CERTIFICATION OF ORIGINALITY

This is to certify that I am responsible for the work submitted in this project, that the original work is my own except as specified in the references and acknowledgements, and that the original work contained herein have not been undertaken or done by unspecified sources or persons.

(MUHAMMAD FAIZ BIN AHMAD FAUZI)

Abstract

This project is to create a new system that generate unique timetable for students in Universiti Teknologi Petronas which include function for reducing time consumption and automate student manual process during timetabling or find alternative of slot. EasyPHP is use to create dynamic web application including the algorithm. Other than that, this project also aims to improvise the current timetable in term of Human Computer Interaction where better visual design and application of colour are included. As add on, this project can provide backup timetable in various medium such as smartphone, social network and email as both of them are the most gadget and site used by students nowadays. At same time, students can do discussion from the medium aforementioned such as Facebook's group and GoogleGroup's thread.

CHAPTER 1

INTRODUCTION

1.1 Background of Study

Most educational institutions at the beginning of each semester are faced with the problem of scheduling their courses. Generating a timetable manually is time consuming especially to time scheduler or in Universiti Teknologi Petronas, the Academic Central Services (ACS). However, students in UTP also become part of time scheduler when new semester start. This is because students responsible to create their own time table based on slots provided by ACS.

Several modules already provided in Timetabling Information Centre such as Staff Timetable, Module or Course Timetable, Location Timetable, Programmes of Study Timetable. Below is current standard of timetabling by students:

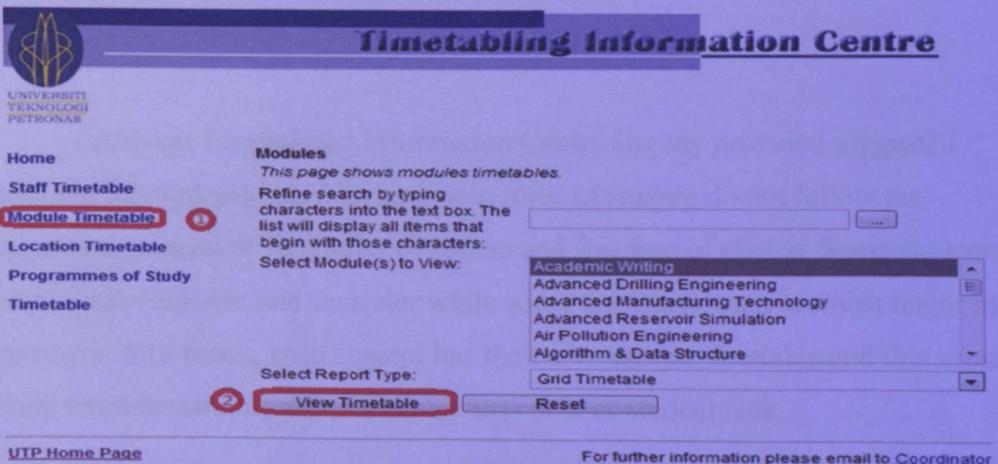

Figure 4 : Timetabling Information Centre

1. Firstly, student will open internet browser and go to <http://utppt.utp.edu.my/swsoddprd/>
2. Then, student will choose the Module Timetable, select any module (course) to view and click on View Timetable.
3. After choose several module, student then will manually create timetable using Microsoft Excel or blank paper as shown below.

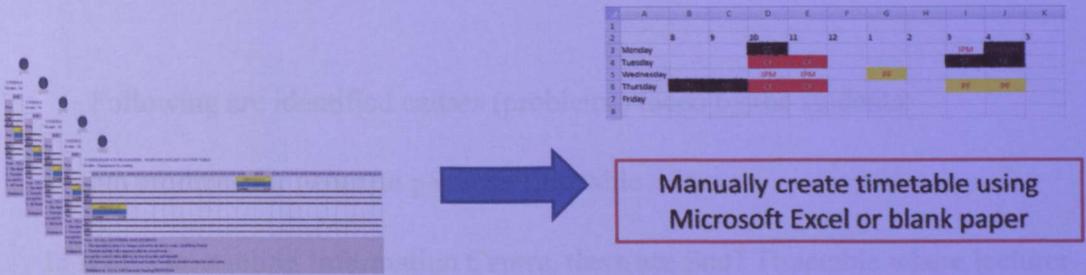

Figure 5 : Manual Timetabling Process

To overcome these problems, the author comes out with new solution where students can generate their own unique timetable automatically with great interface and user friendly web application. This project focussing on improvising the suggested timetable into free customize timetable for student automatically using certain algorithm.

Although Timetabling Information Centre already provided suggested timetable for students based on semester, most of student do not follow the suggestion because of flexibility of course and freedom of choice. Some students want to take major in one semester while some the others want to finish major in two semesters. As a result, each student has their own unique timetable and this somehow create more constraints either from lecturer side or student side.

1.2 Problem Statement

Every new semester, almost 5000 students taking a lot of time to create the best timetable considered many constraints. Although UTP Timetabling Information Centre already provided suggested timetable for students based on year and semester, most of the them did not follow the suggestion because several problems.

Following are identified causes (problems) faced by the students:

a) No modules for generate personal timetable

In UTP Timetabling Information Centre, there are Staff Timetable where lecturer can check their timetable, Module Timetable where student can check their course's slot, Location Timetable where students and lecturers can check their location of class and Programmes of Study Timetable or also functioning as suggested timetable by Academic Central Service. Unfortunately, there is no modules for generate personal timetable for students. It is because adding more function will need more cost and more time to develop it.

b) A lot of processes to create timetable

As mentioned, students need to go through many processes during timetabling. Students need to go to UTP Timetabling Information Centre, then choose a course and repeat again based on how many course taken. After that, students need to combine the entire course's slot into one timetable using Microsoft Excel or blank paper.

c) Time consuming and tedious

A lot of processes during timetabling consume much time and tedious especially during manually combine all course's slot into one timetable.

d) Confusing suggested timetable

SEMESTER JANUARY 2022

Note: TO ALL LECTURERS AND STUDENTS
 1. This timetable is subject to changes at least for the first 2 weeks (Add Drop Period)
 2. Tutorials and labs will commence after the second week.
 3. Except for courses which delivery are based on labs and tutorials.
 4. All Students must check Individual and Moodle Timetable for detailed activities for each course.

Figure 6 : Screenshot of Programmes of Study Timetable

Above is one of screenshot taken in Programmes of Study Timetable or suggested timetable. The problem here is the timetable is using same colour for every different course and this is not following the Human Computer Interaction where the different entity must be labelled with different colour. Due to not following the HCI standard, the timetable confusing the students and this is one big problem with suggested timetable.

e) Students always forgot the location of class

Usually after students created timetable, they will printed out and stamped it anywhere such as plastic document case. This is because most of student will never memorize their own timetable. Some students who have smartphone will save their soft copy of timetable inside. While some students always lose their timetable due to virus and improper save. As a result, they have to create their timetable again and go through long process of timetabling again.

1.3 Objective

In general, mostly students in UTP create their own unique timetable using manual ways such as Microsoft Excel and blank paper due to their desire to have more time which is timetable with less Credit Hour and save the best for the last during final year to focus on Final Year Project and avoid confusion.

Based on problems faced by students, three objectives are desired to be achieved:

1. To create a new system that generate unique timetable for students in UTP which include two function :
 - a. First Function : Automatic generate timetable for students using web-based applications to save more time and no need software to install
 - b. Second Function : Share on Facebook function and send to email function so students can do discussion about timetable using Facebook's group or GoogleGroup's thread.
2. To develop more interactive timetabling solution with more color label which meet requirement of Human Computer Interaction
3. To create backup timetable in various medium such as smartphone, email and social network.

1.4 Scope of Study

From these objectives above, the project would satisfy:

1. Data format based on UTP Timetabling Information Centre specification
2. Algorithm need in timetabling for students
3. Human Computer Interactions requirements for timetabling

1.5 Significances of Project

From the information above, the project was set to provide new module for students to generate timetable automatically. This project will reduce time consumption during timetabling process and automate the manual ways of timetabling.

This project also will provide more interactive and user friendly timetable which meet Human Computer Interaction (HCI) requirements. As a result, students will be more ease during timetabling and no more confusing timetable.

Not only that, this project will make sure that students can access their unique timetable through smartphone so students always can check the timetable and no more worrying about loss of timetable because there is online backup through email.

Other than that, students can share their generated timetable with their friend through Facebook share button. By doing this, students can tag their friend in generated timetable and can discuss about it easily through comments thread in Facebook. As a result, not all students have to create redundant timetable because sharing function in this project.

1.6 Feasibility Study

1.6.1 Timeframe

For the final year project, the author has given the timeframe of two semesters to complete the whole project (roughly about 8 months). Hence, the activities are crafted and planned carefully, and have been divided during the two distinctive periods.

The first semester, the author will:

- a) Identify the project that is required to be developed
- b) To recognize the problem(s) faced and the solution(s) through the project
- c) Provide the paper work - Literature review and methodology of developing the project
- d) Extensive analysis on the data collected
- e) Continuation on the reports and documents needed before the development of the project (blueprint data)
- f) Determine the tools needed in developing the project
- g) Come up with some small prototypes of the project

For the second last semester, the author will focus on:

- a) Full system development
- b) Testing and implementation of the developed project
- c) Monitoring, maintaining and debugging the project.

1.6.2 Technical

This project will fully develop using PHP and software that the author will use is EasyPHP. EasyPHP is a WAMP package including the server-side scripting language PHP, the web server Apache, the SQL server MySQL, as well as development tools such as the database manager PhpMyAdmin, the debugger Xdebug and many others. This software bundle allows the author to list the docroot, extensions, change of Apache port, the timezone, max execution time, error reporting manage modules and so on. EasyPHP also provide best environment for PHP developers because all errors, warnings and notices including coding best practices and recommended coding standards in PHP are displayed. This configuration is intended to force the beginners and even some experienced programmers to develop good habits and write code clean and consistent. Current technology used by UTP Timetabling Information Centre is ASP. Net which is costly and need license to develop.

CHAPTER 2

LITERATURE REVIEW

Objective 1 : To create a new system that generate personal unique timetable for students on web in UTP

Time Tabling

Time tabling is a process of assigning events or activities to resource such as time (timeslots), space (rooms) and personnel which satisfy all constraints (L. Jonathan at.al,2000). The research on timetabling problems has a long history of more than 40 years, starting with Gotlieb in 1962 (C.C. Gotlieb,1962). Over the last 30 years, many approaches and models have been proposed for dealing with a variety of timetabling programs. And of course when dealing with timetabling, good usage of algorithm will produce better timetable in terms of flexibility and efficiency.

The task of producing by hand (manually), a satisfactory, conflict free timetable is always a tedious and time consuming process (A.M. Abbas at.al,2001). The main difficulty is the absence of any dependable idea for doing that, beyond an exhaustive search of all available alternatives. This means plenty of trial and error attempts. And again, the only way to automate the process is using current technology combine with algorithm.

However, in modern times, Schaerf states that course timetabling is one of main three university problem. This is because university have mass of people divided into several entities such as students and lecturers which got their own different schedule. To create timetable for each of them surely need a very good algorithm to make sure all constraints can be overcome.

Entity

According to Carter and Laporte , students and lecturers (or faculty members) are assigned to courses, course sections, or classes and events (individual meetings between students and teachers) are assigned to classrooms and time slots. As mentioned, the university course timetabling problem is to schedule a set of sessions for each course within a given number of rooms and time periods. More specifically, each lecturer offers several courses in each semester and each course has 1-3 lecture and lab per week depending on the credit hours of course. In UTP, course timetabling related to below three main entities:

- Lecturer : to schedule the course into the preferred time frame
- ACS : to schedule all course into available time periods and classrooms
- Student : to schedule preferred course without clash by choosing the right time.

Subject, classroom location, timeslot are the other entities that will need to be directly assigned in a completed university's timetable.

Constraint

Class scheduling is always an important problem for an education institute. The time scheduler has to consider the constraints of class rooms, teaching utilities, conflict in courses and making both the faculties and students happy. However, in Universiti Teknologi Petronas, class scheduling provided by Academic Central Service and students create their own schedule based on slot provided. So, in this case, time scheduler categorized into two sides such as ACS and students. ACS responsible to consider constraints of class rooms, teaching utilities and lecturer availabilities while students responsible to consider constraints of conflict in courses and simultaneity.

In time table scheduling, constraints are used to drive the scheduling process to produce good quality schedule. Systematically, constraints classified into several categories such as simultaneity and predetermined unavailability. Simultaneity is a

constraint to prevent students from attending more than one class at time or clash. Predetermined unavailability on the other hand is a constraint to reserve time slots for special case such as seminars involves lecturer and students or religious slot (L. Joo-Hwee at.al, 1991).

Between examination timetable and the course timetable, complexity of the constraints in examination timetable is considered to be relatively simpler to automate compared to course timetable (M.V. Padmini at.al, 2010).

Medium

Nowadays, the best medium for application is Internet or specifically, web-based. The reliable and fast generation of timetable is demanding in generating the timetable especially if the timetable system is running in a web based (S. Awang at.al, 2009). In UTP, raw course timetable for students provided through website from UTP itself. So, the web-based medium is the best solution in UTP as students do not need to install any applications except web-browser which is compulsory software inside any operating system. Generally, solutions obtained for specific universities are unsuitable for all universities (M.Davoudzadeh at.al, 2009). This is because of the differences in the number and in the type of constraints from university to university.

As a conclusion for first objective, there are a lot of system that generate timetable existed but no system generate personal timetable so far. However, based on literature review, the project to create new system that generate personal unique timetable for students on web in UTP is not impossible due to possibility done by case study on timetabling, constraint and medium.

Objective 2 : To develop more interactive timetabling solution with more colour label which meet requirement of Human Computer Interaction

Human-Computer Interaction (HCI) is the interaction between man and machine. In essence, it means people interact with computers or machines that contain the computers. The ultimate goal of Human-Computer Interaction research is exploring how to design the computer to help people complete the necessary tasks more safely and efficiently (H.X. Liu,2003).

In case of timetabling, the computer is the system itself. Involvement of HCI in timetable can create a great interaction between the user and system (J.J. Thomas at.al,2009). There are several interactive ways in HCI such as Data Interaction, Image Interaction, Voice Interaction and Behaviour Interaction.

In timetabling, data interaction is obviously important because the general purposes of this interaction is the mutual communication and establish the mutual platform between the user and the system. That mean the user will enter suitable data while the system will process the data entry and then generate result wanted by the user. Hence, the key of the design of the interface lies on how to achieve a perfect and harmonious human-computer interaction. To achieve this interaction, the system must provide user friendly interface such as symbols, colours and graphic so the user easily understand the system very well(X.Y. Yang at.al,2009).

According to Gong Chao, the application of colour should achieve the best show effect. The application of colour is include in visual design where the main purpose of visual design is to make users comfortably and easily to use. Gong Chao provide several principles of visual design that involve colour's application.

- To enhance computer's function of memorizing and reduce user's burden of short-term memory.

- Make the whole colour of interface within five colour systems and minimize the use of red and green. Similar colours should be used in icons on behalf of similar meanings.
- To enhance visual stimulate of graphic symbols through the application of colours. Different colour gives us different feeling, check this on the following table.

Colour	Psychological Reaction
Red	Fervency, peril, spark ...
Orange	Warm, joy, envy ...
Yellow	Sunshine, hope, cheerfulness, commonness ...
Green	Peace, safety, growth, greenness ...
Blue	Equability, mind ...
Purple	Elegance, dignity, weightiness, mystery ...
Black	Solemnity, vigorous, fear, death ...
White	Immaculacy, holiness, lustration, sunshine ...
Grey	Commonness, chill, modesty ...

Table 1: Colour and Psychology

As a conclusion for second objective, Human Computer Interaction approach is very important in timetabling because it needs mutual understanding between the user and the system to generate best personal timetable. Bad HCI means less user friendly which resulted bad timetable due to misunderstanding between both parties.

CHAPTER 3

METHODOLOGY

3.1 Rapid Application Development Life Cycle

The term RAD refers to a software development methodology, namely rapid application development. This methodology is targeted towards faster development times in and higher quality systems disregard to software planning than the traditional System Development Life Cycle. The key objectives of RAD are: High Speed, High Quality and Low Cost. Basically, planning is minimized or even replaced by prototyping, which provides an early look on how the final application might be used.

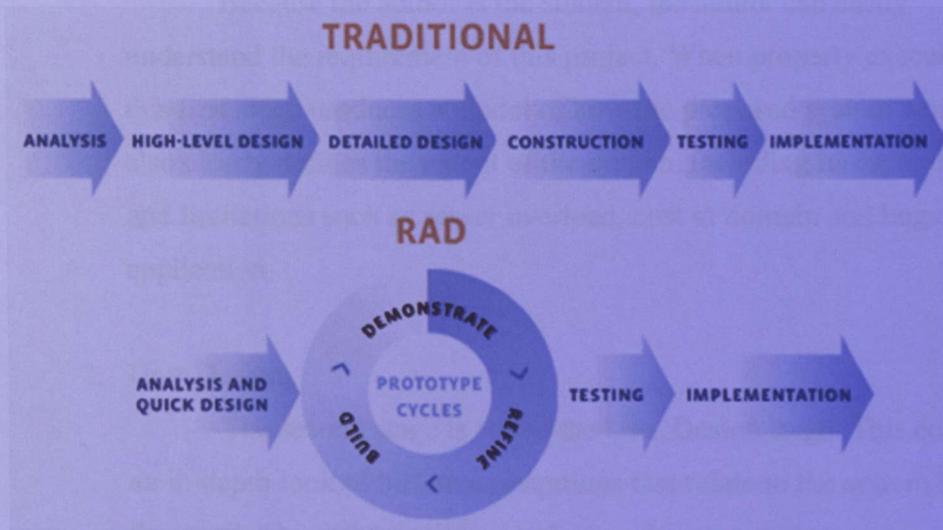

Figure 7 : RAD Life Cycle

Usually, software development includes many stages, like planning, implementation, testing, and deployment maintenance. When it comes to rapid

development, it uses two key techniques: iterative development and software prototyping.

Most of the times, iterative development goes hand in hand with incremental development, which implies developing the system in smaller pieces at a time through repeated cycles. Prototyping refers to the process of building small programs which simulates some of the features of the final products and offers a view on product's design.

The RAD system is split into four separate phases: Requirements Planning, User Design, Construction and Implementation.

1. Requirement phase or Analysis:

The first stage in the RAD process is Requirements Planning. This stage involves reviewing the areas that are clearly necessary to the system being built. The review creates a solid overview, covering the requirements and outlining the functions performed by the system.

Because the author is the student, the author can easily understand the requirement of this project. When properly executed, this first stage produces a model of how the proposed system works. It also clearly defines the extent of the system, including its capabilities and limitations such as server overload, cost of domain and bugs in application.

2. User Design:

The second stage is called the User Design stage. This covers an in-depth look of business operations that relate to the system being designed. The author will be employing the proposed system, analyze how data is used and how this use affects the flow of operations from a user standpoint. This step is designed to eliminate ideas that work in theory but are inefficient in actual practice. As example, save function which is every timetable generated will be recorded in server is not

necessary due to complex programming and can cause server overload.

From this study, an outline of the system is clarified. The flow of how users will actually interact with the system is designed, including sample screens and procedures. By the end of this step, the general idea behind the new system begins to transform into a specific plan.

3. Construction (Iterative development or Prototyping):

The third stage is called Construction. At this point, the author work alongside users to finish the system design and begin building it. This construction allows the author to program key parts of the system and immediately test features with user feedback. As key pieces of the system are built and tested, the overall project comes together.

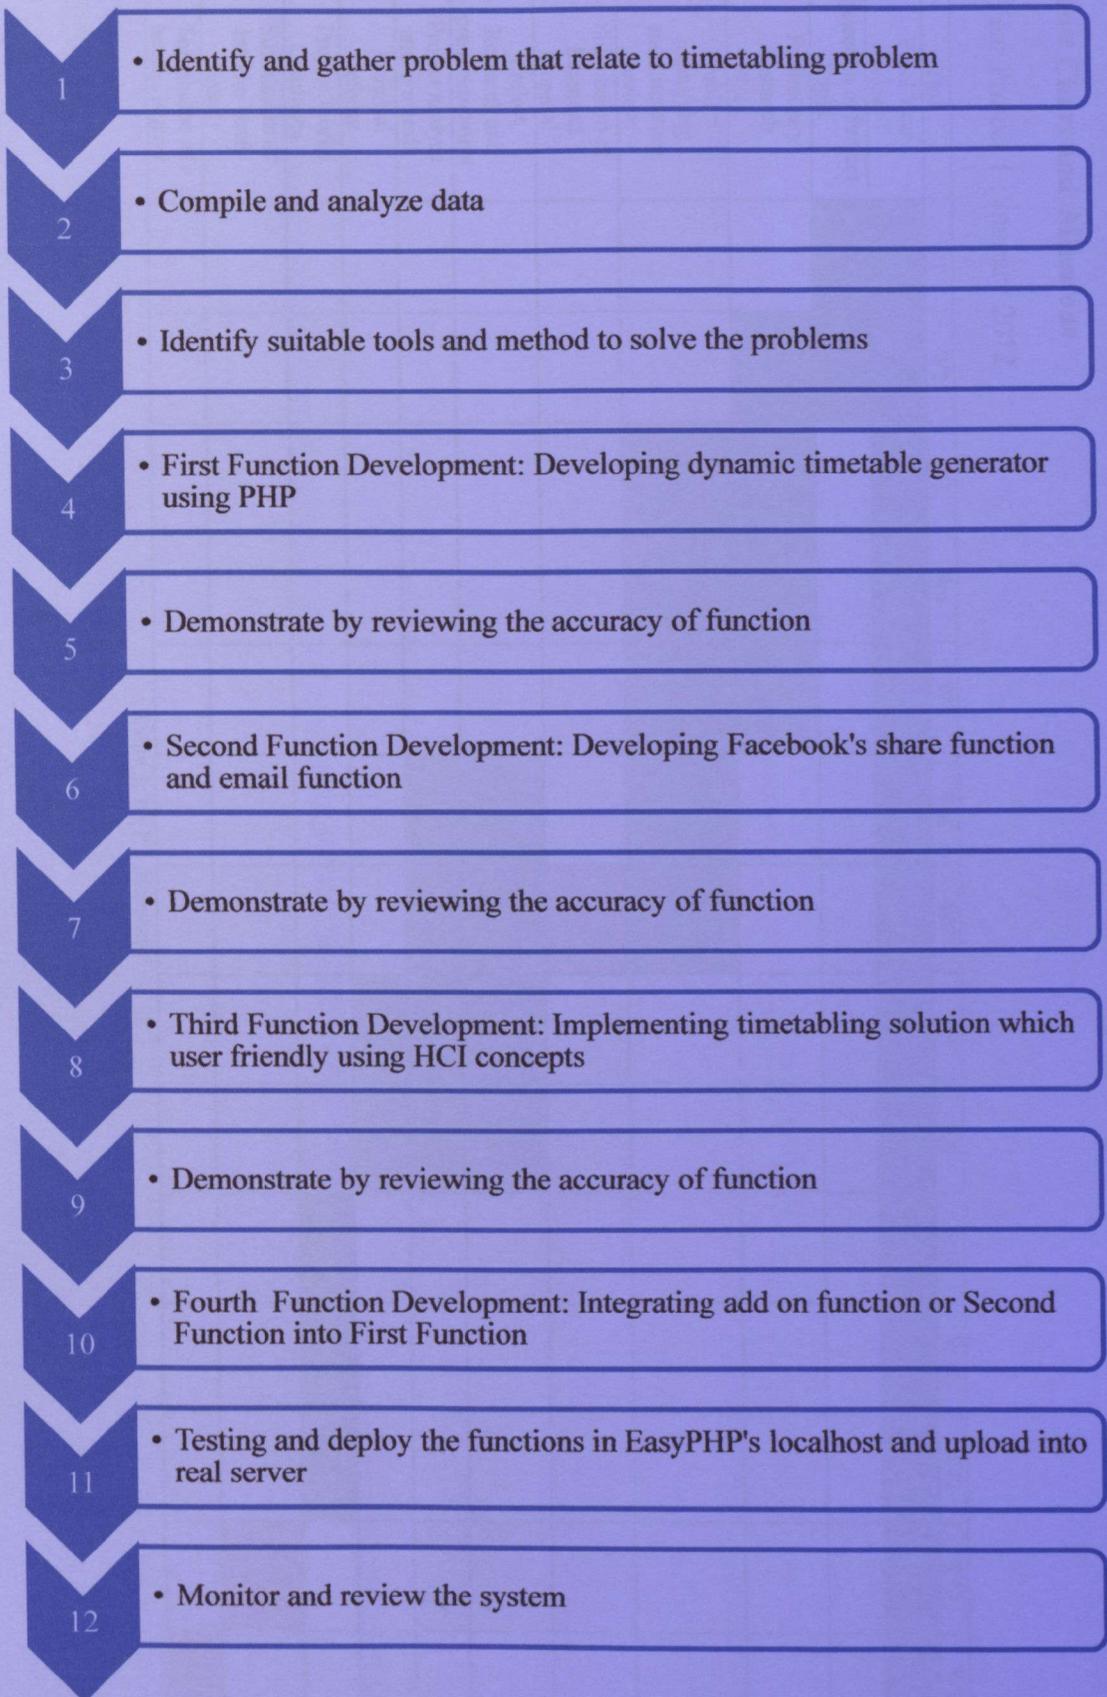

4. Implementation:

The fourth and final stage is Implementation. At this point, the new software system is finalized and installed. If previous versions of the system are in use, connections are built to upgrade to the new version and transfer older data. For this step, the author published the project into real server and hosting where students already can use it as long they have the internet.

One of the main goals of RAD is producing high quality software in a short time and with a low budget through iterative development, intensive prototyping and user involvement. This objective is obtained through breaking the whole project in smaller pieces which are easier to handle and allow developers and users to easily change some of the features if it is necessary.

To sum up, RAD is the best way to build small to medium projects, because it is faster, cheaper and more user oriented, this is why the author use RAD tools for timetabling project.

3.2 Research Design

3.3 Gantt Chart and Milestone

Milestone/DateLine	Red

3.4 Tools

The tools needed in this project are:

- a) Microsoft Windows 32-bit Operating System Seven
- b) Microsoft Office Excel 2007
- c) EasyPHP Bundle

These are among tools required to fulfil the objective of this project. There a lot of alternative tools can be used to replace listed tools. Indeed, the listed tools were selected based on availability of forum for discussion and cost rate at minimum. Because the author using RAD method to develop the project, less tools is better so the author can focus more on development by using specific tools compared to study and practice using the new tools first.

CHAPTER 4

RESULT AND DISCUSSION

4.1 Data Gathering and Analysis

Basically, all the data or in this project are taken from <http://utptt.edu.my/swsordprd> where all the courses each semester already being decided by UTP. Below is the print screen:

The screenshot shows the main page of the Timetabling Information Centre. At the top, there is a logo for Universiti Teknologi PETRONAS and the title "Timetabling Information Centre". On the left side, there is a navigation menu with links: Home, Staff Timetable, Module Timetable (highlighted), Location Timetable, Programmes of Study, and Timetable. The main content area is titled "Modules" and contains the following text: "This page shows modules timetables." Below this, there is a search instruction: "Refine search by typing characters into the text box. The list will display all items that begin with those characters:" followed by a text input field and a search button. Underneath, it says "Select Module(s) to View:" followed by a list box containing the following modules: Academic Writing, Advanced Database Systems, Advanced Drilling Engineering, Advanced Manufacturing Technology, Advanced Reservoir Simulation, and Advanced Well Test Analysis. Below the list box, there is a "Select Report Type:" dropdown menu currently set to "Grid Timetable". At the bottom of the main content area, there are two buttons: "View Timetable" and "Reset". At the very bottom of the page, there is a footer with the text "UTP Home Page" on the left and "For further information please email to [Coordinator](#)" on the right.

Figure 8 : Main Page of UTP timetabling

For the prototype functionality, only 3 courses included in project to focus on timetable generator first and then credibility.

4.2 Result and Discussion

Another main focus is to keep the interface as simple as possible while at same time user friendly where all the information user needs are easily access to. Below are proposed interface of first step in timetable generator:

Personal Timetable

Home | Settings

Choose Course Taken

-
-
-

Need More?:

Figure 9 : Main page in Personal Timetable Generator

The main page of this project is user friendly where the students only need to choose what course they want and if they take more than 4 courses, the button function for add course is available. To get optimum result, students have to sort the courses based on priority so it easy for student to delete courses. After choose course taken, generate timetable button will directly go to generated timetable page.

Personal Timetable

Home | Settings

Generated Timetable

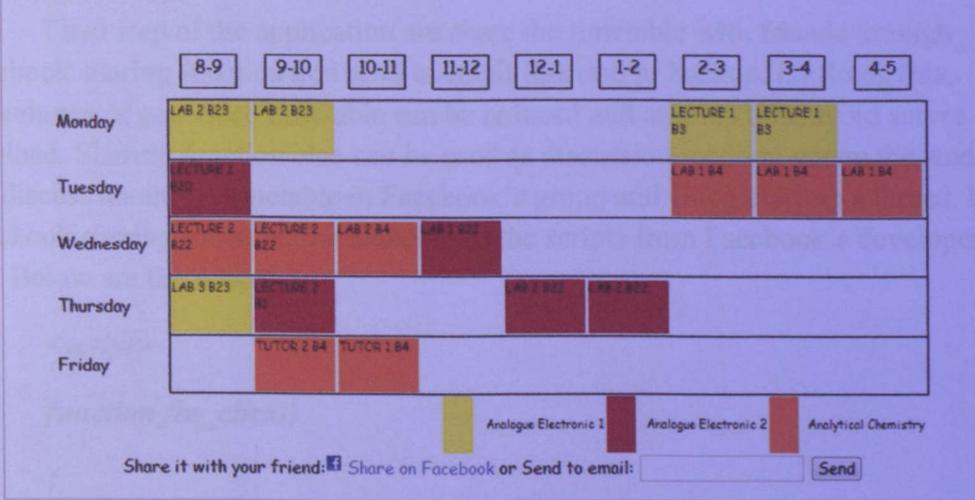

Figure 10 : Generated Timetable Page

The generated timetable will sort the courses in specific time from UTP Timetabling Centre and each course will be given unique colour label to satisfy Human Computer Interaction criteria. However, if clashed happen, the alert will appear above the generated timetable as shown below:

Personal Timetable

Home | Settings

Generated Timetable

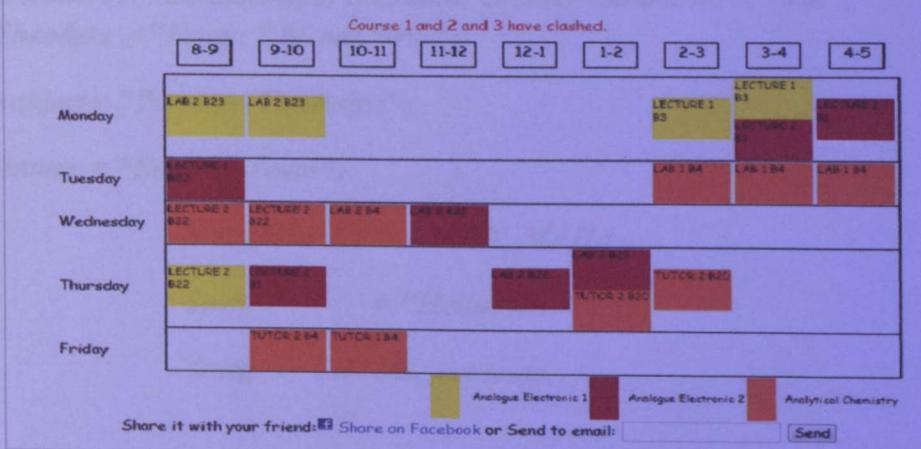

Figure 11 : Alert Window for Clash

When clash detected, the application will show where the clash occur and by this function, students can show to the lecturer this generated timetable in case the lecturer can define the courses allocation so the students can enrol all courses without clash.

Final step of the application are share the timetable with friends through Facebook sharing function and send to email function as backup. By doing this, redundancy of generated timetable can be reduced and at same time avoid server overload. Sharing function also can be used as discussion medium where the students can discuss about the timetable in Facebook's group and GoogleGroup's thread. For Facebook sharing function, the author uses the scripts from Facebook's developer site. Below are the scripts:

```
<script>

function fbs_click()
{
u=location.href;t=document.title;
window.open('http://www.facebook.com/sharer.php?u='+encodeURIComponent(u)+'&t='+encodeURIComponent(t),'sharer','toolbar=0,status=0,width=626,height=436');return false;}

</script>
```

For email-to function, below are the scripts:

```
$from = $_POST['mail'];
// To send HTML mail, the Content-type header must be set
$headers = 'MIME-Version: 1.0' . "\r\n";
$headers .= 'Content-type: text/html; charset=iso-8859-1' . "\r\n";
$headers .= "From: ".$from . "\r\n";

subject = "Personal Timetable";

$name = "Support Team";

$recipient = ADMIN_MAIL;

$msg = "Hello,<br/>";

$msg .= $HTML_contents;

//$msg .= "<b>Comments:</b>-" . $comments . "<br/>";
```

```
$msg .= <br/><br/>Regards<br/>".$name."<br/>".$from;
```

```
if (mail($recipient, $subject, $msg,$headers))
```

```
{ nl2br("<b>Message Sent:</b>
```

```
To: $recipient
```

```
Subject: $subject
```

```
Message:$msg");
```

```
}
```

If further enhancement is needed, the author will try to avoid using open source software as far as possible. This is because most of big university will tend to avoid the system containing open source software. This is due copyright issue in open source software does not have developers to refer.

CHAPTER 5

CONCLUSION AND RECOMMENDATIONS

5.1 Conclusion

This project will develop a new system that generate personal unique timetable for students in UTP. All functions contained in this system integrate to be an efficient tools especially reducing time consumption and user friendly interface. The system developed from several sources of software such as Microsoft Excel 2007 for initial design during prototyping process and EasyPHP Bundle where the main application will develop using this tool because easiness of using, portable and compatible in almost Windows Operating System. Moreover, current timetabling based on ASP. Net from Microsoft where the developers need to buy a license compared to EasyPHP which is open source and can create dynamic web site like ASP. Net.

In conclusion, the current research aims to reduce time consumption and create more user friendly application based on Human Computer Interaction criteria. The achievable of listed objective can bring this project to new milestone where better platform can be provided and system will be implemented in UTP Timetabling Information Centre.

5.2 Recommendations

If further enhancement been done, the author will try to avoid using open source software as the tools needed. This is because most of big university will tend to reject the system contained open source software. This is due copyright issue as open source software does not have any specific developers to refer.

Due to time constraint, several interfaces could not be finished and below are several recommendation will need in further enhancement.

5.2.1 Develop more user friendly interaction using jQuery and JavaScript

In generated timetable, the alert only appears as simple notification without pop up which is will be more interactive and user friendly. The author recommends using JavaScript and below is example of interface that will pop up if any clashes happen:

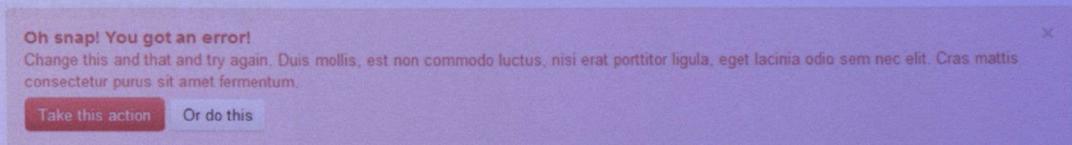

Figure 12 : Alert using Javascript

By using this alert notification, the user or students will be more alert on any clashed happen in generated timetable.

In generated timetable also, the courses inside are not interactive and less information contained. The author recommends using popovers function from JavaScript platform so more information can be insert. Below is example of popovers when student hover over the courses in generated timetable:

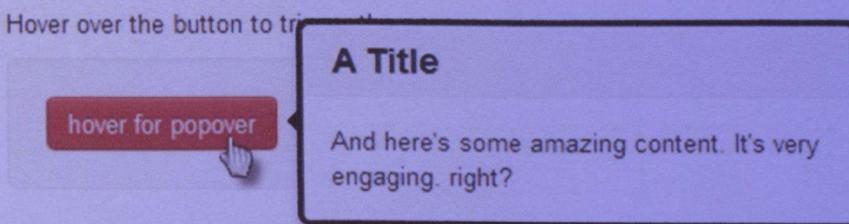

Figure 13 : Popover suggestion

Inside the popover, extra information can be output such as lecturer's info, credit hours and so on.

In prototype, there are only 3 courses in database but in real university's database, hundreds of course available and this will cause difficulty for the user to scroll and search desired courses. To overcome this problem, the author recommends using typeaheads function from JavaScript's platform as shown below:

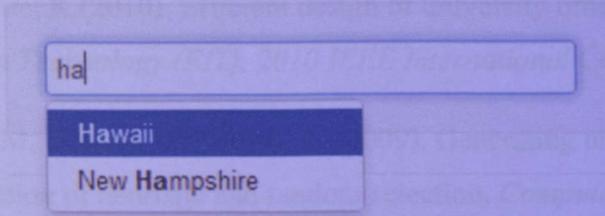

Figure 14 : Typeaheads Suggestion

Other than interface issues, the author also recommends to develop better algorithm in future where the timetable can be generated without any constraint at all and better user design.
