We read with great interest the profound and instructive review by Gilotra et al. on cardiac sarcoidosis.¹ However, we were surprised to see no comment on the raised possibility that steroids might precipitate electrical instability.² Ventricular tachyarrhythmias and electric storm have been

reported to frequently occur in the first 12 months after initiation of corticosteroid therapy.³ This is an issue of clinical importance and it would have been useful to include this in the review along with a commentary from the authors. □
