LIST OF RIVERS SUBJECTED TO SHORELANDS ZONING  
AND SUBDIVISION CONTROLS

Public Law 564, enacted by the 106th Legislature, "An Act to Extend the Deadline for Mandatory Shoreland Zoning", directs the State Planning Office to prepare a list of rivers whose shorelands shall be subjected to zoning and subdivision controls. A river, so subjected, is defined in this Act as "any free flowing body of water from that point at which it provides drainage for a watershed of 25 square miles to its mouth." Since all salt water is also subjected to shoreland zoning and subdivision controls, the mouth of a river is taken to be the head of tide, a geographically definable location. For purposes of clarification a number of small coastal rivers which are mostly or completely estuarine have been listed. They are to be considered as part of the "salt water" phase of significant water bodies.

The remainder of the list comprises freshwater rivers and streams above the head of tide. They are grouped as follows:

1. Minor Coastal Rivers
2. Major Coastal River Basins
3. Major River Basins

The sequence of river listing within river basin categories proceeds from the mouth and works upstream, conforming to the river and stream numeric code developed for MIDAS. The MIDAS stream number is listed for each river in order to provide a

HD  
211  
M2

means to relate each river name to basic information about each river which could, in the future, be extracted and summarized upon requests made to MIDAS. Counties and minor civil divisions in which each river occurs are listed except that for several of the very large rivers only the pertinent counties are listed. Also listed is the upstream limit, above which a river is not subjected to zoning and subdivision controls. It should be pointed out that these upstream limits usually drain land of more than 25 square miles, because the most frequent type of limit is the confluence of two streams, each of which drains less than 25 square miles but both usually sum up to more than 25 square miles. Several up-stream limits were adjusted slightly to conform to physical features such as intersecting roads. Very infrequently latitude and longitude coordinates were required to locate an upstream limit.

The map overlay system at a scale of 1:250,000, developed by the Water Resources Planning Division of the State Planning Office was used to determine rivers and their upstream limits. Through trial and error measurement of watershed areas by use of a dot grid, the nearest fit to 25 square-mile watersheds was established and related to geographic places. A map of Maine at a scale of 1:250,000 showing significant rivers has been prepared to accompany this list. A reproducible master will be filed in the State Planning Office. This map will show water, county-minor civil division lines, broadened lines of significant rivers darkened for emphasis and the tidal reach of ocean water at the coast shaded differentially to be distinguished from river lines.

A Table of Contents locates major drainage divisions, and an Index of Minor Civil Divisions provides cross-tabulation to correlate significant rivers and their locations.

Burton R. Anderson
