managers is needed to be able to curb food waste more effectively (Filho *et al.*, 2021).

1  
2  
3 In this context, Aschemann-Witzel et al. (2015) noted that it was difficult to find  
4 information on food waste initiatives that had been successful and that could serve as an  
5 example for the design of future initiatives. In this line, Kim et al. (2020) pointed out that  
6 the influence of food waste-related initiatives in consumer behavior should be measured.  
7  
8  
9

10  
11  
12 Thus, a food waste-related teaching initiative is successful when it achieves its aim, in  
13 this case, generating knowledge and awareness about the value of food and the  
14 consequences of its waste, prompting students to feel the need to change their behavior  
15 and to try to avoid food waste. In this sense, the field of social marketing could help  
16 achieve this goal, since it seeks to cause a change in students' behavior (Zamri *et al.*,  
17 2020), raising students' awareness of the food waste consequences and encouraging them  
18 to reduce the amount of food wasted.  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28

29  
30 Hübsher et al. (2021) reflect on the role of universities as social marketing partners,  
31 promoting changes in students' behavior so that they become agents that, in turn, cause  
32 sustainable social change. Balonas and Marques (2018), following the social marketing  
33 perspective, also present universities as the best place to stimulate reflection and action  
34 regarding food waste and sustainability.  
35  
36  
37  
38  
39  
40  
41

42 Thus, institutions that seek to reduce food waste should design awareness initiatives  
43 within an effective social marketing strategy for changing behaviors. Most institutional  
44 food waste initiatives are information-based interventions. However, Soma et al. (2021;  
45 2020), in their recent analysis of the range of formats used in such interventions, found  
46 that the best methods of increasing awareness involve combining food waste information  
47 campaigns with activities that include participants and engage them in a particular  
48 behavioral pattern.  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 In the context of higher education and food waste practices, previous research has  
4  
5 considered a number of teaching experiences aimed at increasing sustainable behaviors  
6  
7 and awareness among students, including lectures on theory, information sessions, guest  
8  
9 lectures, service learning, practical lessons, case study analysis and debates (Chiba *et al.*,  
10  
11 2021; Menon and Suresh, 2020). However, it is important to note that the level of these  
12  
13 experiences' success may vary depending on the context of study, that is, on the specific  
14  
15 awareness goal (Chiba *et al.*, 2021).  
16  
17  
18  
19

20 In the context of food waste, both information sessions and activities have been deployed  
21  
22 to increase students' awareness (Balonas and Marques, 2018; Ahmed *et al.*, 2018; Feijoo  
23  
24 and Moreira, 2020; Maher and Burkhart, 2017). When Ahmed *et al.* (2018) proposed the  
25  
26 inclusion of food waste reduction practices in the canteen of a US university, they  
27  
28 involved students in the monitoring of these practices and their results. The intervention  
29  
30 aimed to reduce food waste in the student canteen by tracking the problem, promoting  
31  
32 student awareness, and applying specific measures to resolve the problem. The  
33  
34 intervention was found to be effective in terms of the development of the students' critical  
35  
36 thinking. Pinto *et al.* (2018) showed that informing university students about waste in the  
37  
38 canteen could be enough to change their waste habits, albeit the results were modest. A  
39  
40 Spanish university conducted a project in which Chemical Engineering undergraduates  
41  
42 collected data about food waste behaviors in their households (Feijoo and Moreira, 2020).  
43  
44 Following the activity, the students reported greater awareness of food waste issues, and  
45  
46 approximately 60% of them perceived a change in their own consumption habits.  
47  
48  
49  
50  
51

52 The present study proposes a teaching initiative that includes several activities and  
53  
54 teaching tools: information sessions, challenges, and discussion sessions. Besides, two  
55  
56 questionnaires will measure whether these activities are useful to raise awareness and to  
57  
58  
59  
60

1  
2  
3 push a more sustainable behavior. In the next section, the teaching experience and its  
4  
5 measurement will be described in detail.  
6  
7

### 8 **3. Methodology**

9  
10  
11 Given the main objective of sensitizing university students to the importance of food and  
12  
13 the need to reduce food waste, we designed an information activity, including some  
14  
15 voluntary active participation from the students, to be embedded into two marketing  
16  
17 subject modules. Next, the activity, the questionnaire and the participants are described.  
18  
19

#### 20 **3.1 Design of the Initiative**

21  
22  
23 The initiative analyzed was part of a broader strategy to encourage responsible  
24  
25 consumption among 1<sup>st</sup> year students of a Business Administration degree and an  
26  
27 Economics degree. It included four activities and was implemented in two courses:  
28  
29 Introduction to Marketing (1<sup>st</sup> semester at Business Administration) and Fundamentals of  
30  
31 Marketing (2<sup>nd</sup> semester at Economics). The total number of students enrolled in these  
32  
33 courses was 468, distributed into three groups of such subjects. Table 1 describes the main  
34  
35 aspects of this context and offers an outline of the activities, included in the teaching  
36  
37 initiative, explained below.  
38  
39  
40  
41

42  
43 This initiative, in relation to responsible food consumption, was held in the practical  
44  
45 classes of the aforementioned subjects. In both subjects, the activities were carried out  
46  
47 with two groups of students, with a third group serving as a control. The activities were  
48  
49 conducted in practical sessions for four weeks (one session per week), and about 20  
50  
51 minutes were used in each session.  
52  
53

54  
55 In the first session, the problem of food waste and its consequences were explained and  
56  
57 students were set the challenge of assessing throughout the following week their behavior  
58  
59 at home, how much food they wasted and if they believed that the waste was avoidable.  
60

1  
2  
3 An Excel spreadsheet was provided so that students could record their figures for each  
4  
5 day. In the second session, students discussed the data collected during the previous  
6  
7 week's challenge, received information about some other consequences of food waste,  
8  
9 and were set the same challenge for the following week. In the third session, they were  
10  
11 asked again about their behavior during the week and given information on some key  
12  
13 methods for reducing food waste at home. Finally, in the fourth session, they were  
14  
15 informed about two mobile applications (TooGoodToGo and NiceToEatYou, now  
16  
17 Enchanted to Eat You) that can be used to help curb food waste (Table 1).

WEEK	CALENDAR /Subject		ACTIVITY	CHALLENGE	LEARNING GOALS
	Intro, Mk.	Fund. Mk.			
1	23-27 Sept. 2019	17-21 Feb. 2020	Pre-Questionnaire / Information about FW problem and its trace (20') / and challenge proposal and explanation	Students write down in an excel sheet, all the food wasted for one week (until the next practice class)	Distinguish between food loss and waste / Knowing the main causes of the problem
2	30 Sept.- 4 Oct. 2019	24-28 Feb. 2020	Assessment of the results obtained in the students' records on their own experiences and sharing with the rest of their classmates and proposal of extending the challenge	Students write down in an excel sheet, all the food wasted for one week (until the next practice class)	Raise awareness about the amount of food, still in good condition, that is thrown away
3	7-11 Oct. 2019	2-6 March 2020	Assessment of the results obtained the previous week and proposal of advice, tricks, customs that allow curbing food waste		Students get conscious of their practices at home and how they may improve them
4	14-18 Oct. 2019	9-13 March 2020	We asked the class about their perceptions of the activity and informed them about two food waste Apps to fight this kind of waste.		Discover all the possibilities of taking advantage of a food before throwing it away.
5	21-25 Oct. 2019	16-20 March 2020	Post-Questionnaire		

(a) Due to the Covid-19 lockdown, questionnaires in the Fundamental of Marketing course were delivered online

In order to measure the impact of this initiative on the students' perceptions about the food waste problem and to see whether their behavior had changed, an experimental design was adopted, dividing the students into two groups: the treatment group (with students that participated in the activities) and the control group (where students did not take part of the activities). Furthermore, two questionnaires were administered. The content of the questionnaires was almost the same, except that the second one included an additional question about satisfaction with the initiative. Students provided a nickname in the two questionnaires so that both waves could be connected. The first questionnaire (pre-activity) was administered to students, before the start of the first session, to find out their assessments of their food consumption habits inside and outside the home. For students on the Introduction to Marketing course, the second questionnaire (post-activity) was self-administered in the following week, after the end of the last activity. For those on the Fundamentals of Marketing course, due to the COVID-19 lockdown, the questionnaire had to be administered online during the following two weeks, after the end of the last activity.

### 3.2 Design of the Questionnaire

The questionnaire consisted of 12 items. It began by inquiring about the importance that the students gave to the fight against food waste in relation to other responsible behaviors. The first item listed 10 different behaviors related to responsible consumption which the participants had to rank from 1 to 10 according to their perceived importance. Subsequent items focused on different aspects of the students' habits and practices regarding food waste at home, measured on 7-point Likert scales developed in previous studies: household food waste management skills (Stancu *et al.*, 2016), management of leftovers (Stancu *et al.*, 2016), awareness of the consequences of food waste (Zhang *et al.* 2019; Wang *et al.* 2011) and attitude toward food waste (Wang *et al.*, 2018). Items about food

waste in restaurants were also drawn from previous studies and focused on attitudes toward food waste and intention to reduce food waste in restaurants (Lorenz *et al.*, 2017).

The remaining items focused on the frequency with which food was thrown away at home, the amount and types of food thrown away, and other food waste behaviors (Diaz-Ruiz *et al.*, 2018). (See the Appendix for details.)

In addition to these items, the second questionnaire measured satisfaction with the activity by means of three items drawn from previous research (Bhattacharjee *et al.*, 2012). Intention to recommend the activity to other students or for deployment on other courses was measured using three items on loyalty from a scale proposed by Zeithaml *et al.* (1996) that we adapted to the educational context.

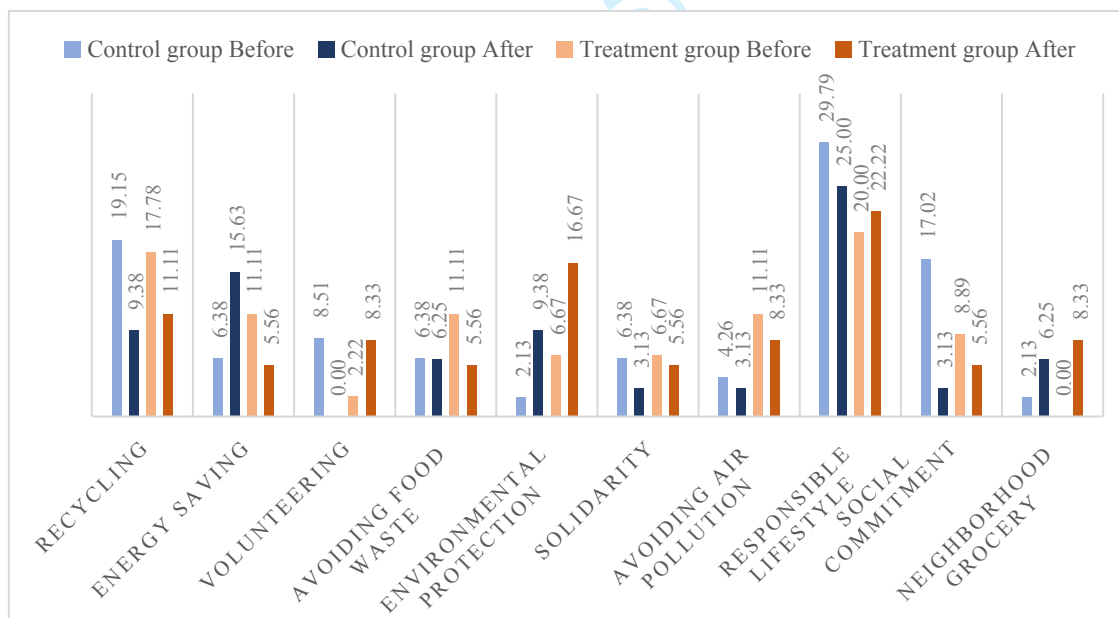

### 3.3 Participants

The total population consisted of 468 first-year students in Economics and Business Administration. The treatment group consisted of the 311 students who participated in the information and awareness activities; the control group consisted of 157 students who did not participate in the activities. 191 students in the treatment group, and 114 in the control group completed the pre-activity questionnaire. 154 students completed the post-activity questionnaire in the treatment group and 66 students did it in the control group. To analyze our results and compare the students' answers before and after the activity, we asked the students to provide a nickname in their surveys. Most of them were reluctant to do it, and others did not remember the nickname they used in the pre-activity questionnaire when they completed the post-activity survey. Furthermore, we had to eliminate some incomplete questionnaires from our sample. As a result, we finally obtained 99 valid questionnaires from 52 participants that completed the two questionnaires correctly and belonged to the treatment group and 47 to the control group.

#### 4. Results

First, for the item regarding the relative importance of food waste among a range of behaviors, Figure 1 shows the percentage of respondents who identified each behavior as the most important, both before and after the initiative and for both treatment and control groups. For both groups, the most important responsible behavior (i.e., the one most frequently ranked first) was following and maintaining a responsible lifestyle. The other rankings differed across groups and stages. For the control group, the second most important behavior before the activity was recycling (paper, plastic, glass), followed by social commitment; after the activity, this changed to energy saving and recycling, which tied with environmental protection. For the treatment group, the second most important behavior before the activity was recycling, followed by energy saving and avoiding food waste; after the activity, this changed to environmental protection, followed by recycling.

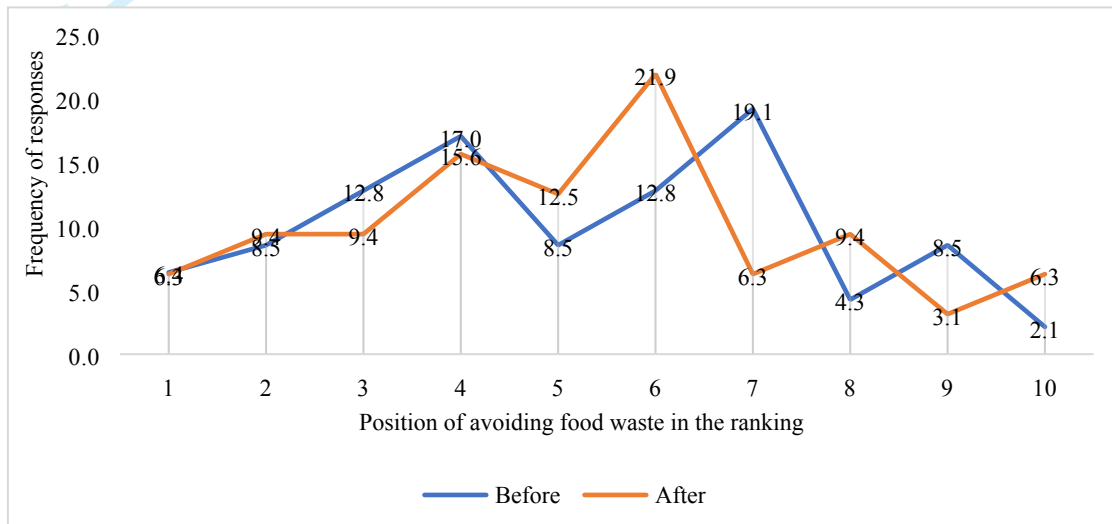

**Figure 1.** Relative importance of different responsible behaviors (% of respondents ranking each behavior as the most important before and after the activity)

Note: Control group  $N = 47$ , treatment group  $N = 52$ .

In terms of behaviors for avoiding food waste, the mode values for the control group were 6 and 7 (see Figure 2).

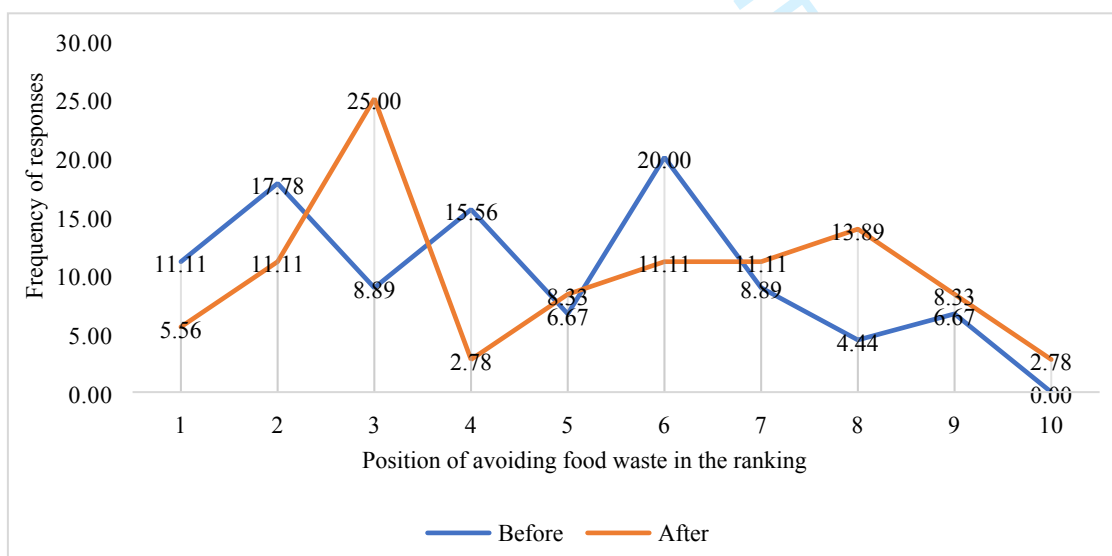

**Figure 2.** Importance ranking for avoidance of food waste by frequency of responses in the control group (%)

Note: Control group  $N = 47$ .

For the treatment group, this measure changed from 6 before the activity to 3 after the activity (see Figure 3). Thus, the treatment group perceived avoiding food waste as more important behavior after the activity than before it.

**Figure 3.** Importance ranking of avoidance of food waste by frequency of responses in the treatment group (%)

Note: Treatment group  $N = 52$ .

Second, because we collected the students' responses in two stages (before and after the initiative), two exploratory factor analyses (EFAs) were conducted in SPSS to explore the unidimensionality of the constructs. This analysis revealed a solution formed by five constructs in each stage: household food waste management skills, awareness of the consequences of food waste, management of leftovers, attitude toward food waste in restaurants, and intention to reduce food waste in restaurants. As the two items for attitude toward food waste at home did not load on the same factor, we decided to treat them separately.

The confirmatory factor analysis (CFA) for the responses before the activity confirmed this solution (see Table 2). However, we decided to eliminate item 5 concerning household food waste management skills, because its loading was below the threshold value of 0.5 (Hulland, 1999; Nunnally, 1978). Cronbach's alpha values and the composite reliability index for all constructs exceeded the minimum acceptable value of 0.7 (Nunnally, 1978; Hair *et al.*, 2011), confirming internal consistency, with the exception of management of leftovers, which we therefore decided to analyze separately. The CFA for the responses after the activity confirmed the unidimensionality of the constructs. All the items loaded higher on their respective constructs, the loadings exceeded the threshold value, and the Cronbach's alpha values were higher than 0.7 for all constructs (Table 2).

**Table 2.** Items loadings and Cronbach's alpha

	Before the activity		After the activity	
	Item loading	Cronbach's alpha	Item loading	Cronbach's alpha
<b>Household food waste management skills</b>				
HSKILL1	0.849	0.840	0.842	0.828

An analysis of mean differences was then conducted. Table 3 shows the differences for the treatment group and Table 3 for the control group. Although there was an improvement in the treatment group for almost all the variables, most of these improvements were not significant.

In the treatment group (see Table 3), differences before and after the activity were found for attitude toward food waste in restaurants and in the quantity of dairy products thrown away. Thus, as a result of the activity, the students' attitude toward food waste at restaurants improved and they reduced the quantity of dairy products they threw away at home. We also observed an increase in the means for items 1 and 2 regarding the management of leftovers; after the activity, participants reported eating more leftovers and storing them more often in suitable conditions so that they lasted longer.

Note. \* $p < 0.2$ ; \*\* $p < 0.1$ ; \*\*\* $p < 0.05$ . HSKILL: household food management skills; AWA: awareness of the consequences of food waste; ATTR: attitude toward food waste in restaurants; INTR: intention to reduce food waste in restaurants; SNR: social norms in restaurants; PNR: personal norms in restaurants; ATTH: attitude toward food waste at home; LEFT: management of leftovers at home; FQ: quantity of food thrown away; BREAD/DAIRY/FRUIT/VEG/MEAT/FISH/BAKE/PREC: quantity of bread/ dairy products/fruit/vegetables/meat/ fish/ baked goods/pre-cooked products thrown away.

In the control group, there was a decrease in the means for items 1 and 2, indicating both a reduction in these students' perception that avoiding food waste is positive for society and a deterioration in their management of leftover food. However, in this group, the quantity of bread thrown away was reduced (see Table 4).

Regarding differences between those who took part in the activity and those who did not, the improvement in management of leftovers by incorporating them into new dishes was greater for the treatment group. The difference before and after the activity in the means for item 1 regarding attitude toward food waste at home was greater for the control group (see Table 5).

<b>PREC</b>	38	-0.079	1.634	36	-0.114	1.875	-0.035	0.086

Note: \* $p < 0.2$ ; \*\* $p < 0.1$ ; \*\*\* $p < 0.05$ . HSKILL: household food management skills; AWA: awareness of consequences; ATTR: attitude toward food waste in restaurants; INTR: intention to reduce food waste in restaurants; SNR: social norms in restaurants; PNR: personal norms in restaurants; ATTH: attitude toward food waste at home; LEFT: management of leftovers at home; FQ: quantity of food thrown away; BREAD/DAIRY/FRUIT/VEG/MEAT/FISH/BAKE/PREC: quantity of bread/dairy products/fruit/vegetables/meat/fish/baked goods/pre-cooked products thrown away.

Figure 4 represents graphically the mean differences of all the variables used in this study for both groups (treatment and control). Waste of dairy products reduced in both groups, but waste of most other food types increased, although the differences for vegetables, meat and fish were small. The other variables improved after the activity in the treatment group, except for intention to reduce food waste in restaurants, awareness of consequences and item 3 of leftovers management. Thus, there was an improvement

1  
2  
3 (albeit not a significant one) in the participants' eating of leftovers (item 2 of leftovers  
4 management) and incorporating them into new dishes (item 1 of leftovers management),  
5  
6 their attitude toward food waste, their perceptions about household food waste  
7 management and their attitude toward food waste in restaurants, with the largest  
8 improvement shown in the last of these.  
9  
10  
11  
12  
13  
14

15 From these results, it can be cautiously concluded that the teaching initiative on the  
16 importance of avoiding food waste has been successful for university students, since it  
17 raised their awareness about the food waste consequences and improved their perception  
18 about household food waste management, but it cannot be concluded that the initiative  
19 has been totally effective because the real behavior of the student in relation to food waste  
20 has not been controlled afterwards. Even so, this study contributes to the literature on  
21 food waste by addressing the lack of research that measures the effectiveness of different  
22 initiatives and campaigns (Pinto *et al.*, 2018; Schanes *et al.*, 2018), and can guide other  
23 researchers to design future food waste preventive initiatives.

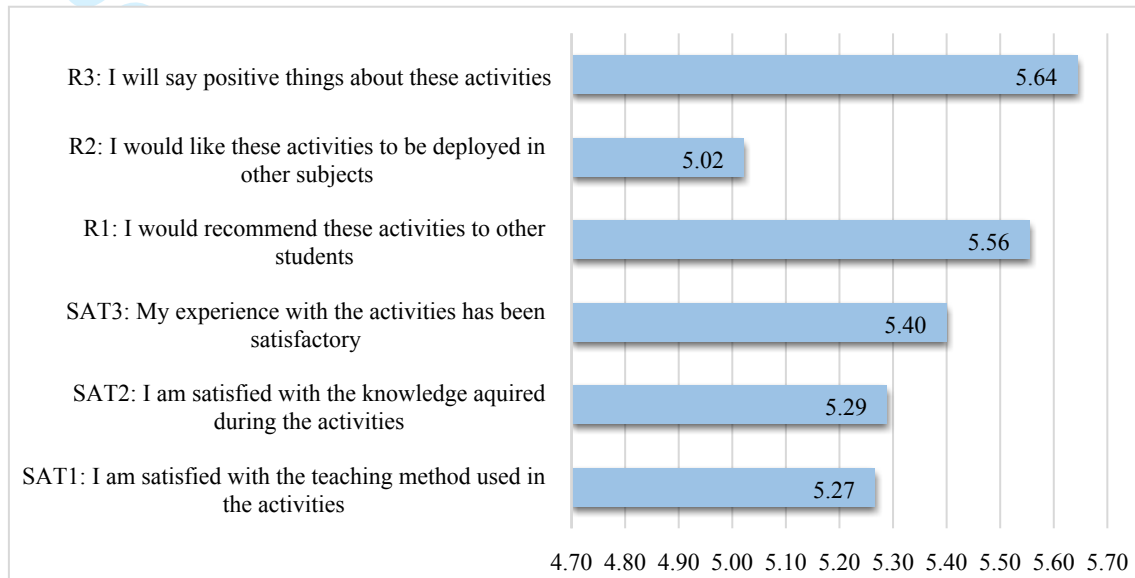

**Figure 4.** Mean differences between treatment and control groups

Note. HSKILL: household food management skills; AWA: awareness of consequences; ATTR: attitude toward food waste in restaurants; INTR: intention to reduce food waste in restaurants; SNR: social norms in restaurants; PNR: personal norms in restaurants; ATTH: attitude toward food waste at home; LEFT: management of leftovers at home; FQ: quantity of food thrown away; BREAD/DAIRY/FRUIT/VEG/MEAT/FISH/BAKE/PREC: quantity of bread/dairy products/fruit/vegetables/meat/fish/baked goods/pre-cooked products thrown away.

Finally, as described above, we asked the participants about their satisfaction (SAT1, SAT2, SAT3) with the activity and their intention to recommend (R1, R2, R3). In general, the students were satisfied with this kind of activity and were willing to recommend it, with means ranging from 5 to 6 on a 7-point Likert-scale (see Figure 5). The intention to say positive things about the activity and to recommend it to other students was particularly high. These results will encourage teaching staff in marketing subjects to

implement similar activities in future courses, with appropriate changes to increase active student participation.

**Figure 5.** Means for satisfaction with the activity and intention to recommend

## 5. Discussion

The problem of food waste has become increasingly important over the last decade. Wasting food runs contrary to the 12<sup>th</sup> SDGs that we must all work toward. Raising awareness of the problem has been shown to improve knowledge of the consequences of food waste and to increase intention to curb waste behaviors (Visschers *et al.*, 2016; Principato *et al.*, 2015).

Initiatives developed to raise awareness of the problem of food waste are numerous and diverse, but their impact on students' awareness and behavior has rarely been measured (Stöckli *et al.*, 2018; Young *et al.*, 2017). This study addresses how useful an information and awareness-raising initiative is to raise undergraduate students' awareness on the problem of food waste and to reduce their food waste behavior, designing and administering questionnaires before and after it.

1  
2  
3 Given the low response rate, our results must be interpreted with caution. However, there  
4  
5 is evidence that the information sessions on the main causes and consequences of food  
6  
7 waste and key tips for avoiding food waste were successful. Specifically, our results show  
8  
9 changes in the students' perceptions of their behaviors in managing leftovers at home,  
10  
11 with greater efforts to eat leftovers, to use them to prepare other dishes, and to reduce the  
12  
13 amount of dairy produce thrown away. The participants' attitude toward food waste in  
14  
15 restaurants also improved. Most of the variables related to food waste concern and  
16  
17 awareness of food waste consequences improved because of the impact of the teaching  
18  
19 initiative on the treatment group. Although the results were not significant, there was an  
20  
21 improvement in the participants' management of leftovers and incorporation of them into  
22  
23 new dishes. Students' perceptions and attitude toward food waste at home also improved,  
24  
25 but the biggest change was in their attitude toward food waste in restaurants. This last  
26  
27 result may be because young people in restaurants perceive pressure from others and are,  
28  
29 therefore, more likely to feel ashamed if they leave food on the plate.  
30  
31  
32  
33

34  
35 Specifically, waste of dairy products reduced in both groups, although it increased for  
36  
37 most other food types. This may be because the consumption of dairy products (including  
38  
39 yogurt and cheese) is relatively common, stable and recurrent, which allows it to be  
40  
41 managed better.  
42  
43  
44

45  
46 These results, although limited, are relevant, and the objective of this study is achieved.  
47  
48 Therefore, it can be concluded that the information and awareness activities on the  
49  
50 problem of food waste were moderately effective, at least in terms of student's  
51  
52 perceptions, since they perceived that the initiative caused an improvement in their level  
53  
54 of food waste awareness and their behavior regarding the management of leftovers at  
55  
56 home and a reduction in the quantity of dairy products wasted. This is consistent with the  
57  
58 findings of previous initiatives conducted in higher education institutions in which similar  
59  
60

1  
2  
3 activities had a positive impact on students' behavior (Feijoo and Moreira, 2020; Ahmed  
4  
5 *et al.*, 2018).

6  
7  
8 Furthermore, the combination of different types of interventions (including  
9  
10 information/education, prompts, nudging and games) also appear to be the most  
11  
12 promising method (Stöckli *et al.*, 2018; Soma *et al.*, 2021), as young people's knowledge  
13  
14 of the serious consequences of food waste does not necessarily discourage them from  
15  
16 generating such waste. More research is needed on the effectiveness of different  
17  
18 initiatives for curbing food waste.  
19  
20  
21

### 22 23 **5.1 Academic and practical implications**

24  
25  
26 Our study contributes to educational institutions' function of informing and training  
27  
28 students in more responsible consumption patterns (Sibbel, 2009), particularly in the  
29  
30 context of marketing, a discipline that has traditionally appeared to encourage  
31  
32 consumption. It also contributes to the literature on food waste by using an experimental  
33  
34 design to measure real changes in awareness, attitudes and behaviors regarding food  
35  
36 waste, in contrast to qualitative studies based solely on students and teachers' perceptions.  
37  
38 In this way, our study contributes to food waste research by providing evidence of the  
39  
40 usefulness of an initiative conducted in a higher education institution with the aim of  
41  
42 increasing awareness and changing behavior regarding food waste. Awareness activities  
43  
44 seem to be promising, as they led to an improvement in students' perceptions about their  
45  
46 behaviors regarding the management of leftovers.  
47  
48  
49

50  
51  
52 Not only the results but also the procedures of this study can serve as a basis for the design  
53  
54 of future initiatives, thereby answering the calls of food waste researchers (Aschemann-  
55  
56 Witzel *et al.*, 2015; 2017). On the basis of our findings, the study encourages behavioral  
57  
58 researchers on food waste to design further initiatives of this type, combining information  
59  
60

1  
2  
3 activities about food waste and its consequences with key tips on how to avoid and reduce  
4  
5 food waste. The authors note that the participation of students in an initiative of this type  
6  
7 is likely to be greater if they are actively involved in its design and given some  
8  
9 responsibility for carrying it out with their classmates.  
10  
11  
12

## 13 **6. Conclusions**

14  
15  
16 It is taken for granted that universities must contribute to achieving the SDGs (United  
17  
18 Nations, 2020) by educating and training their students in favor of sustainability. Here,  
19  
20 an initiative was designed to inform and educate students about the problem of food waste  
21  
22 and its consequences, offering some key methods and prompts for reducing their own  
23  
24 food waste. Before and after the activities, a questionnaire was administered to analyze  
25  
26 whether the activities had influenced the students' perceptions and behaviors in a way  
27  
28 that allowed us to prove its usefulness.  
29  
30  
31

32  
33 The objective of this study was achieved since the students perceived that the information  
34  
35 and awareness activities had caused an improvement in their food waste-related behavior  
36  
37 and a reduction of the dairy products wasted at home. However, these results should be  
38  
39 interpreted with caution, given certain limitations of the study and the circumstances  
40  
41 under which it was conducted.  
42  
43  
44

45  
46 One of these limitations is the low response rate. In particular, it was difficult to analyze  
47  
48 the questionnaire of all the participants, since some of them did not submit their responses  
49  
50 under a nickname. Despite their teachers explaining that they should do this to guarantee  
51  
52 their anonymity, and that they should remember their nickname and reuse it for the second  
53  
54 questionnaire, many of the students did not follow the recommendations. Future  
55  
56 initiatives should seek solutions to this problem, perhaps by offering a reward or gift to  
57  
58 stimulate student interest, a technique that has been helpful in similar contexts (Soma *et*  
59  
60

1  
2  
3 *al.*, 2021). The activity could also be made more interesting to the students by involving  
4  
5 them in its design and even its implementation (Kim *et al.*, 2020). Another limitation of  
6  
7 this study is due to the COVID-19 pandemic and the resulting lockdown. These  
8  
9 circumstances meant that the questionnaires collected during March 2020 had to be  
10  
11 completed online, not in class like the rest. This extraordinary situation is also likely to  
12  
13 have reduced the response rate, as students were facing the challenge of finding new ways  
14  
15 to attend classes, as well as growing concern about the spread of the disease among family  
16  
17 and friends.  
18  
19  
20  
21

22  
23 It should be noted that the data reflect the perception that students have of their behavior,  
24  
25 not actual behavior. This involves some limitations, such as the fact that students may not  
26  
27 be completely aware of their behaviors, and the fact that their answers may be influenced  
28  
29 by social desirability bias and peer pressure due to their classmates' behavior (Malhotra,  
30  
31 2019). Therefore, it cannot be firmly stated that this initiative has been effective and  
32  
33 future research should try to check for the impact of teaching initiatives on students' food  
34  
35 waste behavior by using measures such as food quantity in kilograms or observed  
36  
37 behavior.  
38  
39  
40

41  
42 The study encourages the research community to repeat this type of initiative, with the  
43  
44 suggested improvements, in order to train and educate young people in making more  
45  
46 responsible personal and professional decisions. Furthermore, it would be interesting to  
47  
48 conduct an additional questionnaire with a time lapse after the last activity so researchers  
49  
50 could see whether the initiative is useful to change awareness and behavior in the long  
51  
52 run.

## Appendix

### Measurement scales

<b>Rank the following behaviors according to their importance, ranging from 1<sup>st</sup> (most important) to 10<sup>th</sup> (least important):</b>	
Recycling (paper, plastic, batteries, containers, clothing, etc.)	
Energy saving (lighting, water, gas, etc.)	
Volunteering activities (sharing, giving away)	
Avoiding food waste	
Environmental protection	
Solidarity	
Avoiding air pollution	
Following a responsible lifestyle	
Active social commitment to my community	
Neighborhood grocery shopping	
<b>Quantity of food thrown away</b>	
<i>How much food do you think you throw away at home in a 7-point scale, where 1 is “nothing” and 7 is “a lot”?</i>	
<i>How often do you throw away the following types of food in a 7-point scale, being 1 “never” and 2 “very often”?</i>	
<b>BREAD</b>	Bread, cereals
<b>DAIRY</b>	Dairy products, yogurts, and cheese
<b>FRUIT</b>	Fruits
<b>VEG</b>	Vegetables
<b>MEAT</b>	Meat
<b>FISH</b>	Fish
<b>BAKERY</b>	Bakery pieces
<b>PREC</b>	Pre-cooked dishes
<b>Household food waste management skills</b>	
<i>How would you score the following skills according to your performance in a 7-point scale, where 1 means “not at all skilled” and 7 “very skilled”?</i>	
HSKILL1	Meal planning
HSKILL2	Shopping planning (shopping list, checking of food stored, etc.)
HSKILL3	Shopping the adequate pieces of food and the adequate quantity to prepare meals and consume them at home
HSKILL4	Cooking/meal preparation
HSKILL5	Keeping and reusing leftovers
<b>Leftovers' management</b>	
LEFT1	The leftovers are usually eaten as such or just reheated when used again
LEFT2	The leftovers are usually transformed into a different dish by adding some ingredients before eating them
LEFT3	The leftovers are stored in appropriate conditions so they will last
<b>Awareness of consequences of food waste</b>	
AWA1	I think food waste has some effects on the environment
AWA2	I think that food waste has some effects on the society
AWA3	Nature resources will be excessive consumed if we do not do household waste sorting
AWA4	The life of descendants would be badly influenced if we do not do household waste sorting
<b>Attitude toward food waste at home</b>	
ATTH1	Avoiding food waste makes me feel satisfied
ATTH2	I think that avoiding food waste contributes to society positively
<b>Attitude toward food waste in the restaurant</b>	
ATTR1	In the restaurant, not eating everything up is a mistake

ATTR2	In the restaurant, not eating everything up is irresponsible
ATTR3	In the restaurant, not eating everything up is unacceptable
ATTR4	In the restaurant, not eating everything up is inappropriate
<b>Intentions to reduce food waste in the restaurant</b>	
INTR1	I generally try to return an empty plate
INTR2	I generally try not to waste any food in the restaurant
<b>Satisfaction with the activity</b>	
SAT1	I am satisfied with the teaching method used in the activities
SAT2	I am satisfied with the knowledge acquired during the activities
SAT3	My experience with the activities has been satisfactory
<b>Recommendation intentions</b>	
R1	I would recommend these activities to other students
R2	I would like these activities to be deployed in other subjects
R3	I will say positive things about these activities
