

INTRO/ABSTRACT

To create an open source platform that will be used as a full fledged IT department management system. Ultimately to provide a free full fledged licensed management system

METHODS

1) We have split the complete project in to mini modules

Eg: for db connection

We created a folder called db connection.

Where it will take care of connection php application to backend MySQL db.

2. We used session management in our project ...with out login no one access our application pages.

3. We followed a approach "Separation of concern".

Which means we created a new folder structure based on the menu requirements. For eg : Management , Data , Security & Licensing etc..

We have created 4 different tabs in the website. The login page, IT Department, Management, Data, Software/licensing.
