

# More Functions Related to $\check{S}A^*$ - Open Set in Soft Topological Spaces

P. Anbarasi Rodrigo<sup>1</sup>  
S. Anitha Ruth<sup>2</sup>

## Abstract

In this paper, we introduce some soft functions like  $\check{S}$  Strongly  $\alpha^*$  - continuous function,  $\check{S}$  Perfectly  $\alpha^*$  - continuous function,  $\check{S}$  Totally  $\alpha^*$  - continuous function. We study the connections of these function with other  $\check{S}$  function. Also, we establish the relationships in between the above functions and also investigate various aspects of these functions.

**Keywords:** soft functions, continuous function

## 1. Introduction

Molodtsov introduced the concept of soft sets from which the difficulties of fuzzy sets, intuitionistic fuzzy sets, vague sets, interval mathematics and rough sets have been rectified. Application of soft sets in decision making problems has been found by Maji et al. whereas Chen gave a parametrization reduction of soft sets and a comparison of it with attribute reduction in rough set theory. Further soft sets are a class of special information.

Shabir and Naz introduced soft topological spaces in 2011 and studied some basic properties of them. Meanwhile generalized closed sets in topological spaces were introduced by Levine in 1970 and recent survey of them is in which is extended to soft topological spaces in the year 2012. Further Kannan and Rajalakshmi have introduced soft  $g$  – locally closed sets and soft semi star generalized closed sets. Soft strongly  $g$  – closed sets have been studied by Kannan, Rajalakshmi and Srikanth. Chandrasekhara Rao and Palaiappan introduced generalized star closed sets in topological spaces and it is extended to the bitopological context by Chandrasekhara Rao and Kannan.

Recently papers about soft sets and their applications in various fields have increased largely. Modern topology depends strongly on the ideas of set theory. Any Research work should result in addition to the existing knowledge of a particular concept. Such an effort not only widens the scope of the concept but also encourages others to explore new and newer ideas. Therefore, in this work we introduce a new soft generalized set called  $\check{S}\alpha^*$  open set and its related properties. This may be another starting point for the new soft set mathematical concepts and structures that are based on soft set theoretic operations.

## 2. Preliminaries

In this section, this project  $X$  be an initial universe and  $\hat{E}$  be a set of parameters. Let  $P(X)$  denote the power set of  $X$  and  $A$  be a non – empty subset of  $\xi$ . A pair  $(F^s, A)$  denoted by  $F^s_a$  is called a soft set over  $X$ , where  $F^s$  is a mapping given by  $F^s: A \rightarrow P(X)$ .

**Definition2.1.1 [8]** For two soft sets  $(F^s, A)$  and  $(G, B)$  over a common universe  $X$ , we say that  $(F^s, A)$  is a soft subset of  $(G, B)$  denoted by  $(F^s, A) \subseteq_s (G, B)$ , if

- i.  $A \subseteq_s B$  and
- ii.  $F^s(e) \subseteq_s G(e)$  for all  $e \in \xi$

**Definition2.1.2 [8]** The complement of a soft set  $(F^s, A)$  denoted by  $(F^s, A)^c$  is defined by  $((F^s, A))^c = ((F^{sc}, A)$ , where  $F^{sc}: A \rightarrow P(X)$  is a mapping given by  $F^{sc}(e) = X - F^s(e)$ , for all  $e \in \xi$ .

**Definition2.1.[8]** A Subset of a  $\check{S}$ topological space  $(X, \tau_s, \xi)$  is said to be

1. a  $\check{S}$  Semi-Open set
2. if  $(F^s, \hat{E}) \subseteq_s \check{S}Cl(\check{S}int(F^s, \hat{E}))$  and a  $\check{S}$  Semi-Closed set if  $\check{S}int(\check{S}Cl(F^s, \hat{E})) \subseteq_s (F^s, \hat{E})$ .
3. a  $\check{S}$  Pre-Open set [1] if  $(F^s, \hat{E}) \subseteq_s \check{S}Int(\check{S}Cl(F^s, \hat{E}))$  and a  $\check{S}$ Pre-Closed set if  $\check{S}Cl(\check{S}Int(F^s, \hat{E})) \subseteq_s (F^s, \hat{E})$ .

- $\text{int}(F^s, \hat{E}) \subseteq_s (F^s, \hat{E})$  a  $\check{S}$   $\alpha$ -Open set [1] if  $(F^s, \hat{E}) \subseteq_s \check{S} \text{In}(\check{S} \text{Cl}(\text{int}(F^s, \hat{E})))$  and a  $\check{S}$   $\alpha$ -Closed set if  $\check{S} \text{Cl}(\check{S} \text{int}(\check{S} \text{Cl}(F^s, \hat{E}))) \subseteq_s (F^s, \hat{E})$ .
4. a  $\check{S}$   $\beta$ -Open set [1] if  $(F^s, \hat{E}) \subseteq_s \check{S} \text{cl}(\check{S} \text{int}(\check{S} \text{cl}(F^s, \hat{E})))$  and a  $\check{S}$   $\beta$ -Closed set if  $\check{S} \text{Int}(\check{S} \text{Cl}(\text{int}(F^s, \hat{E}))) \subseteq_s (F^s, \hat{E})$ .
  5. a  $\check{S}$   $\alpha$ -generalized Closed set (briefly  $\check{S}$ gs-Closed) if  $\check{S} \text{Cl}(F^s, \hat{E}) \subseteq_s (G, \xi)$  whenever  $(F^s, \hat{E}) \subseteq_s (G, \xi)$  and  $(G, \xi)$  is  $\check{S}$  Open in  $(X, \tau_s, \xi)$ . The complement of a  $\check{S}$  gs-Closed set is called a  $\check{S}$ gs-Open set.
  6. a  $\check{S}$  Semi-generalized Closed set (briefly  $\check{S}$  Sg-Closed) if  $\check{S} \text{Cl}(F^s, \hat{E}) \subseteq_s (G, \xi)$  whenever  $(F^s, \hat{E}) \subseteq_s (G, \xi)$  and  $(G, \xi)$  is  $\check{S}$ semi Open in  $(X, \tau_s, \xi)$ . The complement of a  $\check{S}$  Sg-Closed set is called a  $\check{S}$  Sg-Open set.
  7. a generalized  $\check{S}$  Semi-Closed set (briefly gs-Closed) if  $\check{S} \text{Cl}(F^s, \hat{E}) \subseteq_s (G, \xi)$  whenever  $(F^s, \hat{E}) \subseteq_s (G, \xi)$  and  $(G, \xi)$  is  $\check{S}$ Open in  $(X, \tau_s, \xi)$ . The complement of a  $\check{S}$ gs-Closed set is called a  $\check{S}$ gs-Open set.
  8. a  $\check{S}$   $\omega$ -Closed [9] if  $\check{S} \text{Cl}(F, \xi) \subseteq_s (G, \xi)$  whenever  $(F, \xi) \subseteq_s (G, \xi)$  and  $(G, \xi)$  is  $\check{S}$ semi Open in  $(X, \tau_s, \xi)$ .
  9. a  $\check{S}$   $\omega$ -Closed [9] if  $\check{S} \text{Cl}(F^s, \hat{E}) \subseteq_s (G, \xi)$  whenever  $(F, \xi) \subseteq_s (G, \xi)$  and  $(G, \xi)$  is  $\check{S}$  semi Open.
  10. a  $\check{S}$   $\alpha$ -generalized Closed set (briefly  $\check{S}$   $\alpha$ g-Closed) if  $\alpha \check{S} \text{Cl}(F^s, \hat{E}) \subseteq_s (G, \xi)$  whenever  $(F^s, \hat{E}) \subseteq_s (G, \hat{E})$  and  $(G, \hat{E})$  is  $\check{S}$   $\alpha$ Open in  $(X, \tau_s, \hat{E})$ . The complement of a  $\check{S}$   $\alpha$ g-Closed set is called a  $\check{S}$   $\alpha$ g-Open set.
  11. a  $\check{S}$  generalized  $\alpha$  Closed set (briefly  $\check{S}$ g $\alpha$ -Closed) if  $\alpha \check{S} \text{Cl}(F^s, \hat{E}) \subseteq_s (G, \hat{E})$  whenever  $(F^s, \hat{E}) \subseteq_s (G, \hat{E})$  and  $(G, \hat{E})$  is  $\check{S}$  Open in  $(X, \tau_s, \hat{E})$ . The complement of a  $\check{S}$  g $\alpha$ -Closed set is called a  $\check{S}$ g $\alpha$ -Open set.
  12. A  $\check{S}$  generalized pre Closed set (briefly  $\check{S}$ gp-Closed)[1] if  $p \check{S} \text{Cl}(F^s, \hat{E}) \subseteq_s (G, \hat{E})$  whenever a  $\check{S}$  gp-Open set.
  13. a  $\check{S}$  generalized pre regular Closed set (briefly  $\check{S}$ gpr-Closed) [5] if  $p \check{S} \text{Cl}(F^s, \hat{E}) \subseteq_s (G, \hat{E})$  whenever  $(F^s, \hat{E}) \subseteq_s (G, \hat{E})$  and  $(G, \hat{E})$  is  $\check{S}$  regular Open in  $(X, \tau_s, \hat{E})$ . The complement of a  $\check{S}$ gpr-Closed set is called a  $\check{S}$  gpr - Open set.

### 3.1 Strongly $\check{S}\alpha^*$ -continuous function

**Definition 3.1.1:** A  $\check{S}$  function  $f: (X, \tau_s, \hat{E}) \longrightarrow (Y, \tau_s, K)$  is said to be strongly  $\check{S}\alpha^*$ -continuous function, if the inverse image of every  $\check{S}$   $\alpha^*$ -  $\hat{O}(Y)$  in  $(Y, \tau_s, K)$  is  $\check{S}$  -  $\hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ .

**Theorem 3.1.2:** Let  $f: (X, \tau_s, \hat{E}) \longrightarrow (Y, \tau_s, K)$  be strongly  $\check{S}\alpha^*$ -continuous function, then it is  $\check{S}$ -continuous function.

Proof:

Let  $(F^s, \hat{E})$  be  $\check{S}$  -  $\hat{O}(X)$  in  $(Y, \tau_s, K)$ . Since every  $\check{S}$  -  $\hat{O}(X)$  is  $\check{S}$   $\alpha^*$ -  $\hat{O}(X)$ , then  $(F^s, \hat{E})$  is  $\check{S}$   $\alpha^*$ -  $\hat{O}(X)$  in  $(Y, \tau_s, K)$ . Since,  $f$  is strongly  $\check{S}\alpha^*$ -continuous function,  $f^{-1}(F^s, \hat{E})$  is  $\check{S}$  -  $\hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ . Therefore,  $f$  is  $\check{S}$ -continuous.

**Remark 3.1.3:** The converse of the above theorem need not be true.

**Example 3.1.4:** Let  $X = \hat{Y} = \{x_1, x_2\}$ ,  $\tau_s = \{F^s_1, F^s_2, F^s_3, F^s_{15}, F^s_{16}\}$ , and  $\sigma_s = \{F^s_3, F^s_{11}, F^s_{12}, F^s_{15}, F^s_{16}\}$ ,  
 $\check{S} \alpha^* - \hat{O}(\hat{Y}) = \{F^s_1, F^s_2, F^s_3, F^s_7, F^s_8, F^s_9, F^s_{10}, F^s_{11}, F^s_{12}, F^s_{13}, F^s_{14}, F^s_{15}, F^s_{16}\}$ . Let  $f : (X, \tau_s, \hat{E}) \rightarrow (\hat{Y}, \tau_s, K)$  be defined by  $f(F^s_1) = F^s_3$ ,  $f(F^s_2) = F^s_{11}$ ,  $f(F^s_3) = F^s_{12}$ ,  $f(F^s_4) = F^s_1$ ,  $f(F^s_5) = F^s_2$ ,  $f(F^s_6) = F^s_{13}$ ,  $f(F^s_7) = F^s_4$ ,  $f(F^s_8) = F^s_{14}$ ,  $f(F^s_9) = f(F^s_{10}) = f(F^s_{11}) = f(F^s_{12}) = F^s_2$ ,  $f(F^s_{13}) = F^s_9$ ,  $f(F^s_{14}) = F^s_6$ ,  $f(F^s_{15}) = F^s_{15}$ ,  $f(F^s_{16}) = F^s_{16}$ . Clearly  $f$  is  $\check{S}$ -continuous but not strongly  $\check{S} \alpha^*$ -continuous function, because  $f^{-1}(F^s_4)$  is not  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ .

**Theorem 3.1.5:** Let  $f : (X, \tau_s, \hat{E}) \rightarrow (\hat{Y}, \tau_s, K)$  be strongly  $\check{S} \alpha^*$ -continuous function iff the inverse image of every  $\check{S} \alpha^* - \check{C}(\hat{Y})$  in  $(\hat{Y}, \tau_s, K)$  is  $\check{S} - \check{C}(X)$  in  $(X, \tau_s, \hat{E})$

Proof:

Assume that  $f$  is strongly  $\check{S} \alpha^*$ -continuous function. Let  $(F^s, \xi)$  be any  $\check{S} \alpha^* - \check{C}(X)$  in  $(\hat{Y}, \tau_s, K)$ . Then,  $(F^s, \hat{E})^c$  is  $\check{S} \alpha^* - \hat{O}(X)$  in  $(\hat{Y}, \tau_s, K)$ . Since  $f$  is strongly  $\check{S} \alpha^*$ -continuous function.

$f^{-1}((F^s, \hat{E})^c)$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ . But  $f^{-1}((F^s, \xi)^c) = X - f^{-1}((F^s, \xi))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E}) \Rightarrow f^{-1}((F^s, \hat{E}))$  is  $\check{S} - \check{C}(X)$  in  $(X, \tau_s, \hat{E})$ . Conversely, assume that the inverse image of every  $\check{S} \alpha^* - \check{C}(X)$  in  $(\hat{Y}, \tau_s, K)$  is  $\check{S} - \check{C}(X)$  in  $(X, \tau_s, \hat{E})$ . Let  $(F^s, \hat{E})$  be any  $\check{S} \alpha^* - \hat{O}(X)$  in  $(\hat{Y}, \tau_s, K)$ . Then,  $(F^s, \hat{E})^c$  is  $\check{S} \alpha^* - \check{C}(X)$  in  $(\hat{Y}, \tau_s, K)$ . By assumption,  $f^{-1}((F^s, \hat{E})^c)$  is  $\check{S} - \check{C}(X)$  in  $(X, \tau_s, \hat{E})$ . But  $f^{-1}((F^s, \hat{E})^c) = X - f^{-1}((F^s, \hat{E}))$  is  $\check{S} - \check{C}(X)$  in  $(X, \tau_s, \hat{E}) \Rightarrow f^{-1}((F^s, \hat{E}))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ . Hence  $f$  is strongly  $\check{S} \alpha^*$ -continuous function.

**Theorem 3.1.6:** Let  $f : (X, \tau_s, \hat{E}) \rightarrow (\hat{Y}, \tau_s, K)$  be strongly  $\check{S}$ -continuous function then it is strongly  $\check{S} \alpha^*$ -continuous function.

Proof: Let  $(F^s, \hat{E})$  be any  $\check{S} - \hat{O}(X)$  in  $(\hat{Y}, \tau_s, K)$ . Since every  $\check{S} - \hat{O}(X)$  is  $\check{S} \alpha^* - \hat{O}(X)$ , Since  $f$  is strongly  $\check{S}$ -continuous function, then  $f^{-1}((F^s, \hat{E}))$  is both  $\check{S} - \hat{O}(X)$  and  $\check{S} - \check{C}(X)$  in  $(X, \tau_s, \hat{E})$ .

$\Rightarrow f^{-1}((F^s, \hat{E}))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ . Hence  $f$  is strongly  $\check{S} \alpha^*$ -continuous function.

**Remark 3.1.7:** The converse of the above theorem need not be true.

**Example 3.1.8:** Let  $X = \hat{Y} = \{x_1, x_2\}$ ,  $\tau_s = \{F^s_1, F^s_2, F^s_3, F^s_5, F^s_7, F^s_8, F^s_9, F^s_{10}, F^s_{12}, F^s_{13}, F^s_{14}, F^s_{15}, F^s_{16}\}$ ,  $\tau_s^c = \{F^s_1, F^s_2, F^s_4, F^s_6, F^s_7, F^s_8, F^s_9, F^s_{10}, F^s_{13}, F^s_{14}, F^s_{15}, F^s_{16}\}$ , and  $\sigma_s = \{F^s_1, F^s_{13}, F^s_{15}, F^s_{16}\}$ ,  
 $\check{S} \alpha^* - \hat{O}(\hat{Y}) = \{F^s_1, F^s_3, F^s_7, F^s_8, F^s_{11}, F^s_{12}, F^s_{13}, F^s_{15}, F^s_{16}\}$ . Let  $f : (X, \tau_s, \hat{E}) \rightarrow (\hat{Y}, \tau_s, K)$  be defined by  $f(F^s_1) = F^s_5$ ,  $f(F^s_2) = F^s_2$ ,  $f(F^s_3) = F^s_3$ ,  $f(F^s_4) = F^s_4$ ,  $f(F^s_5) = F^s_5$ ,  $f(F^s_6) = F^s_6$ ,  $f(F^s_7) = F^s_7$ ,  $f(F^s_8) = F^s_8$ ,  $f(F^s_9) = F^s_9$ ,  $f(F^s_{10}) = F^s_{10}$ ,  $f(F^s_{11}) = F^s_{11}$ ,  $f(F^s_{12}) = F^s_{12}$ ,  $f(F^s_{13}) = F^s_{13}$ ,  $f(F^s_{14}) = F^s_4$ ,  $f(F^s_{15}) = F^s_{15}$ ,  $f(F^s_{16}) = F^s_{16}$ . Clearly  $f$  is strongly  $\check{S} \alpha^*$ -continuous function but not strongly  $\check{S}$ -continuous function, Since  $f^{-1}(F^s_5)$  is  $\check{S} - \hat{O}(X)$  but not  $\check{S} - \check{C}(X)$

**Theorem 3.1.13:** Let  $f : (X, \tau_s, \hat{E}) \rightarrow (\hat{Y}, \tau_s, K)$  be strongly  $\check{S} \alpha^*$ -continuous function and  $g : (X, \sigma_s, \hat{E}) \rightarrow (\hat{Z}, \eta_s, K)$  be  $\check{S} \alpha^*$ -continuous function, then

*More Functions Related to  $\check{S}\alpha^*$  - Open Set in Soft Topological Spaces*

$g \circ f : (X, \tau_s, \hat{E}) \longrightarrow (Z, \eta_s, K)$  is  $\check{S}\alpha^*$ -continuous.

Proof: Let  $(F^s, \hat{E})$  be any  $\check{S} - \hat{O}(X)$  in  $(Z, \eta_s, K)$ . Since  $g$  is  $\check{S}\alpha^*$ -continuous, then  $g^{-1}((F^s, \hat{E}))$  is  $\check{S}\alpha^* - \hat{O}(X)$  in  $(Y, \sigma_s, K)$ . Since  $f$  is strongly  $\check{S}\alpha^*$ -continuous function, then  $f^{-1}(g^{-1}((F^s, \hat{E})))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E}) \Rightarrow (g \circ f)^{-1}((F^s, \hat{E}))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ . Hence  $g \circ f$  is  $\check{S}\alpha^*$ -continuous.

**Theorem 3.1.14:** Let  $f : (X, \tau_s, \hat{E}) \longrightarrow (Y, \sigma_s, K)$  be strongly  $\check{S}\alpha^*$ -continuous function and  $g : (Y, \sigma_s, K) \longrightarrow (Z, \eta_s, K)$  be  $\check{S}\alpha^*$ -irresolute, then

$g \circ f : (X, \tau_s, \hat{E}) \longrightarrow (Z, \eta_s, K)$  is strongly  $\check{S}\alpha^*$ -continuous.

Proof: Let  $(F^s, \xi)$  be any  $\check{S}\alpha^* - \hat{O}(X)$  in  $(Z, \eta_s, K)$ . Since  $g$  is  $\check{S}\alpha^*$ -irresolute, then  $g^{-1}((F^s, \xi))$  is  $\check{S}\alpha^* - \hat{O}(X)$  in  $(Y, \sigma_s, K)$ . Since  $f$  is strongly  $\check{S}\alpha^*$ -continuous function, then  $f^{-1}(g^{-1}((F^s, \xi)))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E}) \Rightarrow (g \circ f)^{-1}((F^s, \xi))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ . Hence  $g \circ f$  is strongly  $\check{S}\alpha^*$ -continuous.

**Theorem 3.1.15:** Let  $f : (X, \tau_s, \hat{E}) \longrightarrow (Y, \sigma_s, K)$  be  $\check{S}\alpha^*$ -continuous and  $g : (Y, \sigma_s, K) \longrightarrow (Z, \eta_s, K)$  be strongly  $\check{S}\alpha^*$ -continuous function, then

$g \circ f : (X, \tau_s, \hat{E}) \longrightarrow (Z, \eta_s, K)$  is  $\check{S}\alpha^*$ -irresolute.

Proof: Let  $(F^s, \hat{E})$  be any  $\check{S}\alpha^* - \hat{O}(X)$  in  $(Z, \eta_s, K)$ . Since  $g$  is strongly  $\check{S}\alpha^*$ -continuous, then  $g^{-1}((F^s, \hat{E}))$  is  $\check{S} - \hat{O}(X)$  in  $(Y, \sigma_s, K)$ . Since  $f$  is  $\check{S}\alpha^*$ -continuous function, then  $f^{-1}(g^{-1}((F^s, \hat{E})))$  is  $\check{S}\alpha^* - \hat{O}(X)$  in  $(X, \tau_s, \hat{E}) \Rightarrow (g \circ f)^{-1}((F^s, \hat{E}))$  is  $\check{S}\alpha^* - \hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ . Hence  $g \circ f$  is  $\check{S}\alpha^*$ -irresolute.

**Theorem 3.1.16:** Let  $f : (X, \tau_s, \hat{E}) \longrightarrow (Y, \tau_s, K)$  be strongly  $\check{S}\alpha^*$ -continuous function and  $g : (X, \sigma_s, \hat{E}) \longrightarrow (Z, \eta_s, K)$  be strongly  $\check{S}\alpha^*$ -continuous function, then

$g \circ f : (X, \tau_s, \hat{E}) \longrightarrow (Z, \eta_s, K)$  is strongly  $\check{S}\alpha^*$ -continuous.

Proof: Let  $(F^s, \hat{E})$  be any  $\check{S}\alpha^* - \hat{O}(X)$  in  $(Z, \eta_s, K)$ . Since  $g$  is strongly  $\check{S}\alpha^*$ -continuous, then

$(g^{-1}(F^s, \hat{E}))$  is  $\check{S} - \hat{O}(X)$  in  $(Y, \tau_s, K)$ . Since  $f$  is strongly  $\check{S}\alpha^*$ -continuous function, then  $f^{-1}(g^{-1}((F^s, \hat{E})))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E}) \Rightarrow (g \circ f)^{-1}((F^s, \hat{E}))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ . Hence  $g \circ f$  is strongly  $\check{S}\alpha^*$ -continuous.

**Theorem 3.1.17:** Let  $f : (X, \tau_s, \hat{E}) \longrightarrow (Y, \sigma_s, K)$  be  $\check{S}$ -continuous function and  $g : (Y, \sigma_s, K) \longrightarrow (Z, \eta_s, K)$  be strongly  $\check{S}\alpha^*$ -continuous function, then

$g \circ f : (X, \tau_s, \hat{E}) \longrightarrow (Z, \eta_s, K)$  is strongly  $\check{S}\alpha^*$ -continuous.

Proof: Let  $(F^s, \hat{E})$  be any  $\check{S}\alpha^* - \hat{O}(X)$  in  $(Z, \eta_s, K)$ . Since  $g$  is strongly  $\check{S}\alpha^*$ -continuous, then

$g^{-1}((F^s, \hat{E}))$  is  $\check{S} - \hat{O}(X)$  in  $(Y, \sigma_s, K)$ . Since  $f$  is  $\check{S}$ -continuous function, then  $f^{-1}(g^{-1}((F^s, \hat{E})))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E}) \Rightarrow (g \circ f)^{-1}((F^s, \hat{E}))$  is  $\check{S} - \hat{O}(X)$  in  $(X, \tau_s, \hat{E})$ . Hence  $g \circ f$  is strongly  $\check{S}\alpha^*$ -continuous.
