## Introduction

The suborder Symphyta (Insecta: Hymenoptera) includes plant-feeding sawflies, horntails and parasitic orussid wasps (Orussidae), which parasitize wood-boring insects (Smith, 1988). Sawflies are economically important insects which contain major forest and horticulture pests with wide distribution in the world (Viitasaari, 2002). There are about 800 genera and more than 8000 species within 14 families of sawflies in the world, where about 1800 species in 11 families occur in the West Palaearctic region (Taeger *et al.*, 2010). Major faunistic works on this group were conducted by Mallach (1931), Zirngiebl (1956), Benson (1968), Chevin (1985) and Khayrandish *et al.* (2015, in press). Prior to this work, 178 species, 60 genera and 9 families of sawflies had been recorded from Iran (Khayrandish *et al.*, 2017).

## Material and Methods

Sawfly specimens of the Hayk Mirzayans Insect Museum (HMIM), located at the Iranian Research Institute of Plant Protection (IRIPP), Tehran, Iran, were examined and about 300 specimens were identified to species level. The specimens were mostly collected by the entomologists of the Insect Taxonomy Research Department of IRIPP between 1945 and 2013. The identifications were made possible using the keys by Gussakovskij (1935), Benson (1951, 1952, 1958, 1962, 1968), Quinlan & Gauld (1981), Zhelochovtsev & Zinovgev (1993) and Zombori (1981, 1982a, 1982b, 1984).

## Results

We have identified 60 sawfly species, and record here the species *Abia candens* Konow, 1887; *Pristiphora appendiculata* (Hartig, 1837); *Macrophyia chrysura* (Klug, 1817) and *Tenthredopsis nassata* (Geoffroy, 1785) for the first time from Iran.

## Discussion

According to the previous studies, 18 species of Argidae, nine species of Cephidae, four species of Cimbicidae, seven species of Megalodontesidae, two species of Orussidae, three species of Pamphiliidae, two species of Siricidae, two species of Xiphydriidae and 131 species of Tenthredinidae have been reported from Iran until now (Khayrandish *et al.*, 2012, 2015, 2017, in press; Khosravi *et al.*, 2014; Taeger & Blank, 2011; Abai, 2009; Shahmohammadi *et al.*, 2008; Wei, 2008; Taeger, 2002; Shinohara, 1997; Modarres Awal, 1997; Ebrahimi, 1995; Shahrokh & Zare, 1995; Beneš & Abai, 1991; Koch, 1988; Chevin, 1985; Beneš, 1981; Benson, 1968; Zirngiebl, 1956; Gussakovskij, 1935; Mallach, 1931). We have here reported further four species from Iran and increased the total number of sawflies of Iran to 182 species. The species *Ametastegia persica*, *Craesus persicus* and *Macrophya diaphenia* are considered endemic to Iran (Khayrandish *et al.*, 2017). The Iranian fauna of Symphyta is very similar to the countries of western Palaearctic region (Taeger & Blank, 2011; Benson, 1968; Çalma ur & Özbek, 2004a, 2004b; Taeger & Blank, 2011).

Among the reported families, Tenthredinidae with 38 (63.33%), Cephidae with six (10%) genera, Tenthredinidae with 135 (73.77%), and Argidae with 18 (9.84%) species have the highest number of genera (Table 1).

**Table 1.** Frequency and abundance of sawflies (Hymenoptera: Symphyta) in Iran.

	Number	Percentage	Number	percentage

The provinces of Gilan, with 38 genera and 79 species, Mazandaran, with 32 genera and 78 species, and Alborz, with 23 genera and 43 species, host the highest number of genera and species of sawflies in Iran (Table 2).
