However, there are no empirical studies to support discounts for controlling interests. Therefore, some appraisers do not believe that this discount should be taken. Instead, they find other ways to build it into their valuation. Many valuation analysts believe that the illiquidity of owning shares in a closely held business should be built into the discount rate. Frequently, they bury it into a higher discount rate or a lower multiple. But with that being said, the U.S. Tax Court has allowed DLOMs on controlling interests in the range of 3 percent to 33 percent, depending on the facts and circumstances. In the *Estate of Andrews v. Commissioner*, 79 T.C. 938 (U.S. Tax Court, November 29, 1982), the court found the following:

Even controlling shares in a nonpublic corporation suffer from lack of marketability because of the absence of a ready private placement market and the fact that floatation costs would have to be incurred if the corporation were to publicly offer its stock.

Later in this chapter, I will discuss private company discounts, which some analysts consider to be a form of a DLOM. There is some interesting data in that section, but don't jump ahead yet. You will get there soon.

## DLOM—The Qualitative Stuff

In this section, we are going to discuss restricted stock studies, pre-initial public offering (pre-IPO) studies, and other instances that will require you to do more talking than calculating. There is a considerable amount of important information in this section.

### Restricted Stock Studies

The most common sources of data for determining an appropriate level of a DLOM are studies involving restricted stock purchases or IPOs. Revenue Ruling 77-287 refers to the *Institutional Investor Study Report of the Securities and Exchange Commission*, which addresses restricted stock issues.<sup>1</sup> Many studies have updated this one.

*Restricted stock* (or *letter stock*, as it is sometimes called) is stock issued by a corporation that is not registered with the SEC and cannot be readily sold into the public market. The stock is frequently issued when a corporation is first going public, making an acquisition, or raising capital. Corporations issue restricted stock, rather than tradable stock, mainly to avoid (1) downward pressure on their stock price when an excessive number of shares are available for sale at any one time and (2) the costs of registering the securities with the SEC.

The registration exemption on restricted stocks is granted under Section 4(2) of the 1933 Securities Act (Securities Act). The intent of Section 4(2) is to provide “small” corporations with the ability to raise capital without incurring the costs of a public offering. Regulation D, a safe harbor regulation that became effective in 1982, falls under Section 4(2) of the Securities Act and provides uniformity in federal and state securities laws regarding private placements of securities. Securities bought under Regulation D are subject to restrictions, the most important being that the securities cannot be resold without either registration under the act or an exemption.<sup>2</sup> The exemptions for these securities are granted under Rule 144:

Rule 144 (17 C.F.R. 230.144 1980) allows the limited resale of unregistered securities after a minimum holding period of two years. Resale is limited to the higher of 1 percent of outstanding stock or average weekly volume over a 4 week period prior to the sale, during any three month period. There is no quantity limitation after a four year holding period.<sup>3</sup>

Therefore, to sell their stock on the public market, holders of restricted stock must either register their securities with the SEC or qualify for a Rule 144 exemption. A holder of restricted stock can, however, trade the stock in a private transaction. Historically, when traded privately, the restricted stock transaction was usually required to be registered with the SEC. However, in 1990, the SEC adopted Rule 144a, which relaxed the SEC filing restrictions on private transactions. The rule allows qualified institutional investors to trade unregistered securities among themselves without filing registration statements.<sup>4</sup> The primary purpose of Rule 144a was to make it easier for institutions that were prohibited from dealing in illiquid securities to buy and sell debt securities from large publicly traded corporations privately without the need for extensive SEC filings. In 1997, this rule was changed again, shortening the required holding period for these stocks to one year. In 2007, this rule was revised again to be effective in 2008, which further shortened the holding period to six months.

**Notes:**

General—Highlighted items signify changes to Rule 144 versus the immediately prior period.

1. Amendments to Rule 144 are applicable to securities acquired before or after the Effective Date.
2. Allows purchases by non-affiliates to tack the prior non-affiliate owner's holding period onto his/her own.
3. For exchange-listed and Nasdaq-quoted securities, up to the greater of (i) 1% of the outstanding shares of the same class being sold, or (2) the average reported weekly trading volume during the four weeks prior to sale. For OTC securities (OTCBB and Pink Sheets), 1% of the outstanding shares of the same class being sold.
4. Time period includes the Initial Holding Period. As an example, between 1997 and 2008, after 1 year non-affiliates may begin to sell shares in accordance with Rule 144's volume limitations. After 1 additional year (2 years total from the date of acquisition of the restricted shares), the shares may be sold freely.

The overall effect of these regulations on restricted stock is that when the stocks are issued, the corporation is not required to disclose a price, and on some occasions, even when they are traded, the value of restricted securities is not required to be a matter of public record.

Various studies have been performed relating to restricted stocks. Each of these studies attempts to quantify the discount taken against the freely traded price of minority shares in the public market. A list of the more frequently cited studies is included in table 15.2.

Too often, valuation analysts use the average discounts that are cited in business valuation publications and textbooks without reading the actual studies. This is both dangerous and negligent. A valuation analyst should understand these studies before using them. Keep in mind that many of these studies are old. Also, if the valuation analyst is going to use these studies, he or she needs to discuss the relevance of them to the valuation subject as of the valuation date.

## SEC Institutional Investor Study

As part of a major study of institutional investor actions performed by the SEC, the amount of discount at which transactions in restricted stock take place, compared with the prices of otherwise identical but unrestricted stock on the open market, was addressed. The report introduced the study with the following discussion about restricted stock:

Restricted securities are usually sold at a discount from their coeval market price, if any, primarily because of the restrictions on their resale. With the information supplied by the respondents on the purchase prices of the common stock and the dates of transaction, the Study computed the implied discounts in all cases in which it was able to locate a market price for the respective security on the date of the transaction.<sup>5</sup>

<sup>5</sup> *Institutional Investor Study Report of the Securities and Exchange Commission*, 2444.

A reproduction of table XIV-45 of the SEC *Institutional Investor Study*, which shows the size of the discounts at which restricted stock transactions took place compared with the prices, as of the same date, of the freely traded but otherwise identical stock is shown in table 15.3 (on the following page). The data shows that about half of the transactions (in terms of real dollars) took place at discounts ranging from 20 percent to 40 percent.

The discounts were lowest for those stocks that would be tradable on the New York Stock Exchange (NYSE) when the restrictions expired and were highest for those stocks that could be traded in the over-the-counter market when the restrictions expired. The overall average discount in this study was 25.8 percent. For stocks whose market would be nonreporting, over-the-counter companies when the restrictions expired, the average discount was approximately 32.6 percent. Think about the closely held company whose shares have no prospect of any market, it would make sense that the discount would have to be higher.

The research from the SEC *Institutional Investor Study* was the foundation for SEC Accounting Series Release No. 113 (October 13, 1969) and No. 1-18 (December 23, 1970), which require investment companies registered under the Investment Company Act of 1940 to disclose their policies about the cost and valuation of their restricted securities. As a result of the study, there is now an ongoing body of data about the relationship between restricted stock prices and their freely tradable counterparts. This body of data can provide empirical benchmarks for quantifying marketability discounts.

### Gelman Study

In 1972, Milton Gelman of National Economic Research Associates, Inc., published the results of his study of the prices paid for restricted securities by four closed-end investment companies specializing in restricted securities investments.<sup>6</sup> Gelman used data from 89 transactions between 1968 and 1970 and found that both the average and median discounts were 33 percent, and that almost 60 percent of the purchases were at discounts of 30 percent and higher. This data is consistent with the SEC study.

### Moroney Study

An article by Robert E. Moroney of the investment banking firm Moroney, Beissner & Co. contained the results of a study of the prices paid for restricted securities by 10 registered investment companies.<sup>7</sup> The study included 146 purchases at discounts ranging from 3 percent to 90 percent. The average discount was approximately 35.6 percent. Despite the fairly broad range, the average discount was, once again, in line with the other studies.

In this article, Moroney compared the evidence of actual cash transactions with the lower, average discounts for lack of marketability determined in some previous estate and gift tax cases. He stated that at the times of these other cases, there was no available evidence about the prices of restricted stocks that could have been used as a benchmark to help quantify these discounts. However, he suggested that higher discounts for lack of marketability should be allowed in the future as more relevant data becomes available. He stated

Obviously the courts in the past have overvalued minority interests in closely held companies for federal tax purposes. But most (probably all) of those decisions were handed down without benefit of the facts of life recently made available for all to see. Some appraisers have, for years, had a strong gut feeling that they should use far greater discounts for nonmarketability than the courts had allowed. From now on those appraisers need not stop at 35 percent merely because it's perhaps the largest discount clearly approved in a court decision. Appraisers can now cite a number of known arm's length transactions in which the discount ranged up to 90 percent.<sup>8</sup>

(Source: Institutional Investor Study Report of the Securities and Exchange Commission, H.R. Doc. No. 64, Part 5, 92nd Cong., 1st Session 1971, Table XIV-45.)

Approximately four years later, Moroney wrote another article in which he stated that courts had started to recognize higher discounts for lack of marketability:

The thousands and thousands of minority holders in closely held corporations throughout the United States have good reason to rejoice because the courts in recent years have upheld illiquidity discounts in the 50 percent area.<sup>9</sup>

Despite Moroney's writings, the courts have not universally accepted large discounts. We have witnessed some discounts that were larger than the average, but overall, the courts are still somewhat reluctant to recognize the difficulty in obtaining liquidity for an illiquid asset.

### **Maier Study**

J. Michael Maier of Connecticut General Life Insurance Co. conducted another interesting study on lack of marketability discounts for closely held business interests.<sup>10</sup> The results of this well-documented study were published in the September 1976 issue of *Taxes*. Using an approach similar to Moroney's, Maier compared the prices paid for restricted stocks with the market prices of their unrestricted counterparts. The data covered the five-year period from 1969–1973. The study showed that “the mean discount for lack of marketability for the years 1969–1973 amounted to 35.43 percent.”<sup>11</sup> In an attempt to eliminate abnormally high and low discounts, Maier eliminated the top and bottom 10 percent of the purchases. Guess what? The resulting average discount was 34.73 percent, almost the exact same discount that was derived without the top and bottom items removed.

Maier's remarks are a good learning tool because he distinguishes between a discount for lack of marketability and a lack of control discount:

The result I have reached is that most appraisers underestimate the proper discount for lack of marketability. The results seem to indicate that this discount should be about 35 percent. Perhaps this makes sense because by committing funds to restricted common stock, the willing buyer (a) would be denied the opportunity to take advantage of other investments, and (b) would continue to have his investment at the risk of the business until the shares could be offered to the public or another buyer is found.

The 35 percent discount would not contain elements of a discount for a minority interest because it is measured against the current fair market value of securities actively traded (other minority interests). Consequently, appraisers should also consider a discount for a minority interest in those closely held corporations where a discount is applicable.<sup>12</sup>

Now the plot thickens. Not only were larger discounts seen, but now there were opinions (other than mine) that more than one discount could be applicable. This could mean that interests in smaller, closely held companies that are being valued should be discounted quite a bit when they are compared with interests in publicly traded guideline companies.

### **Trout Study**

The next study that we learned about was performed by Robert R. Trout.<sup>13</sup> Trout was with the Graduate School of Administration, University of California—Irvine, and Trout, Shulman & Associates. Trout's study of restricted stocks covered the period 1968–1972 and addressed the purchases of these securities by mutual funds. Trout attempted to construct a financial model that would provide an estimate of the discount appropri-

9 Robert E. Moroney, “Why 25% Discount for Nonmarketability in One Valuation, 100% in Another,” *Taxes* (1977): 316–320. Edwin A. Gallun, 33 T.C.M. 1316 (1974), allowed 55 percent. *Estate of Maurice Gustave Heckscher*, 63 T.C. 485 (1975), allowed 48 percent. Although *Estate of Ernest E. Kirkpatrick*, 34 T.C.M. 1490 (1975), found per share values without mentioning discount, expert witnesses for both sides used 50 percent the first time a government witness recommended 50 percent. A historic event, indeed!

10 J. Michael Maier, “Discounts for Lack of Marketability for Closely Held Business Interests,” *Taxes* (1976): 562–571.

11 *Ibid.*, 571.

12 *Ibid.*

13 Robert R. Trout, “Estimation of the Discount Associated With the Transfer of Restricted Securities,” *Taxes* (1977): 381–385.

ate for a private company's stock. Creating a multiple regression model involving 60 purchases, Trout measured an average discount of 33.45 percent for restricted stock from freely traded stock. I used to think that this was quite a coincidence, or these guys were in cahoots, but the truth is that it is not a coincidence and they are not in cahoots. The reality is that there was a fairly tight range among all the studies when the economic situation, period of restriction, and market conditions were somewhat similar.

### Standard Research Consultants Study

In 1983, Standard Research Consultants analyzed private placements of common stock to test the applicability of the SEC *Institutional Investor Study*.<sup>14</sup> Standard Research studied 28 private placements of restricted common stock from October 1978 to June 1982. The discounts ranged from 7 percent to 91 percent, with a median of 45 percent, a bit higher than the discounts seen in the other studies. During this period, however, the economy experienced extraordinarily high interest rates.

Only 4 of the 28 companies studied had unrestricted common shares traded on either the American Stock Exchange or the NYSE, and their discounts ranged from 25 percent to 58 percent with a median of 47 percent—not significantly different from the 45 percent median of the remaining companies that traded in the over-the-counter market.

### Willamette Management Associates, Inc., Study

Willamette Management Associates analyzed private placements of restricted stocks for the period from January 1, 1981 to May 31, 1984.<sup>15</sup> In discussing this unpublished study, Willamette states that the early part of it overlapped with the last part of the Standard Research Study, but there were very few transactions that took place during the period of overlap. According to the discussion of the study in Pratt's *Valuing a Business*, 5th edition, most of the transactions in the study took place in 1983.

For this time period, Willamette identified 33 transactions that could be classified as arm's length transactions with reasonable confidence and for which the price of the restricted shares could be compared directly with the price of shares in otherwise identical but unrestricted shares of the same company at the same time. The median discount for the 33 restricted stock transactions compared with the prices of their freely tradable counterparts was 31.2 percent, a little bit lower than the other studies but substantially lower than the study by Standard Research.

### Silber Study

In 1991, another study of restricted stock was published, but it included transactions during the period from 1981–1988. This study, by William L. Silber, substantiated the earlier restricted stock studies and found an average price discount of 33.75 percent.<sup>16</sup> Silber identified 69 private placements involving the common stock of publicly traded companies. The restricted stock in this study could be sold under Rule 144 after a two-year holding period. Similar to Trout, Silber tried to develop a statistical model to explain the price differences between securities that differ in resale provisions. Silber concluded that the discount on restricted stock varies directly with the size of the block of restricted stock relative to the amount of publicly traded stock issued by the company. He found that the discounts were larger when the block of restricted stock was large compared with the total number of shares outstanding. Silber also noted that the size of the discount was inversely related to the creditworthiness of the issuing company.

### Stout Study

Stout Risius Ross conducted a study from 1979 to April 1992.<sup>17</sup> In spite of the long time period covered, this study analyzed about 100 transactions involving companies that were generally not the smallest capitalization companies. It supported the results of the SEC *Institutional Investor Study* in finding that the DLOM was higher for smaller capitalization companies. This study, however, found an average discount of only about 23 percent. Stout Risius Ross has a searchable database available from BV Resources ([www.BVResources.com](http://www.BVResources.com)) that is different than the original study. I will discuss this database shortly.

### Management Planning Study

The last study that covered the period before the Rule 144A change that took place in April 1997 was conducted by Management Planning, Inc. This study is discussed in *Quantifying Marketability Discounts*, by Z. Christopher Mercer, ASA, CFA. The Management Planning study includes restricted stock transactions for the period from 1980–1995.

The primary focus of the Management Planning study was to identify companies that had made private placements of unregistered common shares that would, except for the restrictions on trading, have similar characteristics to that company's publicly traded shares. Companies included in the study had to have in excess of \$3 million in annual sales and be profitable for the year immediately prior to the private placement. It was required that the company be a domestic corporation, not considered to be in a development stage, and the common stock of the issuing company had to sell for at least \$2 per share.

Management Planning analyzed 200 private transactions involving companies with publicly traded shares. Of the 200, 49 met the base criteria described. Of these, the average mean discount was 27.7 percent, whereas the average median discount was 28.8 percent.<sup>18</sup>

A more detailed analysis of the Management Planning Study indicated a large range of discounts relative to the sample companies due to varying degrees of revenues, earnings, market share, price stability, and earnings stability. The average revenues for the companies selected for review were \$47.5 million; however, the median revenue figure was \$29.8 million, indicating that the average sales figure was affected by a few companies that were significantly larger than the others studied. The average discount for companies with revenues under \$10 million was 32.9 percent.

Likewise, the average reported earnings of the study group were skewed by 20 companies in the study whose earnings exceeded \$1 million and that, in fact, had a median earnings figure of \$2.9 million. Twenty-nine of the companies studied earned less than \$1 million, whereas the median earnings of all the companies in the sample was \$0.7 million. The average discount of sample companies in the fourth quartile for the 5 factors considered—revenues, earnings, market price per share, price stability, and earnings stability—was 39.3 percent.

### Bruce Johnson Study

Bruce Johnson studied 72 private placement transactions that occurred from 1991–1995. The range was a 10 percent premium to a 60 percent discount with an average discount for these 72 transactions of 28 percent. This study covered the first half decade after the Rule 144 restrictions were relaxed. The results seem to indicate that discounts are lower when the holding period is shorter.

### Columbia Financial Advisors, Inc. Study

Columbia Financial Advisors, Inc. (CFAI) conducted two studies, the first covering the period from January 1, 1996, to April 30, 1997, and the second covering the period from 1997–1998. The first analysis used 23 private transactions (8 involving restricted securities and 15 involving private placements with no registration rights): The average discount was 21 percent, with a median of 14 percent. The 1990 adoption of Rule 144A seems to have had an effect on these discounts.

CFAI conducted another restricted stock study to assess the effects of another alteration to Rule 144. Mandatory holding periods, as of April 29, 1997, were reduced from two years to one year. CFAI used 15 transactions, each of whose stock was privately placed. The average discount for this group was 13 percent, with a median of 9 percent. In the last edition of this book, I stated “These discounts are clearly impacted by the shorter holding period.” After having some time to reflect on this statement, as well as our firm performing its own restricted stock study, I am no longer sure that the shorter holding period is what actually drove the discounts down in this study. First of all, the sample size was pretty small. Second, the time period that was covered in this study was at the time that the stock market was climbing into “Never-Never Land.” The market started to price many of the smaller companies that were issuers of restricted stock into the stratosphere; therefore, investors had a false euphoria that the illiquidity due to the restrictions was not going to be a problem because the stock prices kept going up. Well, we all know what happened to many of those companies when the bubble burst in 2000!

### Trugman Valuation Associates, Inc. Study

Since the last edition of this book, even our firm jumped on the bandwagon and performed our own restricted stock studies. We published them in *Business Valuation Review*, and because you were nice enough to buy my book, I am going to include a detailed discussion about them.<sup>19</sup>

The first Trugman Valuation Associates (TVA) Restricted Stock Study was a time-focused study that analyzed implied restricted stock discounts covering the period from January 2007 to December 2008. The reason that this period was chosen was that it was before the “Great Recession” and it was at a time that the law reduced the sale restrictions to six months.

The TVA Restricted Study contained a detailed statistical analysis of 80 unregistered stock sales (chosen after reviewing about 6,900 Form 8-K filings) looking at relationships between the implied restricted stock discounts and various company-specific variables. The companies included in our study are listed in table 15.4 (on the following page).

The average and median implied discounts in the TVA study were 18.1 percent and 14.4 percent, respectively, which fall below the average and median discounts of many previously published studies. However, this downward trend in implied restricted stock discounts has little meaning due to the wide dispersion of the implied discounts that ranged from a premium of 1.5 percent to a discount of 73.5 percent. Comparisons between the results of our study and the results of select other studies are included in table 15.5.

The standard deviation of the implied discounts was 15.6 percent, which is very large in relation to the average. The large dispersion indicates that the average and median discounts do not do a very good job of explaining the market’s perception of liquidity risk or how implied restricted stock discounts have changed over time. Therefore, using an average or median discount as a starting point in a benchmarking analysis to calculate a DLOM based on the data in the TVA study, or any other study for that matter, could potentially result in inaccurate DLOM calculations because the average and median are of little value when the dispersion of the discounts is this high. See, I knew that chapter on statistics would come in handy.

.....  
<sup>19</sup> Special thanks goes to my analyst, William Harris, ASA, CFA, who performed the studies. It would not have happened without his hard work.

Due to the lack of confidence in the average and median discounts, we performed a statistical analysis of the 80 transactions to try to identify whether any variables have statistical relationships with the implied restricted stock discounts. The first analysis that was performed was a correlation analysis, which is presented in table 15.6.

<b>TABLE 15.6 Correlation Analysis</b>		
	<b>Correlation</b>	<b>R<sup>2</sup></b>
Volatility	0.78	0.60
Debt Ratio	0.22	0.05
Exchange	0.51	0.26
Volume	(0.25)	0.06
Shares Placed per Average Volume	0.54	0.29
Share Turnover	(0.32)	0.10
Market Cap	(0.30)	0.09
Revenues	(0.23)	0.05
Total Assets	(0.28)	0.08
Book Value	(0.27)	0.07
Positive Net Income	(0.13)	0.02
Positive EBITDA	(0.20)	0.04
Positive Operating Cash Flow	(0.26)	0.07
Days until Registration	0.38	0.15

The purpose of this type of analysis is to examine the strength and direction of the linear relationship between two variables. In this instance, the variables analyzed were the implied discount against variables related to risk, liquidity, size, earning capacity, and contractual rights. The correlation analysis found that only the price volatility of the underlying security had a noteworthy linear relationship with the implied restricted stock discounts. However, caution must be used in analyzing and interpreting the correlation coefficient and the coefficient of determination (also known as the R<sup>2</sup> measure) statistics due to the numerous limitations associated with a correlation analysis.

One of the main problems associated with correlation analysis is the sensitivity of the correlation coefficient and the coefficient of determination to outliers contained in the data set. The removal of certain outliers can cause significant changes in these statistical measures. Therefore, the various correlation coefficients and R<sup>2</sup> measures calculated in the TVA study are likely overstated or understated due to the significant presence of outliers within the sample.

Another problem associated with correlation analysis is that the correlation between two variables is not an indication of causality, meaning that the correlation coefficient does not necessarily imply that one variable causes changes in the other. A correlation between two variables can either be high by coincidence or even by the presence of a third hidden variable that affects changes of the two variables analyzed. For example, in the TVA study, price volatility had a noteworthy linear relationship with the implied restricted stock discounts indicating a correlation coefficient of 0.78 and an R<sup>2</sup> statistic of 0.60. Statistically, this reads as “60 percent of

the variation in restricted stock discounts can be explained by the price volatility of the underlying security.” Although this can mean that price volatility does, in fact, have a direct impact on the size of implied restricted stock discounts, it can also mean that a third factor, such as trading activity, could be the driving force behind the relationship.

To illustrate this further, suppose a very thinly traded company issues restricted stock. The company’s trading history contains a few large price swings, which increases the company’s price volatility. In addition, the company’s stock price might not trade at a fair market price due to its lack of trading activity. As a result, the implied discount on the restricted stock could be larger due to the difference between the “true” fair market price of the stock and the thinly traded price of the stock. Based on these factors, the company will have high volatility and a high implied discount. In this example, price volatility does not have a direct impact on the implied discount, but because of the company’s thin trading activity, it might appear that price volatility, in fact, does have a direct impact on the implied discount. In actuality, trading activity (or the lack thereof) is the driving force behind the large discount and high volatility in this example. Therefore, caution must be used in interpreting correlation and  $R^2$  statistics because they are used to measure possible, not actual, cause and effect relationships.

A third problem associated with correlation analysis is that correlation and  $R^2$  statistics do not always hold over time. Changes in the economy, regulatory environment, and the characteristics of the companies that issue restricted stock all change from year to year. Therefore, the correlation and  $R^2$  statistics must be measured over extended periods of time in order to get a true indication of whether a statistical relationship does or does not exist.

So, with all the shortcomings associated with correlation and  $R^2$  statistics, the question that arises is “what use is the correlation analysis presented in the TVA Restricted Stock Study?” One way that this analysis can be used is by looking at the signs (positive or negative) of the correlation coefficients. A positive (negative) correlation coefficient means that a positive (negative) linear relationship exists between two variables. In the TVA study, volatility, debt ratio, shares placed per average volume, and over the counter stocks all had positive correlation coefficients. This makes sense because one would expect the implied discount to increase with volatility, debt, and the size of the placement in relation to trading volume. Volume, share turnover, and all size and earnings measures had negative correlation coefficients, which also makes sense because one would expect lower discounts for larger companies, companies with positive earnings, and companies with high share turnover. Therefore, when constructing a DLOM for a closely held company, one might make upward or downward qualitative adjustments to the DLOM for the subject company based on these factors.

The correlation analysis also indicates that no one variable or combinations of variables that were analyzed in the study has enough explanatory power to predict an implied restricted stock discount. Therefore, when constructing a DLOM for a closely held company, a qualitative analysis is still of significant importance. Quantitative models, (such as the Black-Scholes Option Pricing Model) which rely heavily on a measure of price volatility, may still require upward or downward qualitative adjustments because only a portion of the implied restricted stock discounts are explained by price volatility based on the analysis that we did.

Because my goal is to present differing opinions about this stuff for you to ponder, Lance Hall, formerly from FMV Opinions, told me (and I do not necessarily disagree):

As you know, I have always had a problem with option models in determining discounts. First, as you know, you can’t buy liquid options on privately held companies. More important, however, since most options are on liquid underlying publicly traded securities, does an option price tell you anything about liquidity? No! It only tells you the cost to “hedge” your investment, not achieve liquidity.

The second part of the TVA study involved dividing the data into quartiles based on different variables and examining the trends in implied discounts across quartiles. The quartile analysis is presented in table 15.7.

**TABLE 15.7 Analysis of Quartiles**

	1st Quartile	2nd Quartile	3rd Quartile	4th Quartile
	<b>Discounts</b>			
Volatility	(46% and under)	(47%–56%)	(57%–78%)	(79%+)
Average	10.55%	13.48%	14.95%	33.57%
Median	8.47%	14.16%	11.62%	28.43%

**TABLE 15.7 Analysis of Quartiles** *(continued)*

	1st Quartile	2nd Quartile	3rd Quartile	4th Quartile
	<b>Discounts</b>			
Total Assets	(14,468 and under)	(14,468–45,608)	(45,609–142,652)	(142,653+)
Average	32.68%	14.53%	13.86%	11.50%
Median	27.16%	14.11%	13.59%	8.23%
Standard Deviation	21.20%	14.11%	9.37%	8.90%
Book Value (000s)	(4,945 and under)	(4,946–18,515)	(18,516–52,331)	(52,331+)
Average	26.68%	22.76%	10.71%	12.40%
Median	20.24%	22.45%	10.89%	10.39%
Standard Deviation	19.32%	17.87%	7.31%	8.61%

This analysis can be useful in quantifying a DLOM for a privately held company as the data consists of various financial statement variables, including revenues, debt ratio, total assets, market cap, and book value, that can serve as benchmarks for a privately held company. For example, suppose the valuation subject has a market value of \$20 million, total assets of \$14 million, and a debt ratio of 60 percent. Based on the quartile analysis, the market value of \$20 million falls in the first quartile, which has an average implied discount of 24.5 percent and a median implied discount of 23.01 percent. A total asset base of \$14 million falls within the first quartile of total assets, which has an average discount of 32.68 percent and a median of 27.16 percent. A total debt ratio of 60 percent falls within the third quartile of debt ratios, which has average and median discounts of 16.3 percent and 15.16 percent, respectively. Based on these factors, a quartile analysis would result in a range of implied discounts from 15.16 percent based on the debt ratio to 32.68 percent based on total assets. However, caution must still be used in applying this approach as the standard deviations in each quartile are significant, and each quartile contains only 20 data points. In addition, the average or median discounts do not smoothly trend upward or downward from the first quartile to the fourth quartile in all cases. This could be the result of a variety of drivers that affect the implied discounts. For example, a large company might have high price volatility and be highly leveraged. Therefore, this type of analysis is most effective when utilized with multiple variables, as in the preceding example, and applied alongside other qualitative and quantitative methodologies. The breakdown of the discount by quartiles is shown in table 15.9 on the following page.

We also included a holding period analysis in the TVA study which was based on the number of days the restricted stock remained unregistered after issuance. The majority of the restricted stock transactions that were analyzed included registration rights, which provided the ability for the securities to be registered prior to the conclusion of the required Rule 144 holding period. This analysis indicates that the average and median discounts increased, along with the number of days that the stock was left unregistered. The analysis of registration rights is included in table 15.8.

**TABLE 15.8 Analysis of Registration Rights**

Quartile	Days Before Registration	Discount		
		Average	Median	Standard Deviation
1	0–31 days	11.6%	10.0%	8.0%
2	32–63 days	14.3%	12.9%	11.3%
3	64–185 days	20.4%	15.9%	18.4%
4	185+days	26.9%	18.8%	18.6%

This analysis can be of good use when performing a valuation in which the holding period for the security is known. A drawback of applying this analysis is that the period in which the restricted stock remains unregistered is not known at issuance. In addition, the upward trend in implied discounts could potentially be caused by some third hidden variable or some individual characteristics within each quartile. In other words, the holding period may not be the only driving force behind the larger discounts across quartiles.

Thus far, we have discussed the different ways in which the TVA study can be utilized and the various considerations that must be taken into account when interpreting the statistical data presented in the study. When using the TVA study, there are other factors that must also be taken into consideration in addition to the interpretation of the statistical data presented. These considerations include the general economic conditions that were present when the restricted stock study was performed, changes in the regulatory environment, and various sample biases.

As previously stated, the TVA study covered the period from January 1, 2007, to December 31, 2008. By the middle of this time period, the United States was in the midst of its largest economic recession since World War II. The economic conditions present during the time period covered by the TVA study are of significant importance as economic downturns lead to increased financial market volatility and deteriorating investor confidence. This can affect restricted stock discounts in a variety of ways.

TABLE 15.9 Breakdown of Quartiles by Discount

	Discount	Sales (000s)	Total Assets (000s)	Book Value (000s)	Volatility	Average Trading Volume (000s)	Debt Ratio	Market Cap (000s)	Number of OTC Stocks

One way the discounts can be affected is by increased financial market volatility: When volatility increases, the probability of a stock losing value during the required Rule 144 restriction period increases. Therefore, buyers of such restricted securities could require a steeper discount to compensate for the additional risk of loss. At the same time, however, discounts could decrease during times of economic uncertainty resulting from depressed stock prices in the public marketplace. In both instances, there is no empirical evidence available to support either assumption because too many other company- and transaction-specific factors influence implied restricted stock discounts. In addition, different assumptions and search processes of the various restricted stock studies performed over the years make interpreting long-term trends in the discounts over the years difficult. Nevertheless, the fact that the time period covered in the TVA study was a period of extreme economic turmoil should be taken into consideration when using the data to apply DLOMs to closely held companies. Stout Risius Ross found a satisfactory relationship between the Chicago Board of Options Exchange Volatility Index (VIX) and the magnitude of the discount for private placements with registration rights. This would indicate that market disruptions do affect the magnitude of the discount. If there is a long-term time horizon, an adjustment to the discount may be warranted. Further adjustment may be warranted in the event of a highly volatile stock market.

Another concern that arises during economic downturns is the financial condition of the companies that issue restricted stock. In the TVA study, only 22 of the companies had positive net income; 25 companies had positive earnings before interest, taxes, depreciation, and amortization (EBITDA); and 26 had positive cash flow from operations. One possible explanation for the lack of profitable companies included in the sample set is the economic conditions present during the time frame in which the analysis was performed. Therefore, using this study for supporting a DLOM could potentially require a closer look at the individual companies included in the sample and how their financial condition compares to that of the valuation subject.

Transaction volume is another issue that is affected by economic conditions. The most recent transaction that met our search criteria took place during August 2008. No transactions were located from September 2008 to December 2008. During these three months, financial market turmoil was at its peak with the collapse of investment banking giant Lehman Brothers. Therefore, the average and median implied discounts of 18.1 percent and 14.1 percent, respectively, could possibly be understated because no data was available at the peak of the financial market downturn.

In addition to the general economic environment, changes in the regulatory environment can also have an impact on implied restricted stock discounts. The required holding period under Rule 144 was reduced from 1 year to 6 months effective in February 2008. One would expect that implied restricted stock discounts would decline as the result of the shortened holding period. However, based on the 80 transactions analyzed in the TVA study, this was not the case. In 2007, there were 57 transactions with average and median discounts of 17.3 percent and 14.3 percent, respectively. In 2008, there were 23 transactions analyzed with average and median discounts of 20.2 percent and 19.6 percent, respectively. As a result, it does not appear that the shortening of the holding period has caused the expected decline in implied restricted stock discounts. This could be the result of increased volatility in the financial markets, which could have offset the effects of the reduction in the Rule 144 holding period. However, the more likely reason is the fact that each specific unregistered stock sale transaction has its own unique circumstances and characteristics that drove the discount higher or lower. Implied restricted stock discounts cannot be explained by any one variable. Therefore, it is still quite possible that a reduction in the required Rule 144 holding period caused lower discounts in some cases. However, on average, numerous other transaction-specific factors offset the impact of the reduction in the required holding period. With that being said, Stout Risius Ross found that when the 2-year holding period was changed to a 1-year holding period, this peculiarity was answered when they looked at volatility. The Russian Ruble collapse, the failure of the Long-Term Capital Management hedge fund, the Dot-Com Bubble collapse, and September 11th all caused volatilities to rise dramatically. When you take out the effects of the increased volatilities, discounts actually dropped for 1-year holding period data from 1997–2001. With the increase between 2007 and 2008, again, the reason was a dramatic increase in volatility offsetting the reduced holding period.

Another issue that arises with the reduction of the required Rule 144 holding period is whether or not to apply an average or median restricted stock discount to a valuation subject when the estimated holding period is longer than six months. A discount higher than the average or median restricted stock discount could be warranted. Additional analysis could be required in order to quantify discounts for investments with holding periods that exceed six months.

Finally, sample biases must be taken into account when using the TVA study. As previously discussed, a substantial portion of the companies included in the restricted stock study were unprofitable, non-dividend-paying companies. Although the economic environment could potentially explain this for some of these companies, another explanation is the fact that many of these companies were in the early stages of their operation and issued restricted stock as a way to raise cash to pursue profitable ventures and grow their businesses. Therefore, when using this study, a comparison between the valuation subject and the companies included in the restricted stock study is imperative because it may not make sense to use a discount in the upper range of the study for a mature, profitable, dividend-paying valuation subject.

Since the majority of the companies included in the sample were not profitable, the sample did not contain a sufficient number of dividend-paying companies. Dividends have the effect of mitigating the DLOM because the investor receives a current return on his or her investment, which partially offsets the possible loss in market value during the time it takes to sell. In this instance, the various discounts calculated in the study could be overstated due to the fact that the majority of the companies included in the sample were non-dividend payers. However, the dividend-paying history of the subject is one of many factors that must be considered in quantifying a DLOM. For example, it is quite possible that the long-term growth potential of some of the newly formed companies included in the sample are larger than mature, profitable, dividend-paying private companies in a saturated industry. This factor also highlights the importance of a comparative analysis between the valuation subject and the companies that issue restricted stock in order to quantify an appropriate DLOM.

About halfway through the time period covered by the first TVA Restricted Stock Study, the landscape for the restricted stock market had changed. On November 15, 2007, it was announced that the required holding period under Rule 144 would be reduced from one year to six months beginning in February 2008. The first edition of the TVA Restricted Stock Study included some transactions that took place after the changes to the Rule 144 holding period; however, the extreme level of volatility and uncertainty in the public markets during the 2007–2008 time frame made it difficult to truly analyze the impact of the reduction in the required Rule 144 period on implied restricted stock discounts.

### The Second TVA Restricted Stock Study

The shortened holding period had now been in effect for more than three years. This allowed us to collect enough data to perform a better analysis of the impact that the changes to the Rule 144 holding period have had on implied restricted stock discounts. We applied the same search criteria in the second study as we did in the first TVA Restricted Stock Study.

After our search process was completed, we determined that 56 additional transactions met our criteria, in addition to the original 80 transactions from our first study. This gave us a total of 136 transactions to work with. Of the total 136 transactions, 89 took place after the rule change, whereas 47 transactions took place before. Details of all the transactions appear in table 15.10 on the following page.

**TABLE 15.10 Unregistered Stock Sales**

Company	Ticker	Date of Transaction	Exchange	Price per Share (\$)	Shares Placed	Offering Amount (\$)	Discount Announced in Filing	Discount	Avg. Stock Price Transaction Month (\$)	Discount
Atlas Mining Co.	ALMI	1/10/2007	OTC BB	1.35	1,481,482	2,000,001	N	N/A	1.62	16.7%

<b>Average</b>										<b>16.6%</b>
<b>1st Quartile</b>										<b>7.0%</b>
<b>Median</b>										<b>14.3%</b>
<b>3rd Quartile</b>										<b>23.8%</b>
<b>High</b>										<b>73.5%</b>
<b>Low</b>										<b>-10.2%</b>
<b>Standard Deviation</b>										<b>14.93%</b>
<b>Number of Transactions</b>										<b>136</b>

The 136 transactions in total had an average implied discount of 16.6 percent, a median of 14.3 percent, and a standard deviation of 14.9 percent. For the 47 transactions that took place before the rule change, the average and median discounts were 17.9 percent and 14.8 percent, respectively. For the 89 transactions that took place after the rule change, the average and median discounts were 15.9 percent and 14.2 percent, respectively. A brief statistical summary of the data before and after the rule change is presented in table 15.11.

**TABLE 15.11 Pre-Rule Change Versus Post-Rule Change**

	Pre-Rule Change	Post-Rule Change
Average	17.9%	15.9%
Median	14.8%	14.2%
Standard Deviation	14.6%	15.1%
Number of Transactions	47	89

In an attempt to better understand the data and the factors that drive the implied restricted stock discounts, we updated the correlation and quartile analyses that were performed in the first study. These analyses were performed to see if the addition of the new data changes any of the conclusions reached in the first study.

*Correlation analysis.* The updated correlation coefficients and  $R^2$  statistics are presented in table 15.12. In reviewing these statistics, it becomes apparent that volatility still remains the only variable that has a notable statistical relationship with the implied discounts.

**TABLE 15.12 Correlation Analysis**

	Correlation	$R^2$
Volatility	0.70	0.49
Debt Ratio	0.15	0.02
Exchange	0.47	0.22
Volume	(0.08)	0.01
Shares Placed per Average Volume	0.40	0.16
Share Turnover	(0.11)	0.01
Market Cap	(0.17)	0.03
Revenues	(0.09)	0.01
Total Assets	(0.16)	0.02
Book Value	(0.04)	0.00
Positive Net Income	(0.17)	0.03
Positive EBITDA	(0.27)	0.08
Positive Operating Cash Flow	(0.30)	0.09
Days Until Registration	0.26	0.07

However, despite the weak statistical relationships, the correlation coefficients for each of the variables are consistent with economic theory. The price volatility, shares placed per average volume, debt ratio, exchange, and days until registration variables, all had positive correlation coefficients, which indicate that the implied discounts tend to increase when these variables increase. On the other hand, all size, volume, and profitability metrics had negative correlation coefficients, which indicate that discounts tend to be higher for smaller, thinly traded, and less profitable companies. Nevertheless, the linear relationships between implied restricted stock discounts and all the variables analyzed, with the exception of volatility, are not strong enough to derive any meaningful conclusions.

*Quartile analysis.* We also performed an update to the quartile analysis that was presented in the first study. First, we divided the data into 4 quartiles based on each variable. Each quartile contained a total of 34 transactions. A summary of this analysis is presented in table 15.13.

**TABLE 15.13 Quartile Analysis**

	1st Quartile	2nd Quartile	3rd Quartile	4th Quartile
Volatility	(47% and under)	(48%–59%)	(57%–78%)	(79%+)

Average	26.22%	19.45%	11.14%	9.61%
Median	23.75%	16.97%	10.89%	8.87%
Standard Deviation	17.44%	15.47%	10.12%	8.99%

In analyzing the data in table 15.13, it becomes apparent that the only variables in which the average and median implied discounts change as expected across all four quartiles are volatility, book value, and revenues. The average and median implied discounts for all the other variables analyzed, with the exception of the debt ratio, change as expected from the first quartile to the fourth quartile. However, in each of these cases, the change in the averages or the medians from the second quartile to the third quartile was inconsistent. This can partially be attributed to the high standard deviation of the discounts contained in each of these groupings.

The data was further analyzed by constructing quartiles sorted by discount. This analysis is presented in table 15.14 on the following page.

TABLE 15.14 Quartiles by Discount

	Discount	Sales (000s)	Total Assets (000s)	Book Value (000s)	Volatility	Average Trading Volume (000s)	Debt Ratio	Market Cap (000s)	Number of OTC Stocks
<b>1st Quartile</b>									
Average	1.30%	125,925	855,572	198,287	50.38%	337	0.63	381,993	1
Median	1.99%	43,241	319,966	55,365	50.84%	63	0.61	137,302	
High	6.98%	917,574	9,248,229	1,127,228	91.63%	2,832	1.66	1,675,956	
Low	-10.16%	—	2,958	(159,997)	19.37%	1	0.18	20,360	
Standard Deviation	4.61%	211,734	1,630,907	338,635	17.65%	671	0.36	466,505	
<b>2nd Quartile</b>									
Average	10.26%	248,407	977,512	(119,279)	60.98%	293	0.74	280,864	5
Median	10.66%	42,650	119,144	28,896	56.85%	36	0.64	144,083	
High	14.29%	5,865,685	17,479,867	610,180	142.02%	2,074	6.34	1,383,384	
Low	6.98%	—	1,261	(7,695,606)	22.37%	0	0.01	5,585	
Standard Deviation	1.99%	997,366	3,109,615	1,349,311	27.16%	539	1.04	307,789	
<b>3rd Quartile</b>									
Average	18.25%	104,616	304,621	62,081	63.82%	293	0.77	273,346	7
Median	17.54%	26,253	74,477	16,868	57.53%	82	0.54	100,942	
High	23.81%	1,207,997	3,870,851	662,133	115.67%	4,777	6.93	4,514,891	
Low	14.33%	—	3,168	(78,435)	26.05%	3	—	10,947	
Standard Deviation	3.04%	247,455	721,818	123,173	21.14%	821	1.15	757,350	
<b>4th Quartile</b>									
Average	36.61%	30,596	133,298	23,739	113.15%	245	0.94	133,123	17
Median	30.85%	2,813	13,375	5,357	99.05%	26	0.63	76,470	
High	73.51%	238,495	3,215,510	246,770	247.84%	4,201	7.62	608,652	
Low	23.81%	—	4	(8,772)	32.84%	0	0.01	9,879	
Standard Deviation	13.40%	59,354	547,734	50,808	53.36%	743	1.37	137,779	

In this instance, volatility is the only variable in which the average and median increase were expected across each quartile. With the exception of the debt ratio, the changes in the averages and the medians of all the other variables are consistent when going from the first quartile to the fourth quartile. However, the changes in the inner quartiles vary. Another apparent trend in the data in table 15.14 is the number of over-the-counter stocks that were contained in each quartile. The fourth quartile contained 17 over-the-counter stocks in comparison to only 1 in the first quartile.

The final part of this analysis involved an analysis of registration rights. In the first study, the data was divided into four quartiles based on the number of days the stock remained unmarketable before it was registered. This analysis was updated using the same time periods that were used in the first study. The update to this analysis is presented in table 15.15.

Days Before Registration	Average	Median	Standard Deviation
0–31 days	12.22%	10.26%	11.29%
32–63 days	15.31%	14.08%	11.48%
64–185 days	16.27%	14.59%	15.80%
185+ days	24.77%	18.51%	17.55%

A review of this data shows that the average, median, and standard deviation of the discounts are higher for stocks that remain unmarketable for longer periods of time.

The update to the first edition of the TVA Restricted Stock Study contained a brief analysis of the impact of the changes to the required Rule 144 holding period as well as an update to the statistical analysis. The average and median discounts for the 89 transactions that took place after the change to the Rule 144 holding period were slightly lower than the average and median discounts of the 47 transactions that took place before. However, this decrease was not as drastic as one would expect. One possible explanation for this is the level of market volatility that was present in the marketplace during these two time periods. To demonstrate, presented in figure 15.1 is the historic trend in the VIX. The trend in this chart shows that volatility in the stock market increased significantly in late 2008 and remained relatively high throughout 2009 and 2010 in comparison to 2007.

**Figure 15.1 VIX Historical**

Considering that the change to the Rule 144 holding period was announced in November 2007 and became effective in February 2008, the transactions that occurred after the rule change took place during a more highly volatile market. In addition, there are other economic, company-specific and transaction-specific factors that could potentially drive the implied discounts. This further supports the notion that various factors collectively must be considered when trying to quantify implied illiquidity discounts.

The update to the statistical analysis performed in the first study resulted in similar conclusions. The only company-specific variable that had a notable statistical relationship with the implied discounts was volatility. Although it is possible that other variables affect the implied discounts to some degree, we were unable to quantify the impact of these variables with a high degree of statistical certainty.

The addition of the new data to the second edition of the TVA Restricted Stock Study provides empirical data on implied illiquidity discounts through 2010. However, when using this new data as a guide to derive a discount for lack of marketability for a closely held business, additional factors must be taken into account, most notably, the change in the holding period. The holding period for a minority interest in a closely held company is usually much longer than the six-month holding period for the majority of the transactions contained in this study. Valuation theory tells us that this should warrant a larger discount. The question becomes how much larger should it be when considering the financial condition, dividend-paying history, risk, and other factors related to the valuation subject in comparison to the companies contained in this study. These are some of the various factors that must be taken into consideration when using the data from this study and constructing discounts for lack of marketability in general.

The TVA Restricted Stock Studies also suggest that there is not one specific factor that universally drives all implied restricted stock discounts higher or lower. Each sale of unregistered stock has its own unique circumstances and contractual rights that could warrant higher or lower discounts. This factor reiterates the importance of a thorough qualitative analysis in constructing DLOMs for private companies.

### Pluris Study

In this study, Pluris analyzed 1,016 private placements of unregistered common stock from the first quarter of 2007 through the third quarter of 2009. After eliminating certain transactions based on the analysis criteria selected, Pluris studied 681 transactions. Pluris found that the average discount for these transactions was 18.8 percent, whereas the median was 18.6 percent. Similar to the findings of other studies, Pluris found that the highest discount quintile had lower than average market capitalization, higher volatility, and greater market-to-book ratios.

### Stout Risius Ross Study

The Stout Risius Ross (SRR) study included transactions from September 2005 through May 2010. After screening these transactions based on a number of selected criteria, SRR analyzed 98 transactions. Based on these transactions, the average discount was 10.9 percent and the median discount was 9.3 percent.

SRR analyzed various factors and how they affect the DLOM. A strong relationship was found between subject company volatility, block size, dividends, and profitability. Growth, size, and leverage showed a moderate relationship, whereas financial distress, recent price performance, and registration rights did not show any type of conclusive relationship.

### More About the DLOM

All the studies about restricted stock deal with minority blocks of stock in public companies. Therefore, the restricted stock studies may be a useful guide in assessing a DLOM for a minority interest. However, a control value may also need to reflect a DLOM, although it probably would be smaller than a DLOM attributable to minority shares. Because a minority interest is more difficult to sell than a controlling interest, the DLOM is usually larger for minority interests. The average DLOM ranges between 25 percent and 45 percent based on the studies previously discussed. Larger discounts may be appropriate if the starting point is a minority marketable, interest value based on public guideline company methods. This is due to the fact that a minority investor in the public market measures liquidity as three days to cash.

Let's discuss a bit of reality. The IRS does not like this reality, but a minority interest in a closely held company may be nearly impossible to sell. In many cases, the only potential market for the minority interest would be other owners in the same company who would like to obtain additional ownership in the company. However, think about the company that is not paying dividends (mainly because it does not have the capacity to pay them), and the controlling owners have no intention of selling the company in the foreseeable future. What would someone pay for an interest in a company that is not going to throw off a return? Nothing! Now, later in this chapter, we will discuss a Tax Court case that tells us to consider the willing seller as well as the willing buyer. I do not care whether there is a buyer, seller, or both—no return generally means no economic value!

But what about entire closely held companies? Clearly, it will take more than three days to sell. In fact, over the years, the business brokers that I have spoken with have told me repeatedly that it generally takes six to nine months to sell a closely held company if priced properly. I was involved in a court case in which the opposing expert raised the issue that many closely held businesses do not sell at all. Frequently, this is because they are overpriced. Many business owners have visions of grandeur and think that sweat-equity has value. They find out quickly how little sweat-equity is really worth in the marketplace. It seems that when a closely held business is properly priced, for reasonable negotiations to take place, a six- to nine-month time period is realistic.

The question that the valuation analyst must ask is "Should the comparison be made to freely traded stocks at the minority level from the public market?" The answer should be obvious. Absolutely not! In fact, think about how long it takes to sell an entire public company. By the time the due diligence is done and the regulatory agencies bless the transaction, more than a year can go by. Entire closely held companies may be more marketable (or maybe the better term would be liquid) than their public counterparts. Unfortunately, we do not have any empirical data on which to base the discount.

Many valuation analysts believe that a 100 percent control position is fully marketable. I think that it depends on the facts and circumstances and must be considered on a case by case basis. Certain businesses will be more difficult to sell than others. Keep in mind, however, that while the owner is attempting to sell the business, he or she continues to get the cash flow from the investment (assuming that there is some) to mitigate the loss incurred in the time it takes to sell the investment. This would reduce the discount.

Let me throw out one more thought. One of the items that the valuation analyst should investigate as part of the industry analysis is whether there is a consolidation or any form of sales activity going on in the industry. If the market has transactions, and if the subject company is a good company, they may be more marketable because they may attract a possible buyer. If the valuation analyst finds that the industry is dormant, it may be a reasonable sign that the company will suffer from illiquidity and may not be able to be sold very easily. This is one more reason for performing the industry analysis. Each of the factors of Revenue Ruling 59-60 eventually come together in a single valuation in which each item has an impact on another item. Do not make the mistake of thinking that these factors are mutually exclusive.

### Stout DLOM Calculator<sup>TM20</sup>

Over the past decade, the business valuation profession has seen a growth in resources available by subscription. One of the tools that I have come to like is the Stout DLOM Calculator<sup>TM</sup> brought to us by the same folks who created the Stout Restricted Stock Study. The calculator is available from BV Resources. This tool includes over 700 transactions that took place between 1980 and 2015. More data is added when appropriate. More than 95 percent of the transactions reviewed were deemed invalid for use in this study because they did not meet Stout's acceptance criteria. This is not a surprise because we reviewed thousands of public filings to narrow our restricted stock study down to only 136 useable transactions.

The calculator was released in fall 2010. This interactive, Internet-based tool, which incorporates input from a user's subject company, takes valuation analysts step-by-step through Stout's preferred DLOM determination method. The calculator provides valuation analysts with many benefits, including the following:

- Greatly reduces time and effort in deriving DLOMs
- Makes detailed comparisons between subject companies and issuers of restricted stock included in the Stout study

20 Much of this section has been adapted from *The 2016 Companion Guide* to the Stout DLOM Calculator.

- Provides users with the options to exclude restricted stock transactions with premiums, registration rights, and trim for specific holding periods, allowing for an even more detailed comparison
- Provides users with an option to adjust the relevant financial statistics in the Stout study for inflation for enhanced comparability with a subject company as of a specific valuation date
- Allows users flexibility to enter their own assumptions and tailor the results based on their professional knowledge and experience
- Creates an easy-to-follow set of exhibits that can be inserted into the analyst's valuation report
- Provides users with the confidence that they are always utilizing the latest restricted stock data and DLOM methodology suggested by Stout

*Inflation Adjustment Tool.* Users who choose not to use the calculator can still adjust the statistics in the Stout study for inflation. An inflation adjustment tool that adjusts the data in the Stout study to a user-selected valuation date based on the consumer price index published by the U.S. Bureau of Labor Statistics is available on the website.

*Consideration of stock market volatility.* Each transaction in the Stout study occurring after June 1990 includes a VIX variable,<sup>21</sup> which represents the level of expected short-term future volatility in equity markets around the time of the transaction. Many valuation analysts have determined that a public company's stock price volatility is a key determinant of the DLOM. I will discuss this in greater detail in the quantitative section of this chapter, but this was also discussed as part of the TVA Restricted Stock Study. The real issue, however, is that the volatility of private company stock can be extremely difficult (if not impossible) to estimate. In response to this dilemma, Stout has made an empirical connection between DLOMs and overall stock market volatility, making it possible to incorporate stock market volatility as a consideration when determining DLOMs for minority, nonmarketable interests in private companies. This is especially important for valuations with valuation dates during 2008 and 2009, when stock markets demonstrated unprecedented levels of volatility and when, as a result, investors fled to the safety of highly liquid, low volatility assets such as short-term Treasury bills.

*Selection criteria.* The transactions in the Stout study were discovered through searches using a number of sources, including 10K Wizard, Security Data Corporation; EDGAR and EDGAR Pro; Dow Jones News Retrieval; Disclosure CompactD; and S&P Corporate Transactions Records. More recent transactions come from Sagient Research, a data research company that compiles PIPE<sup>22</sup> transactions. For each transaction identified, Stout states that it reviewed all relevant public filings and exhibits thereto, including but not limited to, forms 8K, 10K, 10Q, S-1, S-3, and S-4; stock purchase agreements; and registration rights agreements. Overall, thousands of private placement transactions were reviewed during the construction of the Stout study. Transactions were eliminated from the study for the following reasons:

1. The transaction was not a private placement of unregistered shares (for example, the stock was registered prior to the transaction date) or the stock was registered and became fully marketable within 30 days of the transaction.
2. The private placement was of debt, preferred stock, convertible preferred stock, or some kind of hybrid equity-derivative security (the security issued must be identical to the publicly traded common stock in all respects other than its unregistered status).
3. The private placement was issued as part of a stock-warrant unit or had warrants attached, or detachable warrants or options were issued with the common stock.
4. The transaction did not close (for example, was announced and later withdrawn).
5. The stock was not traded on a domestic exchange.
6. The stock traded below \$1 for the entire month of the transaction.

21 The Chicago Board Options Exchange Volatility Index® (VIX) is a key measure of market expectations of near-term volatility conveyed by Standard and Poor's 500 stock index option prices. Since its introduction in 1993, VIX has been considered by many to be the world's premier barometer of investor sentiment and market volatility. See [www.cboe.com/micro/vix/introduction.aspx](http://www.cboe.com/micro/vix/introduction.aspx).

22 The acronym PIPE stands for private investment in public equities.

7. Significant pieces of information were unavailable to the extent they were unable to determine the private placement discount, such as the following:
  - a. The market reference price for the fully liquid shares was unavailable.
  - b. The private placement transaction price was unavailable.
  - c. Only the net transaction proceeds to the issuer were reported publicly (net of unknown transaction costs and fees), not the gross purchase price.
8. There were special contractual arrangements between buyer and seller limiting either the economic upside or downside of the buyer (for example, an agreement to increase the number of shares purchased if the market trading price were to fall below a certain level within some specified period of time)
9. The stock was issued in connection with a merger or acquisition, in exchange for services or in connection with any other transaction that could cast doubt on what the fair market value of the restricted stock was.
10. The lead purchaser<sup>23</sup> in the transaction was, based on explicit language provided in the issuer's public filings (or, if not explicitly stated, based on Stout's best judgment considering all available evidence), a related party or received one or more seats on the issuer's board of directors as a result of the transaction.

*DLOM calculation.* The DLOM (transaction discount) is the percentage difference between the private placement price per share and the market trading price per share. If stated explicitly in the language describing the private placement, the transaction discount represents the discount agreed to between the issuer and the purchaser. If not stated, the transaction discount is the percentage difference between the private placement price per share and the closing market price as of the date prior to the agreement date. If the agreement date is not known, the market trading price represents the closing market price as of the day prior to the first to occur of the announcement date or the closing date. For many transactions in the Stout Study, only the month of the transaction, not the exact transaction date, is specified. In these instances, the market trading price is represented by the high-low average stock price for the month of the transaction. Discounts are reported as positive figures, and premiums are reported as negative figures.

*Analysis of the data.* The issue is to determine which company-specific and broader market variables are relevant determinants of the DLOM. In general, these variables relate to the issuer's risk profile, the degree of liquidity of the privately placed stock, and the overall level of stock market volatility around the time of the transaction.

Using data from this study, 736 (out of 778 transactions in the database) private placement transactions of unregistered common stock, with and without registration rights, issued by publicly traded companies from July 1980 through September 2015, were examined and will be discussed here. The overall average discount for all 778 transactions in the Stout Study (as of March 2016) was 19.27 percent, and the median discount is 15.03 percent. However, there are few true premiums in the market for restricted stock, and it is believed that these premiums may be the result of an investment opportunity not available to other investors or an unidentifiable relationship with the seller. Premiums have been excluded from the analysis. The average discount for the 736 transactions, excluding premiums, is 20.89 percent, and the median discount is 16.11 percent. The discount was calculated by dividing the difference between the private placement price and the market reference price by the market reference price. The market reference price in this study is represented by the stock price on the agreement date, closing date, announcement date, or the high-low average stock price for the month of the transaction if no date is specified. The sample distribution is shown in figure 15.2.

.....  
23 A lead purchaser is deemed to be any purchaser of greater than 50 percent of the shares acquired in the private placement.

**Figure 15.2 The Stout Restricted Stock Study**

*Investment risk and discounts.* The impact of investment risk on the DLOM is significant. Smaller, less profitable entities, with a higher degree of income and balance sheet risk and greater stock price volatility tend to issue restricted stock at higher discounts. The following table provides a comparison of company characteristics between high-discount transactions and low-discount transactions. The sample is divided into five percentile groups, or quintiles, based on the distribution of the restricted stock discount, and medians are computed for each quintile group across all parameters. Due to the long time period over which the Stout study transactions took place, company financial characteristics have been adjusted for inflation for better comparability.<sup>24</sup> As shown in the data in table 15.16 on the following page, lower market values, revenues, total assets and book values, and higher market-to-book (MTB) ratios and stock price volatility, are correlated with higher discounts.

Accordingly, higher investment risk, as reflected in smaller firm size, higher MTB ratios, and increasing stock price volatility tends to increase the discount. Profitability is also often used as an indicator of firm risk. However, absolute levels of earnings and losses do not demonstrate a strong correlation with the discount due primarily to the greater impact of company size on the discount. Private placements by large, unprofitable firms tend to exhibit lower discounts than small, profitable firms. Net profit margin tends to be a better indicator than net income because it is not affected by firm size.

<sup>24</sup> For this analysis, financial characteristics have been adjusted based on percentage changes in the U.S. Bureau of Labor Statistics Consumer Price Index, using a base value of 217.97 as of June 1, 2010.

**TABLE 15.16 Comparison of Company Characteristics Between High-Discount Transactions and Low-Discount Transactions**

Quintile <sup>1</sup>	1	2	3	4	5
Discount					
Low	0.0%	7.4%	13.0%	20.9%	33.9%
High	7.4%	13.0%	20.8%	33.5%	91.3%
<b>Median</b>	<b>4.1%</b>	<b>10.0%</b>	<b>16.1%</b>	<b>26.2%</b>	<b>43.2%</b>
Company Characteristics (Median Statistics) <sup>2</sup>					
Market Value (\$mm)	183.5	194.2	116.6	102.1	57.7
Revenues (\$mm)	31.7	42.3	20.9	17.1	8.4
Total Assets (\$mm)	112.9	88.1	37.0	23.1	11.4
Book Value of Equity (\$mm)	49.6	42.3	20.4	13.7	6.5
MTB Ratio	2.6	3.2	3.6	5.7	6.1
Net Income (\$mm)	(4.5)	(2.2)	(2.8)	(4.6)	(2.6)
Net Profit Margin	-6.7%	-5.4%	-8.3%	-23.4%	-38.7%
Volatility	64.0%	65.4%	73.7%	80.2%	104.0%
VIX	17.8	17.6	17.3	17.5	21.3

1 Transactions sorted by Discount. Each "Quintile" includes 147 or 148 transactions.  
2 All statistics have been adjusted for inflation as of January 2016.  
3 Premiums have been excluded from this analysis.

*Discounts by industry.* The marketability discount variance in the Stout study across the spectrum of industries is summarized in table 15.17.

**TABLE 15.17 Industry Analysis**

Industry Description	SIC Range	Trans. Count	Median Statistics					
			Discount	% Shares Placed	Market Value (\$mm)	Total Assets (\$mm)	MTB Ratio	Issuer Volatility
All	All	736	16.1%	10.3%	\$118.3	\$ 14.1	4.0	74.7%
Mining	1000-1999	95	14.6%	10.2%	168.1	76.5	3.4	69.6%
Manufacturing	2000-3999	308	16.8%	11.3%	110.8	26.5	4.8	77.8%
Transportation, Communications, Electric, Gas and Sanitary Services	4000-4999	40	14.9%	9.9%	144.7	88.5	2.8	69.2%
Wholesale Trade	5000-5199	12	25.1%	14.7%	46.3	19.5	4.8	83.0%
Retail Trade	5200-5999	32	12.0%	9.5%	106.9	89.9	3.9	67.8%
Finance, Insurance and Real Estate	6000-6999	92	9.8%	10.2%	169.4	977.4	1.4	49.3%
Services	7000-8999	155	24.4%	9.1%	94.5	16.1	7.1	85.6%

\* 2 transactions from the Agriculture industry (SIC 0179 and 0191) have been excluded from this table.  
Note—the figures in this table have been adjusted for inflation as of January 2016.

The median discounts vary somewhat based on the standard industrial classification (SIC) of the companies in the study. However, the variation in discounts appears to result from differing key financial characteristics among the SIC groups. For example, higher-than-average discounts in the services industry may be due to the significantly lower-than-average total asset values and greater stock price volatility than other SIC groups. Similarly, lower-than-average discounts in finance, insurance, and real estate, as well as retail trade, are correlated with higher market values and total assets and lower stock price volatility than the other SIC groups. Accordingly, Stout determined that a company's industry should not, in itself, have a significant impact on the DLOM, which is, instead, driven much more by a company's financial characteristics and stock price volatility.

*Degree of liquidity and discounts.* The variables discussed up until now are primarily indicators of a company's financial and market risk. The Stout study also provides data about variables that are directly associated with the particular degree of liquidity of the block of restricted stock sold in each private placement. This data is particularly important to the valuation of interests in privately held companies.

The Rule 144's safe harbor provisions for the resale of restricted stock are more imposing on affiliates than nonaffiliates and on noncurrent issuers than current issuers. Based on the publicly available information regarding the transactions in the Stout study, all issuers in the study are subject to the reporting requirements of the Securities Act and are likely current in their filings. However, although Stout has eliminated private placements that are known to involve related party purchasers, it is unknown whether one or more purchasers in each transaction might be deemed to be an affiliate. Accordingly, for each transaction in the Stout study, it is unclear what the purchaser's expectations are regarding the required holding period under Rule 144. This is further complicated by the presence of registration rights agreements in transactions,<sup>25</sup> the terms of which are largely unknown (especially for older transactions); therefore, the resulting impact on the liquidity of the shares is impossible to assess.

Despite the aforementioned difficulty in estimating the likely required holding period related to each transaction, it is true that, all else being equal, large blocks of unregistered stock (expressed as a percentage of total shares outstanding) are more illiquid than small blocks. This results from the both of the following:

1. Rule 144's volume limits after the initial required holding period and prior to the ultimate holding period
2. The difficulty in disposing of a large block of stock in a short period through public sales due to general market supply and demand conditions

Rule 144's volume limits allow for the resale, in any three-month period, of the greater of 1 percent of the company's total outstanding shares or the average weekly trading volume for the four weeks before each such sale.<sup>26</sup> Thus, under the dribble-out provisions, a block of 20 percent or more would take up to five years to resell after the initial holding period, assuming the following:

1. It was sold to just one buyer.
2. The holder of the block was deemed an affiliate under Rule 144 and, thus, would be subject to Rule 144 volume limits indefinitely
3. The trading volume of the stock was so low<sup>27</sup> that 1 percent of total shares outstanding was the most that the buyer could sell in any three-month period.

As one can expect, the discount is correlated with the size of the block of stock sold in the private placement, as shown in figure 15.3 on the following page.

.....  
 25 Approximately half of all transactions in the Stout study are known to include registration rights, and for another approximately one-quarter of transactions, the presence of registrations rights is not known.

26 For Over The Counter Bulletin Board (OTCBB) and Pink Sheets companies, only the 1 percent of outstanding shares metric applies.

27 Or the issuer's shares are traded on the OTCBB or Pink Sheets.

**Figure 15.3 Block Size and Discounts**

The data show that the discount increases due to a greater degree of illiquidity (that is, larger block size), and the magnitude of this relationship is most significant among block sizes greater than 30 percent. Specifically, increasing block size from less than 30 percent (median discount of 15.8 percent) to greater than 30 percent (median discount of 38.8 percent) results in an increase to the median discount of 23.0 percentage points ( $38.8\% - 15.8\% = 23.0\%$ ), or 2.45 times ( $38.8\%/15.8\% = 2.45$ ). The largest blocks of restricted stock, which may require many years to liquidate through public sales, are so illiquid that they resemble *private equity*. Stated differently, Rule 144's dribble-out provisions, in addition to general supply and demand conditions for the securities, make it so difficult to sell such blocks in public trading that the most attractive solution, in most cases, would be a private sale. As will be explained shortly, these facts, along with the empirical data discussed previously, are used to derive DLOMs for minority interests in private companies.

**Market volatility and discounts.** The impact of broader market risk, measured by volatility in the equity markets, is also provided in the Stout study. An analysis of the discounts associated with transactions occurring during periods of abnormally high market volatility suggests that given a fixed level of company-specific financial and market risk and the degree of liquidity of a security, discounts are greater during high volatility periods than during normal periods.

In order to assess the impact of broader market risk on restricted stock discounts, Stout has assigned each transaction a market volatility variable. For this analysis, Stout utilized VIX values, a widely used measure of market risk.<sup>28</sup> To control for short-term fluctuations in VIX values (which are highly volatile) and to account for the typical time period required to complete a private placement transaction, Stout has calculated a trailing six-month average daily VIX closing value for each transaction. Because only the transaction month and not the exact day is known for many of the transactions, the market volatility variable for each transaction is the maximum trailing six-month average daily VIX closing value for the month of the transaction. When sorted by the VIX variable, transactions occurring during times of high VIX values have higher-than-normal discounts, particularly when controlling for Rule 144 changes by analyzing only one-year holding period data as demonstrated by the data in table 15.18.

<sup>28</sup> The CBOE Volatility Index® (VIX®) is a key measure of market expectations of near-term volatility conveyed by S&P 500 stock index option prices. Since its introduction in 1993, VIX has been considered by many to be the world's premier barometer of investor sentiment and market volatility.

**TABLE 15.18 VIX Variables**

			Median Statistics			
VIX Range:						
Percentile Group	Low	High	% Shares Placed	Total Assets (\$mm) <sup>1</sup>	VIX	Discount
1-Year Holding Period <sup>2</sup>						
0-60th	11.2	–	23.1	10.8%	57.2	14.7
60th-100th	23.1	–	32.9	8.1%	20.5	25.3

<sup>1</sup> Adjusted for inflation as of January 2016.  
<sup>2</sup> 332 Transactions, February 20, 1997–November 14, 2007.  
*Note*—This analysis excludes all blocks > 30% shares placed and is not adjusted to a two-year equivalent.

VIX Percentile Group	VIX Range:		Median Multiplicative Adjustment Factor <sup>1</sup>
	Low	High	
0-60th	11.2	23.1	1.00
60th-80th	23.1	25.2	1.16
80th-100th	25.2	32.9	1.23
Implied	32.9	40.0	1.39
Implied	40.0	50.0	1.57
Implied	50.0	60.0	1.78

<sup>1</sup> Multiplicative differences between the RSED for each transaction and the actual discount for such transactions.

Transactions involving large blocks demonstrate higher discounts due to poorer liquidity. In order to isolate market risk and control for the degree of liquidity, for the previous analysis, Stout has excluded transactions with block sizes greater than 30 percent. As illustrated, the top 40 percent of transactions (60th–100th percentile) when sorted by the VIX, over the entire time period covered by the study, have a median discount of 18.1 percent versus a discount for the bottom 60 percent of transactions of 14.29 percent.

To control for certain factors such as changes to Rule 144, a similar analysis was performed for the period between February 20, 1997 and November 14, 2007, and the period from November 15, 2007 to the present, during which Rule 144 was unchanged. This analysis is illustrated in the preceding figures. The most recent period is characterized by extremely high VIX values due to the recent financial crisis. Before 2009, the highest VIX in the Stout study was 32.9, but, from 2009–2011, there were 20 transactions with a VIX higher than 32.9. Many of the transactions from November 15, 2007 to the present have an unusually high VIX, with two-thirds above 23; as a result, a multiplicative adjustment factor was calculated using data from the period between February 20, 1997 and November 14, 2007. For this period, which captures times of very high stock market volatility (for example, the tech boom and bust of 1997–2002), as well as periods of very low stock market volatility (for example, 2003 to mid-2007), the Stout study contains 332 transactions with block sizes less than 30 percent, providing a rich sample for analysis. As shown, the top 40 percent of transactions (those

in the 60th to 100th percentiles) when sorted by VIX have a median discount of 25.89 percent versus only 12.11 percent for the bottom 60 percent of transactions. Based on the analysis, in the event that a valuation date falls within a period of high market volatility, it is appropriate to apply an adjustment factor to the discount arrived at by comparison of company-specific financial and market risk and security liquidity characteristics. In the future, as we move further away from the peak of the financial crisis, VIX should decrease and there should be a more well-rounded range of VIX values for transactions having a six-month holding period. Stout says that the suggested adjustment factors will then change accordingly, if necessary.

The impact of market volatility on restricted stock discounts is particularly important during the latter part of 2008, when the VIX soared well above historical highs. Prior to 2008, a VIX reading of 20 or below was considered to be an indication of investor calm and confidence in the market, while a VIX value of 30 or above was considered to reflect investor panic. From 1990 through mid-2008, the VIX briefly topped 40 during only three periods: the 1998 Russian debt crises and subsequent collapse of the Long-Term Capital Management hedge fund; the Dot-Com Bubble collapse; and the attack on the World Trade Center and Pentagon on September 11, 2001. However, during October 2008, the average VIX closing value was 61.18 and on October 27, 2008, the VIX closed at more than 80. Based on the historical data analyzed previously, one would expect significantly higher restricted stock discounts during this period in light of such extreme market volatility.

The Stout study includes 39 arm's length common-stock-only private placements during 2008. Not surprisingly, the majority of these transactions occurred during the first half of the year, and only 6 were completed after August 2008, when investors largely fled to less volatile, more liquid investments. The median discount for the transactions occurring between January 1, 2008 and September 15, 2008, was 9.8 percent. However, it was 24.2 percent for transactions occurring after September 15, 2008, approximately 2.5 times the median discount for the first 8 months of the year. Furthermore, companies that successfully completed private placements after August 2008 demonstrated substantially stronger financial and market risk characteristics than those during the first 8 months of the year, which would otherwise suggest lower, rather than higher, discounts for such companies. This indicates that the actual impact of increased market volatility may be even greater than observed (for instance, when the VIX is below 30). Furthermore, only 2 of these transactions occurred while the VIX was greater than 40, and only 1 occurred when the VIX was greater than 50, suggesting severely limited demand for illiquid securities during this time of extreme market volatility.

One issuer included in the Stout study, Western Alliance Bancorporation (WAL), privately placed an 11.2 percent block of its common shares on June 27, 2008, and another 11.3 percent block on September 30, 2008. Based on block size and the terms of registration rights provided in each case, the two blocks purchased appear roughly equivalent with respect to liquidity. Furthermore, between June 27 and September 30, WAL's share price increased from \$8.11 per share to \$15.50 per share, similar to the share price increases of major competitors Bank of America and Wells Fargo, suggesting an improved market for WAL's stock and the financial sector generally. However, between the two transaction dates, the VIX increased from 23.4 to 39.4, a two-fold increase. As a result, the June transaction had a discount of 2.1 percent, whereas the September transaction had a discount of 25.6 percent.

*Summary of findings.* In summary, the main conclusions of the Stout study are that the magnitude of the DLOM is negatively correlated with the issuing firm's

- market value of equity;
- revenues;
- total assets;
- book value of shareholders' equity; and
- net profit margin.
- On the flip side, the magnitude of the DLOM is positively correlated with the issuing firm's MTB ratio;
- the issuing firm's stock price volatility;
- the block size of the placement, described as a percent of the total ownership; and
- the level of market volatility prevailing as of the transaction date, as measured by the VIX.

*Stout's Two-Year Equivalent Discount.* Rule 144 has been amended twice to reduce the required holding period. The required holding period was initially decreased from two years to one year in 1997 and then decreased further in 2008 to six months. The addition of transaction data with shorter holding periods has

increased the average liquidity of the aggregate restricted stock data. As a result, the average discount in the Stout study has been decreasing with the addition of shorter holding period transactions. Examining data from the Stout study shows that the overall median discounts for the two-year (243 transactions), one-year (342 transactions), and six-month (151 transactions) holding period transactions are 22.1 percent, 15.7 percent, and 12.0 percent, respectively.

In addition to shorter holding periods, the relative liquidity of the Stout study has increased even further as a result of additional transactions having registration rights. Transactions in which registration rights were granted typically have dramatically shorter holding periods than transactions in which no registration rights were granted. The median discount for the 340 transactions with registration rights is 13.2 percent, compared to 18.6 percent for the 261 transactions without registration rights.

The increase in liquidity as a result of the shorter holding periods and the increased number of transactions with registration rights reduces meaningful comparability with private companies. Stout has solved this dilemma by isolating that portion of the discount related to the differences in expected holding period time frames.

Isolating the discount differential between transactions having two-year holding periods, one-year holding periods, and six-month holding periods and those transactions having registration rights (which typically is a four-to-six-week holding period) required developing a data set in which the data were most similar. In developing this data set, Stout made the following adjustments:

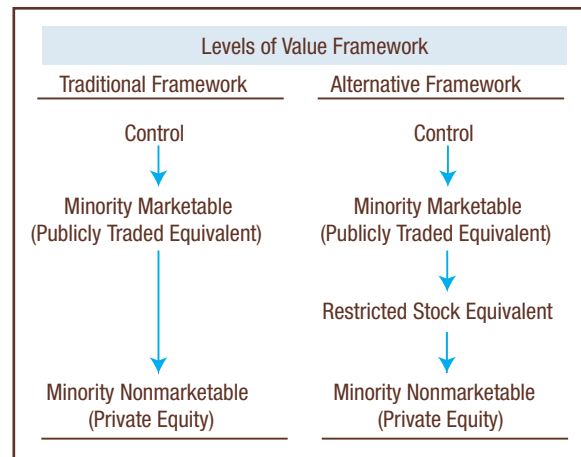

1. *Premiums*: There are a few premiums (negative discounts) in the Stout study. Logically, a knowledgeable investor would rather acquire the stock on the public marketplace without paying a premium. Although Stout does not have access to the underlying purchase contracts, they believe that many of these premiums may be the result of an investment opportunity not available to other investors or an unidentifiable relationship with the seller. For this reason, they have excluded transactions with premiums.
2. *Large-block transactions greater than 20.0 percent*: The data show that discounts increase due to a greater degree of illiquidity. The larger the percentage block sale, the longer the holding period under the dribble-out provisions of Rule 144. Small percentage block transactions of less than 20.0 percent are least affected by block size. For this reason, Stout has excluded transactions of percentage blocks larger than 20.0 percent.
3. *Top quintile VIX transactions*: Transactions occurring during times of high VIX values have higher-than-normal discounts, all things being equal. For this reason, Stout has excluded transactions that occurred during the periods in which the VIX was in the top quintile.
4. *Companies classified by SIC code 6XXX*: SIC code 6XXX includes companies in the finance, insurance, and real estate industries. During the recession, these companies were among the most impacted and exhibited some characteristics inconsistent with historical trends. For this reason, they have excluded transactions classified by SIC code 6XXX.

Based on their analysis of the adjusted data sets described previously, the indicated adjustments to the Stout study holding period data are as follows:

- *Registration rights*: The appropriate adjustment for transactions having registration rights was calculated by comparing the median two-year holding period transactions without registration rights to the median for all six-month transactions with registration rights. This adjustment factor for six-month transactions having registration rights is 6.9 percent.
- *Six-month holding period*: The appropriate adjustment for six-month holding period transactions was calculated by comparing the median two-year holding period transactions without registration rights to the median six-month holding period transactions without registration rights. The adjustment factor for the six-month holding period transactions, without registration rights, is 5.7 percent.
- *One-year holding period*: The appropriate adjustment for one-year holding period transactions was calculated by comparing the median two-year holding period transactions without registration rights to the median one-year holding period transactions without registration rights. The adjustment factor for one-year holding period transactions, without registration rights, is 3.8 percent.

The result of the preceding adjustments is that each additional data point (currently six-month or six-month with registration rights) is as meaningful in the determination of the appropriate discount for lack of marketability as are the two-year holding period data.

*Stout's preferred DLOM determination methodology.* When valuing minority interests in privately held entities, valuation analysts often use a valuation framework with three different levels of value: control; minority marketable (publicly traded equivalent); and minority nonmarketable (private equity). However, the difference between the public and private levels of value can be further refined by another, intermediate level of value—the *restricted stock equivalent value*. This is helpful because there is no available empirical data that provides a directly observable measure of the difference between the public and private equity levels of value. Through this more detailed framework, valuation analysts can hopefully measure the DLOM for minority interests in private companies more accurately by first determining the discount applicable as *if the company were a public company issuing restricted stock* through an empirical comparison with actual restricted stock issuers. From there, valuation analysts can determine a discount increment to account for the greater illiquidity of private company stock versus typical restricted stock in public companies.

There are several important differences between restricted stock in public companies and private company interests. However, the difference is one of degree and not of kind. That is, interests in private entities and the restricted stock of public entities are both illiquid securities. Furthermore, in both cases, their illiquidity is a function of being *cut off from public markets*. In the case of restricted stock, this condition is a temporary one, whereas for private entities it is more long-term and, in many cases, even permanent. It is important to note that both restricted stock in public companies and interests in private entities may generally be sold at any point in time in private transactions. What they each lack is access to public markets.

Minority interests in private companies should typically be considered less marketable than restricted stock in public companies because interests in private companies have no market, whereas public companies have already established trading markets for their shares, and their restricted shares will eventually become fully tradable in those markets, simply with the passage of time.

*Stout's discount determination methodology.* The calculator automates the data sorting and formula building that a user would otherwise have to conduct manually. An analysis of the Stout study data suggests that the most important determinants of the DLOM are (1) the issuing firm's financial and market risk; (2) the level of stock market volatility prevailing around the transaction date; and (3) the degree of liquidity of the securities. Accordingly, Stout's determination of the appropriate DLOM for minority interests in private companies involves a three-step analysis:

1. *Restricted stock equivalent discount (RSED).* The discount applicable to the shares (or other equity interest) in a private company, as if they were typical restricted shares in a public company. The determination of the RSED is based on a comparative analysis of the subject company and the Stout study companies issuing small blocks of restricted stock (less than 30 percent shares placed).
2. *Market volatility adjustment.* The adjustment to the RSED required in the event that equity markets demonstrate unusually high volatility around a given valuation date. The adjustment factor is derived from a comparison of Stout study transactions occurring during months with normal trailing six-month average VIX values versus those occurring during months with very high trailing six-month

average VIX values. The result of applying the market volatility adjustment to the RSED is the adjusted restricted stock equivalent discount (ARSED).

3. *Private equity discount (PED)*. The discount required for private equity, which reflects the fact that interests in private companies are significantly less liquid than all but the most illiquid issues (for instance, the largest blocks) of restricted stock in public companies. The adjustment to go from the ARSED to the PED is based on the adjustment factors derived from the comparison of discounts associated with small-block versus large-block transactions in the Stout study.

The three steps outlined previously relate to the alternative levels of value framework as shown in figure 15.4.

**Figure 15.4**

Level of Value	Adjustment	Supporting Data / Methodology
Marketable Minority (Publicly Traded Equivalent)	] Restricted Stock Equivalent Discount	Comparative Analysis with Small-Block Restricted Stock Transactions
Restricted Stock Equivalent (Normal Volatility Time Frame)		
Restricted Stock Equivalent (Unusual Volatility Time Frame)	] Market Volatility Adjustment	Restricted Stock Transactions During Unusual Volatility Months vs. Normal Months
Nonmarketable Minority (Private Equity)	] Private Equity Adjustment	Large-Block vs. Small-Block Restricted Stock Transactions

Stout does not advocate estimating the DLOM based on a direct comparison of the subject company with large-block transactions, which would necessitate a single step to derive the PED, because there is not a sufficient sample of large-block transactions to allow for a detailed financial characteristics comparison to account for the various risk factors that impact the DLOM.

*RSED*. The RSED takes the subject company value from the public equity equivalent (minority marketable) level of value to the restricted stock equivalent level of value. Because the goal in this first step is to determine the RSED and not the total discount applicable to a privately held entity, Stout bases this analysis on a comparison of small-block transactions only, or blocks in which less than 30 percent of the shares were placed. For the determination of the RSED, the financial characteristics of the subject private company are analyzed in relation to the small-block data. For private companies, Stout typically performs this analysis on the following variables: market value, revenues, total assets, book value of equity, MTB ratio, net profit margin, and volatility. Although stock price volatility demonstrates a strong positive correlation with the DLOM, because it is not a measurable variable for the stock of private companies, Stout typically does not use this variable in the determination of DLOM's for private companies. Stock price volatility, however, should be considered in determining DLOM's for restricted stock in publicly traded companies. Additionally, Stout typically does not consider industry classification to be a significant determinant of the DLOM. Accordingly, when Stout determines the RSED for a subject entity, they generally use financial risk characteristics, rather than industry classification, for selecting the companies in the Stout study that they consider most comparable to the subject entity.

To perform a comparative analysis across the selected variables, Stout sorts the data into five equal percentile groups (quintiles) for each variable and computes the median discount for each group. They then compare the subject entity with the data for each parameter to see in which quintile group it belongs. The median discount for the quintile group in which the subject entity falls provides one indication for the appropriate RSED. An example of this analysis with respect to the total assets variable is provided in table 15.19.

**TABLE 15.19 Total Assets Variable**

	Count	Range (\$mm) <sup>1</sup>		Median Discount	Subject Company Value (\$mm)	Indicated Discount
		High	Low			
1st Quintile	147	42,956.5	224.3	14.3%		
2nd Quintile	147	222.5	66.0	15.2%		
3rd Quintile	147	66.0	25.0	19.8%		
4th Quintile	147	24.4	10.3	24.7%	<b>15.0</b>	<b>24.7%</b>
5th Quintile	148	10.3	0.0	32.7%		

<sup>1</sup> Adjusted for inflation as of January 2016.  
<sup>2</sup> Adjusted to two-year equivalent discounts.

The weighted average of the discount indications is then computed; the selection of weights is based on what factors tend to be the most important determinants of the DLOM. In most cases the key variables are considered to be market value, total assets, shareholders' equity, and volatility (if available). Revenues, MTB ratio, and net profit margin tend to be somewhat weaker indicators. However, the weights applied in any particular case may vary based on the specific facts and circumstances surrounding the subject company and the subject interest being valued.

In addition to the discount indication provided by the preceding analysis, Stout performs an additional analysis that involves identifying companies that are comparable to the subject company across a number of the key variables discussed previously. Again, because the initial goal is to determine the RSED, they base this analysis on small-block transactions only. Each transaction in the study is analyzed to see if the issuing entity is a match with the subject company across the variables considered to be the key financial risk characteristics that affect the discount. For this purpose, a match on any particular variable is defined as the issuing entity being in the same quintile group as the subject company for that variable. The median discounts for each of the subsamples are computed, which provide additional indications for the appropriate RSED for the subject company. In this analysis, particular attention should be given to the number of transactions included in each sample. Generally, depending on the sufficiency of the number of transactions, the greatest weight should be given to the discount indications from the subsamples with the greatest number of matches. The results of this analysis are provided in table 15.20. In the example, Stout attempts to match the subject company with the issuers across all seven variables.

**TABLE 15.20 Sample Transactions**

Number of Quintile Matches	Number of Transactions in Sample	Median Discount
7	0	NA
6	3	19.9%
5	10	19.3%
4	24	21.6%
3	97	18.3%
2	222	16.6%
1	423	17.5%

The RSED for the subject company is selected, giving consideration to each of the indications from the two analyses previously described.

*Market volatility adjustment.* Having determined the RSED, which is based on the risk characteristics of the subject company, the next step is to determine the appropriate market volatility adjustment in the event that a valuation date occurs within a period of abnormally high market volatility.

Note that in the data in table 15.21, there are differences in company financial characteristics between the low- and high-VIX groups, such as company size (measured by total assets, for example) that may account for a portion of the observed difference in discounts. Accordingly, in determining the appropriate market volatility adjustment, Stout first determines what the RSED would be for each high-VIX transaction. Because the RSED analysis is based on all small-block transactions occurring in low-, normal-, and high-VIX time periods, the resulting RSED generally provides an indication for the discount appropriate in normal VIX time periods. Stout then compares the actual discount for each high-VIX transaction with the indicated RSED and calculates a multiplicative adjustment factor related to that transaction. For example, if the RSED is indicated at 15 percent, and the actual transaction discount is 18 percent, the multiplicative adjustment factor would be 1.20 (or  $18\% \div 15\%$ ). Stout performs this calculation for all high-VIX transactions, which produces the output in table 15.22.

**TABLE 15.21 VIX Analysis**

Percentile Group	VIX Range:		Median Statistics				
	Low	High	% Shares Placed	Total Assets (\$mm) <sup>1</sup>	VIX	Discount	
1-Year Holding Period <sup>2</sup>							
0-60th	11.2	–	23.1	10.8%	57.2	14.7	15.9%
60th-100th	23.1	–	32.9	8.1%	20.5	25.3	29.7%

<sup>1</sup> Adjusted for inflation as of January 2016.

<sup>2</sup> 332 Transactions, February 20, 1997-November 14, 2007.

<sup>3</sup> Adjusted to two-year Equivalent Discounts.

Note—This analysis excludes all blocks > 30% shares placed.

**TABLE 15.22 Multiplicative Adjustment Factor**

VIX Percentile Group	VIX Range:		Median Multiplicative Adjustment Factor <sup>1</sup>
	Low	High	
0-60th	11.2	23.1	1.00
60th-80th	23.1	25.2	1.16
80th-100th	25.2	32.9	1.23
Implied	32.9	40.0	1.39
Implied	40.0	50.0	1.57
Implied	50.0	60.0	1.78

<sup>1</sup> Multiplicative differences between the RSED for each transaction and the actual discount for such transaction.

As shown by the positive median multiplicative adjustment factors using 1-year holding period data from the 60th to 100th percentiles, the RSED tends to underestimate the actual transaction discounts for high-VIX transactions. Accordingly, when the VIX is between 23.1 and 25.2, a 1.16 times multiplicative factor is indicated to apply to the RSED to determine the ARSED, and, when the VIX is between 25.2 and 32.9, a 1.23 times multiplicative factor is indicated to apply to the RSED to determine the ARSED. These results are extrapolated to arrive at implied adjustment factors in the event that the VIX is even higher than normal, such as during the 2008–2010 period.

The VIX statistic utilized for this analysis is the trailing 6-month average VIX for the transaction month, and so it follows that the trailing 6-month average VIX for a given valuation date should be given primary consideration in determining which adjustment factor, if any, is appropriate. However, it is Stout's opinion that investors would consider more near-term trends in the VIX, as well, and so consideration may be given to either rising or falling VIX values closer to the valuation date. For example, in the event the VIX value on a given valuation date is significantly above historical levels, such as during fall 2008, VIX values at the valuation date may capture investor sentiment better than trailing 6-month averages. In fact, during such a time period, it may be appropriate to apply adjustment factors in excess of those indicated by the top quintile. For example, due to the collapse of credit markets stemming from the mortgage crisis and compounded by rapidly declining economic conditions in the United States and abroad, on October 24, 2008, the VIX reached a record level of nearly 90, reflecting unprecedented expectations of future volatility. Given that the highest VIX value observed in the Stout study is only 32.9, the indicated adjustment factors would not appropriately consider this unique period in history.

Valuation analysts should also consider the possibility that a downward adjustment to the RSED may be appropriate during times of historically low stock market volatility. Stout's analysis of the transactions, which have 6-month trailing average VIX values as low as 11.2, suggests that no downward adjustment is necessary when the VIX is between 11.2 and 23.2. However, if in the future the VIX falls below the levels represented in the study, a downward adjustment may be appropriate.

*Private equity discount (PED).* The ARSED (calculated by applying the market volatility adjustment to the RSED) represents the discount appropriate for a public company issuing restricted stock that will ultimately have access to a public trading market. Interests in privately held entities are generally subject to significantly greater illiquidity; therefore, an additional analysis must be performed to calculate the appropriate PED. However, Stout notes that in certain cases, a particular subject interest may possess similar or even improved liquidity in comparison to the typical restricted securities in public companies. Under these rarer circumstances, a downward adjustment to the RSED may be warranted.

The adjustment factor that brings the subject company value from the restricted stock equivalent level of value to the private equity (nonmarketable minority) level of value is based on an analysis of the largest (most illiquid) blocks of stock in the study. This analysis involves comparing the discount indications for large-block transactions (for instance, those that most resemble private equity) with those for small-block transactions (those used in determining the RSED).

Unlike differing percentage minority interests in public companies, which have differing degrees of liquidity due to the factors discussed previously, differing percentage minority interests in private entities generally have similar degrees of illiquidity. Furthermore, the degree of illiquidity of typical minority interests in private companies is most similar to the degree of illiquidity of large blocks of restricted stock in public companies. Therefore, a large-block comparison is appropriate for minority interest private equity valuations of any percentage interest because of the more similar degree of illiquidity.

As shown in table 15.23, the discounts associated with block sizes greater than 30 percent are substantially greater than those associated with block sizes less than 30 percent. Stout notes that there are differences in company financial characteristics between the small- and large-block groups, such as company size (measured by total assets, for example) that may account for a portion of the observed differences in discounts.

Accordingly, in determining the appropriate PED adjustment factor, Stout first determines what the RSED would be for each large-block transaction (recall that the RSED analysis is based only on a comparison between the subject company and issuers of small-blocks of restricted stock). They then compare the actual discount for each large-block transaction with the indicated RSED and calculate a multiplicative adjustment factor related to that transaction. For example, if the RSED is 15 percent, and the actual transaction discount is 30 percent, the multiplicative adjustment factor would be 2.0 (or  $30\% \div 15\%$ ). Stout performs this calculation for all large-block transactions, which produces the output in table 15.24.

**TABLE 15.23 Discounts by Block Size**

% Shares Placed	Median Statistics		
	Total Assets (\$mm) <sup>1</sup>	Issuer Volatility	Discount
0%-10%	\$41.1	75.1%	15.0%
10%-20%	\$48.6	72.1%	15.6%
20%-30%	\$30.9	75.3%	20.2%
30%-40%	\$43.4	81.8%	33.2%
> 40%	\$16.1	84.0%	39.2%

<sup>1</sup> Adjusted for inflation as of January 2016.

**TABLE 15.24 Multiplicative Adjustment Factor**

% Shares Placed	Median Multiplicative Adjustment Factor
30%-40%	1.71
40%-50%	1.79

As shown by the positive median multiplicative adjustment factors, the RSED significantly underestimates the actual transaction discounts for large-block transactions. Accordingly, for very illiquid interests, such as private equity, a 1.71–1.79 multiplicative adjustment factor range, which has been adjusted to reflect a two-year equivalent discount (the appropriate multiplicative adjustment factor range is 1.92–1.95 times for the traditional DLOM), has been deemed appropriate to convert the RSED to the appropriate PED. Stout notes that in certain circumstances, applying this range of adjustment factors may yield very high PEDs, potentially higher than 50 percent to 60 percent. Although this may be appropriate, consideration should be given to the fact that only 5.9 percent of all transactions and 20 percent of large-block transactions have discounts greater than 50 percent. The distribution of discounts is presented in table 15.25.

**TABLE 15.25 Discounts By Block Size**

Percentile	Discounts <sup>1</sup>		
	All Transactions	Small Blocks	Large Blocks
10th	8.1%	8.0%	10.7%
20th	11.0%	11.0%	18.4%
30th	13.6%	13.4%	23.5%
40th	16.3%	16.1%	26.6%
50th	19.9%	19.4%	40.6%
60th	23.8%	23.4%	43.5%
70th	28.8%	27.9%	46.3%
80th	36.0%	34.8%	53.8%
90th	44.8%	43.1%	63.1%
100th	95.1%	95.1%	90.8%

<sup>1</sup> Adjusted to two-year equivalent discounts.

In order to ensure the reasonability of the PED indications, in addition to calculating multiplicative adjustment factors, Stout has calculated inverse multiplicative adjustment factors (for instance, a multiplicative adjustment factor based on one minus the discount indication). The inverse of the discount represents the percent of the publicly traded value that the transaction price represents, rather than the discount to the publicly traded value. For example, an \$8.00 per share purchase price in which the publicly traded value is \$10.00 per share represents either a 20 percent discount or 80 percent of the publicly traded value. In this case, 80 percent is the inverse of the 20 percent discount. If the actual discount for a large-block transaction is 40 percent (60 percent inverse discount), and the RSED for the same transaction is 20 percent (80 percent inverse discount), the inverse multiplicative factor is calculated as  $60\% \div 80\%$ , or 0.75. Performing this analysis for each large-block transaction results in the output (based on the two-year equivalent discount) in table 15.26.

**TABLE 15.26 Inverse Multiplicative Factors**

% Shares Placed	Median Adjustment Factors	
	30%-40%	40%-50%
Multiplicative	1.71	1.79
Inverse Multiplicative	0.83	0.75

The appropriate multiplicative and inverse multiplicative adjustment factor ranges are 1.71–1.79 and 0.75–0.83, respectively, unadjusted for the two-year equivalent discount.

The inverse multiplicative factors should generally be considered when the RSED indication for a subject company is more than approximately 20 percent to 25 percent but should not be given weight for lower RSEDs (doing so will artificially inflate the PED). The appropriate adjustment factor to use to derive the PED is selected from the ranges derived from these adjustment factors, giving consideration to all the available data. For most valuations, absent strong arguments to the contrary, the PED for the subject interest is likely to be drawn from the middle of this range. An example of this analysis is provided in table 15.27.

<b>TABLE 15.27 Private Equity Discount</b>			
<b>ARSED</b>	<b>25.0%</b>		
	<b>Median Adjustment Factors</b>		
	<b>% Shares Placed</b>	<b>30%-40%</b>	<b>40%-50%</b>
	Multiplicative	1.71	1.79
	Inverse Multiplicative	0.83	0.75
<b>PED Range</b>		<b>Low</b>	<b>High</b>
	Multiplicative	34.2%	35.8%
	Inverse Multiplicative*	33.6%	40.0%
<b>DLOM Range</b>

	Wide Range	33.6%	40.0%
<b>Selected PED</b>		<b>36.0%</b>	
* Calculated as $[1 - [1 - \text{ARSED}] \times \text{Inverse Multiplicative Factor}]$			

*Additional considerations.* In analyzing how a subject interest stacks up against the Stout study transactions, consideration should be given to the following:

1. *Risk comparison.* Although the average private firm tends to be riskier than the average public firm, the issuers also tend to be riskier than the average public firm. Carefully analyze where the subject private firm fits within the data set across the relevant parameters. For larger private companies, the analysis may indicate that the subject company is less risky than the average firm in the study, which may indicate a lower DLOM.
2. *Dividend yield.* Liquidity represents the ease of converting an asset into cash. For publicly traded stock, this typically occurs through the sale of the securities for cash. However, a portion of a stock's value may be related to its dividend-paying capacity. If a private firm pays significant and consistent dividends, this may reduce the lack of marketability discount because much of the value of the stock is received in cash by shareholders on a regular basis. In other words, the presence of dividends lowers the DLOM for the security. In cases of high dividend yields, the DLOM should be lower than the indications from the most illiquid restricted stocks in the study because such blocks are generally non-dividend-paying. Due to the limited number of transactions in the study involving dividend-paying firms, this will involve a subjective adjustment determined by the valuator.
3. *Salability.* Valuation analysts must consider the relative ease of finding a buyer for a given interest when determining an appropriate DLOM. Certain factors may result in an interest being relatively more or less attractive, including but not limited to, the following:
  - a. *Ego satisfaction.* The marketability of certain assets may be significantly improved by the "sex appeal" of owning such assets. Minority interests in professional sports franchises or movie studios, for example, have historically not followed trends demonstrated by broader private equities markets. Due to the wide appeal of owning such assets, there seems to be a greater demand for such assets relative to typical interests in private firms.

- b. *Dollar value of interest (percent of ownership)*. All else equal, a small dollar-value position in a private firm may be significantly more difficult to dispose of than a larger dollar-value position due to the high cost of due diligence. Therefore, purchasers of such interests may demand greater discounts to compensate for this high percentage cost.
  - c. *Right of first refusal*. The presence of a right of first refusal on behalf of a private company or its shareholders is typically thought to have a negative impact on a minority shareholder's ability to market interests in the company because potential purchasers may be hesitant, and possibly unwilling, to incur time and cost in evaluating interests with little certainty of ultimately being able to acquire such interests.
4. *Anticipation of a liquidity event*. If a private company anticipates a liquidity event in the foreseeable future, through which shareholders will receive cash or liquid securities equal to a value in excess of the nonmarketable minority value, such as in a typical change-of-control transaction, the DLOM appropriate for such interest may be lower than that indicated from the transactions in the Stout study. Key considerations in determining the likelihood of a near-term liquidity event may include the following:
    - a. *Depth/age of key management*. Although the strength and remaining tenure of a private company's management team may reduce the risk of a minority investment in the firm, it may also inversely affect the DLOM. A weak management team, or the lack of an adequate succession plan, may increase the probability of the controlling shareholder(s) seeking a sale or merger, which may provide an opportunity for liquidity for minority shareholders.
    - b. *Merger and acquisition cycle/demand in industry*. If there exists a significant probability that the subject private company will experience a liquidity event in the foreseeable future due to active IPO or merger and acquisition markets, a downward adjustment to the indicated DLOM may be warranted.
  5. *Economic cycle*. Comparing a subject interest to the study transactions, which have been compiled during a 28-year period, results in an indication of the DLOM applicable in a relatively normal economic cycle. Generally, weak economic climates are accompanied by poorer performance of companies, less access to capital, and weaker demand for equity investments, including minority interests in private firms. Alternatively, when economies are booming and high levels of capital are seeking investment at high valuations, the marketability of equity interests, including minority interests in private firms, is improved.
  6. *Prior transactions*. Prior transactions in the stock of a subject company may not only provide indications of value for the subject interest, but also may provide clues about the existence of a market for a particular interest. In certain private firms, for example, there may be many, if not hundreds or even thousands of shareholders, some of which may, at any point in time, be interested in increasing their ownership position. If there has been a history of trading activity in the stock of a private company, the liquidity of the subject interest should be considered greater than the most illiquid restricted stock and, in some cases, may even be greater than small blocks of stock in the Stout study.

In addition to all the information that we have just discussed, the *Companion Guide* for the Stout Opinions Calculator on the Business Valuation Resources website provides a good case study in how to use all of this information.

## Pluris DLOM Database

Because we do not have enough databases to subscribe to, here is another one, brought to us by ValuSource. The Pluris DLOM database is constructed of data from restricted stock private placement transactions. This is a searchable database containing actual transactions in restricted stock and private placements.

According to its website, ValuSource claims to include more than 3,000 transactions since 2001. The Pluris DLOM database draws on the LiquiStat™ databases that include both restricted stock transactions and warrant transactions. The LiquiStat database includes transactions in the secondary market for illiquid securities. With the use of the LiquiStat data, the Pluris DLOM Database is able to determine the value of restricted stock private placement transactions with warrants attached. However, the search interface for the Pluris DLOM Database also allows the user to screen for only those transactions that do not include warrants.

One of the things that makes this database a bit different than the others is that it analyzes discounts taken in transactions between investors unrelated to the issuing company. This involves sales in private transactions to other investors and, as a result, may actually capture a better willing-buyer-willing-seller scenario.

The Pluris DLOM database contains more than 80 data points for each transaction, including the following:

- Closing and announcement dates
- Market prices for the underlying stock on each date, plus at set intervals before and after each date, industry descriptions, and classifications
- Trading volume and volatility for each stock, as well as the VIX as of each transaction date
- Details of any warrants issued with each deal
- Detail on the operating performance and financial position of each restricted stock issuer

## Pre-IPO Studies

Another manner in which the business valuation profession and users of its services determine DLOMs is through the use of closely held companies that underwent an IPO of their stock. In these instances, the value of the closely held stock is measured before and after the company went public.

John Emory, formerly of Robert Baird & Co., conducted 10 studies over time periods ranging from 1980 to June 2000, comparing the prices in closely held stock transactions, when no public market existed, with the prices of subsequent IPOs in the same stocks. Unfortunately, the last study in this group is old. However, it provides us with a thought process about these transactions. These studies consisted of an analysis of 4,088 prospectuses in an attempt to determine the relationship between the IPO price and the price at which the latest private transaction occurred up to five months before the company went public. The average discount in these studies ranged between 42 percent and 60 percent, with the higher discounts occurring at the time that interest rates were high and low. The median discounts ranged from 40 percent to 66 percent. The results are presented in table 15.28.

**TABLE 15.28 The Value of Marketability as Illustrated in Initial Public Offerings of Common Stock**

Study	# of IPO Prospectus Reviewed	# of Qualifying Transactions	Discount	
			Mean	Median
1997–2000(a)	1,847	283	50%	52%
1997–2000(b)	1,847	36	48%	44%
1997–2000(c)	NA	53	54%	54%
1995–1997	732	91	43%	42%
1994–1995	318	46	45%	45%
1992–1993	443	54	45%	44%
1990–1992	266	35	42%	40%
1989–1990	157	23	45%	40%
1987–1989	98	27	45%	45%
1985–1986	130	21	43%	43%
1980–1981	97	13	60%	66%
<b>Total</b>			<b>47%</b>	<b>48%</b>

(a) Expanded study.  
 (b) Limited study.  
 (c) Dot-Com study.

(Source: John D. Emory, Sr., F.R. Dengel III, and John D. Emory, Jr., "Expanded Study of the Value of Marketability as Illustrated in Initial Public Offerings of Common Stock," *Business Valuation Review* [December 2001]. Copyright © 2001, American Society of Appraisers. Used with permission.)

Although these discounts seem slightly higher than those of the restricted stock studies, don't jump for joy yet. There are several thoughts that should enter your mind. Were many of the purchases that took place before the IPO truly at arm's length (you know—make sure that Uncle Harry, Aunt Millie, and Cousin Gerry all end up with stock before the IPO. What is even worse is that the mural painter for the Facebook headquarters became a multi-millionaire when the company went public)? Furthermore, if the purchaser was aware of the IPO, he or she would also realize that there would soon be liquidity and, because of the new infusion of capital that would be coming into the company, the stock price might be higher than it would have been had the company not gone public. All of these factors could have affected the IPO price, as well as the price that the purchaser was willing to pay for the shares. Therefore, these discounts may be overstated.

A similar private, unpublished study was performed by Willamette Management Associates. The median discounts in the Willamette studies were considerably higher than the others, ranging from 31.8 percent to 73.1 percent.

### Valuation Advisors' Lack of Marketability Discount Study

Another study that I really like is the Valuation Advisors' Lack of Marketability Discount Study (VALOMDS). This study breaks down the discount for lack of marketability based on the amount of time that transactions occurred prior to the IPO. Fortunately, this discount study has been and is regularly updated. It's unbelievable that this study is available from BV Resources (who would have thought?). The VALOMDS compares the IPO stock price to pre-IPO common stock, common stock options, and convertible preferred stock prices. It includes more than 12,580 pre-IPO transactions from 1985 to the present time. It has almost doubled since the previous version of this book.

The database can be used to develop a subject-company-specific DLOM based on the quantitative characteristics of your subject company and expected holding period. An example of a complete transaction report appears in figure 15.5.

**Figure 15.5 Valuation Advisors Lack of Marketability Discount Study**

#### Transaction Detail

<a href="#">PRINTABLE FORMAT</a>		<a href="#">RETURN TO RESULTS</a>

(Source: Valuation Advisor's Lack of Marketability Discount Study™. Used with permission.)

The VALOMDS is an online database of pre-IPO private stock and option transaction data. This study is an Internet-based tool and includes transactions with time frames greater than two years. Data fields include the following:

- Individual four-digit SIC code
- Individual 3 and up to 6-digit North American Industry Classification System (NAICS) code
- Business description
- Date of transaction or date of IPO
- Revenues Assets
- Operating income Time period (year)
- Common stock, common stock options, or convertible preferred stock

One of the nice features of this database is that you can get to all the details in the database. Most companies (except partnerships, foreign companies, and mutual companies) that have gone public since 1986 and had pre-IPO transactions in their stock or options are included in the database. This includes insider transactions and options. The database is searchable by SIC or NAICS codes, company revenues, assets, operating income, time period, and type of security. Similar to the restricted stock studies, the size of the discount does not correlate to the SIC or NAICS codes. It seems that the industry does not matter.

The data contained in the VALOMDS clearly indicates that the longer the period of time before a liquidity event (the IPO), the greater the discount. The liquidity of a minority interest in a closely held company can take a considerable amount of time if a sale of the company is not planned. Therefore, it seems that the discounts based on this study could be very high.

### Quantitative Marketability Discount Model<sup>29</sup>

Another method that has been discussed in the valuation community is the Quantitative Marketability Discount Model (QMDM) developed by Mercer Capital. The QMDM was originally published in 1997.<sup>30</sup> The QMDM Companion can be purchased online at [www.mercercapital.com](http://www.mercercapital.com).

The QMDM, a shareholder-level discounted cash flow model, is a valuation method within the income approach. The QMDM provides a standardized format for analyzing, projecting, and discounting relevant shareholder cash flows that is applicable to almost any subject minority nonmarketable interest.

The QMDM inputs are analogous to those used in traditional enterprise-level discounted cash flow models as shown in table 15.29.

<b>TABLE 15.29</b>	
<b>Enterprise Level DCF Assumptions</b>	<b>Shareholder-Level DCF (QMDM) Assumptions</b>
1. Forecast Period	1. Range of Expected Holding Periods
2. Projected Interim Cash Flows (during forecast period)	2a. Expected Distribution / Dividend Yield 2b. Expected Growth in Distributions / Dividends 2c. Timing (Mid-Year or End of Year)
3. Projected Terminal Value (at end of forecast period)	3a. Growth in Value Over Holding Period 3b. Premium or Discount to Projected Enterprise Value
4. Discount Rate	4. Range of Required Holding Period Returns

Each of the discounted cash flow inputs (from the enterprise model on the left side of table 15.29) are tailored to the considerations of minority shareholders in private enterprises (on the right side). Although the QMDM directly values the subject minority nonmarketable interest, it is not used in isolation but, rather,

<sup>29</sup> A special thanks to Mercer Capital for allowing me to use the information in my book. Most of this section has been adapted from Mercer Capital's write up of the Quantitative Marketability Discount Model.

<sup>30</sup> Z. Christopher Mercer, *Quantifying Marketability Discounts* (Memphis, TN: Peabody Publishing, L.P., 1997).

in conjunction with a contemporaneous valuation of the subject enterprise because the shareholder level expectations regarding cash flows, risk, and growth are inextricably linked to the corresponding expectations with respect to the enterprise.

A benefit of the QMDM is that it forces the valuation analyst to focus on the subject interest's characteristics that determine the magnitude of a discount. The QMDM is driven by the following assumptions from table 15.29.

*Assumption No. 1: Range of expected holding periods.* When constructing an enterprise level discounted cash flow model, the valuation analyst must first determine the forecast horizon or length of the discrete projection period. This was discussed in chapter 12. Shareholder-level discounted cash flow models are no different. In the QMDM, the forecast horizon is referred to as the *expected holding period*. Investors develop holding period expectations by considering factors that may be more qualitative than quantitative. By considering the facts and circumstances of a particular valuation, valuation analysts may assess the likelihood that the expected holding period will be relatively short, relatively long, or somewhere in between. Although subjective, the holding period expectations are reasonably related to the following:

- Historical ownership policies: Insiders, outsiders, family, investors, and so on
- Buy-sell or other shareholder agreements
- Management and ownership succession: Age, health, competence, emerging liquidity needs, and so on
- Business plans and likely exit strategies of the controlling owner(s): Emerging attractiveness for equity offering or acquisition
- History of transactions involving minority interests

*Assumption No. 2A: Expected dividend yield.* Valuation analysts using a shareholder-level discounted cash flow model must project interim shareholder cash flows during the expected holding period. Other things being equal, expected dividends mitigate the marketability discount relative to a similar investment with no dividends. In other words, interim cash flows offer direct access to at least a portion of enterprise cash flows. Valuation analysts estimate the expected interim cash flows for a particular subject interest (and the resulting minority marketable yield) on the basis of several considerations:

- The history of dividends and distributions.
- Preferential dividend claims.
- Other enterprise characteristics. Sometimes, a company has not paid dividends in the past because available cash flow has been used to repay accumulated enterprise debt. If the debt has been repaid at the valuation date, or is about to be repaid, or even if the debt has been paid down to relatively normal financing levels, shareholder distributions may reasonably be expected. Occasionally, a company may be expected to make a one-time distribution, either in addition to normal distributions or in their absence. If such a distribution is reasonably expected at the valuation date, the valuation analyst may separately estimate its impact on shareholder value. Companies may also have periodic but irregular distributions. The analyst may need to estimate these separately, if significant, or estimate an average distribution yield based on historical, but irregular, distributions.
- Controlling shareholder characteristics.
- Enterprise tax characteristics. With pass-through entities, the valuation analyst must convert the anticipated cash distribution to a C corporation equivalent yield. In some cases, the resulting C corporation equivalent yield may be negative, for example, when pass-through income tax liabilities exceed cash distributions.

C corporations pay dividends; S corporations and other tax pass-through entities make distributions. S corporation distributions are not equivalent to C corporation dividends, which are taxable to shareholders. S corporation distributions are adjusted to the equivalent of C corporation dividends by dividing the S corporation distribution by  $(1 - \text{dividend tax rate})$ .

For C corporations, the calculation of expected dividend yield is straightforward. The expected dividend is divided into current value at the minority marketable level to obtain the yield. In table 15.30 on the following page, a C corporation has an expected dividend of \$0.45 per share (annual basis), and a minority marketable value of \$10.00 per share. Therefore, the C corporation's dividend yield is 4.5 percent.

**TABLE 15.30**

C Corporation Dividend Yield		Inputs / Calculations	
Expected Dividends		\$ 0.45	< > Appraiser's estimate
÷ Marketable Minority Interest Value	÷	\$10.00	< > Per the valuation
<b>Implied Ongoing Dividend Yield</b>		<b>4.5%</b>	<b>Rounded</b>

As shown in table 15.31, S corporation distributions can be made equivalent to C corporation dividends by “grossing up” the after corporate and personal tax distributions by the arithmetic inverse of the personal income tax rate on dividends from C corporations.

**TABLE 15.31**

C Corp Equivalent Distribution(\$) for an S Corp	=	$\frac{\text{Pro Rata (Gross) Distribution} - (\text{Personal Income Tax} \times \text{Pro Rata Pass-Through Income})}{(1 - \text{Personal Income Tax Rate on Dividends})}$
	=	$\frac{\text{Net (After Personal / Corporate Taxes) S Corp Distribution}}{(1 - \text{Personal Income Tax Rate on Dividends})}$

Applying the formula in table 15.31 to S corporation distributions yields a C corporation equivalent distribution. Table 15.32 presents the general formula, while table 15.33 presents an example of the calculation.

**TABLE 15.32**

C Corp Equivalent DistributionYield for an S Corp	=	$\frac{\text{C Corp Equivalent Distribution(\$) for an S Corp}}{\text{Marketable Minority Indication of Value for the S Corp}}$
--	---	---

*Assumption No. 2B: Expected growth of dividends.* For many business entities that pay a regular dividend or distribution to their owners, there is a reasonable probability that the dividend will grow as the enterprise grows. For this reason, the QMDM requires the valuation analyst to make a reasonable assumption about the expected growth rate of dividends. With respect to growth in dividends, analysts make one of four potential assumptions, depending on the facts and circumstances pertaining to the subject interest:

1. *Dividends will grow at the same rate as the expected growth in value (a constant dividend yield).*
2. *Dividends will grow at the same rate as the expected growth of core earnings (a constant dividend payout ratio).*
3. *Dividends will not grow (a constant dollar dividend).*
4. *Dividends will grow at some other rate. Other special circumstances may dictate the appropriate dividend growth assumption.* For example, if a company is on the verge of paying off a significant debt and its cash flow will be freed to pay increased dividends, it may be appropriate to estimate a blended future growth rate for dividends.

**TABLE 15.33**

QUANTITATIVE MARKETABILITY DISCOUNT MODEL (QMDM)  
QMDM ASSUMPTION #2a  
C Corporation Equivalent Yield for Tax Pass-Through Entity

C CORPORATION EQUIVALENT DIVIDEND YIELD FOR TAX PASS-THROUGH ENTITIES		Inputs / Calculations	
1	Expected Pre-Tax Earnings of Pass-Through Entity	\$1.00	Per Share, appraiser's estimate
2	Personal Federal Ordinary Income Tax Rate	35.0%	
3	Personal State Ordinary Income Tax Rate	4.0%	Blended Federal/State Rate
4	Blended Marginal Tax Rate	37.6%	Federal Rate × (1 – State Rate) + State Rate
5	<b>Pass-Through Taxes</b>	\$0.376	Line 1 × Line 4

7	Expected Total Distributions	\$0.800	Line 1 times Line 6
8	– Pass-Through Taxes on Pretax Earnings	(\$0.376)	From Line 3 above
9	= After-Tax Dividend	\$0.424	
10	After Tax Dividend	\$0.424	From Line 9 above
11	+ Blended Tax Rate on C Corp Dividends	15.0%	Federal/State corporate marginal rate (1 – personal blended tax rate)
12	<b>= C Corporation Equivalent Dividend</b>	\$0.499	After Tax dividend ÷ Blended Tax Rate on Dividends
13	C Corporation Equivalent Dividend	\$0.499	From Line 12 above
14	+ Marketable Minority Interest Value	\$10.00	Per Share, appraiser's estimate (Exhibit x)
15	<b>Implied Ongoing Dividend Yield – C Corporation Basis</b>	= 5.00%	C Corporation Equivalent Basis, Rounded

*Assumption No. 2C: Timing of dividend receipt.* Dividends can be assumed to be received at the end of each year or at the middle of each year (simulating continuous, or quarterly, dividend payments). Given the importance of dividends or distributions to value for high-distribution entities, valuation analysts should be clear about this assumption and the reasons for the choice between end-of-year and mid-year receipt. If the company actually pays dividends or makes distributions, a good practice would be to use the timing convention that corresponds to what the company actually does in practice.

*Assumption No. 3A: Expected growth rate in value.* The expected growth in value defines the terminal value in the shareholder-level discounted cash flow model. The QMDM assumes that marketability occurs at the minority marketable level of value, although the model allows the appraiser to change this assumption, if warranted. The assumption related to the growth rate in value can be driven by a number of factors:

1. Several reference points can assist valuation analysts in estimating the expected growth in value. In most appraisals using the income approach, valuation analysts develop specific estimates of earnings or cash flow growth. If the discounted future benefits method is used, specific growth assumptions are made for a finite forecast period. If the Gordon Model is used to estimate the terminal value, an assumption is made regarding the expected long-term growth beyond the finite forecast period.
2. Public company investor returns consist of two components: current income (or dividend yield) and capital appreciation (or growth in value). For public companies, the expected growth in value is the required return less the expected dividend yield. For private companies, various potential agency costs can disturb this relationship. Mercer assigns these agency costs to two categories, both of which increase the marketability discount applicable to the subject minority interest:
  - a. Non-pro-rata distribution of enterprise cash flows
  - b. Suboptimal reinvestment of enterprise cash flows

3. Note that the burden of expected suboptimal reinvestment is borne by all shareholders in the enterprise, whether owning a control or minority interest. From a controlling shareholder's viewpoint, the enterprise value is based on the normalized cash flows and efficient reinvestment of undistributed earnings because the business could be sold for that value. However, the value of the business plan is reduced by the effect of the anticipated suboptimal reinvestment. The difference between the controlling shareholder and the minority shareholder of a private company is that the former has the power to eliminate the potential decrement in value by a change in reinvestment policy or through distributions. The latter does not, and the valuation analyst must consider this impact in determining the marketability discount applicable to minority interests.

*Assumption No. 3B: Adjustments to the terminal value.* The expected growth in value establishes the terminal value at the minority marketable level of value. A related assumption specifies any premium or discount for the terminal value estimate relative to the minority marketable base. Sometimes, the facts of a particular valuation suggest that marketability may be achieved at the end of the expected holding period at a different level of value. For example, the enterprise may be sold to a strategic buyer. Alternatively, a minority interest discount may be irrelevant if a partnership is expected to liquidate within the relevant expected holding period. In such cases, the valuation analyst may indicate that a premium would be expected. Whatever is done, however, should be supported by the valuation analyst. Avoid just making assumptions because "that is what I think will happen."

*Assumption No. 4: Required holding period (rate of) return ( $R_{hp}$ ).* After estimating the interim shareholder cash flows and terminal value at the end of the holding period, application of the discounted cash flow model requires the valuation analyst to specify a discount rate or the required holding period return ( $R_{hp}$ ). (Doesn't this sound like what was covered in chapter 12? Mercer uses the conventional model for a discounted cash flow analysis.) Minority shareholders in private companies bear additional, unique risks associated with the non-marketability of such investments in addition to the underlying risks of the enterprise. Therefore, the appropriate discount rate for the QMDM is the sum of the enterprise discount rate ( $R_{mm}$ ) and the holding period premium (HPP) to compensate for the unique risks of non-marketability.

$$R_{hp} = R_{mm} + \text{HPP}$$

*Estimating the required holding period return.* The discount rate relative to the minority interest must be assessed so that the minority returns can be discounted to present value. Relative to the enterprise discount rate, the minority investor must be compensated for additional risks, such as the following:

- Uncertainty of holding period
- Likelihood of interim cash flows
- Prospects for marketability
- Uncertainty regarding a favorable exit
- Restrictive agreements
- Information costs and monitoring costs

An example of a build up required return rate for a minority interest given common risk categories faced by minority shareholders and sample risk premiums is shown in table 15.34 on the following page.

**TABLE 15.34**

## Application of the QMDM

The QMDM model requires the input of the assumptions outlined previously. Two of the assumptions, the holding period and the discount rate, are entered as ranges. As illustrated in table 15.35, with a range in holding period of 5–10 years, and a range of discount rate of 20 percent to 22 percent, the range of marketability discounts is 20.0 percent to 42.0 percent.

*Benefits of the QMDM.* The QMDM is a shareholder-level discounted cash flow method. The calculated range of marketability discounts is nothing more than a sensitivity table enabling the valuation analyst or reader of appraisal reports to understand the sensitivity of the conclusion to relevant changes in key assumptions. The model forces the analyst to focus on the characteristics of the subject minority interest, rather than just the characteristics of various empirical studies that may or may not be relevant to the subject stock. The use of the QMDM enables valuation analysts to make valuation judgments regarding minority nonmarketable investments based on facts and circumstances pertinent to each valuation situation. The discount for lack of marketability is quantitatively related to the cash flows that are projected to be received by the subject interest.

Critics of the QMDM claim that there are too many assumptions that enter into the model, and as such, the model is possibly subject to manipulation by the valuation analyst. However, let's be honest, there are no more assumptions in the QMDM than in a typical discounted cash flow analysis. If a valuation analyst plans to manipulate numbers to obtain a desired end result, that is an ethical issue that goes way beyond this textbook. As with all assumptions made in this profession, the valuation analyst must exercise integrity and objectivity.

## Costs of Flotation

Another consideration in determining a DLOM is the cost of flotation of a public offering. These costs are generally significant and will frequently include payments to attorneys, accountants, and investment bankers. The costs associated with smaller offerings can be as much as 25 percent to 30 percent of a small company's equity, but these costs will probably be much less applicable to the small- and medium-sized companies that are appraised because many of these companies, due to their financial condition (among other reasons), could not go public. Some older information related to flotation costs is included in exhibit 15.1. On occasion, we reference it in our reports. I have looked for more recent information without success. Sometimes we have to settle for what we can get. Just be careful not to rely solely on older data. That can get you burned.

### EXHIBIT 15.1 Costs of Flotation

The methods of liquidating an entire company are to execute an IPO of the stock or to sell the stock in a private transaction. There are several costs associated with executing an IPO, which include the following:

1. Auditing and accounting fees, to provide potential buyers or underwriters with the financial information and assurances they demand.
2. Legal costs, at a minimum, to draft all of the necessary documents, and often to clear away potential perceived contingent liabilities or to negotiate warranties, or both.
3. Administrative costs on the part of management to deal with the accountants, lawyers, potential buyers, or their representatives.
4. Transaction and brokerage costs, if a business broker, investment banker, or other transactional intermediary is involved.

One of the most comprehensive studies on the costs of public flotation was published by the SEC in December 1974. It covered 1,599 initial public offerings. The breakdown of the study is presented in the following table.

(continued)

**EXHIBIT 15.1 Costs of Flotation** *(continued)*

SEC Study on the Costs of Flotation			
Size of issue (Millions)	Number	Compensation (Percent of gross proceeds)	Other expense (Percent of gross proceeds)
Under .5	43	13.24%	10.35%
.5–.99	227	12.48%	8.26%
1.0–1.99	271	10.50%	5.87%
2.0–4.99	450	8.19%	3.71%
5.0–9.99	287	6.70%	2.03%
10.0–19.99	170	5.52%	1.11%
20.0–49.99	109	4.41%	0.62%
50.0–99.99	30	3.94%	0.31%
100.0–499.99	12	3.03%	0.16%
Over 500.00	0	—	—
<b>Total /Averages</b>	<b>1,599</b>	<b>8.41%</b>	<b>4.02%</b>

The data shows a significant decline in the level of expense relative to the size of the issue as the size of the issue increases. Offerings under \$1 million can have expenses as high as 23.6 percent of the offering. In contrast, offerings over \$500 million, on average, have expenses equal to only 3.2 percent of the offering.

A second study on the subject was published by Jay R. Ritter in 1987. The results are presented in the following table.

Direct Expenses of Going Public as a Percentage of Gross Proceeds (1977–1982)				
Gross Proceeds <sup>a</sup> (\$)	Number of Offers	Underwriting Discount <sup>b</sup> (%)	Other Expenses <sup>c</sup> (%)	Total cash Expenses (%)
<b>Firm Commitment Offers</b>				
100,000–1,999,999	68	9.84%	9.64%	19.48%
2,000,000–3,999,999	165	9.83%	7.60%	17.43%
4,000,000–5,999,999	133	9.10%	5.67%	14.77%
6,000,000–9,999,999	122	8.03%	4.31%	12.34%
10,000,000–120,174,195	176	7.24%	2.10%	9.34%
All Offers	664	8.67%	5.36%	14.03%

*(Table continued)*

**EXHIBIT 15.1 Costs of Flotation**

Direct Expenses of Going Public as a Percentage of Gross Proceeds (1977–1982)				
Gross Proceeds <sup>a</sup> (\$)	Number of Offers	Underwriting Discount <sup>b</sup> (%)	Other Expenses <sup>c</sup> (%)	Total cash Expenses (%)
<b>Best-Efforts Offers</b>				
100,000–1,999,999	175	10.63%	9.52%	20.15%
2,000,000–3,999,999	146	10.00%	6.21%	16.21%
4,000,000–5,999,999	23	9.86%	3.71%	13.57%
6,000,000–9,999,999	15	9.80%	3.42%	13.22%
10,000,000–120,174,195	5	8.03%	2.40%	10.43%
All Offers	364	10.26%	7.48%	17.74%

a Gross proceeds categories are nominal; no price level adjustments have been made.

b The underwriting discount is the commission paid by the issuing firm; this is listed on the front page of the firm's prospectus.

c The other expenses figure comprises accountable and nonaccountable fees of the underwriters, cash expenses of the issuing firm for legal, printing, and auditing fees, and other out-of-pocket costs. These other expenses are described in footnotes on the front page of the issuing firm's prospectus. None of the expense categories includes the value of warrants granted to the underwriter, a practice that is common with best efforts offers.

*(Reprinted from: Jay R. Ritter, "The Costs of Going Public," Journal of Financial Economics, January 1987, p. 272.)*

This study again shows a relationship between the size of the offering and the expenses as a percentage of the offering. It is clear that smaller deals incur significantly larger costs as a percentage of gross proceeds.

**DLOM—The Quantitative Stuff**

Now that we have covered the qualitative stuff, it is time to pull out the old calculators and get ready to address the quantitative methods that are growing in use within the business valuation community. I was going to say popularity, but that is just not true. Although we are starting to see the methods that will soon be discussed being used more and more, some of this stuff is so theoretical that it may take a while for it to be fully accepted. Personally, I hope that I can retire before this all kicks in. Please buy another copy of this book for a friend! Well, here goes nothing.

**Option Theory**

As much as I hate the thought of covering stock options in this book, I have to do it. It is actually explained in more detail in chapter 25. Stock option theory has become an important tool in attempting to quantify the DLOM. So, here is what I plan to do. In this chapter, I am going to keep it simple.

Fortunately, stock option models are available on the Internet, where all you have to do is plug in the correct numbers and out pops an answer.

So, let's do an example to demonstrate the use of option pricing to calculate a DLOM. Assume the following facts: You are valuing a closely held business in the automobile industry (a car dealership) and determine that the value on a minority, marketable basis is \$1,357 per share. Your inputs into the option model appear as follows:

<b>Black-Scholes Model</b>	
<b>Date</b>	
8/31/2010	
<b>Inputs Variables</b>	
Stock price as of	\$1,357.00
Exercise price	\$1,357.00
Term (in years)	5.0
Volatility (annual)	60.06%
Annual rate of quarterly dividends	0.00%
Risk-free rate	1.33%
<b>Intermediate Computations</b>	
Present value of stock ex-dividend	\$1,356.53
Present value of exercise price	\$1,269.53
Cumulative volatility	134%
<b>Call Option</b>	
Proportion of stock present value (PV)	76.45%
Proportion of exercise price PV	-26.69%
Call option value	\$ 698.20
<b>Put Option</b>	
Proportion of stock PV	-23.55%
Proportion of exercise price PV	73.31%
Put option value	\$ 611.21
DLOM	45.06%

Now let's discuss what we did here. First of all, this was just one of the variations that was performed using the model. We did the same set of calculations varying the holding period and risk-free rates (to conform to the holding periods). In the case of the subject closely held company, the stock has not been restricted by the SEC, but instead by the company itself. The restrictions on the stock are based on the shareholders' agreement and its closely held status. Although this is not a pure case of where a stock option model applies, we use this model because it can provide us with a reasonable basis for a discount.

In calculating the value of a put option on the company, we used the Black-Scholes option pricing model with the following inputs:

Minority, marketable price per unit*	=	\$1,357
Exercise price	=	\$1,357
Term (years)	=	Various

Risk-free rate	=	Various

\* Based on the minority, marketable value determined in this valuation and 10,000 shares of common stock outstanding as of August 31, 2010.

Because no empirical data exists on the time it takes to sell minority interests in closely held businesses, we looked at various holding periods for the put option. Longer holding periods were analyzed because an interest in a closely held company cannot be converted to cash immediately, and the holding periods tend to be lengthy. The results of our Black-Scholes pricing analysis are presented as follows:

<b>Black-Scholes Results</b>					
<b>6 Months</b>	<b>1 Year</b>	<b>2 Years</b>	<b>3 Years</b>	<b>4 Years</b>	<b>5 Years</b>
12.55%	18.36%	42.59%	44.61%	44.33%	45.06%

The preceding discounts serve as a proxy for the cost of liquidity for an investor in an industry related to the closely held company. The option pricing model indicates that the cost of liquidity ranged from 12.55 percent to 45.06 percent, depending on the holding period.

A major assumption in the option pricing model is that the future volatility of the guideline companies will resemble the past. We used the publicly traded guideline companies to determine the average volatility to be plugged into the model. In the near term (at the valuation date, which was August 31, 2010), volatility in the automobile market will likely be somewhat lower due to the anticipated recovery in the overall economy. Lower volatility would increase the liquidity of an investment in a closely held entity.

Another factor considered is that the volatility calculated using the option pricing model reflects the volatility of a number of large publicly traded guideline companies, each operating a number of automobile dealerships. The diversification inherent to holding multiple investments reduces the volatility and, therefore, increases the liquidity of an investment in these companies in comparison to an investment in the company. In addition, the subject company is subject to a higher level of risk, thus, increasing its potential volatility and reducing liquidity.

Finally, the holding period for an investment in the company is expected to be longer than five years because there was no liquidity event anticipated. The small number of shareholders supports the notion of a longer holding period, which would suggest a DLOM in excess of 40 percent.

This is also a good time to tell you about a quirk in using option pricing models to calculate a DLOM. Companies that pay dividends are considered to provide more liquidity to their shareholders, and the theory tells us that the DLOM should be lower if dividends are paid. If you notice in the preceding model, we input 0 percent for the annual rate of dividends. If you put a dividend yield into the Black-Scholes model, the calculated DLOM actually goes up, not down. This is because a put option's price goes up as the stock price goes down. When a public company pays a dividend, its stock price goes down because the equity of the company is being

reduced by the dividend. When using a stock option model to calculate a DLOM for a closely held interest, the underlying assumption is that the individual already owns the stock, therefore, he or she will receive a dividend to offset any potential reduction in the per share value of the stock.

An article<sup>31</sup> that appeared in the *Journal of Entrepreneurial Finance* criticizes using stock option models to calculate the DLOM. The authors state that the current practice of using the cost of a put option as a proxy for the DLOM tends to overstate the discount. They believe that while a put option insures that the investor will receive no less than the current value of the underlying asset, the use of a put also allows the investor to maintain the asset's upside potential, thus, overstating the DLOM.

Instead, the authors attempt to demonstrate that the cost of monetizing a nonmarketable asset at its current value through a loan, secured by an at-the-money equity collar, more effectively captures the true cost of marketability. They further state that when puts and calls cannot be employed to secure the current value on the underlying asset, a portfolio consisting of the nonmarketable asset and a stock index in which puts and calls can be written on the index, can be constructed. The effectiveness of the portfolio in creating a risk-free outcome depends upon the correlation and volatility of the stock index and the nonmarketable asset. The calculations shown in the article demonstrate that, relative to current practice, the use of an equity collar with a loan greatly reduces the implied DLOM.

This is an interesting article and should be considered as one more thought-provoking theory that goes against the old conventional wisdom.

## Longstaff Model

Francis Longstaff developed a model to measure what he termed the upper bound on the value of marketability.<sup>32</sup> His model assumes that a hypothetical investor has perfect market timing (that is, he has the foresight to always sell the stock at the market's peak). It also assumes that the investor receives a stock that is restricted from trading for T periods. Conceptually, the lost value in the restriction would equal the present value of the proceeds from the perfectly timed sale less the proceeds from the sale of the asset at the end of the restriction period.

Longstaff was focused on illiquidity issues with publicly held companies, such as investors holding IPO investments and periods in which market trading is halted. He was not primarily concerned with closely held companies.

The Longstaff model, though published in 1995, was not utilized by the business valuation industry for years. It became part of the theoretical underpinning for the use of stock options to measure the DLOM. Longstaff's research shows that the DLOM is tied to the length of the restriction period as well as the underlying stock volatility; these are two key variables in a stock option.

The volatility of a closely held stock cannot be directly measured. Analysts use volatility metrics from guideline public companies or another industry measurement. This can be one area of weakness in the use of stock options because the model is very sensitive to volatility. But that is not just Longstaff—it is all option pricing models.

Because the Longstaff model assumes a perfect timing variable, the discounts tend to overstate the DLOM because actual investors do not know the optimum time to sell. If you have a burning desire to see more information about this model, buy the previous edition of my book. I took out content in this edition because I felt that there was more important information to discuss than a model that I have never seen used in practice.

## Other Option Models

Although I have little intention of spending a lot of time on these other models, I believe that valuation analysts should be aware that they exist and consider some additional research on them beyond what is in this book. I sat through a conference session given by Bob Duffy (retired from Grant Thornton) and Linda Trugman (of my household and firm) and heard about some of this stuff.

*European protective put options.* David Chaffe wrote about this type of option in 1993.<sup>33</sup> A European protective put calculates a DLOM as the cost of locking in the current price to protect the downside risk of price movements during a period of illiquidity. The appeal of this calculation is that the formula itself and the key inputs, such as the risk-free rate and volatility, can be audited. This makes the calculation replicable. European options can be exercised only at the end of the option term. As such, the option is priced based on the end-of-period stock price.

Unlike a European put, a lookback put option (Longstaff) is path-dependent; it assumes that the holder of the option had perfect hindsight and would exercise the option at the optimal point. The value of a lookback put option is greater than that of a regular option; therefore, it costs more, which results in a larger DLOM.

*Asian protective put options.* Similar to a lookback option, Asian protective put options are path dependent because their terminal payoffs are determined by the average price of the stock or the average exercise price during the life of the contract. The value of an Asian option is lower than a standard contract, a consequence of the fact that the averaging process reduces volatility of the stock or exercise price movement. As such, if all else is equal, Asian puts result in lower DLOMs than other puts or lookback options.

Generally, two types of Asian options exist: (1) average rate (or stock price) and (2) average strike (or exercise price, best for protecting against lack of marketability). There are three methods to calculate Asian options: (1) arithmetic (most often used), (2) geometric, or (3) weighted average.

*Arithmetic Average Strike Put model.* The Arithmetic Average Strike Put model is based on research by John D. Finnerty, PhD.<sup>34</sup> It does not assume that the investor has any special market-timing ability. It assumes that in the absence of any restrictions, the investor would be equally likely to sell the shares anytime during the restriction period.

The model appears to be more appropriate for (unrelated) institutional investors, who are much less likely to have any private information that can be exploited. It is consistent with the range of discounts observed empirically in letter-stock private placements with a one year restriction period. This model tends to overstate the DLOM for volatilities under 45 percent. Comments extend equally to geometric Asian puts. Tests by other appraisers have found that this model produces reasonable results in the short term but over longer holding periods, the discount can actually decrease. Obviously, there are issues with this concept.

In an article written by John Stockdale,<sup>35</sup> the author reached some interesting conclusions about some of these models. His conclusions were as follows:

- The Longstaff model can result in DLOMs greater than 100 percent.
- The Chaffe and Finnerty models produce reasonable results in the short term, but over long holding periods, the discount can actually decrease.
- The data indicates that mathematical models should be used in conjunction with qualitative factors and appraiser judgment.

*Long-term equity anticipation securities (LEAPs).* A LEAP is a type of long-term put option. Robert R. Trout, PhD, and Ronald Seaman, ASA, have conducted separate research into LEAPs as a type of insurance against

33 David B.H. Chaffe, III. "Option Pricing as a Proxy for Discount for Lack of Marketability in Private Company Valuations." *Business Valuation Review* (December 1993): 182–88.

a decline in the value of the underlying security. Trout conducted the first study on LEAPs, with the results shown in table 15.36.

Seaman expanded Trout's work with subsequent studies done in 2005, 2006, and 2008. The earlier studies measured the marketability discounts implied by LEAPs in company size categories stratified by revenues and book value.

**TABLE 15.36 Implied DLOM on LEAPs as of March 2003 on Options Due January 2005**

Company	Stock Price	Strike Price	Option Price	Implied DLOM
Amazon	\$22.69	\$20.00	\$5.202	2.92%
Ford Motor Co.	7.45	7.50	2.20	29.53%
General Motors	31.20	30.00	6.70	21.47%
Morgan Stanley	22.00	20.00	4.70	21.36%
Microsoft	23.27	25.00	6.10	26.21%
Nextel	12.47	12.50	4.30	34.48%
Qlogoc	36.24	35.00	7.00	19.32%
Qualcom	34.98	35.00	8.80	25.16%
Tco Int'l	14.18	15.00	3.00	21.16%
<b>Average</b>				<b>24.62%</b>
<b>Median</b>				<b>22.92%</b>

(Source: Trout, Robert R., "Minimum Marketability Discounts," *Business Valuation Review*, September, 2003. Used with permission.)

By the time that Seaman performed his 2006 study, he expanded the earlier work to include all valid LEAPs in the market. He also expanded the categories to include size, risk (as measured by Value Line safety ratings, and also by betas), profitability, growth, and dividend yield. Not surprising, the study proved that company size and risk had significant effects on the implied DLOM. However, profitability, as measured by the prior year's earnings, growth, and dividend yield had minor effects on the DLOM.

The 2006 study covered more than 900 LEAPs that were purchased in 2006 and were set to expire in 2008 or 2009. The 2009 LEAPs expired in 30 months, whereas the 2008 LEAPs expired in 18 months. The results of the size study are shown in table 15.37.

**TABLE 15.37 Implied DLOM on 2009 LEAPs Stratified by Revenues**

Company Size in Revenues	Average	Median
\$10 Billion plus	14.6%	13.4%
\$1 Billion to \$10 Billion	18.5%	16.6%
\$500 Million to \$1 Billion	24.8%	21.0%
Under \$500 Million	31.2%	28.6%
Under \$100 Million	38.1%	35.0%

(Source: Seaman, Ronald M., "Minimum Marketability Discounts, 3rd Edition" *Business Valuation Review*, Spring, 2008. Used with permission.)

The study on volatility revealed similar implied discounts. The more volatile the stock price, the higher the discount. This is shown in table 15.38.

Seaman's 2008 study covered 1,036 LEAPs purchased between November 24, 2008, and December 1, 2008. The implied DLOM on 2011 LEAPs based on revenues is shown in table 15.39.

The 2011 LEAPs, purchased at the height of the market disaster in 2008, imply discounts that are almost twice as large as the discounts for the LEAPs purchased in 2006. Clearly, these discounts were driven by demand for puts in a market projected to decline. It also indicates that there is an increase in illiquidity during recessionary periods.

The 2008 study was also stratified by industry, and the results indicate that the implied premiums change by industry and time period. This is really interesting because the restricted stock studies and the pre-IPO studies did not appear to be industry-sensitive. What this also means is that a discount that applies to a subject company at one date may not be valid for that same subject company at another date, and a single discount that applies to a given time period cannot automatically be applied across industries. Who said this was going to be easy? The industry breakdown appears in table 15.40.

### Using Bid-Ask Spreads to Estimate the DLOM

Another method that is gaining some popularity in the business valuation profession is to use the spread  $M$  between bid and ask prices. These are the public market prices based on the market makers' *bid price* (price at which he or she buys the stock), and the *ask price* (price at which he or she sells the stock).

The spread between the bid and ask is the result of a number of costs or risks undertaken by the market maker. They may include any or all of the following:

1. *Order processing costs.* Administrative costs of executing transactions (labor, accounting, and so on).

**TABLE 15.38 Implied DLOM on 2009 LEAPs Stratified by ValueLine Beta**

Company Beta	Average	Median
0.6 – 0.8	14.0%	12.4%
0.9 – 1.1	16.5%	14.3%
1.2 – 1.4	19.2%	17.3%
1.5 – 1.7	21.5%	19.6%
1.8 and higher	24.4%	23.0%

(Source: Seaman, Ronald M., "Minimum Marketability Discounts, 3rd Edition", BVR, Spring, 2008. Used with permission.)

**TABLE 15.39 Implied DLOM on 2011 LEAPs Stratified by Revenues**

Company Size in Revenue	Average	Median
\$10 Billion plus	37.1%	35.0%
\$1 Billion to \$10 Billion	43.9%	41.4%
Under \$500 Million	53.7%	50.1%
Under \$100 Million	64.6%	61.5%

(Source: Seaman, Ronald M., "Minimum Marketability Discounts, 3rd Edition", BVR, Spring, 2008. Used with permission.)

**TABLE 15.40 Implied DLOM on 2010 LEAPs Stratified by Industry**

Industry	Average	Median
All Companies	36.4%	33.5%
Basic Materials	38.6%	36.0%
Conglomerates	31.2%	24.6%
Consumer Goods	34.6%	30.9%
Financial	41.6%	37.9%
Healthcare	36.5%	32.6%
Industrial Goods	35.3%	33.5%
Services	37.1%	33.9%
Technology	34.5%	32.0%
Utilities	25.2%	23.6%

(Source: Seaman, Ronald M., "Minimum Marketability Discounts, 3rd Edition", BVR, Spring, 2008. Used with permission.)

2. *Inventory holding costs.* The opportunity cost of holding the stock and the related price risk.

3. *Adverse selection costs.* Costs of dealing with insiders and well-informed traders.

Research shows that the higher the (1) trading volume; (2) the number of traders in the market; and (3) the number of exchanges the stock trades on, then the lower the bid-ask spread. In other words, the market maker requires a lower mark-up if the stock enjoys high liquidity.

There are a number of steps to follow if you want to use bid-ask spreads to estimate the DLOM of the subject company. First, identify appropriate guideline companies and obtain their bid-ask data spreads at the valuation date. This information is available from a number of sources (for example, Yahoo! Finance provides bid-ask prices). Identify guideline companies that are the equivalent of a large closely held company or have low trading volume.

Small publicly traded companies that have a modest active trading volume will not have bid-ask spreads that are meaningful enough to conduct an analysis. Publicly registered companies that have minimal volume or large privately held or individual ownership percentages will possibly have large bid-ask spreads.

Identify operating metrics that are likely to affect liquidity (for instance, return on equity, return on assets, operating margin, and so on). Perform a regression analysis with the operating metrics as the independent variables and the bid-ask spread, as a percentage of the trading price, as the dependent variable. You can then predict the subject's DLOM as a function of its operating metrics using the regression results.

An example of a bid-ask spread analysis is contained in table 15.41.

**TABLE 15.41 XYZ Company DLOM Bid-Ask Spread Analysis**

Public Companies	Bid-Ask/ Price	EBIT %	ROE	Trading Volume	Insider Holdings	
Acadia Realty Trust	26.81%	33.55%	9.65%	117,612	10.01%

As with all the methods used to estimate a DLOM, this one is also subject to criticism. The bid-ask spread encompasses factors other than liquidity. Market makers' administrative overhead is considered to be a cost of doing business, not a liquidity factor. Also, the cost of dealing with the most-informed market segment is not a liquidity factor either.

### Yield Spread Between Short-Term and Long-Term Risk Free Securities

Another manner in which the DLOM is estimated is by reviewing the difference in the yield spreads between short-term and long-term risk-free securities. This is especially used to assess marketability discounts for limited partnerships and is calculated by the yield spread between a short-term bond and a long-term bond. This can be used as a proxy for illiquidity.

Although long-term bonds are considered to be marketable, they are rarely marketable at the bond's par value.

Investors could be stuck holding a long-term bond until maturity if interest rates go up. Therefore, higher returns often have to be paid to compensate for the longer exposure period in the market. This is why long-term bonds pay more than short-term bonds. This was mentioned in the discussion about risk-free bonds in chapter 13.

The variance between the returns is an indication of the higher rate of return that investors require for the longer holding period. The percentage increase is an indication of the implied marketability discount. The high volatility in the bond market between 2000 and 2004 caused the DLOM indication to be horrible. This is truly a case of a bad situation becoming worse. However, the historical long-term median discount is approximately 33 percent, but the average and standard deviations are so great that the data may not prove to be very meaningful to support a DLOM.

## Ashok Abbot Model

Dr. Ashok Abbott developed a model to explain the observed change in the market value of a public company due to NASDAQ delisting and the resultant cost of lost marketability. He breaks the cost of the marketability loss down into two factors, the loss of liquidity and the effect of market conditions prevailing at the time of the loss of liquidity event.

The original study looked at 172 NASDAQ de-listings between 1982 and 2001. He removed stocks that were de-listed for reasons other than Rule 550 (loss of market maker participants). Dr. Abbott also removed stocks from the study that might have been de-listed because of merger, bankruptcy, liquidation, or going private to help eliminate confusion in interpreting the data. He also removed market outliers.

The NASDAQ de-listing process occurs if a security's number of market makers drops below 2 (for small firms) or 4 (for large firms). A company receives a notice of deficiency, giving it 90 days (the period of de-listing) to address its liquidity or be dropped from the market.

Dr. Abbott gathered the following information on each of the 172 stocks:

- Name of firm
- Date of the de-listing notice
- Market capitalization of the de-listed firm on the day of the de-listing notice
- Total turnover of the issued stock for the de-listed firm for the year leading to the date of the de-listing notice
- Total value of transactions in the issued stock for the de-listed firm for the year leading to the date of the de-listing notice

The study identifies the impact of the loss of marketability on the market value of the firm and identifies factors that significantly drive the discount. Dr. Abbott used a regression analysis with a dependent variable equal to the cumulative excess return for a 90-day event window (for instance, the period between the notice of deficiency and the de-listing) starting on the day of the deficiency notice and ending with the actual de-listing.

The Center for Research in Security Prices calculated the excess returns by subtracting the market returns for the analysis period from the actual returns. This isolates the liquidity loss from the loss due to market conditions. Causal relationships were tested for a relationship between the observed excess returns for the de-listed firm and the market value on the date of the de-listing announcement, prior-year cumulative excess returns measuring the gains to stockholders from owning the firm compared to holding a market portfolio, the market value of the firm, and the total observed turnover signifying the observed liquidity of the firm.

Dr. Abbott found that the DLOM declines (the decline measured as less market value lost in the de-listing) as the company becomes more profitable, the company becomes larger, or the volume of trades taking place during the year increases. This can be thought of as an illiquidity, rather than a marketability issue.

## Where the Qualitative and Quantitative Factors Meet (or Not?)

As far back as 1977, in Revenue Ruling 77-287, the IRS recognized the effectiveness of restricted stock study data in providing useful information about the quantification of DLOMs. The various pre-IPO studies of transactions in closely held stocks did not exist at that time, but the IRS and the courts have sometimes been receptive to the use of this data for assisting in quantifying DLOMs. Unfortunately, we have seen many court cases begin to question the validity of the underlying data and the use of these studies. A court case such as

*Charles T. McCord, Jr., et ux. v. Commissioner*<sup>36</sup> should be read to gain an understanding of the challenges posed by the courts.

Another Tax Court case that I believe can serve as a good learning tool for all valuation analysts (even me!) is *Bernard Mandelbaum et al. v. Commissioner*.<sup>37</sup> Despite the valuation analyst's research and logical argument, the court in Mandelbaum did not allow the 70 percent and 75 percent discounts deducted in the valuations.<sup>38</sup> The court, however, was extremely methodical in its opinion, and although the decision has its faults, it can be used as a guide for valuation analysts, particularly in the tax arena. Many court cases involve multiple issues. However, *Mandelbaum* relates to only one aspect of the valuation universe, namely the DLOM.

In discussing the DLOM and how it fits in with this case, let's first discuss some of the background regarding the opposing arguments. There were six dates in which shares of the valuation subject (Big M), were gifted from shareholders to other parties. These gifts required the filing of gift tax returns covering dates from 1986–1990.

One issue needs to be mentioned here. The Big M stock was subject to two shareholder agreements. The first agreement required that any positions on the board that became vacant be filled by current members and that the new directors be either current shareholders or their spouses. Upon death, the shares were to be sold to Big M, and the company had sole discretion over what period of time they would pay for the shares. The company also had a right of first refusal for live shareholders (as opposed to dead ones), and again, could determine the time period for the purchase. The company had 90 days to decide whether it would exercise its purchase option.

The second agreement was pretty similar to the first, but if someone wanted out, they had to offer their shares to family members before they could sell to outsiders. These types of agreements are not terribly unusual, except for the provision that allows the company to have sole discretion over the time period for the payout.

To support its determination of value and, therefore calculation of the taxpayers' deficiency, the IRS's expert concluded an applicable DLOM of 30 percent for the gifted shares on the six dates in question. This discount level was calculated relying on three of the restricted stock studies discussed earlier in this chapter. These studies provided a range of DLOMs between 30 percent and 35 percent.

On the other side, the taxpayer, Bernard Mandelbaum and family, utilized the services of another expert to support the values reported on their gift tax returns for the specified dates. To find an applicable DLOM, the petitioner's expert employed a similar analysis to that of the respondent's expert. However, the petitioner's expert used 10 studies, including the 3 used by the respondent's expert, to determine an acceptable range of DLOMs. Furthermore, the petitioner's expert also took into account the details of Big M's shareholder agreements and prior events involving the company and shareholders. Based upon these considerations, and the 10 studies that included 7 restricted stock studies and 3 pre-IPO studies, the petitioner's expert concluded that a 75 percent DLOM applied for the valuation dates in 1986–1989, and a 70 percent DLOM was applicable for the dates in 1990.

The discounts that were concluded were substantially higher than the discounts included in the 10 studies analyzed because of the petitioner's expert's analysis of the restrictions placed upon the company's shares by the shareholders' agreements. Also, he interviewed employees of investment firms to determine the required rate of return of potential investors. These returns ranged from 25 percent to 40 percent. As a result of this, the petitioner's expert determined that a rate between 35 percent and 40 percent would be appropriate for Big M.

After listening to both experts, Judge David Laro gave no weight to either side's expert. First, the court discussed the IRS's expert, his determination of a DLOM, and the resulting value of the gifted shares for the

<sup>36</sup> *Charles T. McCord, Jr., et ux. v. Commissioner*, 120 TC 358.

<sup>37</sup> *Bernard Mandelbaum et al. v. Commissioner*, T.C. Memo. 1995-255.

<sup>38</sup> *Ibid.*

subject dates. Judge Laro did not like the fact that the respondent's expert compared this private company's shares to restricted stocks of public companies, while choosing to ignore the shareholders' agreements.

Also, the court found additional fault with the respondent's expert's conclusions because of his use of such a limited number of restricted stock studies when several others existed. Using the studies as the basis of a range without considering the inherent differences between the subject company and the companies included in the analyses did not conform to what the court felt was a reasonable and justified comparison. To say the least, the judge did not seem impressed.

Analyzing the taxpayer's expert, the court found several faults with the basis of his conclusions. He was less impressed with the petitioner's expert. It was determined that the expert put too much weight on the shareholders' agreement within the conclusion of the DLOM. While Judge Laro stated that the IRS's expert's conclusions mistakenly left out the effect of the agreements, he felt that the taxpayer's expert placed too much emphasis upon them.

The biggest problem that the court found with the taxpayer's expert's opinion is that his analysis did not look at both a willing seller and a willing buyer, it only considered the hypothetical buyer. Judge Laro felt that no shareholder would be willing to sell Big M stock at such a large discount. He was probably correct! The court also was not too thrilled with the taxpayer's expert's analysis that indicated that the shareholders would be stuck holding the stock for a 10–20-year period.

Also, when trying to reflect the characteristics of a willing buyer, the taxpayer's expert erred in developing a comparable group of possible investors. According to the court, the group of investors that the taxpayer's expert attempted to use as a surrogate did not include a good sample of willing buyers. For these reasons, Judge Laro did not hold either analysis in high regard and, for the most part, left them out of his resolution of the correct DLOM value.

Because Judge Laro did not find any value in either experts' analysis, he took on the responsibility of concluding a DLOM for application to the value of Big M's share price on each of the valuation dates. This is where I take my hat off to Judge Laro. Although I may not agree with all the factors that he discusses in his opinion, it is clear that he gave more thought to getting at a reasonable DLOM than either expert did. When you read this opinion, think of the 11 factors from the Moroney article that I will soon discuss in this chapter. Judge Laro attempted to do a similar analysis with some slightly different factors.

The reason that I like this opinion is not because of the conclusion. Reading this opinion provides me with a great idea of what the judge was thinking when pure mathematics would not allow him (or a valuation analyst) to quantify the DLOM. He looked at qualitative factors and elaborated on each about the impact on the DLOM. This is exactly what I suggest the valuation analyst does to support his or her opinion.

Before I tell you what I don't agree with (and why), let's look at the factors considered by Judge Laro (box 15.1) and discuss each item.

**Private Versus Public Sales of the Stock.** The Court used this factor because the studies include transactions of securities with similar attributes to those of privately held stock. Restricted stock is stock of a public corporation, but to avoid dilution and registration costs, is not registered for trading within the public market. However, these shares of stock can be traded privately, mirroring the transaction characteristics of a closely held company. Because these transactions were required to be registered with the SEC until 1990, analysis was permitted, resulting in the creation of the studies. As a result, Judge Laro started his analysis by using the 35 percent to 45 percent discounts from these studies as a benchmark.

**BOX 15.1****Factors Considered by Judge Laro**

- Private versus public sales of stock
- Financial statement analysis
- Company's dividend policy
- Nature of the company, its history, its position in the industry, and its economic outlook
- Company's management
- Amount of control in transferred shares
- Restrictions on transferability of stock
- Holding period for stock
- Company's redemption policy
- Costs associated with making a public offering

**Financial Statement Analysis.** The purpose of including this factor in the analysis was to reflect the notion that a company with favorable financial characteristics would be attractive to willing investors. This attractiveness will result in added marketability. On the other hand, if the company's financial position is weak, it would be less marketable.

Because companies are involved in their own respective industries, this analysis should be done according to publicly traded industry competitors that share similar operating characteristics so that the subject company can be rated accordingly. The purpose of using this factor is to rate and highlight the financial characteristics of a firm according to such items as income, liquidity, and debt. This sounds like a guideline public company analysis.

**Company's Dividend Policy.** In determining a company's attractiveness, most investors will look to see what type of dividend-paying history the company has. Investors purchase a company's stock for one of three reasons:

1. To realize capital appreciation in the stock's price
2. To receive dividend payments over the course of owning the security
3. To realize a combination of reasons 1 and 2

The company's dividend policy, either payment history or capacity for payment as in this case, will increase the attractiveness and, therefore, marketability of a firm's stock. If an investor can receive dividend payments on top of potential appreciation, there may be additional individuals who want to purchase the stock. This has the potential of increasing marketability, resulting in a decreasing effect upon a DLOM for a privately held stock.

**Nature of the Company, Its History, Its Position in the Industry, and Its Economic Outlook.** In general, business performance varies in relationship to the economy. Businesses can be affected by global, national, and local events. For industry purposes, changes in regulatory environments and market forces will also have an impact upon the attractiveness of a company.

Investors will analyze a company's background, industry, and the economic factors that affect it, so that they will have a better idea of what to base future expectations on. This is done to determine where the company is heading and how this will affect its attractiveness to potential investors.

**Company's Management.** Because the operations and goals of a company are determined by management, their experience and involvement are fundamental when assessing attractiveness. The management team is responsible for the company's performance. If investors lack confidence in a company's management, the organization will lose marketability because some investors will not be interested in stock ownership. Based upon the conclusion of the management team's effect upon operations and financial performance, according to Judge Laro, this factor's effect upon the DLOM can be determined.

**Amount of Control in Transferred Shares.** When a company's stock is transferred in blocks, a block that represents control will have additional appeal over a block without such control. This is true because as a block of stock has more control, a potential investor will have the ability to direct and run a company using his or her procedures and guidelines (or whims!).

This will affect the attractiveness of a company's stock, depending on the type of investor. In some, but not all occasions, investors will not address this factor in determining the attractiveness of a company, because control is not an issue.

**Restrictions on Transferability of Stock.** The more restrictive it is to transfer shares, the less marketable the shares will be. This is why we see so many attorneys who draft family limited partnership agreements put in these really stringent restrictions (for example, you cannot sell your shares unless the sky becomes pink with yellow polka dots). In this case, the judge felt that because the shareholder agreements did not fix a price, there was less of a restriction in selling to an outsider.

**Holding Period for Stock.** In some instances, a company's stock may have to be held for a period of time so that the benefits of ownership can accumulate to create a sufficient profit for the investor. Such an event would cause the security to lose some of its marketability because of the need to maintain ownership. This increases market risk, whereas marketability decreases. The holding period is essential for calculating marketability levels and the resulting DLOM because it is a direct determinant of how quickly an individual can purchase a stock and turn around and sell it in the future.

**Company's Redemption Policy.** This factor is important because it will determine if the company can purchase shares from shareholders so that they can gain access to cash. This analysis will indicate how the company can aid in, or detract from, its stock's liquidity. This is especially important for privately held firms because of the nonexistence of a ready market. If a company readily buys back shares, this will increase the liquidity of those shares, thereby increasing marketability. However, if the opposite is true, then the stock of the company is less marketable because another option for sale is removed.

**Costs Associated With Making a Public Offering.** When determining the value of a privately held stock, the cost to make a public offering is typically incorporated within the analysis. This is due to the need for determining which party is required to pay the costs of registering the security. In a case in which the buyer must bear the expense, marketability will decrease because some investors will not consider such a transaction as an option because of the cost. This event causes the pool of potential investors to decrease. If the investor does not have to absorb this cost when making the purchase, the marketability of the stock will be greater. This factor is directly related to economics because as the expense of purchases go up, demand will decrease and vice-versa.

I said that I do not agree with everything in this case. In my humble opinion, I believe that Judge Laro mixed up some issues that affect risk and not liquidity. Although there may be a fine line, and possibly an overlap, I think many of the factors Judge Laro discussed affect the freely traded value of the stock, and liquidity, to a much lesser degree. The factors that bother me the most are the following:

- Financial statement analysis
- Dividend capacity and growth prospects
- Nature of company, its history, its position in the industry, and its economic outlook
- Management

If you read Revenue Ruling 59-60, the eight factors assist the valuation analyst in the valuation of the closely held stock. The four factors that I have listed previously affect the underlying valuation. They should not affect both the freely traded value and liquidity. Although I fully agree that dividends will lower the DLOM due to the mitigation of the holding period risk, dividend-paying capacity is considered in valuing an interest in a company.

However, overall, I still think that this is a great case to read.

The pre-IPO studies and court cases are proof that discounts larger than those quoted from the restricted stock studies can be justified. Think about the appropriateness of the discounts that can be applicable to interests in companies that are not large enough to go public! One of the best explanations of why a DLOM varies from case to case was written by Robert E. Moroney in an article titled, "Why 25% Discount for Non-marketability in One Valuation, 100% in Another?"<sup>39</sup> The 11 factors that are discussed in the Moroney article regarding factors that should be considered in the application of a DLOM are included in box 15.2.

.....  
39 *Taxes* (1977): 316-320.

**BOX 15.2**

**Moroney's 11 Factors for Consideration in the Application of a DLOM**

1. **High dividend yield.** Companies that pay dividends tend to be more marketable than companies that do not.
2. **Bright growth prospects.** Companies that have bright growth prospects are easier to sell than companies that do not. This makes them more marketable.
3. **Swing value.** If a block of stock has swing value, it may be more marketable than the typical small block of stock. This swing value could include a premium. This can be emphasized when a 2 percent interest exists with two, 49 percent interests. The 2 percent interest can be worth quite a bit to either 49 percent interest if it will give that interest control of the company.
4. **Restrictions on transfer.** Restrictions on transfer make the stocks less marketable because of the difficulty in selling them.
5. **Buy-sell agreements.** Buy-sell agreements can go either way. The agreement can create a market for the stock, making it more marketable, or the agreement can restrict the sale, making it less marketable.
6. **Stock's quality grade.** The better the quality of the stock, the more marketable it will be. This can be evidenced by comparing the subject company with others for supporting strengths and weaknesses.
7. **Controlling shareholder's honesty.** The integrity of the controlling shareholder can make a big difference with regard to the ability to sell a partial interest in a company. If the controlling shareholder tends to deal with the other shareholders honestly, the other interests in that company tend to be more marketable.
8. **Controlling shareholder's friendliness.** Similar to the degree of that shareholder's honesty, the manner in which he or she deals with others can make the stock more marketable.
9. **Prospects for the corporation.** If a corporation has good prospects for the future, it will generally be more marketable.
10. **Prospects for the industry.** A company that is in an industry with good prospects will also generally be more marketable.
11. **Mood of the investing public.** When the investing public is bullish, they are more readily willing to make an investment. This can increase the stock's marketability.

(© CCH INCORPORATED, a Wolters Kluwer Business. All Rights Reserved.)

A discussion of how each of these factors relates to the valuation subject can be used to assist in supporting the size of the discount. Obviously, these items can be used to determine if more or less of a discount is warranted, but they will not help the valuation analyst quantify the discount in terms of percentages.

## Private Company Discount

The private company discount is similar to the DLOM. In fact, this discount is the same as the DLOM, except that it is purely size-related. I used to call this the small company discount. However, it really does not only relate to small companies.

The valuation analyst must again be careful not to double-count when considering this type of discount. Size factors may have already been considered in the selection of multiples or capitalization rates. Data in publications such as *Mergerstat® Review* indicates that the acquisition prices for entire private companies tend to be lower than tender offer prices for public companies. One possible explanation for this is that entire private companies tend to be smaller than many of the public companies involved in tender offers.

Even small companies follow a similar trend. An analysis performed a number of years ago by Raymond Miles and based on data from The Institute of Business Appraisers' (IBA) market database further supports the premise that small companies sell for lower multiples than large companies. Miles included the data in table 15.42 in "Correlation Between Company Size and Price-to-Earnings Multiples," in an article titled "Price/Earnings Ratios and Company Size Data for Small Businesses," published in the September 1992 issue of *Business Valuation Review*:

**TABLE 15.42 Correlation Between Company Size and Price-to-Earnings Multiples**

Range of company (\$000)	Mean P/E
0–49	1.66
50–99	2.11
100–149	2.44
150–199	2.74
200–249	3.06
250–499	3.44
500–1,000	4.26

Miles's study of the IBA database indicated that the price-to-annual-earnings multiple increases as a company's size increases.

There are various reasons for a private or small company discount. Closely held companies do not make as much reliable information available to the willing buyer as public companies do, and this may cause acquirers to view the private company as riskier than its public counterpart. The closely held company may also be less marketable than the public company because of the lack of an institutional following. Another reason for the possible discount is that the majority or single shareholder or owner may have all of his or her investment in one business; therefore, he or she has liquidity needs that are very different from those of diversified shareholders in public companies.

Although *Mergerstat*<sup>®</sup> *Review* documents that the entire private company tends to sell at a lower price than that for tender offers of public companies, it does not indicate whether it took longer to sell the privately held company. This may also be justification for the discount. Most of the *Mergerstat*<sup>®</sup> *Review* data results from buyer-initiated transactions. It would be interesting, and probably useful, to know the difference, if any, between published prices of completed transactions in which the seller may have initiated the negotiations and those that were initiated by the buyer. This could help the valuation analyst understand if the parties' motivations could have affected the transaction price.

Completed transactions in which the buyer initiated the transaction would be applicable for valuations used to establish an estimated sale price for planning or negotiating purposes or to perform an allocation of the purchase price when the transaction has already taken place. Completed transactions in which the seller initiated the transaction would be more applicable for estate and gift tax purposes than for other purposes in which the amount of time and effort required to complete the sale is relevant to the value concluded. The sales of closely held businesses are generally seller-initiated because the owners decide to sell their business, and the ultimate sales price already includes a DLOM. If the business was priced too high, interim reductions in the selling price may have taken place during the marketing period. In reality, these reductions may have also corrected the selling price from the seller's "great expectations" to a more reasonable level of market value.

## Some More Empirical Data

In an article titled "The Private Company Discount," professors Atulya Sarin, John Koeplin, and Alan C. Shapiro conclude that for both the domestic transactions and the foreign transactions,<sup>40</sup> the discount for earnings multiples is statistically and economically significant. The discount using the book value multiples is significant

.....  
40 Note that differences in book value multiples actually are significant only for the mean not the median.

only for domestic transactions and the discount using the revenue multiples is not significant for either the domestic or foreign transactions.<sup>41</sup>

However, as they point out in their article, “the net sales and assets of the sample of private companies that were acquired are significantly smaller than those of the comparable public targets.” In light of the research reported previously, it may be that size accounted for all of the difference. Also, for valuation multiples, some feel that the median is a better measure of central tendency than the mean. The mean enterprise-value-to-book-value multiple for domestic transactions is higher for private companies than for public companies, but the median is less.

Just remember that although all of this data supports the notion that smaller companies and private companies sell at lower multiples than larger companies and public companies, respectively, the valuation analyst will be double-counting if he or she uses this data to support the discount after he or she has already either reduced the multiples in the application of the market approach or if he or she obtained the market data from sources that already reflect the lower multiples. What I am saying is simple—don’t double-count!

## Key Person Discount

A key person discount is frequently seen in the valuation of a closely held business when the key person is no longer going to be part of the business. This is often the case when the valuation is being performed for an estate of which the decedent was the key person in the business. One way to determine the appropriate discount is to review the case law for the size of discounts allowed in the past and try to associate the facts of a particular case with the assignment at hand. Be careful not to let case law drive the valuation.

A better way to handle this discount may be to build the effect of the loss of the key person into the forecast of future operations or to add an additional risk component to the discount rate. If the loss of the key person is a true loss, the business will probably suffer. The amount of the loss will be based on the importance of the key person and on how long it may take to find a replacement and bring that replacement up to the level where the key person had been.

Not all owners of businesses are key persons. The valuation analyst should not take a discount unless he or she has the appropriate support for the loss attributable to that person. Key person attributes may include the following:

- Strong relationships with suppliers
- Strong relationships with customers
- Employee loyalty to the key person
- Unique marketing vision, insight, and ability
- Unique technological or product innovation capability
- Extraordinary management and leadership skills
- Financial strength (ability to obtain debt or equity capital, personal guarantees)

There are various factors to consider in analyzing the key person discount. First, consider the services rendered by the key person and degree of dependence on that person. Some businesses would be devastated without the key person. (I keep thinking that mine would be but my wife/partner keeps reminding me that I am the “associates” in Trugman Valuation Associates.) Also, think about the likelihood of loss of the key person. If that person is still active in the business, what is the possibility that this person may leave? By the way, the key person does not always have to be the owner of the business.

When the valuation analyst is considering the likelihood of the key person leaving, he or she should first consider the age and health of the individual. A 75-year old person is more likely to leave than a 57-year-old person, if all else but age is equal. But what if the 57-year-old was recently diagnosed with a terminal illness? As for the nonowner, what about the hair stylist that leaves and opens up a competing shop across the street?

41 Atulya Sarin, John Koeplin, and Alan C. Shapiro, “The Private Company Discount,” *Journal of Applied Corporate Finance* 12: 100.

Factors such as the depth and quality of other company management, the availability and adequacy of potential replacements for the key person, as well as the compensation paid to the key person and probable cost of hiring and compensating the replacement for that person should also be considered. The valuation analyst also needs to consider the value of irreplaceable factors lost, such as vital customer and supplier relationships, insight and recognition, and personal management styles to ensure company-wide harmony among the employees, not to mention the risks associated with the disruption and operation under a new individual. And finally, the valuation analyst should not forget to consider the impact on the company if its borrowing capacity is taken away due to the loss of the personal guarantor of the company's debt. None of these factors can be taken too lightly.

However, with all of these considerations, there are frequently mitigating conditions that would serve to offset some, if not all, of the loss attributable to the key person. Life insurance or disability insurance proceeds payable to the company, not earmarked for other purposes, such as repurchase of the key person's stock, can help mitigate the loss. In fact, Revenue Ruling 59-60 specifically states the following:

The loss of the manager of a so-called "one-man" business may have a depressing effect upon the value of the stock of such business, particularly if there is a lack of trained personnel capable of succeeding to the management of the enterprise. In valuing the stock of this type of business, therefore, the effect of the loss of the manager on the future expectancy of the business and the absence of management-succession potentialities are pertinent factors to be taken into consideration. On the other hand, there may be factors which offset, in whole or in part, the loss of the manager's services. For instance, the nature of the business and of its assets may be such that they will not be impaired by the loss of the manager. Furthermore, the loss may be adequately covered by life insurance, or competent management might be employed on the basis of the consideration paid for the former manager's services. These, or other offsetting factors, if found to exist, should be carefully weighed against the loss of the manager's services in valuing the stock of the enterprise.

Don't forget other mitigating factors such as the compensation saved after the key person is gone if the compensation to the key person was greater than the cost of replacement. You should also consider whether there are any employment or non-compete agreements.

## Quantifying the Magnitude of the Key Person Discount

Ideally, the magnitude of the key person discount should be the estimated difference in the present value of net cash flows with and without the involvement of the key person. If the key person was still involved, the projected cash flows for each year would be greater than without that individual. The value differential, with and without the impact of the key person, would be the key person discount. However, this only really works if the valuation analyst can forecast the impact of the loss of the key person. If we had 20-20 hindsight, we could measure the loss in a manner that is similar to the "before and after" method of calculating economic damages (we will actually discuss this in chapter 26).

A significant factor in the quantification of the key person discount is the presence or absence of employment or non-compete agreements. In the absence of such agreements, the stock may be worth only its tangible asset value.

## Court Cases Involving Key Person Discount

I have repeated this several times now, so I am going to say it again here. The valuation analyst should not rely on court cases to support the discounts. However, with that said, some of the more important court cases that you may want to read include the following:

- Estate tax cases
  - *Estate of Mitchell v. Commissioner*<sup>42</sup> (10 percent discount allowed)

<sup>42</sup> *Estate of Mitchell v. Commissioner*, T.C. Memo 1997-461, 74 T.C.M. (CCH) 872 (U.S. Tax Court, October 9, 1997), affirmed in part, vacated in part, remanded by 250 F.3d 696 (9th Cir., May 2, 2001). The estate appealed the Tax Court's conclusion in *Estate of Mitchell* on other grounds. On May 2, 2001, the 9th Circuit Court of Appeals reversed and remanded *Mitchell*. The 9th circuit decision held that the Tax Court was internally inconsistent in its ruling on minority and marketability issues and failed to adequately explain its conclusion.

- *Estate of Feldmar v. Commissioner*<sup>43</sup> (25 percent discount allowed)
- *Estate of Rodriguez v. Commissioner*<sup>44</sup> (expert for the taxpayer adjusted expected earnings before capitalizing; the court accepted taxpayer's expert's methodology and numbers)
- *Estate of Huntsman v. Commissioner*<sup>45</sup> (with little explanation, the Tax Court discounted one company's stock from \$31 to \$29 per share and another company's stock from \$11 to \$10 per share at date of death because of the key man factor)
- *Estate of Yeager*<sup>46</sup> *v. Commissioner* (10 percent discount allowed)
- Gift tax case
  - *Furman v. Commissioner*<sup>47</sup> (10 percent discount allowed)

One more thing to consider is that adding a key person discount may also increase the possibility that the client will be audited by the IRS. If the other discounts total 35 percent, you may or may not get the audit notice. However, add an additional 15 percent to the 35 percent already taken, and the 50 percent discount will very conceivably flag an audit. That is not to say that the valuation analyst should not consider it or that the analyst will not get it through the IRS if it is well-supported. Just be ready for the audit!

## Blockage Discount

A blockage discount is another type of discount, although it applies only to publicly traded companies. This discount may occur when a large block of stock is placed on the market at one time. The large block hitting the market all at once may cause the price per share to decline in order for all the shares to be sold. The Tax Court has been pretty clear on the point that a blockage discount cannot be taken on closely held shares.

According to the *International Glossary of Business Valuation Terms*, a *blockage discount* is "an amount or percentage deducted from the current market price of a publicly traded stock to reflect the decrease in the per share value of a block of stock that is of a size that could not be sold in a reasonable period of time given normal trading volume."

According to Research Institute of America

[w]here stock is actively traded in, and the turnover is substantial enough, it will yield a representative price picture for valuing smaller blocks but furnish no adequate basis for the valuation of abnormally large blocks. In valuing abnormally large blocks, there has been a definite and flowing recognition by the courts, and reluctantly by IRS, of the blockage rule.

The blockage rule attributes to the unit of a large block a lower value than the market value per unit as found for small lots. It must be shown that the existing market is clearly not broad enough to absorb the large block without decline of the price level. This rule is a concession to the obvious fact that sudden unloading of a large quantity of a commodity tends to drive the price down. It has been applied by the courts for estate, gift and income tax purposes.<sup>48</sup>

Treasury Regulation 20.2031-2(b)(1) states the following:

In general, if there is a market for stocks or bonds, on a stock exchange, in an over-the-counter market, or other, the mean between the highest and lowest quoted selling prices on the valuation date is the fair market value per share or bond.

43 *Estate of Feldmar v. Commissioner*, T.C. Memo 1988-429, 56 T.C.M. (CCH) 118 (U.S. Tax Court, Sept. 12, 1988).

44 *Estate of Rodriguez v. Commissioner*, T.C. Memo 1989-13, 56 T.C.M. (CCH) 1033 (U.S. Tax Court, Jan. 10, 1989).

45 *Estate of Huntsman v. Commissioner*, 66 T.C. 861 (U.S. Tax Court, Aug. 17, 1976).

46 *Estate of Yeager v. Commissioner*, T.C. Memo 1986-448, 52 T.C.M. (CCH) 524 (U.S. Tax Court, Sept. 17, 1986).

47 *Furman v. Commissioner*, T.C. Memo 1998-157, 75 T.C.M. (CCH) 2206 (U.S. Tax Court, April 30, 1998).

48 *Federal Tax Coordinator 2d*, "P-Basis and Valuation of Property," P-6233, (Research Institute of America).

In section 25.2512-2(3), the regulation states the following:

In certain exceptional cases, the size of the block of stock to be valued in relation to the number of shares changing hands in sales may be relevant in determining whether selling prices reflect the fair market value of the block of stock to be valued. If the executor can show that the block of stock to be valued is so large in relation to the actual sales on the existing market that it could not be liquidated in a reasonable time without depressing the market, the price at which the block could be sold as such outside the usual market, as through an underwriter, may be a more accurate indication of value than market quotations.

The theory behind this is that by attempting to sell a large block of stock, two things can occur: The supply of the stock goes up by a large percentage, and the demand is not there, or it takes such a long time to sell the shares that the present value of money received is less than the market value on a given day, or both. Therefore, a discount might be deemed appropriate to compensate for either the depressive effect of dumping a large block of shares into the market or for the time value of not having use of the proceeds of the sale at the valuation date.

Another question that needs to often be addressed when dealing with blockage issues is how can a block trade be accomplished. The stock exchanges define a *block trade* as a trade of 10,000 shares or more. An NYSE working paper from 1994 explained that 54 percent of the NYSE's volume was from block trades. A block trade can be executed in one of two ways. A block trade can be sent directly to "downstairs" markets comprising the continuous intraday market and batch markets, such as the after-hours crossing sessions at the NYSE. Alternatively, a block trade may first be directed to the "upstairs" market where a brokerage firm (or block broker) facilitates the trading process by locating counterparties to the trade before sending it to the downstairs market. Although downstairs markets offer anonymity and a high degree of immediacy, these characteristics may result in significant adverse selection costs for large trades. By contrast, upstairs intermediation reduces the price impact of a large trade but is associated with additional costs in the form of potential information leakage during the process, lack of immediacy, and higher brokerage fees.

An example of the analysis involved in calculating a blockage discount is shown in exhibit 15.2. In this assignment, we were retained to determine whether there should be a blockage discount, and if so, how much it should be? I apologize for the old dates in this example, but we do not get many of these types of assignments.

### EXHIBIT 15.2 Blockage Discount

Trugman Valuation Associates, Inc. was engaged by (a client) to establish the fair market value of seven million shares of Wal-Mart Stores, Inc. stock as of November 1, 1995. The purpose of this appraisal is to determine the fair market value of these shares for inclusion in a gift tax return.

**Background of the Assignment.** On November 1, 1995, a donor gave each of her daughters a gift of 7,000,000 shares of common stock in Wal-Mart Stores, Inc. On that date, Wal-Mart Stores, Inc. was actively traded on the New York Stock Exchange. Its price was as follows:

High/Ask	Low/Bid	Close/Bid	Average
22 $\frac{1}{4}$	21 $\frac{5}{8}$	22 $\frac{1}{4}$	21.9375

The value of the seven million share block, before discounts, was \$153,562,500. Trugman Valuation Associates was hired to determine the value of these shares on November 1, 1995, including the applicable blockage discount.

## EXHIBIT 15.2 Blockage Discount

According to Research Institute of America

Where stock is actively traded in, and the turnover is substantial enough, it will yield a representative price picture for valuing smaller blocks but furnish no adequate basis for the valuation of abnormally large blocks. In valuing abnormally large blocks, there has been a definite and flowing recognition by the courts, and reluctantly by IRS, of the blockage rule.

The blockage rule attributes to the unit of a large block a lower value than the market value per unit as found for small lots. It must be shown that the existing market is clearly not broad enough to absorb the large block without decline of the price level. This rule is a concession to the obvious fact that sudden unloading of a large quantity of a commodity tends to drive the price down. It has been applied by the courts for estate, gift and income tax purposes.<sup>1</sup>

The issue in this matter is whether or not a discount for blockage is applicable, and if so, what is the appropriate size of the discount?

**History of Wal-Mart Stores, Inc.** Wal-Mart Stores began in 1945 when Sam Walton began a franchise, Ben Franklin Variety Store in Newport, Arkansas. Sam's brother, James, began a similar venture in Missouri in 1946. These operations continued until 1962, when the operation was incorporated in Delaware under the Wal-Mart Stores, Inc. name. In 1984, the company opened its first three Sam's Clubs, and in 1988, its first Wal-Mart Supercenter.

By the end of 1995, Wal-Mart Stores, Inc. owned and operated 1,995 Wal-Mart Stores, 433 Sam's Clubs, and 239 Wal-Mart Supercenters in the United States. The company also has operations in Mexico, Puerto Rico, Canada, Brazil, Argentina, and Indonesia.

At October 31, 1995, Wal-Mart was expanding the number of locations in which it was operating, as well as increasing the size of many of its locations. The result was an increase in sales, which increased the company's net income as well. Net income for the nine months ended October 31, 1995, was up almost 9 percent over the same figure from a year earlier.

In August 1995, the company introduced a website, its main purpose was for use as a marketing tool. At the company's annual meeting in June 1995, management revealed expected revenues in excess of \$90 billion dollars. This was not as high as previously expected but still substantially higher than the year before.<sup>2</sup>

In August 1995, retail stocks, including Wal-Mart's were considered to be bargains. "Retail stocks have been beaten down to where they are bargains, and should be helped by the recent drop in interest rates. Recommended stocks include Wal-Mart Stores..."<sup>3</sup> Mr. Wyatt explains that despite the slump in retail stocks, Wal-Mart Stores' stock price had increased 22.3 percent during 1995, and was expected to continue rising for another year. This type of article in the press helps to generate interest in a stock such as Wal-Mart Stores.

**Valuation Calculations.** The subject of this valuation is shares in a publicly traded company. Treasury Regulation 20.2031-2(b)(1) states the following:

In general, if there is a market for stocks or bonds, on a stock exchange, in an over-the-counter market, or other, the mean between the highest and lowest quoted selling prices on the valuation date is the fair market value per share or bond.

In Section 25.2512-2(3), the regulation states the following:

In certain exceptional cases, the size of the block of stock to be valued in relation to the number of shares changing hands in sales may be relevant in determining whether selling prices reflect the fair market value of the block of stock to be valued. If the executor can show that the block of stock to be valued is so large in relation to the actual sales on the existing market that it could not be liquidated in a reasonable time without depressing the market, the price at which the block could be sold as such outside the usual market, as through an underwriter, may be a more accurate indication of value than market quotations.

(continued)

## EXHIBIT 15.2 Blockage Discount *(continued)*

The theory behind this is that by attempting to sell a large block of stock, two things can occur: The supply of the stock goes up by a large percentage, and the demand is not there, or it takes such a long time to sell the shares that the present value of money received is less than the market value on a given day, or both. Therefore, a discount might be deemed appropriate to compensate for either the depressive effect of “dumping” a large block of shares into the market or for the time value of not having use of the proceeds of the sale at the valuation date.

The stock exchanges define a *block trade* as a trade of 10,000 shares or more. A New York Stock Exchange (NYSE) working paper from 1994 explained that 54 percent of the NYSE’s volume was from block trades.<sup>4</sup>

A block trade can be executed in two ways.

A block trade can be sent directly to “downstairs” markets comprising the continuous intra day market and batch markets such as the after hours crossing sessions at the NYSE. Alternatively, a block trade may first be directed to the “upstairs” market where a brokerage firm (or block broker) facilitates the trading process by locating counterparties to the trade before sending it to the downstairs market. Although downstairs markets offer anonymity and a high degree of immediacy, these characteristics may result in significant adverse selection costs for large trades. By contrast, upstairs intermediation reduces the price impact of a large trade but is associated with additional costs in the form of potential information leakage during the process, lack of immediacy, and higher brokerage fees.<sup>5</sup>

Stock traded on an active market generally represents the price for a small block or blocks of the stock; there is no mechanism for determining the price of a large block. Although a 7,000,000 share block of Wal-Mart only represents a small percentage of the total share holdings, it is a larger number of shares than is traded on an average day.

However, court cases have specifically stated that the value of a block is not determined by what it would bring if dumped as a whole on the market at one time.

Determining a reasonable period of time ‘depends on all the facts and circumstances.’ Periods of up to a year have been found to be reasonable, although the periods may be much shorter if factors such as market volatility and time limitations so dictate.<sup>6</sup>

Some specific examples of determining a reasonable time frame are as follows:

- A blockage discount was allowed for decedent’s 159,000 shares when the average weekly shares traded on the NYSE was 3,600 shares (*Estate of Sophia P. Brownell*, T.C. Memo 1982-632).
- A blockage discount was not allowed for a block of 32,000 shares, when average monthly trading was 10,000 shares per month because the total number of shares being appraised was well below one year’s total trading volume (*Richard O. Wheeler*, T.C. Memo 1978-208).
- A blockage discount was disallowed on two blocks of decedent’s shares, where the size of the block was approximately 1 percent to 2 percent of the total number of shares traded in the year of death. The justification for the discount was that all the shares would be sold at one time. The court stated the following:  
In valuing a block of stock, we are not required to assume that the block was dumped on the market at one time on the valuation date. Rather, the inquiry must be directed to the effect upon the market based on the assumption that the block was being fed out into the market during a reasonable period of time (*Estate of Myrtle M. Sawade*, T.C. Memo 1984-626).

The court follows this up by referencing *Bankers Trust Co. v. United States*, which states, “the courts which have considered the blockage issue have concluded that the problem should be treated in terms of whether the market could have absorbed the shares within a reasonable period of time.”

Clearly, the courts have ruled that the determination of a reasonable period of time is a facts and circumstances test. According to Wal-Mart’s July 31, 1995 Form 10-Q filed with the SEC, Wal-Mart Stores, Inc. had 2,295,757,065 shares of common stock outstanding. The subject block is 0.3 percent of the total out-standing shares.

<sup>5</sup> *Ibid.*

<sup>6</sup> *Estate of Dorothy B. Foote v. Commissioner*, T.C. Memo 1999-37.

**EXHIBIT 15.2 Blockage Discount**

Trading activity and stock prices for the year prior to the gift are as follows:

**Wal-Mart Stores, Inc. Trading Volume**

Date	Volume	High/Ask	Low/Bid	Close/Bid
11/1/94	1,174,000	23.75	23.375	23.625
11/2/94	2,917,000	24.125	23.50	23.875
11/3/94	3,009,000	23.75	23.375	23.50
11/4/94	3,114,000	24.125	23.50	23.75
11/7/94	1,718,000	24.125	23.50	23.875
11/8/94	1,712,000	24.125	23.75	23.875
11/9/94	4,184,000	24.375	23.875	24
11/10/94	1,924,000	24.50	24	24.125
Data intentionally left out of this exhibit. It was for an entire year in the original report.				
10/17/95	7,038,000	22.75	22.125	22.75
10/18/95	5,470,000	23	22.50	22.75
10/19/95	4,758,000	22.875	22.375	22.875
10/20/95	6,559,000	23.125	22.625	23
10/23/95	5,230,000	23	22.50	22.625
10/24/95	3,055,000	22.875	22.50	22.50
10/25/95	3,781,000	22.75	22.25	22.50
10/26/95	3,341,000	22.50	21.75	21.875
10/27/95	3,134,000	22.125	21.75	22.125
10/30/95	2,795,000	22.375	21.75	21.875
10/31/95	5,302,000	22.25	21.50	21.625
11/1/95	4,256,000	22.25	21.625	22.25

Based on this data, the average daily trading volume was 3,167,730 shares, with average ask, bid, and close prices of \$24.50, \$23.98, and \$24.28 respectively.

Over this period, the price traded in a fairly narrow range from \$213 to \$272, a spread of \$63, or approximately 30 percent. Over the one-year period, the price rose until approximately July 1995, and then declined again. This appeared to be a weakness in retail stocks in general, but Wal-Mart's stock price was predicted to rise.

The question becomes, how long would it take to "trickle" 7,000,000 shares into the marketplace, and what effect would this have on the price? The courts have clearly determined that it is unreasonable to base a blockage discount on the expectation that all the shares would be put on the market at one time.

(continued)

**EXHIBIT 15.2 Blockage Discount** *(continued)*

One of the issues that the court has addressed in determining the applicability of a blockage discount is the size of the block being valued in relation to the total number of shares traded in the year. According to the trading data previously listed, total shares traded in the period November 1, 1994 to 1995 amounted to 804,603,400. A 7,000,000 share block is less than 1 percent of the annual trading volume. This figure, in conjunction with prior court cases, seems to indicate that a blockage discount would not be applicable.

The second issue revolves around large daily trades in the stock itself. The table that follows excerpts certain days' trading activities. As previously mentioned, average daily trading in Wal-Mart Stores' stock is approximately 3.2 million shares. The data in this table shows trading activity for those days when the number of shares traded exceeded 5 million shares. There were 20 such days. It should be noted that we were unable to determine if the additional shares traded were in large blocks. Also provided in this table is the closing price for the day prior to the large trading volume days, with the percentage change in the closing price.

**Large Trading Volume Days**

Date	Volume	High/Ask	Low/Bid	Close/Bid	Prior Closing	% Price Change
11/17/94	6,512,000	23.5	22.50	22.625	23.375	-3.21%
11/18/94	5,870,000	23.125	22.625	22.75	22.625	0.55%
12/9/94	7,512,000	21.625	21.125	21.50	21.375	0.58%
12/16/94	9,485,000	23	22.25	23	22.625	1.66%
2/28/95	5,310,000	24.25	23.625	23.75	23.375	1.60%
3/28/95	5,678,000	25.125	24.375	24.875	24.50	1.53%
3/29/95	6,047,000	25.75	24.875	25.50	24.875	2.51%
5/12/95	6,291,000	25.50	24.25	25.25	24.375	3.59%
6/13/95	6,307,000	26.125	25.625	26.125	25.50	2.45%
6/14/95	5,282,000	26.625	26	26.50	26.125	1.44%
6/16/95	6,667,000	26.50	26.125	26.50	26.25	0.95%
8/30/95	9,504,000	25.375	24.75	25	25.125	-0.50%
9/15/95	5,989,000	25.875	25.50	25.625	25.375	0.99%
10/11/95	5,909,000	23.875	22.8125	23	23.875	-3.66%
10/12/95	6,791,000	23.50	22.875	22.875	23	-0.54%
10/13/95	7,796,000	23.25	22.875	23.125	22.875	1.09%
10/16/95	5,790,000	23.125	22.125	22.50	23.125	-2.70%
10/17/95	7,038,000	22.75	22.125	22.75	22.50	1.11%
10/18/95	5,470,000	23	22.50	22.75	22.75	0.00%
10/20/95	6,559,000	23.125	22.625	23	22.875	0.55%
					<b>Mean % Price change</b>	<b>0.50%</b>

## EXHIBIT 15.2 Blockage Discount

A couple of facts can be observed from this data:

1. There is no consistency in the price change size or direction when a larger number of shares are traded.
2. There is an active market for large blocks of stock to be bought and sold.

Overall, when large blocks of Wal-Mart Stores' stock are placed on the market, the average price change is approximately 0.50 percent. This indicates that a block of 7,000,000 shares could be sold within a matter of days (two to three), and the sale of this block would not affect the price. Therefore, in our opinion, a blockage discount would not be applicable.

**Conclusion.** The fair market value of 7,000,000 shares of Wal-Mart Stores, Inc. as of November 1, 1995 is \$153,562,500, and no blockage discount is applicable.

## How About Some Court Cases?

Like so many of the other sections of this chapter, I want to point out The Court cases that you should become familiar with but not rely on. Great concept, isn't it? A blockage discount was allowed for a decedent's 159,000 shares when the average weekly shares traded on the NYSE was 3,600 shares.<sup>49</sup> A blockage discount was not allowed for a block of 32,000 shares, when average monthly trading was 10,000 shares per month because the total number of shares being valued was well below one year's total trading volume.<sup>50</sup> A blockage discount was also disallowed on two blocks of a decedent's shares, where the size of the block was approximately 1 percent to 2 percent of the total number of shares traded in the year of death. The justification for the discount was that all the shares would be sold at one time. The Court stated the following:

In valuing a block of stock, we are not required to assume that the block was dumped on the market at one time on the valuation date. Rather, the inquiry must be directed to the effect upon the market based on the assumption that the block was being fed out into the market during a reasonable period of time.<sup>51</sup>

One of the better cases on this subject that you really want to read to learn what the court feels are the factors to be considered in determining the size of a blockage discount is *Estate of Dorothy B. Foote*, T.C. Memo 1999-37.

## Other Premiums and Discounts

There will be times when other premiums and discounts will be appropriate. Some of these occasions may involve swing vote premiums or litigation uncertainties. A swing vote premium is the increased value that a minority interest may have due to the ability to swing the control in the entity to one of the other shareholders. A 2 percent owner may have a valuable asset if the other shareholders each own 49 percent, and the 2 percent provides one of them with control.

Discounts come in all shapes and sizes. During an estate valuation, our firm applied a discount because of the uncertainty of an ongoing litigation, which made the marketability of the decedent's shares less desirable. An example of this from one of our reports is included in exhibit 15.3. The IRS signed off on this valuation. This should serve as further proof that a well-thought-out discussion can assist the valuation analyst in obtaining larger discounts than those in the published studies. In this instance, the business was owned equally by three family factions. One of the families filed suit against the others to force a buyout of this interest and several others in related entities. At the last minute, a proposed settlement fell apart. During this time, a second family faction decided they would hold the remaining faction hostage by trying to coerce a buyout of their interests as well. This family was anything but close.

49 *Estate of Sophia P. Brownell*, T.C. Memo 1982-632.49, *Richard O. Wheeler*, TC Memo 1978-208.

50 *Richard O. Wheeler*, T.C. Memo 1978-208.

51 *Estate of Myrtle M. Sawade*, T.C. Memo 1984-626.

### EXHIBIT 15.3 Discount for Uncertainty of Litigation

At the date of the decedent's death, the Jones family litigation was still ongoing. Despite a possible settlement five months earlier, a four-year litigation continued to shadow the Jones' entities. A willing buyer would have to consider the risks associated with this litigation because it was not finalized until four months after the decedent's death.

At the date of death, the proposed settlement had fallen apart. A willing buyer of the decedent's one-third interest in the partnership was looking at a best-case scenario in which the one-third interest would become a one-half interest, with the remaining one-half interest being owned by a "nonfriendly" partner. At the conclusion of the litigation, it became obvious that the defendants were not necessarily on the same side.

Obtaining the additional interest would force the partnership to commit to a payout of \$913,772. In addition, the following parcels of real estate, having the following appraised values, would no longer be owned by the partnership:

Smith Township	\$1,165,000
Jones, lot 1	8,000
Jones, lot 2	150,000
Brown Township	3,800
Greene	800,000
<b>Total</b>	<b>\$2,126,800</b>

The total settlement amount of approximately \$3 million is greater than the enterprise value.

The willing buyer would also expend additional legal fees to resolve the issue because the settlement was not definite. Why would anyone want to obligate himself or herself in that way? No prudent investor would purchase this 33.3 percent interest knowing that the best-case scenario would render the company insolvent. Furthermore, part of the overall settlement included an indemnification relating to environmental liability, which is a serious problem for this entity.

This litigation would render this partnership interest virtually worthless due to the contingencies associated with it. A settlement was able to take place because the other Jones entities involved in the litigation interacted, and other companies or individuals were able to generate available funds without depending on Jones, Inc.'s financial success. Therefore, the amount paid in settlement of the litigation was clearly in excess of the fair market value of the decedent's interest in Jones, Inc. This valuation analyst feels that a discount of 100 percent is justified in this instance.

Using the uncertainty of litigation in a valuation of another entity that was related to the subject in exhibit 15.3, we could not justify a 100 percent discount, but we used the information that we had to quantify the size of the discount in dollars instead of as a percentage. A section of a report dealing with this issue can be found in exhibit 15.4. The examples in exhibits 15.3 and 15.4 were part of 7 valuation reports that were prepared for a decedent's estate tax return. The cumulative discount taken for the decedent's minority interests was 75 percent. When the IRS audited this estate, it began the negotiations by allowing a 45 percent combined discount. This told us that we had a very strong case for our discounts. The case finally settled, allowing a 62 percent combined discount. The only reason that the case settled at this level was that the IRS threatened to open up the 25 real estate and machinery appraisals that were used by us in determining the value of the various business interests. Power is a wonderful leverage tool!

Some valuation analysts handle these miscellaneous discounts differently. Some adjust income streams, some adjust discount rates or multiples, and some choose to ignore these factors completely. Short of ignoring them completely, there is no definitive method of handling these items. The valuation analyst should use common sense. The manner in which the valuation analyst chooses to handle these situations may depend on the purpose and function of the valuation assignment. In certain types of litigations, such as divorce, some jurisdictions seem to be against discounts because they feel that the nonbusiness owner spouse is "getting

the shaft.” In actuality, that spouse will probably receive a windfall if no discounts are provided for. However, the valuation analyst should use his or her head. If he or she knows that the particular jurisdiction is against discounts, it can be built into the balance of the valuation. However, if the valuation analyst is working on a job that is governed by statute, he or she must perform the valuation in accordance with the law. Remember, the valuation analyst is supposed to be giving his or her objective opinion about the value of the interest being valued. If the valuation analyst gets a good, supportable number, these types of cosmetics may help him or her advocate his or her own opinion.

### EXHIBIT 15.4 Discount for Uncertainty of Litigation

At the date of death, the Jones family litigation was still ongoing. Despite a possible settlement five months earlier, a four-year litigation continued to shadow the Jones’s entities. A willing buyer would have to consider the risks associated with this litigation because it was not finalized until four months after the decedent’s death.

At the date of death, the proposed settlement had fallen apart. A willing buyer would have to acquire the decedent’s interest subject to the ongoing litigation. The best-case scenario for the willing buyer would be that the tentative settlement from before death is reached, and 37.5 shares are redeemed for \$250,921. This would turn the 33.3 percent interest into a 50 percent interest, with the balance of the stock being owned by an “unfriendly” stockholder group.

The company would also be obligated to disburse \$250,921 for the settlement plus the final costs of settling the litigation. Therefore, the best-case scenario would require the willing buyer to assume the interest subject to this obligation. Because the effective pro rata obligation of the decedent’s interest would be 50 percent of \$250,921, or \$125,461, an equivalent discount is appropriate.

## Application of Valuation Adjustments

Now that we have spent all this time on various types of valuation adjustments (premiums and discounts), I thought that it might be helpful to discuss how they should be applied. The proper application of discounts and premiums requires the valuation analyst to understand their impact. Some discounts and premiums are additive, whereas others are multiplicative. For example, the application of lack of control discounts and DLOMs is multiplicative. This can be illustrated as follows. Assume a lack of control discount of 25 percent and a DLOM of 35 percent. If these discounts were additive, the valuation analyst would add them together and deduct a 60 percent discount from the control value. However, the total discount to be taken from the control value is calculated as follows:

$$1 - [(1 - 0.25)(1 - 0.35)] = 0.5125$$

For those like me who are not into mathematical equations, this same example can be demonstrated as shown in table 15.43.

**TABLE 15.43**

Value on a control, marketable basis	\$100.00
Less lack of control discount (25%)	25.00
Value on a minority, marketable basis	\$ 75.00
Less DLOM (35%)	26.25
Value (cumulative discount 51.25%)	\$ 48.75

The application of a DLOM and discounts for legal restrictions, environmental restrictions, and litigation discounts may overlap. Therefore, be aware of the possibility of double-counting. Private or small company discounts that relate to the sale of an entire business—as opposed to the DLOM relating the control value to public prices—are mutually exclusive.

The private or small company discount that is determinable from the *Mergerstat*<sup>®</sup> *Review* data and other sources may be caused by several factors, including, but not limited to, lack of marketability. The DLOM is exactly what it is meant to be, and to add it to the private or small company discount when the valuation analyst values an entire closely held company would result in a double-counting of the DLOM.

The discount from net asset value and the lack of control discount are mutually exclusive. When a discount from net asset value is applied, a lack of control discount is generally inappropriate. However, the discount from net asset value may apply to the subject company or to the underlying assets. This could result in discounts being applied at both the asset level and the entity level. This is the concept that is being used to value minority interests in family limited partnerships. If the valuation subject is a minority block of shares in a closely held investment, holding, or asset-intensive company, the discount from net asset value—used to obtain the freely traded value—and the DLOM are both applicable and are always multiplicative.

## Conclusion

By now it is evident that supporting valuation premiums and discounts is as much fun as going to the dentist. Although there are empirical studies, databases, and models for most of these premiums and discounts, the application of these and other discounts to any size business or business interests is a very subjective task. Using quantitative methods do not work by themselves, forcing the valuation analyst to go back to the old faithful qualitative methods that the courts seem to hate. Nobody said that this would be easy. In fact, it used to be much easier when everyone just whacked the value by 35 percent with no explanation. But I know that you will not do that after reading the last two chapters.

# Chapter 16

## Revenue Ruling 59–60

### Learning Objectives

In this chapter, I will attempt to review Revenue Ruling 59-60 in more detail. In fact, it will probably be in more detail than newcomers to business valuation have ever seen before. This chapter should be used as a review of most of the valuation concepts that have been covered. If you bought an earlier edition of this book, this chapter will serve as a good refresher for you. Not much has changed; if it ain't broke, why fix it?

### Introduction

This chapter contains an annotated version of Revenue Ruling 59-60. The revenue ruling appears in italics, and the sections of this ruling that are in bold italic print are intended to emphasize a particular point. The author, not the IRS, has done the boldfacing. This ruling is so important to business valuation that I was tempted to boldface the entire document. (Relax, I didn't.)

Revenue Ruling 59-60 is said to be one of the greatest business valuation treatises ever written. It is hard to imagine that it came from our government! This ruling is quoted more often than any other source in the valuation field. Although the ruling was written to provide guidance on the valuation of closely held stocks for estate and gift tax purposes, the IRS expanded its applicability to income taxes. Because of its wide acceptance, many other authorities have looked to this ruling for guidance in valuing closely held stocks and other types of entities for many reasons other than taxes.

Despite having read this document hundreds of times, I continue to find elements that I had not seen before. As we go over the ruling, I will attempt to point out the intent of the ruling and illustrate its compliance with modern valuation theory. The essence of this chapter will be to determine what this revenue ruling really says.

### Revenue Ruling 59-60

***Section 1. Purpose. The purpose of this Revenue Ruling is to outline and review in general the approach, methods and factors to be considered in valuing shares of the capital stock of closely held corporations for estate tax and gift tax purposes. The methods discussed herein will apply likewise to the valuation of corporate stocks on which market quotations are either unavailable or are of such scarcity that they do not reflect the fair market value.***

Although the main focus of this revenue ruling is the valuation of closely held stocks, Revenue Ruling 59-60 has equal applicability to other types of entities. Whether the valuation subject is a partnership, sole proprietorship, or a limited liability company, the factors discussed in this ruling can generally be applied. In addition to the fact that this ruling is applicable to other types of entities, Revenue Ruling 65-192 expanded it to include income taxes, estate and gift taxes, and other taxes.

***Section 2. Background and Definitions.***

***.01 All valuations must be made in accordance with the applicable provisions of the Internal Revenue Code of 1954 and the Federal Estate Tax and Gift Tax Regulations. Sections 2031(a), 203, and 2512(a) of the 1954 Code (sections 811 and 1005 of the 1939 Code)***

*require that the property to be included in the gross estate, or made the subject of a gift, shall be taxed on the basis of the **value of the property at the time of death of the decedent, the alternate date if so elected, or the date of gift.***

Two important points are made right off the bat. First, any valuation that is going to be performed for tax purposes must follow the provisions of the IRC and IRS Regulations. The next point is that the valuation is date specific. The property is to be valued at the date of death, the alternate valuation date, or the date of the gift. This is consistent with the discussion in chapter 3 titled “Effective Date(s) of the Valuation.”

*.02 Section 20.2031-1(b) of the Estate Tax Regulations (section 81.10 of the Estate Tax Regulations 105) and section 25.2512-1 of the Gift Tax Regulations (section 86.19 of Gift Tax Regulations 108) **define fair market value, in effect, as the price at which the property would change hands between a willing buyer and a willing seller when the former is not under any compulsion to buy and the latter is not under any compulsion to sell, both parties having reasonable knowledge of relevant facts. Court decisions frequently state in addition that the hypothetical buyer and seller are assumed to be able, as well as willing, to trade and to be well informed about the property and concerning the market for such property.***

The definition included in this ruling is one of the most commonly used definitions of *fair market value*. To make the definition complete, it is important to understand and include the statement about court decisions (the last sentence of the previous quotation). For a “true” fair market value to be estimated, the situations outlined in box 16.1 must apply.

**BOX 16.1****Considerations for Fair Market Value Conditions**

1. There must be a willing buyer. Not only does the buyer have to be willing, but he or she must also be able to make the purchase. It would not matter if I wanted to buy a company such as Google or General Electric if I do not have the ability to consummate the deal. (Maybe next year if I sell enough of these books!)
2. There must be a willing seller. This concept seems easier than it really is when it comes to smaller businesses. The business owner frequently has certain obligations that may prohibit the sale of the property. For example, imagine a non-assignable lease with 10 years left on it at an above-market rent. This could prevent the willing seller from being able to sell the business, unless the price is lowered substantially so that the willing buyer can pay the higher-than-market rent. This would indicate that the fair market value of the property is reduced due to the unfavorable lease situation.  
  
Considering a market or income approach, cash flow would be reduced because of the higher rent, resulting in a lower value. This could also make the business less marketable. Using an asset-based approach, the valuation analyst would end up with a liability for an unfavorable leasehold. Although the willing seller may not want to sell the property at a reduced price, the economic reality is that the business is worth less.
3. Neither the willing buyer nor the willing seller should be under any compulsion to buy or sell (no duress). Because fair market value assumes a reasonable period of exposure on the market, the buyer and seller cannot be compelled to consummate a transaction. The seller should be able to wait for the market price and not end up with a fire sale situation. The buyer should not be in a position in which he or she has to purchase this business. If the buyer had been unemployed for a while and purchasing his or her employment was the only way to keep from running out of money, the temptation would be to overpay for the opportunity to get back to work.
4. Both buyer and seller must be reasonably knowledgeable about the property (including property market). Fair market value is not achieved if the parties to the transaction do not know what the business is worth compared with similar businesses in the market. Just as buyers are likely to overpay for the business, sellers may, at times, give the business away for too little. This situation should occur only if the buyer or seller fails to call us to do a valuation.

Although this point is not separately stated, fair market value also assumes a covenant not to compete between the willing buyer and seller. If there was no such covenant, the seller could open up next door. Why would anyone purchase a business if this was the case? This point is somewhat controversial. Many valuation analysts believe that a covenant not to compete is not included in fair market value, but let’s face reality. When a business is sold, there is frequently a covenant not to compete. However, its value is rarely determined. More often than not, a negotiation takes place to include something for tax purposes, but this is usually deducted from the overall price that was agreed on by the parties. However, it is included in the sales price that we find in most of the data in the small transaction databases.

**.03 Closely held corporations** are those corporations the shares of which are **owned** by a **relatively limited number of stockholders**. Often the entire stock issue is held by one family. **The result of this situation is that little, if any, trading in the shares takes place. There is, therefore, no established market for the stock and such sales as occur at irregular intervals seldom reflect all of the elements of a representative transaction as defined by the term “fair market value.”**

In this section of the revenue ruling, the IRS concedes that there is no established market for closely held stocks. This admission indicates that fair market value cannot truly be achieved, because there is no market. This concept begins the recognition of the lack of marketability in a closely held company. Revenue Ruling 77-287 addresses the issue of discounts for lack of marketability as it relates to restricted stock. However, if a property cannot be sold due to lack of a market, how can it be worth something other than its value to the current owner? Marketability issues were discussed in great detail in chapter 15. Revenue Ruling 77-287 is reproduced in appendix 10.

### **Section 3. Approach to Valuation**

**.01 A determination of fair market value, being a question of fact, will depend upon the circumstances in each case. No formula can be devised that will be generally applicable to the multitude of different valuation issues arising in estate and gift tax cases. Often, an appraiser will find wide differences of opinion as to the fair market value of a particular stock. In resolving such differences, he should maintain a reasonable attitude in recognition of the fact that valuation is not an exact science. A sound valuation will be based upon all the relevant facts, but the elements of common sense, informed judgment and reasonableness must enter into the process of weighing those facts and determining their aggregate significance.**

Some very important points are raised in this section. First, the circumstances of each case must be considered individually. This means that the valuation analyst cannot treat each valuation the same. This holds true even if the valuation subject is the same type of business that the valuation analyst has valued previously. No two businesses are truly alike. The valuation analyst should consider all the facts before arriving at a conclusion.

Another important concept is that no formula can be devised (not even the formula method from Revenue Ruling 68-609) that can be applied to every valuation. The valuation analyst must consider the facts and circumstances of each assignment to establish which valuation methodologies are appropriate in each situation. Don't rely on a mechanical application.

Now comes one of my favorite parts: Valuation is not an exact science. No kidding! If you can accept this concept, you are on your way to becoming a valuation analyst. If you are looking for black and white, you have come to the wrong place. By now you should recognize that there is no black and white, only a million shades of gray.

The revenue ruling points out the importance of using “common sense, informed judgment, and reasonableness” in performing the assignment. There are no substitutes for these items. Common sense plays a big role in the valuation process because the decisions that are made by a valuation analyst are often subjective. Because we do not always have the best information to work with, common sense frequently gets us through the assignment.

Along with common sense, informed judgment is important. Because the valuation process is so subjective, the valuation analyst needs to be well-informed to make the various choices that have to be made. Using economic, industry, and company information to analyze risk as it pertains to multiples or discount and capitalization rates can only assist the valuation analyst in making an informed judgment.

**.02 The fair market value of specific shares of stock will vary as general economic conditions change** from “normal” to “boom” or “depression,” that is, **according to the degree of optimism or pessimism with which the investing public regards the future at the required date of appraisal. Uncertainty as to the stability or continuity of the future income from a property decreases its value by increasing the risk of loss of earnings and value in the future.** The value of shares of stock of a company with very uncertain future prospects is highly speculative. **The appraiser must exercise his judgment as to the degree of risk attaching to the business of the corporation which issued the stock, but that judgment must be related to all of the other factors affecting value.**

Economic analysis is necessary at the valuation date to determine how the investing public feels about the future income of the property. Uncertainty about future income increases risk and affects the value in the future. Judgment is related to all factors in the valuation process, not just some. Each analysis that the valuation analyst performs—whether it is on the economy, the industry, or the finances of the company—cannot be done in a vacuum. All of these items must be considered for the valuation analyst to assess risk properly. The risk assessment will be used to adjust the multiples derived from guideline companies (comparables) or to adjust discount and capitalization rates.

Risk analysis is discussed in chapter 6. Multiples are discussed in chapters 9 and 10. Discount and capitalization rates are discussed in chapter 13.

**.03 Valuation of securities is, in essence, a prophecy as to the future and must be based on facts available at the required date of appraisal.** As a generalization, **the prices of stocks which are traded in volume in a free and active market by informed persons best reflect the consensus of the investing public** as to what the future holds for the corporations and industries represented. **When a stock is closely held, is traded infrequently, or is traded in an erratic market, some other measure of value must be used.** In many instances, **the next best measure may be found in the prices at which the stocks of companies engaged in the same or a similar line of business are selling in a free and open market.**

The most important lesson learned in this section of the ruling is that valuation is based on the future (the principle of future benefits is discussed in chapter 4). Relying on history alone to perform valuations is clearly wrong. The only time history can be used is if it represents what is expected to happen in the future.

The ruling also points out that the market is the best source of value. Publicly traded stocks are a good consensus of the market because these stocks are actively traded in a free and open market. However, because this information is not available for closely held businesses, the valuation analyst should use the actively traded stocks of companies that are in the same or a similar line of business. “Use the market approach” is the message that is being sent. Even if the guideline company method cannot be used with public companies, the market approach should continue to be a viable alternative. See chapters 9 or 10 for alternative applications of the market approach.

#### **Section 4. Factors to Consider.**

**.01 It is advisable to emphasize that in the valuation of the stock of closely held corporations or the stock of corporations where market quotations are either lacking or too scarce to be recognized, all available financial data, as well as all relevant factors affecting the fair market value, should be considered. The following factors, although not all-inclusive, are fundamental and require careful analysis in each case:**

- (a) *The nature of the business and the history of the enterprise from its inception.*
- (b) *The economic outlook in general and the condition and outlook of the specific industry in particular.*
- (c) *The book value of the stock and the financial condition of the business.*
- (d) *The earning capacity of the company.*
- (e) *The dividend-paying capacity.*

- (f) *Whether or not the enterprise has goodwill or other intangible value.*
- (g) *Sales of the stock and the size of the block of stock to be valued.*
- (h) *The market price of stocks of corporations engaged in the same or a similar line of business having their stocks actively traded in a free and open market, either on an exchange or over-the-counter.*

What can I say? Here it is again. By now, you know the importance of each one of these items. If you don't, you may want to reread the first 15 chapters of this book. If you have read any other business valuation books, the 8 factors outlined in Revenue Ruling 59-60 appear over and over again. These items should be self-explanatory. If they are not, I suggest that you start this book again.

.02 *The following is a brief discussion of each of the foregoing factors:*

(a) **The history of a corporate enterprise will show its past stability or instability, its growth or lack of growth, the diversity or lack of diversity of its operations, and other facts needed to form an opinion of the degree of risk involved in the business.** *For an enterprise which changed its form of organization but carried on the same or closely similar operations of its predecessor, the history of the former enterprise should be considered. The detail to be considered should increase with approach to the required date of appraisal, since recent events are of greatest help in predicting the future; but a study of gross and net income, and of dividends covering a long prior period, is highly desirable. The history to be studied should include, but need not be limited to, the nature of the business, its products or services, its operating and investment assets, capital structure, plant facilities, sales records and management, all of which should be considered as of the date of the appraisal, with due regard for recent significant changes. Events of the past that are unlikely to recur in the future should be discounted, since value has a close relation to future expectancy.*

Revenue Ruling 59-60 discusses the fact that the valuation analyst has to know where the company has been to predict where it is going. History is an important element in any business valuation exercise because it allows the valuation analyst to assess items such as growth, business diversification, and the other elements of risk that pertain to the valuation subject. This information ultimately helps support the multiples, discount rates, and capitalization rates used in the assignment. The valuation analyst will also want to use history as a basis for forecasting future operations, if that is appropriate in the given assignment.

The valuation analyst should obtain a thorough understanding of the company. This goes far beyond just gathering numbers. The analyst needs to understand the evolution of the business, including information regarding the company's product lines, competition, employees, and management and also a considerable amount of additional information that is gathered in the early part of the assignment. These items are discussed in chapter 5.

Revenue Ruling 59-60 also indicates that events of the past that are not expected to recur in the future should be disregarded because the future is more important than the past. These past nonrecurring items will be adjusted during the normalization process. The normalization process is intended to restate the financial information provided by the company to an economic basis (see chapter 6).

(b) **A sound appraisal of a closely held stock must consider current and prospective economic conditions as of the date of appraisal, both in the national economy and in the industry or industries with which the corporation is allied. It is important to know that the company is more or less successful than its competitors in the same industry, or that it is maintaining a stable position with respect to competitors.** *Equal or even greater significance may attach to the ability of the industry with which the company is allied to compete with other industries. Prospective competition which has not been a factor in prior years should be given careful attention. For example, high profits due to the novelty of its product and the lack of competition often lead to increasing competition. The public's appraisal of the future prospects of competitive industries or of competitors within an industry may be*

**indicated by price trends in the markets for commodities and for securities. The loss of the manager of a so-called “one-man” business may have a depressing effect upon the value of the stock of such business, particularly if there is a lack of trained personnel capable of succeeding to the management of the enterprise. In valuing the stock of this type of business, therefore, the effect of the loss of the manager on the future expectancy of the business, and the absence of management-succession potentialities are pertinent factors to be taken into consideration.** On the other hand, there may be factors which offset, in whole or in part, the loss of the manager’s services. For instance, the nature of the business and of its assets may be such that they will not be impaired by the loss of the manager. Furthermore, the **loss may be adequately covered by life insurance, or competent management might be employed on the basis of the consideration paid for the former manager’s services.** These, or other offsetting factors, if found to exist, should be carefully weighed against the loss of the manager’s services in valuing the stock of the enterprise.

This section of the ruling covers several different topics for consideration. It first tells us to consider current and prospective economic and industry information at the date of the valuation. To assess economic and industry risk properly, the valuation analyst must consider the impact of the economy and the industry on the valuation subject. For example, if the valuation subject is a building contractor that primarily builds residential housing, and mortgage interest rates at the date of the valuation are very high but are forecast to go down substantially, a conclusion could be drawn that the current operations, which probably have slowed down considerably because of the high rates, will most likely pick up again in the future with the falling rates. This can affect the forecast of “probable future earnings” and the amount of risk built into the multiples, discount rates, or capitalization rates. Be careful not to double-count by adjusting in both places!

The industry in which the valuation subject operates must be considered as well. If the entire book publishing industry was changing to e-books to accommodate the explosion of e-book readers in the marketplace, and the valuation subject was continuing to publish paper books for the same market, there might be a problem with the future sales of the company’s products. This would obviously affect the company’s value.

The ruling also tells the valuation analyst to consider the possible impact of competition on the valuation subject. If the valuation analyst is valuing a company with a product that is highly profitable and extremely “hot,” there is a good chance that competition will come into the market, even if it was not there before. If the valuation analyst gets the feeling that the situation is too good to be true, it probably is!

The next area covered by the ruling discusses the mood of the investing public. Fair market value comes from the market, and the valuation analyst cannot ignore the market if an industry has become so favorable that investor perception is driving up prices. If investors are willing to pay higher prices for similar types of companies, the valuation subject may be going along for the ride, if all else is equal.

Finally, this section discusses the impact of the loss of a key person. (The ruling actually refers to a “one-man” business. Ladies, on behalf of the Treasury Department, I apologize. We all know that this is politically incorrect! Certainly, in my firm, the key man is a woman.) The loss of a key person will frequently have an impact on a small company, more so than on a large company that has a management team in place. The loss of a key individual can have an adverse effect on the future operations of any business, but the valuation analyst must consider whether that individual can be replaced and how much time it would take to replace him or her.

There may be a slight downturn for the business in the short term until a replacement is found, but it may, in fact, only be short-term. The company may be able to find an adequate replacement who, given a reasonable amount of time, could put the company back on track. There may even be life insurance proceeds to protect the company so that adequate funds are available to handle this problem. The ruling is pretty clear on the fact that the valuation analyst should consider items that offset the loss of the key person, as well as the impact of the loss of the key person.

**(c) Balance sheets should be obtained, preferably in the form of comparative annual statements for two or more years immediately preceding the date of appraisal, together**

with a balance sheet at the end of the month preceding that date, if corporate accounting will permit. Any balance sheet descriptions that are not self-explanatory, and balance sheet items comprehending diverse assets or liabilities, should be clarified in essential detail by supporting supplemental schedules. **These statements usually will disclose to the appraiser (1) liquid position (ratio of current assets to current liabilities); (2) gross and net book value of principal classes of fixed assets; (3) working capital; (4) long-term indebtedness; (5) capital structure; and (6) net worth. Consideration also should be given to any assets not essential to the operation of the business, such as investments in securities, real estate, etc. In general, such nonoperating assets will command a lower rate of return than do the operating assets, although in exceptional cases the reverse may be true. In computing the book value per share of stock, assets of the investment type should be revalued on the basis of their market price and the book value adjusted accordingly. Comparison of the company's balance sheets over several years may reveal, among other facts, such developments as the acquisition of additional production facilities or subsidiary companies, improvement in financial position, and details as to recapitalizations and other changes in the capital structure of the corporation. If the corporation has more than one class of stock outstanding, the charter or certificate of incorporation should be examined to ascertain the explicit rights and privileges of the various stock issues including: (1) voting powers, (2) preference as to dividends, and (3) preference as to assets in the event of liquidation.**

Here, the ruling tells the valuation analyst to obtain at least two years of balance sheets for the valuation subject so that a comparison can be performed. In practice, most valuation analysts look for more years of data (generally five or more). The idea is to spot changes in the company's trends that will help the valuation analyst understand how the company has arrived at its current financial position. A review of the comparative balance sheets will help the valuation analyst understand if the company has made any major acquisitions of other companies (look for intangibles) or productive capacity (look for large increases in fixed assets) or other items that may be necessary to forecast future operations.

If a proper comparison is to be made to guideline public companies, changes to the capital structure should also be considered, assuming that the interest has the ability to change it. This may affect the valuation analyst's decision about whether to value equity or invested capital. Changes in the capital structure may also affect many of the financial ratios that the valuation analyst uses as analytical tools.

Revenue Ruling 59-60 suggests that the valuation analyst review differences in the rights of the different classes of stock that may exist and pay particularly close attention to voting differences, dividend preferences, and rights in liquidation. These items will affect the level of control that is afforded the stockholders. For example, if a stockholder has voting stock as opposed to nonvoting stock, there is more of an ability to shape the direction of the company (assuming there is enough stock to do this). Therefore, there may be a larger control premium or, conversely, a smaller discount for lack of control (minority).

**(d) Detailed profit-and-loss statements should be obtained and considered for a representative period immediately prior to the required date of appraisal, preferably five or more years. Such statements should show (1) gross income by principal items; (2) principal deductions from gross income including major prior items of operating expenses, interest, and other expenses on each item of long-term debt, depreciation and depletion if such deductions are made, officers' salaries, in total if they appear to be reasonable or in detail if they seem to be excessive, contributions (whether or not deductible for tax purposes) that the nature of its business and its community position require the corporation to make, and taxes by principal items, including income and excess profits taxes; (3) net income available for dividends; (4) rates and amounts of dividends paid on each class of stock; (5) remaining amount carried to surplus; and (6) adjustments to, and reconciliation with, surplus as stated on the balance sheet. With profit and loss statements of this character available, the appraiser should be able to separate recurrent from nonrecurrent items of income and expense, to distinguish between operating income and investment income, and to ascertain whether or not any line of business in which the company is engaged is operated consistently at a loss and might**

**be abandoned with benefit to the company.** The percentage of earnings retained for business expansion should be noted when dividend-paying capacity is considered. **Potential future income is a major factor in many valuations of closely-held stocks, and all information concerning past income which will be helpful in predicting the future should be secured. Prior earnings records usually are the most reliable guide as to the future expectancy, but resort to arbitrary five-or-ten-year averages without regard to current trends or future prospects will not produce a realistic valuation.** If, for instance, a record of progressively increasing or decreasing net income is found, then greater weight may be accorded the most recent years' profits in estimating earning power. It will be helpful, in judging risk and the extent to which a business is a marginal operator, to consider deductions from income and net income in terms of percentage of sales. Major categories of cost and expense to be so analyzed include the consumption of raw materials and supplies in the case of manufacturers, processors, and fabricators; the cost of purchased merchandise in the case of merchants; utility services; insurance; taxes; depletion or depreciation; and interest.

This section of the ruling tells the valuation analyst to obtain at least five years of income statement data in sufficient detail so that the valuation analyst can properly understand the data's components as well as the trends. Five years is not automatically the correct number. There will be times when a company's business cycle is longer or shorter, and the valuation analyst must use judgment to determine the appropriate time period to use for that particular assignment. Adjustments should be made to past earnings (for example, reasonable compensation), if appropriate.

The ruling also tells the valuation analyst to consider operating and non-operating income and expense items separately. Because most of the valuation methods are designed to produce the value of the operating assets and liabilities, it is logical to remove the non-operating income and expense items from the stream of income that is used.

Potential future income is discussed in the ruling and is said to be of major importance in valuation. This is the entire valuation process! Nobody buys history. The potential future income, whether in the form of dividends, capital appreciation, or a combination of the two, is what the willing buyer is purchasing. History is used to help predict the future. The ruling emphasizes that the valuation analyst cannot resort to an arbitrary use of history to value a company if it is not reflective of "probable future earnings." Current trends and future prospects must be taken into consideration in the valuation process.

*(e) Primary consideration should be given to the dividend-paying capacity of the company rather than to dividends actually paid in the past. Recognition must be given to the necessity of retaining a reasonable portion of profits in a company to meet competition. Dividend-paying capacity is a factor that must be considered in an appraisal, but dividends actually paid in the past may not have any relation to dividend-paying capacity. Specifically, the dividends paid by a closely held family company may be measured by the income needs of the stockholders or by their desire to avoid taxes on dividend receipts, instead of by the ability of the company to pay dividends. **Where an actual or effective controlling interest in a corporation is to be valued, the dividend factor is not a material element, since the payment of such dividends is discretionary with the controlling stockholders.** The individual or group in control can substitute salaries and bonuses for dividends, thus reducing net income and understating the dividend-paying capacity of the company. It follows, therefore, that dividends are a less reliable criterion of fair market value than other applicable factors.*

The use of dividend-paying capacity, as opposed to the actual dividends paid for a controlling interest, should be considered in a valuation because the controlling shareholders have the ability to control the level of dividends actually disbursed. In fact, most closely held companies do not pay dividends because they are not tax deductible.

More often than not, dividends are paid as additional compensation to create a tax-deductible expense. The dividend-paying capacity will be determined by normalizing the income statement and using the normalized

earnings to derive the net cash flow available to the stockholders. The net cash flow model (discussed in chapter 12) demonstrates this process.

**(f) In the final analysis, goodwill is based upon earning capacity. The presence of goodwill and its value, therefore, rests upon the excess of net earnings over and above a fair return on the net tangible assets.** While the element of goodwill may be based primarily on earnings, such factors as the prestige and renown of the business, the ownership of a trade or brand name, and a record of successful operation over a prolonged period in a particular locality, also may furnish support for the inclusion of intangible value. **In some instances it may not be possible to make a separate appraisal of the tangible and intangible assets of the business. The enterprise has a value as an entity. Whatever intangible value there is, which is supportable by the facts, may be measured by the amount by which the appraised value of the tangible assets exceeds the net book value of such assets.**

In this section, the ruling indicates that goodwill is based on the company's earning capacity. However, the ruling also seems to indicate that there are other factors (such as prestige or the brand name) that may add to the value and that also should be considered. In essence, the ruling indicates that the valuation analyst should value the entire company, and it is the excess over the value of the net tangible assets that becomes the intangible value. The ruling is a bit ambiguous in this section because it starts off by discussing goodwill and concludes by addressing other intangibles as well.

Most valuation analysts recognize the ruling as suggesting that the value of the entire company will include all intangibles, not just goodwill.

**(g) Sales of stock of a closely held corporation should be carefully investigated to determine whether they represent transactions at arm's length. Forced or distress sales do not ordinarily reflect fair market value nor do isolated sales in small amounts necessarily control as the measure of value.** This is especially true in the valuation of a controlling interest in a corporation. **Since, in the case of closely held stocks, no prevailing market prices are available, there is no basis for making an adjustment for blockage.** It follows, therefore, that such stocks should be valued upon a consideration of all the evidence affecting the fair market value. **The size of the block of stock itself is a relevant factor to be considered. Although it is true that a minority interest in an unlisted corporation's stock is more difficult to sell than a similar block of listed stock, it is equally true that control of a corporation, either actual or in effect, representing as it does an added element of value, may justify a higher value for a specific block of stock.**

Revenue Ruling 59-60 suggests that the valuation analyst review past transactions in the subject company's own stock to determine if it can be used as an indication of value. This can be the case only if the stock was transferred in an arm's length manner meeting all the requirements of the definition of *fair market value*. In particular, distress sales and sales of small blocks of stock will generally be a poor indicator of value. The smaller blocks may be used if the valuation analyst is valuing a small block of stock but may be very inappropriate for a controlling block.

This ruling also indicates that a blockage discount is inappropriate for large blocks of stock of a closely held corporation. The sale of a large block of stock of a closely held company will generally not have the same depressing effect (supply may be greater than demand) that selling a large block of stock may have on the public market. However, the ruling recognizes that it is more difficult to sell a minority interest in a closely held company than to sell the same interest in a public company (marketability), but also that controlling interests may have elements giving them more value (control is worth more than minority, and control is more marketable than minority).

**(h) Section 2031(b) of the Code states, in effect, that in valuing unlisted securities the value of stock or securities of corporations engaged in the same or a similar line of business which are listed on an exchange should be taken into consideration along with all other**

**factors.** An important consideration is that the corporations to be used for comparisons have capital stocks which are actively traded by the public. In accordance with section 2031(b) of the Code, stocks listed on an exchange are to be considered first. However, if sufficient comparable companies whose stocks are listed on an exchange cannot be found, other comparable companies which have stocks **actively traded** on the over-the-counter market also may be used. The essential factor is that whether the stocks are sold on an exchange or over-the-counter there is evidence of an active, free public market for the stock as of the valuation date. **In selecting corporations for comparative purposes, care should be taken to use only comparable companies.** Although the only restrictive requirement as to comparable corporations specified in the statute is that their lines of business be the same or similar, it is obvious that consideration must be given to other relevant factors in order that the most valid comparison possible will be obtained. For illustration, a corporation having one or more issues of preferred stock, bonds or debentures in addition to its common stock should not be considered to be directly comparable to one having only common stock outstanding. In like manner, a company with a declining business and decreasing markets is not comparable to one with a record of current progress and market expansion.

Here is the reason that valuation analysts employ the guideline public company method of valuation. Revenue Ruling 59-60 tells the valuation analyst to consider using comparative (guideline) companies to determine the value of the subject company. The ruling also points out that care should be exercised in selecting guideline companies. Comparability must relate to numerous factors and not be restricted to companies in the same or similar line of business. Review the items discussed in chapter 9 for a suggestion of factors to consider when determining comparability.

Another factor discussed is that the publicly traded guideline companies must be actively traded to be used in this analysis. This should eliminate any of the special motivations that buyers and sellers may have had in the market and that are not representative of fair market value (insiders trading shares of a thinly traded issue).

#### **Section 5. Weight to Be Accorded Various Factors.**

The valuation of closely held corporate stock entails the consideration of all relevant factors as stated in section 4. Depending upon the circumstances in each case, certain factors may carry more weight than others because of the nature of the company's business. To illustrate:

- (a) **Earnings may be the most important criterion of value in some cases whereas asset value will receive primary consideration in others.** In general, the appraiser will accord **primary consideration to earnings when valuing stocks of companies which sell products or services to the public; conversely, in the investment or holding type of company, the appraiser may accord the greatest weight to the assets underlying the security to be valued.**
- (b) **The value of the stock of a closely held investment or real estate holding company, whether or not family owned, is closely related to the value of the assets underlying the stock.** For companies of this type the appraiser should determine the fair market values of the assets of the company. **Operating expenses of such a company and the cost of liquidating it, if any, merit consideration when appraising the relative values of the stock and the underlying assets. The market values of the underlying assets give due weight to potential earnings and dividends of the particular items of property underlying the stock, capitalized at rates deemed proper by the investing public at the date of appraisal. A current appraisal by the investing public should be superior to the retrospective opinion of an individual.** For these reasons, adjusted net worth should be accorded greater weight in valuing the stock of a closely held investment or real estate holding company, whether or not family owned, than any of the other customary yardsticks of appraisal, such as earnings and dividend paying capacity.

In section 5 of the ruling, the weight to be assigned to the different approaches used in business valuation is discussed. For companies that sell products or services to the public, earnings are to be afforded the greatest weight during the valuation process. For companies that are asset-intensive, earnings may not be

as meaningful. The ruling is consistent with modern-day valuation theory because an asset-based approach is rarely used for businesses that have an intangible value beyond the valuation of the underlying assets. Obviously, an asset-based approach can be used if the intangible assets are valued separately and added to the result.

While discussing the valuation of the underlying assets, Revenue Ruling 59-60 also suggests that the expenses of liquidation be considered in the determination of value. The irony of this section is that Private Letter Ruling 9150001 specifically frowns on the application of capital gains taxes attributable to the selling of assets. The courts have taken the position that, unless liquidation is imminent, the effect of capital gains taxes is too speculative to be factored into the valuation. This was particularly true prior to the repeal of the General Utilities Doctrine, which was associated with IRC Section 337 liquidations.<sup>1</sup> Now, however, capital gains taxes have been permitted as part of the discount for lack of marketability in cases such as Davis and Eisenberg. There are also cases allowing a dollar-for-dollar reduction; Dunn is one of them. This has created a favorable argument for corporate-level taxpayers because they can no longer escape the corporate-level tax.

Finally, this section reiterates the importance of a market valuation as opposed to what is performed by a valuation analyst. The ruling indicates that the investing public's opinion should be given more weight than a retrospective assessment by an individual. This confirms the importance of having the underlying assets appraised in the determination of the adjusted net worth of a company, particularly when the underlying assets are real estate or investments, which are regularly valued by the market.

#### **Section 6. Capitalization Rates.**

*In the application of certain fundamental valuation factors, such as earnings and dividends, it is necessary to capitalize the average or current results at some appropriate rate. A **determination of the proper capitalization rate presents one of the most difficult problems in valuation. That there is no ready or simple solution** will become apparent by a cursory check of the rates of return and dividend yields in terms of the selling prices of corporate shares listed on the major exchanges of the country. **Wide variations will be found even for companies in the same industry.** Moreover, the ratio will fluctuate from year to year depending upon economic conditions. Thus, **no standard tables of capitalization rates applicable to closely held corporations can be formulated. Among the more important factors to be taken into consideration in deciding upon a capitalization rate in a particular case are: (1) the nature of the business; (2) the risk involved; and (3) the stability or irregularity of earnings.***

This section says it all! Determining the appropriate capitalization rate is one of the most difficult parts of the valuation process. The important part of this section is that there are no easy answers, there are no standard tables, and the valuation analyst needs to consider, at a minimum, the nature of the business, the risk involved, and the stability or irregularity of earnings.

#### **Section 7. Average of Factors.**

*Because valuations cannot be made on the basis of a prescribed formula, there is no means whereby the various applicable factors in a particular case can be assigned mathematical weights in deriving the fair market value. **For this reason, no useful purpose is served by taking an average of several factors (for example, book value, capitalized earnings and capitalized dividends) and basing the valuation on the result.** Such a process excludes active consideration of other pertinent factors, and the end result cannot be supported by a realistic application of the significant facts in the case except by mere chance.*

<sup>1</sup> The General Utilities Doctrine was repealed as part of the Tax Reform Act of 1986. Previously, it would have been possible to liquidate a corporation and avoid a corporate-level tax. The Tax Reform Act of 1986 removed this escape hatch and created double taxation to the corporation and shareholders on the liquidation.

Section 7 of the ruling states that although a valuation analyst attempts to reconcile the final value estimate, there is no formula available to reconcile the various valuation methods that may be applicable to a given valuation. Each valuation assignment consists of a unique set of circumstances that will require the valuation analyst to analyze the results of the different valuation methods used to derive a final estimate of value. Even between similar assignments, the information that the valuation analyst may obtain will provide more or less confidence in the application of certain methods. Companies have different balance sheet compositions, which could affect the weight to be afforded to the net worth of the company.

In simple terms, the valuation analyst should not blindly take an average of all the valuation methods that he or she decided were appropriate because the answer will, no doubt, be incorrect unless he or she is extremely lucky. He or she may be better off buying a lottery ticket!

### **Section 8. Restrictive Agreements.**

*Frequently, in the valuation of closely held stock for estate and gift tax purposes, it will be found that the stock is subject to an agreement restricting its sale or transfer. **Where shares of stock were acquired by a decedent subject to an option reserved by the issuing corporation to repurchase at a certain price, the option price is usually accepted as the fair market value for estate tax purposes.** See Rev. Rul. 54-76, C.B. 1954-1, 194. However, in such case the option price **is not determinative of fair market value for gift tax purposes.** Where the option, or buy and sell agreement, is the result of voluntary action by the stockholders and is binding during the life as well as at the death of the stockholders, such agreement may or may not, depending upon the circumstances of each case, fix the value for estate tax purposes. However, **such agreement is a factor to be considered, with other relevant factors, in determining fair market value.** Where the stockholder is free to dispose of his shares during life and the option is to become effective only upon his death, the fair market value is not limited to the option price. It is always necessary to consider the relationship of the parties, the relative number of shares held by the decedent, and other material facts, to determine whether the agreement represents a bona fide business arrangement or is a device to pass the decedent's shares to the natural objects of his bounty for less than an adequate and full consideration in money or money's worth. In this connection see Rev. Rul. 157, C.B. 1953-2, 255, and Rev. Rul. 189, C.B. 1953-2, 294.*

Revenue Ruling 59-60 reiterates that buy-sell agreements may be binding for estate tax purposes but may not be binding for gift tax purposes. Factors surrounding the buy-sell agreement must be considered by the valuation analyst to determine if the agreement represents an arm's length agreement and not one that is designed to avoid taxes. Consideration must clearly be given to special situations, such as related shareholders, but that is one of many factors to be considered.

The IRS will also scrutinize a situation in which shareholders arbitrarily determine the value for their buy-sell agreement, as opposed to a provision that calls for an independent valuation by a qualified valuation analyst. The general feeling is that there is too much room for manipulation if the determination of this value is left to the shareholders alone.

### **Section 9. Effect on Other Documents.**

*Revenue Ruling 54-77, C.B. 1954-1, 187, is hereby superseded.*

## **Conclusion**

By now, Revenue Ruling 59-60 should be a bit clearer. Considering that the ruling was promulgated in 1959, it has stood the test of time. Business valuation theory corresponds to the factors set forth in this ruling. For the most part, this revenue ruling is like motherhood and apple pie. It just makes sense! Regardless of the set of standards followed in performing a business valuation, they all send the same message: Consider the factors set forth in Revenue Ruling 59-60. I hope the information presented in this revenue ruling has shed new light on the valuation process. Valuation has not really changed. We just get smarter as time goes by.

# Chapter 17

## The Valuation Report

### Learning Objectives

In this chapter, I will explain the following:

- The components of a valuation report
- The types of valuation reports
- The preparation of the business valuation report
- The defense of the business valuation report
- Common errors in business valuation reports

### Introduction

Valuation reports will vary depending on the assignment. The different types of reports generated will be based on the needs of the client and will frequently be cost-driven. A detailed report may be too expensive for a client, although it may be required because of the nature of the assignment. This is a problem the valuation analyst constantly faces.

### Components of a Valuation Report

*Statement on Standards for Valuation Services (SSVS) No. 1, Valuation of a Business, Business Ownership Interest, Security, or Intangible Asset (AICPA, Professional Standards, VS sec. 100)*, begins its discussion about valuation reports in paragraph .47. It states that

.47 A valuation report is a written or oral communication to the client containing the conclusion of value or the calculated value of the subject interest. Reports issued for purposes of certain controversy proceedings are exempt from this reporting standard (paragraph .50).

.48 The three types of written reports that a valuation analyst may use to communicate the results of an engagement to estimate value are as follows: either a detailed report or a summary report for a valuation engagement and a calculation report for a calculation engagement.

Regardless of whether the valuation analyst is a CPA, Standard 10, “Business Appraisal Reporting,” of the *Uniform Standards of Professional Appraisal Practice (USPAP)*, as well as the rest of the USPAP, must be followed for all Financial Institutions Reform Recovery and Enforcement Act (FIRREA) engagements, which are engagements that involve a federally related transaction. Of course, the vast majority of valuation assignments do not fall into this category.

According to the USPAP, each analysis, opinion, and conclusion reached should be communicated in a manner that is not misleading (no kidding!). The report should be clearly and accurately presented. It should also contain enough information to allow the reader to properly understand the contents, the sources of information used by the valuation analyst to draw certain conclusions, and the basis for the conclusions reached. The valuation analyst should also disclose any unusual assumption or limiting condition that directly affects the valuation and should explain their effects on value. Sounds like SSVS No. 1, huh?

The intent of the USPAP is to ensure that the valuation analyst properly communicates his or her findings in a thorough manner that will be helpful to the reader of the report. To accomplish this task, the USPAP lists certain items that must be in a report. For example, a definition of value must be in a report. If it is not, how will the reader properly understand the context in which the analysis has been done?

In my opinion, a good valuation report should contain at least the required disclosures from SSVS No. 1, which will also put the valuation analyst in compliance with the USPAP (if necessary). The required sections of a detailed valuation report per SSVS No. 1 are in box 17.1 for reference.

## Letter of Transmittal

The letter of transmittal is the cover letter in which the valuation analyst basically tells the client, “Here it is, but if you want to know more, see the attached report.” A sample transmittal letter appears as part of the sample report, which is part of the available download for this book.

## Table of Contents

This should be pretty self-explanatory. Make sure the reader can find things in the report.

## Introduction

The introduction section should provide an overall description of the valuation engagement. SSVS No. 1 states that the introduction section may include the content listed in box 17.2, among other things. The information in this section should be sufficient to enable the intended user of the report to understand the nature and scope of the valuation engagement, as well as the work performed. The intended user is “the client or any other party as identified, by name or type, as users of the appraisal or appraisal review report by the appraiser based on communication with the client at the time of the assignment.”<sup>1</sup>

### BOX 17.1

#### Required Sections of a Detailed Valuation Report

- Letter of transmittal
- Table of contents
- Introduction
- Description of the assignment
- Assumptions and limiting conditions
- Sources of information
- Analysis of subject entity and related nonfinancial information
- Subject company information
- Economic data
- Industry information
- Financial statement or information analysis
- Valuation approaches and methods considered
- Valuation approaches and methods used
- Valuation adjustments
- Non-operating assets, Non-operating liabilities, and excess or deficient operating assets (if any)
- Representation of the valuation analyst
- Reconciliation of estimates and conclusion of value
- Qualifications of the valuation analyst
- Appendixes and exhibits

### BOX 17.2

#### SSVS No. 1 Suggested Content for a Valuation Report

- Identity of the client
- Purpose and intended use of the valuation
- Intended users of the valuation
- Identity of the subject entity
- Description of the subject interest
- Whether the business interest has ownership control characteristics and its degree of marketability
- Valuation date
- Report date
- Type of report issued (namely, a detailed report)
- Applicable premise of value
- Applicable standard of value
- Assumptions and limiting conditions (alternatively, these often appear in an appendix)
- Any restrictions or limitations in the scope of work or data available for analysis
- Any hypothetical conditions used in the valuation engagement, including the basis for their use
- If the work of a specialist was used in the valuation engagement, a description of how the specialist’s work was relied upon
- Disclosure of subsequent events in certain circumstances
- Any application of the jurisdictional exception
- Any additional information the valuation analyst deems useful to enable the user(s) of the report to understand the work performed

<sup>1</sup> 2016–2017 *Uniform Standards of Professional Appraisal Practice* (USPAP), The Appraisal Foundation, Washington, DC, p. 3. The footnote in this quote refers the reader to *Advisory Opinion 36* of the USPAP, which discusses the concept of “intended user” in greater detail. It has been omitted from this book.

If the valuation analyst puts all the stuff included in box 17.2 in the introduction, the report will be 50 pages at this point. Personally, I do not put all of this in the introduction section of my reports. I believe that it can make this section too cumbersome. Fortunately, SSVS No. 1 states, “If the above items are not included in the introduction, they should be included elsewhere in the valuation report.” I vote for elsewhere. I prefer to have a “Description of the Assignment” section. This could be a subsection of the introduction, but the valuation analyst should put it where he or she thinks it belongs. In essence, the analyst has control about where the best places are to put the necessary inclusions in the report. There are times that I may place something as the second paragraph after I describe the assignment because I want to emphasize it to the reader. There are other times that I may place it toward the back of the report. In one assignment, my second section of the report stated the following:

#### SPECIAL LIMITING CONDITION OF THIS REPORT

Despite requesting a considerable amount of information required to properly analyze the valuation subject, we were not provided with much of the data. As far as we can tell, there were two main reasons for this, namely:

- 1) The Court largely denied our request for data that we deemed necessary to perform this valuation in accordance with professional valuation standards, and
- 2) XYZ Company, Inc. failed to provide requested documentation that would support its operations.

Appendix 2, at the back of this report, includes a complete list of those items that were requested and the reason that we requested them.

We consider this lack of documentation to rise to the level of a “Scope Restriction” in accordance with our professional standards. Had we received the requested information, our conclusion of value may have been different.

You can probably tell that this was a contentious litigation assignment, and we were concerned about obtaining *sufficient relevant data* to allow us to do our job properly. The appendix in the back of our report listed every item that we asked for, including why we felt it was necessary. This was included after discussing the concern with our client’s legal counsel in the event that he wished to file an appeal regarding the original judge (not the judge that finally heard the case at trial) not providing access to many documents that we believed were necessary to perform this engagement.

### Description of the Assignment

Consider this section of the report as the introduction. This is the part of the report that spells out what the assignment is. It should include a complete description of the valuation subject—for example, “35 shares of the common stock of XYZ Corp., a New Jersey Corporation, which represents a 43.5 percent minority interest in the corporation, owned by John Smith.” This section should also provide the reader with the effective date of the valuation. This is the date at which the business or business interest has been valued. By the way, the valuation date is a specific point in time, for example, December 16, 2016. It is never December 2016. A valuation analyst cannot value something over an entire month. I see too many reports in which there is either no date given, or it is just a month. This is incorrect. The valuation analyst should also disclose the purpose and function of the valuation. The purpose may be to determine the fair market value of the company, whereas the function may be to describe how it will be used (for example, for gift tax purposes, estate tax purposes, or divorce litigation).

The description section will generally disclose the identity of the client. The client may not be the same individual to whom the transmittal letter is addressed. We are frequently retained by parties going through litigation who instruct us to send the report to the attorney. If the client is not the attorney, the cover letter would be addressed to the client but mailed to the attorney. This is like playing “Who’s on First?” The USPAP also has one other requirement that SSVS No. 1 does not. The USPAP requires the intended user of the report to be identified in the report, as well. A valuation analyst may prepare a valuation report for the client or possibly the client’s CPA, who is going to prepare a gift tax return, and both the client and the CPA may be the intended users of the report. Despite the fact that the IRS will receive a copy of the report attached to the gift tax return,

unless the IRS is specifically named as an intended user of the report, they are not. Without getting into a long legal discussion, this has to do with who has the right to rely on the report.

Finally, this section of the report should include the standard of value being used in the report as well as the definition. It is also a good practice to include where that definition comes from. Often, it will be fair market value, but even fair market value is defined differently in certain circumstances. If a different standard of value is used, it should be very clearly defined.

## Scope of Work

For those valuation analysts who want to follow the USPAP, each valuation report should include a summary of the scope of work used to develop the valuation. In the comments to Standard 10-2(a)(viii), it states the following:

Comment: Because intended users' reliance on an appraisal may be affected by the scope of work, the report must enable them to be properly informed and not misled. Sufficient information includes disclosure of research and analyses performed and might also include disclosure of research and analyses not performed.<sup>2</sup>

## Assumptions and Limiting Conditions

This is one of the most important sections of the report. It contains the valuation analyst's assumptions covering the entire report, such as the assumption that the information being provided by the client is valid without independent verification. This should be considered the valuation analyst's disclaimer. The accounting profession knows all about disclaimers.

Valuation analysts are a little more subtle about the way they disclaim certain items. Instead of the typical accountant's disclaimer, which hits the reader between the eyes on the first page of the accountant's report, the valuation analyst's assumptions are placed more subtly within the report. Some valuation analysts prefer to put this section in an appendix at the back of the report. I frequently cut and paste these items from my engagement letter and add any additional items that may be applicable to the current assignment. It does not matter where in the report this goes, as long as it is included. This is called covering your posterior!

Certain assumptions and limiting conditions are standard for all engagements. These should be included in the engagement letter with the client, so there is no misunderstanding about the client's acceptance of the valuation analyst's report subject to at least those assumptions and limiting conditions. There may be others that end up in the report as well. (See chapter 3 for the discussion of engagement letters.) Some of the more common assumptions and limiting conditions are illustrated in the sample reports available for download with this book.

## Sources of Information

Valuation reports are supposed to be replicable by any qualified reader. Therefore, a valuation report should include all the sources considered by the valuation analyst in providing a conclusion of value. This provides a qualified reader with the ability to independently review the various sources used by the original analyst to draw a similar conclusion (or at least understand how the analyst derived his or her conclusion). (Some valuation analysts prefer to put this section in an appendix to the report, rather than in the report itself.) It is advisable to list all the items that were reviewed but, more importantly, those items that had an effect on the conclusion. Do not include items that have no relevance to the assignment at hand. For example, if the valuation analyst is valuing a corporate interest for a divorce, do not list the personal tax returns of the parties unless they had some relevance to the assignment.

Besides listing all the stuff that the valuation analyst reviewed and considered, SSVS No. 1 also tells us that this section may include the following:

.....  
<sup>2</sup> 2016–2017 *Uniform Standards of Professional Appraisal Practice*, The Appraisal Foundation, Washington, DC, p. 67.

- a. For valuation of a business, business ownership interest, or security, whether and to what extent the subject entity's facilities were visited
- b. For valuation of an intangible asset, whether the legal registration, contractual documentation, or other tangible evidence of the asset was inspected
- c. Names, positions, and titles of persons interviewed and their relationships to the subject interest

## Analysis of the Subject Entity and Related Nonfinancial Information

For this section, SSVS No. 1 states that we should include a description of the relevant information from the categories found in box 17.3.

### BOX 17.3

#### SSVS No. 1 Subject Entity Information

- |  |  |
|--|--|
| • Nature, background, and history  | • Economic environment                   |
| • Facilities   | • Geographical markets                   |
| • Organizational structure   | • Industry markets                       |
| • Management team (which may include officers, directors, and key employees) | • Key customers and suppliers            |
| • Classes of equity ownership interests and rights attached thereto          | • Competition                            |
| • Products or services, or both  | • Business risks                         |
|  | • Strategy and future plans              |
|  | • Governmental or regulatory environment |

Once again, this section can be broken up into smaller sections, but the valuation analyst wants to make sure that he or she includes all the important stuff. I break this section down as follows:

- Subject company data
- Economic data
- Industry data

## Subject Company Data

Revenue Ruling 59-60 suggests that one of the eight factors to be considered in performing a valuation is “the nature of the business and the history of the enterprise from its inception.” This section of the report will frequently include a discussion of the following areas:

- History of the business
- Form of organization
- Restrictions on the sale of the subject interest
- Subsidiaries and affiliates
- Ownership and control
- Management
- Product lines
- Subject industry
- Competition
- Location

This section of the report will allow the valuation analyst to demonstrate his or her knowledge of the subject company. One of the greatest faults that I find in other valuation analysts' reports is that they either skip this section or write a one-paragraph description of the company. How can anyone understand what makes the company have value if this narrative is omitted? Sometimes, I even like to put pictures of the subject company's facilities in the report, so that the reader gets to see what I saw and thought was important to the valuation. Imagine explaining the following in a report and following it up with the picture that was included. Our report stated the following:

While conducting our site inspection, several issues were brought to our attention. The Company's racking units are in need of repair. While walking the facility, one of the warehouse staff was hammering in the racks because they often slip out and are very unstable. The following image shows the results of an accident caused by an employee who backed into a racking unit with a forklift. Although the forklift caused the bulk of the damage, it is unclear what the impact of the potentially faulty racking may have had on the situation.

This information is part of the risk assessment that we discussed previously. It provides data that helps to justify discount rates, capitalization rates, discounts for lack of control, discounts for lack of marketability, and control premiums. These items are discussed in detail in chapter 5.

## Economic Data

The valuation report should contain a discussion of the economy, concentrating on how it affects the valuation subject (see chapter 5 for a detailed discussion about the economic analysis that should be done). Remember to make this section relevant to the valuation subject. Some commercial vendors sell an analysis of the economy that can be inserted into a valuation report. The problem with using such an analysis is that it assumes that every valuation subject is affected by the same economic factors. This is not necessarily true. Although a construction contractor may be affected by rising interest rates, a brain surgeon probably is not. Including a long discussion about interest rates in a valuation report for a brain surgery practice will not only be boring but also out of place.

## Industry Data

The report should also contain a discussion of the valuation subject's industry. The discussion should be detailed enough to demonstrate how the valuation subject fits into the industry; how the industry is affected by the economy; whether the industry is mature, stable, or cyclical; and anything else that may be pertinent to the valuation. The discussion may also cover industries that affect the valuation subject, even though the valuation subject is not in that industry. For example, our firm valued a printing business that was specialized; it serviced only the pharmaceutical industry. Our report contained a discussion of the changes in the pharmaceutical industry because they had a major effect on the valuation subject's business. For more information about industry analysis, see chapter 5.

## Financial Statement and Information Analysis

This is the section of the valuation report that includes the trend and ratio analyses of the subject company. With regard to its performance, the subject company should generally be compared not only with itself but also with either guideline companies or industry composite data. This section of the report also includes the financial forecast for the company, including operational expectations (revenues, net profits, and cash flow). This is a critical section of the report because not only does the valuation analyst need this information to perform the valuation calculations, but he or she also needs it for assessing risk, which will be used to adjust either the multiples used in guideline company methodologies or the component of the discount rate pertaining to the specific company risk premium.

## Valuation Approaches and Methods Considered

---

Because the valuation analyst generally considers all applicable approaches and methods, this section of the report is almost boilerplate. This is where the valuation analyst lists the advantages and disadvantages of the approaches to value and why they may or may not be applicable to the particular valuation. For example, this is where the analyst would discuss the fact that he or she will not be using the asset-based approach because he or she is valuing a professional practice, which generates its value from earnings and cash flow.

## Valuation Approaches and Methods Used

---

All the methods that were considered as part of the valuation should be discussed either in a separate section or in the valuation section of the report. This section should also contain a discussion about the search for publicly traded guideline companies. The discussion should include the parameters of the search, the reason that certain companies were considered but eliminated, and the companies selected as guideline companies.

Some valuation analysts include an adjusted balance sheet and a normalized income statement in this section of the report, along with an appropriate discussion of the adjustments that were made. Other valuation analysts will include this information in the financial statement analysis section of the report.

After the discussion of the selected methods of valuation and the calculations of value under each method, a reconciliation should be included in the report, and it should lead to a conclusion of value. SSVS No. 1 suggests a separate section. I think that it belongs here. Once again, the standard is not forcing all of our reports to look the same. We are being advised to make sure to include all important parts of the valuation process somewhere in the report so that the reader can properly understand what we have done.

## Valuation Adjustments

---

This is the section in which SSVS No. 1 suggests that the valuation analyst discuss premiums and discounts and includes a detailed justification for those that were applied in the report, as well as a justification for the size of those premiums or discounts.

## Non-Operating Assets, Non-Operating Liabilities, and Excess or Deficient Operating Assets

---

If the analyst segregated any items from the balance sheet during the valuation process that are to be added back at the end of the process, they must be discussed. The non-operating items were probably normalized from the balance sheet, and the valuation analyst may have discussed this in the financial analysis section of the report. The valuation analyst must not forget to add or subtract this stuff back to or from the operating value of the business (if appropriate). Excess or deficient assets are usually a closing adjustment in a transaction and should be addressed here as well.

## Representation of the Valuation Analyst

---

This is the equivalent to the “Appraiser’s Certification” for the non-CPAs. We usually include this as an appendix to the report.

## Reconciliation of Estimates and Conclusion of Value

---

I generally put this with the analysis of the approaches and methods used. It can be separately stated, but, in my opinion, it flows better right after the valuation analyst discusses the valuation calculations.

## Qualifications of the Valuation Analyst

---

Let the reader of the report know that you are really qualified to do the valuation. Just don’t lie! It is amazing how many reports we see in which the valuation analyst exaggerates his or her qualifications and gets caught doing so. Not only is it unethical, it can be a career-ender if it happens in court under penalties of perjury. It is

not worth your career! Instead, this is where you are saying to the reader of the report that you have the training and background to have done this assignment properly. You may have fooled your client into hiring you, but now the user of the report needs to be convinced. There is no shame in having less experience in valuation, but it should be properly disclosed. We all had to start somewhere.

## Appendixes and Exhibits

This section of the report will generally include the back-up documentation that supports the valuation. Some valuation analysts include a comparative balance sheet and income statement in this section; others may also include all the valuation calculations. To me, there is nothing worse than reading a valuation report in which the valuation analyst makes me constantly jump from the narrative to schedules in the back of the report to follow the story that is being told. I would rather see the financial information included in the body of the narrative. This may be more difficult for the valuation analyst's word-processing person to do, but it is more courteous to the reader. Keep in mind that the reader is frequently the one who will be paying the fee!

## Types of Valuation Reports

During a typical business valuation engagement, the valuation analyst may be asked to issue one type of report or several different types. As indicated previously, SSVS No. 1 states the following:

.47 A valuation report is a written or oral communication to the client containing the conclusion of value or the calculated value of the subject interest. Reports issued for purposes of certain controversy proceedings are exempt from this reporting standard (paragraph .50).

.48 The three types of written reports that a valuation analyst may use to communicate the results of an engagement to estimate value are as follows: either a detailed report or a summary report for a valuation engagement and a calculation report for a calculation engagement.

The standard goes on by stating the following:

- a. *Valuation engagement—detailed Report.* This report may be used only to communicate the results of a valuation engagement (conclusion of value); it should not be used to communicate the results of a calculation engagement (calculated value) (paragraph .51).
- b. *Valuation engagement—summary Report.* This report may be used only to communicate the results of a valuation engagement (conclusion of value); it should not be used to communicate the results of a calculation engagement (calculated value) (paragraph .71). For a valuation engagement, the determination of whether to prepare a detailed report or a summary report is based on the level of reporting detail agreed to by the valuation analyst and the client.
- c. *Calculation engagement—calculation Report.* This type of report should be used only to communicate the results of a calculation engagement (calculated value); it should not be used to communicate the results of a valuation engagement (conclusion of value) (paragraph .73).

Standard 10-2 of the USPAP discusses two types of reports: an appraisal report and a restricted use appraisal report. The comments to this standard state the following:

When the intended users include parties other than the client, an Appraisal Report must be provided. When the intended users do not include parties other than the client, a Restricted Use Appraisal Report may be provided.

The essential difference between these options is in the content and level of information provided. The appropriate reporting option and the level of information necessary in the report are dependent on the intended use and intended users.

An appraiser must use care when characterizing the type of report and level of information communicated upon completion of an assignment. An appraiser may use any other label in addition to, but not in place of, the label set forth in this standard for the type of report provided.

The report content and level of information requirements set forth in this Standard are minimums for both types of report.

A party receiving a copy of an Appraisal Report or Restricted Use Appraisal Report does not become an intended user of the appraisal unless the appraiser identifies such party as an intended user as part of the assignment.

In essence, the distinction being made in the USPAP is the difference between a detailed report and a summary report. It is interesting to note, however, that a detailed report must be provided if the intended users are not the client. This is an attempt to make sure that the reader has all the information necessary to understand the report properly. This can be a potential issue if you perform litigation assignments. Although there is an exception under the reporting standards of SSVS No. 1, there is no such clear exception under the USPAP. This is an area of controversy in the valuation profession, particularly for those valuation organizations that mandate its members follow the USPAP. Therefore, you may not be in compliance with the USPAP if you provide anything less than a detailed or oral report for a litigation assignment.

Whether the engagement is a *valuation* or a *calculation* is defined in the “Scope of Work” section of the USPAP. This is the manner in which the project is identified as well as what steps are necessary to perform a credible job. Keep in mind that a calculation is not a valuation.

Regardless of which report format the valuation analyst uses, every business valuation engagement requires the valuation analyst to do all the work that is necessary to formulate a supportable conclusion of value about the valuation subject. The business valuation report is nothing more than the mechanism that is used to communicate the conclusion. The report, however, can be a dynamic tool to convince the reader that the valuation analyst has done a good job in deriving the conclusion of value.

Each of the report types serves a different purpose in a valuation engagement. The type of assignment can affect the content of the report; therefore, a clear understanding of the engagement is essential before the valuation analyst can do his or her job. Before going too much further, let’s define each of these report types.

## Detailed Reports

A detailed report is covered in SSVS No. 1 beginning at paragraph .51. A detailed business valuation report is the highest-level report that the valuation analyst can provide to his or her client. The contents of the report will generally contain all the information covered earlier in this chapter. A detailed business valuation report can range from 60–100 pages or more. (Four hundred eighty-seven pages is our record. We charged by the pound for that report.)

## Summary Reports

Less than detailed reports are frequently requested and perfectly acceptable in certain situations in which the user of the report is informed that much of the detail is excluded from the report. The USPAP calls these reports *restricted use appraisal reports*. Sometimes, based on the needs of the client, he or she may not want to pay the valuation analyst to include a section in the report that describes the company. This is especially true if the valuation is for planning purposes. However, this description would be important to a third party who is not familiar with the valuation subject.

A summary report contains considerably less information than a detailed report. SSVS No. 1 says “a summary report is structured to provide an abridged version of the information that would be provided in a detailed report, and therefore, need not contain the same level of detail as a detailed report.” However, SSVS No. 1 then goes on to require, at a minimum, that a summary report include the list of items that are included in box 17.4.

**BOX 17.4****SSVS No. 1 Suggested Content for a Summary Report**

- Identity of the client
- Purpose and intended use of the valuation
- Intended users of the valuation
- Identity of the subject entity
- Description of the subject interest
- The business interest's ownership control characteristics, if any, and its degree of marketability
- Valuation date
- Valuation report date
- Type of report issued (namely, a summary report) (paragraph .48)
- Applicable premise of value
- Applicable standard of value
- Sources of information used in the valuation engagement
- Assumptions and limiting conditions of the valuation engagement (paragraph .18)
- The scope of work or data available for analysis, including any restrictions or limitations (paragraph .19)
- Any hypothetical conditions used in the valuation engagement, including the basis for their use (paragraph .22)
- If the work of a specialist was used in the valuation (paragraph .20), a description of how the specialist's work was used, and the level of responsibility, if any, the valuation analyst is assuming for the specialist's work
- The valuation approaches and methods used
- Disclosure of subsequent events in certain circumstances (paragraph .43)
- Any application of the jurisdictional exception (paragraph .10)
- Representation of the valuation analyst (paragraph .65)
- The report is signed in the name of the valuation analyst or the valuation analyst's firm
- A section summarizing the reconciliation of the estimates and the conclusion of value as discussed in paragraphs .68 and .69
- A statement that the valuation analyst has no obligation to update the report or the calculation of value for information that comes to his or her attention after the date of the valuation report

This list has more items on it than the detailed report contains. The valuation analyst just has to write less. When you look closely at these items, you will realize that the standard wants to ensure that the valuation analyst is protected. Most of this stuff is necessary because even though the valuation analyst is issuing a summary report, he or she still performed a full valuation engagement. Whatever the valuation analyst does, he or she should not get mixed up about the assignment. A summary report is appropriate for a full valuation. Anything less in scope falls into a calculation engagement, which requires a different type of report.

## Calculation Reports

This is the only type of report that can be used for a calculation engagement. Think about the calculation engagement as being more of an agreed-upon procedures assignment than a valuation engagement. The valuation analyst will be doing less in scope and, accordingly, he or she needs to report on the lesser scope engagement. SSVS No. 1 requires that the valuation analyst identify that it is a calculation report. The report should contain many of the same items but be adapted for the calculation engagement, including, but not limited to, the analyst's representation, assumptions, and limiting conditions; use of a specialist; appendixes; and exhibits.

As for the section of the report summarizing the calculated value, SSVS No. 1 states that the items listed in box 17.5 should be included in the calculation report.

**BOX 17.5****SSVS No. 1 Suggested Content for a Calculation Report**

- Certain calculation procedures were performed; include the identity of the subject interest and the calculation date.
- Describe the calculation procedures and the scope of work performed or reference the section(s) of the calculation report in which the calculation procedures and scope of work are described.
- Describe the purpose of the calculation procedures, including that the calculation procedures were performed solely for that purpose and that the resulting calculated value should not be used for any other purpose or by any other party for any purpose.
- The calculation engagement was conducted in accordance with the Statement on Standards for Valuation Services of the AICPA.
- A description of the business interest's characteristics, including whether the subject interest exhibits control characteristics, and a statement about the marketability of the subject interest.
- The estimate of value resulting from a calculation engagement is expressed as a calculated value.
- A general description of a calculation engagement is given, including that
  - a calculation engagement does not include all of the procedures required for a valuation engagement, and
  - had a valuation engagement been performed, the results may have been different.
- The calculated value, either a single amount or a range, is described.
- The report is signed in the name of the valuation analyst or the valuation analyst's firm.
- The date of the calculation report is given.
- The valuation analyst has no obligation to update the report or the calculation of value for information that comes to his or her attention after the date of the report.

## Oral Reports

Oral reports are also acceptable, although not advisable. Some attorneys prefer oral reports in litigation as a strategy for keeping the other side guessing. The Federal Rules of Civil Procedure have changed the use of oral reports. This “trial by ambush” approach is now frowned upon in many courts.

This type of report is generally accomplished through testimony, either at a deposition or a trial. On occasion, the valuation analyst's client may just want a verbal opinion regarding what his or her business should sell for. SSVS No. 1 advises the valuation analyst to document the substance of the oral report that is communicated to the client in his or her working papers.

I was going to provide you with a sample oral report, but because this is not a book on tape, I decided against it.

## Preparing the Business Valuation Report

Now that we have discussed the types of reports, the next step is to understand when to use each. Personally, I prefer issuing detailed valuation reports. This type of report allows me to demonstrate not only that I did my job well, but also my knowledge of valuation theory. Knowledge of the different sets of standards from the different valuation organizations can help the valuation analyst play an important litigation support role by assisting the client's attorney in impeaching the other side's expert for not following the standards of the organizations in which the expert belongs.

The standards have been discussed earlier in this book, so there is no need to repeat the discussion here. However, if you did not read about the standards when you encountered them, now would be a good chance to do so (you thought you could skip them and get away with it, huh?). By this point in the book, you should also have awoken from your nap and ordered your own copy of SSVS No. 1 and the USPAP (you have already been given SSVS No. 1 in chapter 2). I would have given you the USPAP, but I hate violating copyright laws.

## Federal Rules of Civil Procedure

This book is not a legal treatise, nor is it intended to address the Federal Rules of Civil Procedure (FRCP), but a valuation analyst must be familiar with the rules regarding reports because they affect expert testimony. The FRCP impose strict rules regarding the disclosure and timing requirements for expert opinions. FRCP 26(a)(2) (B) states that

Except as otherwise stipulated or directed by the court, this disclosure shall, with respect to a witness who is retained or specially employed to provide expert testimony in the case or whose duties as an employee of the party regularly involve giving expert testimony, be accompanied by a written report prepared and signed by the witness. The report shall contain a complete statement of all opinions to be expressed and the basis and reasons therefore; the data or other information considered by the witness in forming the opinions; any exhibits to be used as a summary of or support for the opinions; the qualifications of the witness, including a list of all publications authored by the witness within the preceding ten years; the compensation to be paid for the study and testimony; and a listing of any other cases in which the witness has testified as an expert at trial or by deposition within the preceding four years.

These rules are intended to eliminate the “trial by ambush” technique that certain states have allowed previously. Working with a New York law firm, we were once asked to render our opinion by telephone. The other side could have then deposed us, and unless they asked the correct questions, they might never have known what we did or what we relied on. Let’s face it, that type of law was counterproductive! Maybe with full disclosure, such a case would have settled.

## Using the Report as a Selling Tool

All of us who serve as expert witnesses know that we should be objective if we are to be credible. Those of us who belong to valuation organizations are ethically bound not to be advocates for our client. However, this does not mean that we cannot be advocates for our own opinions or conclusions. The accounting profession has rules on objectivity and integrity.

A business valuation report is the perfect forum for selling the valuation analyst’s conclusion of the value of the valuation subject.

Once the valuation analyst has performed all the required steps to reach a conclusion of value, the next step is to communicate it in such a way that the reader of the report will have no alternative but to realize that the conclusion is reasonable. The manner in which the valuation analyst writes and presents the report can help him or her convince the reader that he or she has reached a reasonable conclusion. I generally want my reports to tell a story. The beginning of my story includes a discussion of the theory of how to value a business or business interest. Keep in mind that the story will change depending on whether you are valuing a controlling interest or a minority interest. It may also change depending on the purpose and function of the assignment.

The middle of my story includes the application of the valuation theory, discussed in the beginning of my story, to the valuation subject. This is the guts of the valuation. It includes the analysis (financial, economic, and industry) and the valuation calculations. This section of the report is intended to show the reader how the theory applies to this valuation. After being presented with the approaches and methods in the beginning section, the reader now sees them with numbers.

The final section of the story is my conclusion, which ties together the first two sections of the report. Here is the theory; here is how it is applied; therefore, my conclusion must be reasonable because I followed the theory. This may seem pretty basic, but it has proven to be an effective tool in the courtroom, regardless of whether it was a bench trial or a jury trial.

The business valuation report should contain a thorough analysis that demonstrates how much the valuation analyst knows about the valuation subject, its industry, and the other items that will affect its value. Too often, reports have all the correct components, but each section is so skimpy that it fails to demonstrate that the valuation analyst did any more than the minimum amount of work in that assignment. For example, a common error is to include financial ratios in the report but fail to discuss what they mean.

The valuation report is the valuation analyst's opportunity to demonstrate his or her knowledge. If the valuation analyst includes items in the report, they should be explained well. The analyst should not be afraid to quote other sources. He or she should use recognized sources in the report to support his or her work. Quoting sources such as the government (the IRS, revenue rulings, the Bureau of Labor Statistics, and so on) makes the valuation analyst's work hard to dispute. Judges and juries show a great deal of respect for information taken from authoritative sources. Quoting other experts in the field also works. I like to include quotes from Pratt, Hitcher, Mercer, and others. Most of the attorneys who have been involved in business valuation litigation know of their works. The valuation analyst can even quote Trugman!

Another way to use the report as a selling tool is to emphasize a particular section, especially if it covers a subjective portion of the process (such as capitalization rates). For example, the valuation analyst can include extra wording in the report if the capitalization rate that he or she has selected is 75 percent. If the analyst had selected 15 percent to 20 percent, he or she would still have to justify the rate, but clearly not as much as if the rate is out of the range that people are used to seeing.

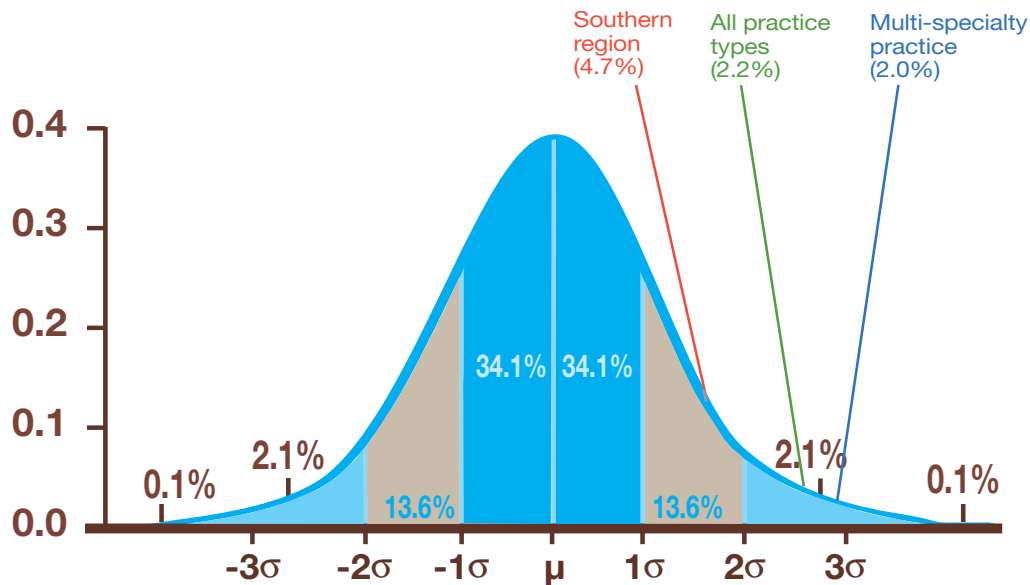

In one particular valuation, we included a discussion of the rates of return required by venture capital firms so that we could support a very high capitalization rate (78 percent). We quoted an article published in *Business Valuation Review* that addressed venture capital returns. The author of this article described different rates of return depending on which stage of the business life cycle the subject was in and we related this to the valuation subject. We showed that the valuation subject could not even qualify for venture capital financing, which supported our assessment of the riskiness of an investment in this company. By quoting another source, we strengthened our argument to the point that the judge found in our favor. Some of the supporting language from our report included the following:

Further support for these high capitalization rates comes from an examination of the venture capital market. "Professional venture capitalism requires a minimum of 40 to 50 percent rates of return on the small company 'superstars' of tomorrow," according to Bradley A. Fowler, Esq. in an article published in *Business Valuation Review*, June 1989. Rates have not changed materially, and as such, this article lends some excellent insight into required rates of return.

According to the article, venture capitalists who are financing seed or start-up companies were looking for 50 percent or more compound rates of return. Quoting a PWC article, the author states, "depending upon the perceived risk, the venture firm is going to want a rate of annual return of 40% to 80% or more. And they will also want the ability to liquidate their investment, usually within five years." Smith Company is clearly not a "superstar." With negative book value, a history of losses, little depth in management, and heavy short-term liabilities, a venture capitalist would not be interested in the company. This should warrant an exceptionally high required rate of return.

Although the article quoted was a bit older, the data was still valid. Sometimes, the valuation analyst must resort to using older articles because they may be the only ones that can be found. The important part of that task will be to convince the reader that the older article is still current.

Another selling tool is the use of graphs. The personal computer has given the valuation analyst a greater capability of demonstrating important points with the use of pictures. Bar charts, pie charts, and trend lines are great tools for driving a point home. A graph that we used in a report to explain statistics about the probability that one particular doctor that was in a medical practice would collect more than \$1 million in revenues in a single year is contained in figure 17.1.

**Figure 17.1 Probability of Collections Greater Than \$1 Million**

In this instance, we performed various analyses comparing the probability of collections for this doctor using a variety of the statistics published for the medical specialty. This graph highlighted the very small probability that it would happen.

Do you really need to say much more? We used this graph to make our point. The use of graphs is especially effective when the valuation analyst is called on to testify. Pointing the judge or jury to a picture in the report will be much more effective than expecting them to read a lengthy report. In fact, the jury never does, and more often than not, the judge does not either. Reports are generally not evidence in a trial. It is the expert's testimony that is the evidence (other than in the U.S. Tax Court, where the expert report is not only evidence, but it serves to be the direct examination of the expert).

The use of color printers not only dresses up the report, but it also highlights the story even better than black and white. A good network-compatible color printer now costs under \$500. The profit from the valuation analyst's next valuation report can buy one (or, it can pay the rent).

Another selling tool for valuation reports is the manner in which they are presented. At our firm, we like to bind our reports in our firm's report covers and include labeled dividers between the sections. We do not use pre-printed dividers because our reports tend to vary. Instead, we use plain dividers and print whatever needs to be on the divider. The appearance of a valuation report can also help sell the report. If it is cosmetically attractive, the reader will believe that a great deal of time went into the work product. We have found that many judges will not read the report but will comment on the fact that it appears to be a well-constructed document.

If the valuation analyst has prepared his or her business valuation report in a comprehensive manner, it will also help him or her prepare for trial. I will use my report to refresh my memory in preparation for testimony. I find that I put so much information in my report that I spend more time reading it than I do going over working paper files. At trial, I will use it as a refresher if I am asked a question that I do not remember the answer to. This is a time saver compared to sitting on the witness stand and going through files.

### Using the Other Side's Report to Help Sell the Conclusion

In a litigation assignment, wouldn't it be great if we were always lucky enough to get the other side's report before we had to do ours? Unfortunately, this does not happen often enough. However, when it does happen, the valuation analyst might as well take advantage of it. The other side's report can help the valuation analyst

structure his or her report to point out the flaws in the methodologies and conclusions of the other valuation analyst. Having the other side's report in advance frequently allows the valuation analyst to emphasize those areas that are known to be a point of contention in the litigation battle of the experts.

Before we go any further, let me make a few comments. First, if the valuation analyst is going to review another valuation analyst's report, he or she might need to be aware of the USPAP Standard 3, "Appraisal Review, Development and Reporting." For those analysts who must follow the USPAP, compliance with this standard is of the utmost importance. Next, many valuation analysts are frequently asked to review the work of others. That is not a problem, but the valuation analyst must be careful to not get caught providing a conclusion of value without performing the necessary steps to be in compliance with the appropriate standards. If the valuation analyst wants to reach a conclusion that says "If John Smith had done this differently, he would have reached \$XX,XXX as his conclusion of value," that is fine. However, the valuation analyst should not start to give his or her own conclusion of value unless he or she has complied with the developmental standards. That is a great way to get in trouble.

Sometimes, critiquing the other side's report before preparing our own points out the many problems that we need to address in our report. We will use whatever information we can to our advantage. The best way to illustrate this point is to use some real examples. An excerpt of a critique that our firm prepared in the past is contained in exhibit 17.1. I will explain how we addressed the problem if it is not evident from the critique itself.

First, I want to caution you that this exhibit is long. However, it should be read in its entirety because it not only reinforces many of the issues that I addressed when performing a business valuation assignment, (what to do and what not to do), but it also demonstrates that the attack on our report by the other valuation analyst allowed us to justify and explain why we did what we did. Again, notice how we are consistent with what I said earlier in this book.

### Exhibit 17.1 Critiquing the Opposing Expert's Report

It should be noted that all of our references to state statutes or case law is our interpretation after speaking with our client's legal counsel. We are not offering a legal opinion.

PAGES 2–4.<sup>1</sup> On page 2, The Smith Report begins by discussing the scope of the assignment and states the following:

Smith was engaged to determine a conclusion of value for DEF as of **December 31, 2015**, determine the **fair market value** of Mr. Brown's 17% ownership interest, and opine on the quality of present management of DEF based upon the analysis done in connection with the valuation. (Emphasis added)

There are several issues with the preceding quote. First, Smith uses the wrong valuation date to value DEF. We include an extensive discussion about fair value in our report on pages 1–8. In essence, the case law seems to indicate that the proper valuation date in a corporate dissolution action would be similar to that which is cited in 15 Pa.C.S. §1572. This statute states that the determination of value should be

The fair value of shares **immediately before the effectuation of the corporate action to which the dissenter objects**, taking into account all relevant factors, but excluding any appreciation or depreciation in anticipation of the corporate action. (Emphasis added)

In this instance, it is our understanding that the correct valuation date should have been August 31, 2015. In addition to valuing The Company as of the wrong date, Mr. Smith values DEF using a standard of value that is inconsistent with Pennsylvania case law. In the scope of the assignment, Mr. Smith states that he was engaged to determine the "fair market value of Mr. Brown's 17% ownership interest." Mr. Smith further elaborates on the standard of value used in the assignment on page 4 of his report which states the following:

<sup>1</sup> Page 3 of The Smith Report discusses a summary of the author's opinions. Instead of addressing each of these opinions on this page, we will address them in more detail within the body of the Smith report.

(continued)

### Exhibit 17.1 Critiquing the Opposing Expert's Report *(continued)*

Fair Value is a judicially determined standard of value. For purposes of this engagement, **I was asked to consider the Fair Value of 100% of DEF to be the Fair Market Value of the Company without valuation discounts attributable to marketability and lack of control.** Accordingly, the Fair Value of a minority interest can be determined by the proportionate interest in the entire Company without discount. However, Fair Market Value of a minority interest would consider applicable valuation discounts from the total company value as discussed within this report. (Emphasis added)

Mr. Smith states that he was advised by legal counsel to consider the fair value of DEF to be the fair market value of The Company without discounts for lack of marketability and control. At the bottom of page 4, The Smith Report quotes Revenue Ruling 59-60, a tax-related promulgation that relates to fair market value, not fair value.

In our report, we quoted Pennsylvania case law, which states the following:

While shareholder oppression cases in Pennsylvania are thin, and such decisions are vague regarding the meaning of 'fair value', the Superior Court, in *In re Glosser Bros, Inc.* 382 Pa. Super 177 (Pa. Super. 1989), a dissenters rights case, provide some guidance. [1] In holding 'fair value is to be construed as going concern value, as contrasted with liquidation value' the Superior Court 'noted that there is a potentially endless list of factors that are considered relevant to this value.' The 'going concern' concept of fair value in a dissenting shareholders' appraisal proceeding and the many individual factors. . . ' *Glosser Bros, 382 Pa. Super at 185 (citing Tri-Continental Corp. v. Battye, Del., 74. A.2d 71, 76 (Del. 1950))*. Such factors include the following:

The basic concept of value under the appraisal is that the stockholder is entitled to be paid for that which has been taken from him, viz., his proportionate interest in a going concern. By value of the stockholder's proportionate interest in the corporate enterprise is meant the true or intrinsic value of his stock which has been taken by the merger. In determining what figure represents this true or intrinsic value, the appraiser and the courts must take into consideration all factors and elements which might reasonably enter into the fixing of value. Thus, market value, asset value, dividends, earning prospects, the nature of the enterprise and any other facts which were known or which could be ascertained as of the date of the merger and which throw any light on future prospects of the merged corporation are not only pertinent to any inquiry as to the value of the dissenting stockholders' interest, but must be considered by the agency fixing the value. [Id. (quoting Battye, 74. A.2d at 72).]

The Pennsylvania Courts have followed Delaware case law, and as a result, the issue at hand is not the fair market value of Mr. Brown's shares but, rather, the fair value of what is being taken from him, which in this case, is his proportionate interest in DEF as a going concern.

By using the wrong valuation date and a standard of value that is inconsistent with Pennsylvania case law, the conclusions reached in The Smith Report are improper and should not be considered by the Trier of Fact.

*PAGE 7.* In discussing the economic and industry analysis, The Smith Report states the following:

The nature of documentation produced through discovery, the background, the history, and the economic and industry information related to DEF, although analyzed, will not be replicated in detail within this report.

The preceding quote indicates that Smith did not perform its own independent economic and industry analysis and, instead, relied on documentation that was "produced through discovery." However, The Smith Report does not specifically state which documents were analyzed that contained such economic and industry information. The only industry source referenced in The Smith Report is an IbisWorld report, which we will address shortly.

A thorough economic and industry analysis is one of the most important parts of a business valuation. According to *Valuing a Business*:

It is difficult to overemphasize the importance of thorough and relevant economic and industry research for a well-prepared business valuation. First, Revenue Ruling 59-60 requires consideration of 'the economic outlook in general and the condition and outlook of the specific industry in particular.' Second, an understanding of the economic and industry outlook is fundamental to developing reasonable expectations about the subject company's prospects.<sup>2</sup>

<sup>2</sup> Shannon Pratt with Alina V. Niculita, *Valuing a Business*, 5th Edition (The McGraw-Hill Companies: New York, New York, 2008): 104.

## Exhibit 17.1 Critiquing the Opposing Expert's Report

*Valuing a Business* goes on to state the following:

The economic and industry outlooks included in valuation reports should be clearly related to the company being valued. It is particularly important to point out how the outlooks will affect the subject company and to focus on those issues most relevant to a thorough understanding of the company's competitive position in its market. As a corollary to this issue, it is important to understand the subject company's relationship to the structure of the industry. Each segment of an industry or an economy may be affected differently by a particular trend or development. Therefore, it is important to focus on the logical impact of each relevant factor on the subject company, whether positive or negative. **Applying economic and industry research to the valuation of the subject company is too often neglected.** (Emphasis added)

By not including a discussion of the economic and industry outlooks and the impact that these outlooks will have on DEF, The Smith Report is omitting an essential piece in determining the value of The Company. Our report contained this important information on pages 26–40.

The Smith Report also provides an additional discussion on the engagement and states the following:

As required by applicable Standards, our valuation considers the same approaches to value used by Mr. Trugman. The financial source documentation and independently obtained publicly available information is also, if not the same, very similar. However, as describe within our report, our conclusion of value for DEF is considerably different than Mr. Trugman's conclusion. **To the extent we do not materially disagree with an underlying assumption or adjustment made by Mr. Trugman we tried to accept his presentation. Our report instead has focused on highlighting material points of difference in our evaluation of the underlying financial information.** As discussed herein our opinions differ in four primary areas - 1) anticipated/projected revenue; 2) consideration of publicly available multiples; 3) assessment of risk in developing our cost of capital; and 4) the failure to consider a prior transaction involving the company's stock (Mr. Roberts) which implied a value of \$60 million and upon which Mr. Trugman advised Mr. Roberts it was valued at \$81 million. Other items impacting value to a lesser extent include a variance in projected EBITDA margin. (Emphasis added).

The preceding quote appears to indicate that Mr. Smith did not perform an independent valuation of DEF but, rather, focused on areas of disagreement with our report and adjusted various items in our report to the benefit of his client. We will address the "four primary areas" of disagreement by Mr. Smith with our analysis later in this critique in the appropriate sections.

*PAGE 8.* The Smith Report discusses the financial analysis that was performed and states the following:

As shown on Exhibit A-1, the Company's operating results have been volatile over the previous five-year period (2011–2015) with sales decreasing from a high of \$134.7 million in 2011 to a low of \$96.3 million in 2013 and then increasing to \$127.3 million in 2015. Over the five-year period, revenue has declined by 5.5%. The five-year negative sales trend is mitigated by the positive trend in sales growth from 2013 to a represented stabilized level of \$127.3 million in 2015. Net income and EBITDA followed a similar trend peaking at \$19.5 million and \$21.6 million before falling to \$9.4 million and \$10.2 million in 2013 and 2014. In 2015, net income was \$14.1 million and EBITDA was \$15.1 million. Overall, net income and EBITDA have declined by 16.4% and 30.1% respectively since 2011. EBITDA for 2010 and 2011 was 16% and 16.2% of sales respectively while stabilized EBITDA averaged 12.4% from 2013 through 2015.

First, it should be noted that The Smith Report includes financial information through December 31, 2015, which is well after the correct valuation date of August 31, 2015. Furthermore, The Smith Report highlights that DEF's revenues and earnings have been volatile over the five-year period but fails to discuss why that was the case. In 2013, one of DEF's production lines was shut down and The Company's financial performance suffered as a result. According to an email from Chris Harris to Frank Brown dated July 17, 2014

I agree. We did \$135mm and can do \$235mm and \$335mm. It isn't rocket science. Short term issues holding us back. This year we had shut lines down and were overstaffed. Lost two years in current project w prior "engineers" ....now we are rebuilding.

In 2014, DEF made capital expenditures of \$2.8 million, most of which related to a new assembly system. Therefore, because valuation is based on anticipated future results, the issue at hand is whether another downturn in financial performance was foreseeable as of the valuation date. In analyzing DEF's Board of Directors' meeting minutes, this did not appear to be the case. The Company budgeted positive revenue growth in 2014 and 2015, as discussed at The Company's Board of Directors' meeting on January 6, 2014. According to the meeting minutes,

(continued)

### Exhibit 17.1 Critiquing the Opposing Expert's Report *(continued)*

RESOLVED, that the [sic]Sales Budget would target \$117.5 million with a focus to award achieving a 10% growth rate in 2015. Registration programs would continue and improvement in on time delivery, quality, performance and net income as outlined above would be completed.

In 2014 and 2015, DEF's revenues increased by 9.5 percent and 20.7 percent, respectively. None of the documentation reviewed, nor The Company's recent financial performance, indicates that another significant downturn was foreseeable. In fact, DEF's own board expected good results.

The Smith Report continues with a discussion of the financial analysis of DEF and states the following:

Over the five-year period, sales, net income and EBITDA have averaged \$117.8 million, \$14.4 million and \$16.2 million, respectively. Given the volatility of the operating results and that normalized 2015 operating results were relatively close to the five-year average, we utilized the Company's 2015 adjusted financial metrics in our income and market approaches to value.

The Smith Report states that DEF's adjusted 2015 operating results were utilized to derive the indications of value under the income and market approaches. By relying on The Company's 2015 results, Smith completely ignores DEF's annual budgets, which are The Company's contemporaneous business records that are a better indication of The Company's expected operating results in the foreseeable future. As previously discussed, these budgets are approved at DEF's Board of Directors' meetings, and as a result, Chris Harris, himself, approves these budgets. Furthermore, in addition to the annual budgets prepared by The Company, Mr. Brown prepares three-year sales forecasts for The Company, which he updates regularly. Smith completely ignores these budgets and forecasts that are prepared internally by The Company during the normal course of business, and as a result, fails to account for The Company's anticipated growth. This causes a significant understatement in the value of DEF.

In the discussion about capital expenditures and depreciation, The Smith Report states the following:

Capital expenditures and depreciation have varied greatly over the five-year period, i.e. ranging from \$0.2 million to \$4.5 million and \$0.5 million to \$4.4 million, respectively with averages of \$1.7 million and \$1.6 million respectively. To normalize the expected average tax shield going forward in our capitalization of earnings, we relied on the five-year average of depreciation and then set forecasted capital expenditures equal to this amount.

Smith determines DEF's future capital expenditures by setting capital expenditures equal to The Company's five-year average depreciation expense. This is an incorrect manner in which to calculate capital expenditures because it completely ignores The Company's actual capital spending needs. The analyst needs to know the capital expenditures to estimate the economic depreciation and not the other way around. The appropriate manner in which to forecast capital expenditures and depreciation is to determine The Company's future capital spending needs and depreciate the future capital expenditures over the economic useful lives of the assets. According to *Financial Valuation: Applications and Models*:

In the normalization process, the depreciation should be adjusted to the level of anticipated capital expenditures; **capital expenditures should not be adjusted to depreciation**. The future depreciation will be generated by future-capital expenditures (Emphasis added).<sup>3</sup>

Furthermore, The Smith Report uses unadjusted depreciation figures to estimate future capital expenditures. DEF's economic depreciation expense has historically been overstated in certain years as The Company has taken advantage of provisions under the Tax Code that allow companies to write off assets as they are acquired. In 2011, DEF recognized bonus depreciation of over \$3 million related to such write-offs. By relying on these unadjusted depreciation figures, the estimated depreciation and capital expenditures in The Smith Report are inaccurate because these items do not reflect the economic useful lives of the assets.

*PAGES 9–10.* The Smith Report includes a discussion about DEF's historic distributions and states the following:

As shown above, any net income of the Company not distributed to the shareholders was retained in the Company to finance an increasing level of accounts receivable and inventory and further, to effectively manage the debt level of the Company.

<sup>3</sup> James R. Hitchner, CPA/ABV/CFF, ASA, *Financial Valuation: Applications and Models*, 3rd ed. (Hoboken, New Jersey, John Wiley & Sons, 2011): 1243.

## Exhibit 17.1 Critiquing the Opposing Expert's Report

Smith states that one of the reasons that DEF has cut its distributions to its shareholders is “to effectively manage the debt level of The Company.” However, later in his report, Mr. Smith determines that the optimal capital structure of DEF is a capital structure that consists of 75 percent equity and 25 percent debt. Based on the business enterprise value of \$77,885,416 in the Smith Report and DEF’s debt balance as of December 31, 2015, the implied capital structure of the business is 93 percent equity and 7 percent debt.

Therefore, based on Mr. Smith’s own calculations, DEF is operating at a sub-optimal level, with not enough debt in its capital structure. Although there are numerous disadvantages to financing operations with a lot of debt, financial theory states that the correct amount of debt in a company’s capital structure can decrease a company’s cost of capital for the benefit of shareholders. With that in mind, some of the cash could have been distributed to shareholders, as opposed to paying down debt to sub-optimal levels. This would have been a benefit to all shareholders. Although this is not intended to second-guess management’s willingness to make these distributions, it further shows that The Smith Report contains an incorrect analysis about the use of the cash.

Another factor that Mr. Smith fails to consider is DEF’s historic policy of maintaining a shareholders’ equity balance of \$14 million and distributing anything in excess of that amount. At December 31, 2015, DEF’s book value was \$33.1 million, which is a much greater amount of book value than The Company has maintained in the years we analyzed. The Smith Report contains no discussion of why the prior policy of distributions was discontinued. Based on his own analysis, the funds were not needed for capital expenditures.

*PAGE 12.* After a discussion of DEF’s financial condition, The Smith Report concludes its financial analysis of The Company with the following statement:

Based on these metrics and financial observations when the Company is compared to other companies in the industry, it is my opinion that DEF’s financial results demonstrate a well-managed company.

After highlighting the historic revenues and earnings volatility of DEF, The Smith Report states DEF’ financial results demonstrate a well-managed company. This seems to be a self-serving statement that contradicts The Smith Report. Furthermore, The Smith Report fails to discuss how The Company’s favorable financial results were factored into its calculation of the discount rate used in its calculation of value. If The Company is so well-managed, why does The Smith Report use a higher discount rate than we used in our report? After all, the discount rate is based on risk. Clearly, The Smith Report includes a greater risk for DEF than we determined, despite being a well-managed company. It appears that Smith is only considering The Company’s favorable financial performance in instances in which it suits its client’s best interest.

*PAGE 14.* In the discussion of the application of the income approach, The Smith Report states the following:

Reliable projections of DEF’s sales, net income, EBITDA and/or cash flow were not available. As a result, a discounted cash flow method could not be developed. As mentioned above and expanded upon in the 2010 Business Plan section of this report, there are no recent sales forecast or projections completed by the Company. There was a business plan prepared by the Company six years ago in 2010. The budgeted results from that plan have not been modified or updated since 2010. Actual operating performance of the Company has also not been consistent with the 2010 Business Plan.

The preceding quote is full of incorrect statements. Either Mr. Smith did not ask his client for the information or he chose to ignore it. DEF prepares internal sales budgets and forecasts and updates these figures regularly. Therefore, DEF had reliable projections that Mr. Smith could have utilized in its analysis. In addition, even if a company does not prepare forecasts or projections internally, it does not mean that an analyst should completely disregard the discounted future benefits method. There is nothing that prevented Mr. Smith from analyzing DEF’S historic growth trends, profitability, and financial ratios, as well as prevailing economic and industry conditions, and use these metrics to prepare a reasonable forecast. Mr. Smith’s client is The Company, and although they would not allow us to perform a site visit or management interview, Mr. Smith clearly had access to The Company’s management. Therefore, there is no reason why a forecast could not have been prepared. According to PPC’s *Guide to Business Valuations*:

In many cases, the valuation consultant may be able to obtain a forecast of future operations from the company being valued. This is the preferred procedure and should be encouraged whenever feasible. In some cases, however, **the consultant may prepare the forecast**. The consultant must consider numerous factors in preparing or reviewing a forecast. A complete discussion of every one would require numerous pages and is beyond the purpose and intent of this Guide.<sup>4</sup> (Emphasis added).

(continued)

### Exhibit 17.1 Critiquing the Opposing Expert's Report *(continued)*

As the quote indicates, if Mr. Smith felt that DEF'S internally prepared budgets and forecasts were unreliable for whatever reason, this is not an excuse to not attempt to prepare a forecast themselves. In this instance, DEF was on a growth curve and had not reached a stabilized level of operations. In 2015, The Company's revenues and net income increased by 20.6 percent and 16.5 percent, respectively. When a company is on such a growth curve, the capitalization of benefits method that is utilized in The Smith Report is an incorrect methodology to use. Furthermore, in its financial analysis of DEF, Mr. Smith highlights how DEF'S historic revenues and earnings were volatile. If that's the case, how can Mr. Smith be so sure that 2015 represents a stabilized year of operations? According to *Valuing a Business*:

The important conceptual underpinning of the capitalized economic income valuation model is that there is either a constant annual income stream in perpetuity or a constant annualized rate of growth (or decline) in the economic income variable being capitalized in perpetuity. Obviously, this constant growth rate projection is rarely met in the real world.

**Unlike the discounted economic income model, the capitalization model does not take into consideration the timing of future changes in expected economic income.** The greater the differences in the anticipated changes over time, especially in the early years, the more the analyst is encouraged to apply the discounted economic income method rather than the capitalized income method.

This leads to some generalizations about the relative attractiveness of the two basic income approach valuation methods:

1. Stable or evenly growing economic income flow. If the economic income flow is either stable or growing (or declining) at a fairly even rate, the capitalized economic income method should conclude as accurate a value indication as the discounted economic income method.
2. Predictable but uneven changes. If there are reasons to believe that changes will be significant but predictable, even though uneven, the discounted economic income model should produce a more accurate valuation.
3. Short- or intermediate-term supergrowth. If growth is expected to be quite high in the immediate future, the discounted economic income model should produce a more accurate valuation. One of the most common mistakes in the application of this method is to use a 10 percent growth for the first few years (even though it may not be sustainable over the long term) and then subtract that 10 percent from the present value discount rate. This mistake will result in a low capitalization rate and in an overvaluation of the subject company.
4. Changes that are erratic and unpredictable as to timing. If the company's economic income is unstable and also more or less random as to timing, the company's risk increases, and thus the present value discount rate increases. However, the discounted economic income method may not be able to produce any more accurate a value indication than the direct capitalization method.<sup>5</sup> (Emphasis added).

The preceding quote further demonstrates that a discounted cash flow method is the more appropriate method to utilize with respect to DEF. DEF'S historic revenues and earnings were not growing at a stabilized rate, The Company is achieving significant revenue and earnings growth, and their internally prepared budgets and forecasts indicate that this growth is expected to continue in the foreseeable future.

Included in table 19 of our valuation report was a comparison of DEF's actual results versus The Company's budgeted results in each of the past five years. With the exception of 2013, a year in which The Company had issues with an assembly line, The Company's actual results have come within a reasonable range of its budgeted results. Therefore, there is no reason why The Company's budgets and forecasts should be completely ignored by Mr. Smith. By ignoring The Company's own growth expectations, Mr. Smith is significantly undervaluing The Company.

*PAGE 15.* The Smith Report discusses the normalization adjustments that were made in order to determine DEF's adjusted earnings before interest, taxes, depreciation, and amortization (EBITDA) and states the following:

EBITDA was \$15,084,163 in 2015. Certain normalization adjustments for legal and consulting, charitable contributions, and relocation and recruiting costs, were identified in Mr. Trugman's report for which **we were unable to review detailed support**. However, based on the description of the expenditure it is not an unreasonable adjustment and we have made the same adjustment to EBITDA. As discussed later in this report, no adjustment was made for compensation. As shown on Exhibit A-1 the adjusted EBITDA for 2015 is \$16,112,106 after the add-back of legal and consulting fees of \$215,781, charitable contributions of \$311,000 and relocation and recruiting costs of \$501,162. This is our best estimate of DEF's EBITDA capacity as of the December 31, 2015. (Emphasis added).

<sup>5</sup> *Valuing a Business*, 244–245.

### Exhibit 17.1 Critiquing the Opposing Expert's Report

Mr. Smith states that he was unable to review support for the normalization adjustments that were made in our report. I do not understand how this statement can be made. Considering that Mr. Smith's client is The Company, there is no reason why the details about these various adjustments could not have been obtained from their client. This is another instance in which Mr. Smith did not perform a thorough enough financial analysis of The Company, as many of these nonrecurring expenses were clearly presented in DEF's internally prepared financial reports.

Furthermore, Mr. Smith omits other normalization adjustments that should have been made. First, DEF has continued to pay a significant salary to Jerry Harris, even though he has not been working with The Company on a full-time basis. This was confirmed in the depositions of Christopher Harris, Frank Brown, and Robert Roberts. According to Christopher Harris's deposition testimony,

Q: Okay. Now, as of this time, Jerry had a stroke and he's not—he's not coming in to work or is he—is he still checking his company email?

A: He is checking it, and he did come in in 2015 a couple times, but, yeah, he's not in as frequently as—he's not in frequently. Let me put it that way. And, yes, he's periodically checking email.<sup>6</sup>

Christopher Harris's testimony indicates that Jerry Harris has not been coming to the office as frequently since he had his stroke. Jerry Harris's role with The Company was also a topic that was discussed at Robert Roberts's deposition. The transcript reads as follows:

Q: You're aware that after he became executive chairman, and even after he suffered his stroke, the company continued to pay Jerry Harris a salary?

A: To my knowledge, yes.

Q: Do you feel that that was earned salary?

A: I don't believe so.

Q: Why not?

A: Well, again, Chris was brought in as the chairman of the company, and in a position where Jerry was kind of the overseer and asking questions and so forth and so on. I don't think the full level of salary—he should have been paid more as a consultant or more as a time on application or something like that rather than the full salary, full remuneration, and, oh, by the way, full distributions.<sup>7</sup>

According to Frank Brown, Jerry Harris's role has been limited to attending board meetings. Frank Brown's testified as follows:

Q: All right, I'll make it simple. Do you know what Jerry is doing for DEF and has been doing over the last year?

A: Just the last year?

Q: Well, let's say since Chris became president, what do you know about Jerry's role?

A: It has been very limited at the board meetings to the point that almost can't talk, that had to be prodded. So that would be my exposure, so it would be very difficult.

Q: And that's because he suffered a health issue, a stroke; correct?

A: That's the believing, yes.<sup>8</sup>

Clearly, the deposition testimony from all three individuals indicates that Jerry Harris' role with The Company has been limited, and he no longer provides the role of a full-time Chief Executive Officer ("CEO"). Therefore, his salary should have been added back or at a minimum, replaced with a board of director fee and/or consultant expense at a much lesser cost.

Another normalization adjustment that was omitted by Smith was depreciation expense. As previously discussed, the depreciation expense reflected in DEF's financial statements does not reflect an economic write-off of the assets because The Company periodically writes off assets as they are purchased. By omitting these various adjustments, Mr. Smith, once again, undervalues The Company.

<sup>8</sup> Deposition Transcript of Frank Brown, March 24, 2016, Page 20, Lines 1–13.

(continued)

### Exhibit 17.1 Critiquing the Opposing Expert's Report *(continued)*

PAGES 16–17. The Smith Report discusses the derivation of the cost of equity that is utilized to calculate DEF's weighted average cost of capital (WACC). The biggest difference between the discount rate used in The Smith Report and the discount rate used in our report has to do with the quantification of industry risk. In our valuation, we accounted for industry risk through use of a beta, based on the guideline public companies that we relied on in our market approach. The beta is a measure of systematic risk that relates to the guideline public companies that we used in our analysis of the market approach. Because these companies were deemed similar to DEF, for purpose of our analysis, the same industry risk for DEF would be best represented by using the beta of these guideline companies. Mr. Smith, however, used an industry risk premium to quantify industry risk, and on page 17, The Smith Report reads as follows:

Different industries tend to have different levels of systematic risk. Duff & Phelps addresses this issue by developing an industry premium methodology. The methodology relies on a full information beta estimation process. Utilizing this methodology, Duff & Phelps estimates industry premia for multiple industries and reports them by SIC code. We utilized SIC code 7372 [sic] (Printed Circuit Boards) to determine the industry adjustment applicable to the Company's operations. Duff & Phelps data indicates an industry premium of 4.08%.

Mr. Smith accounts for industry risk by using an industry risk premium of 4.08 percent for SIC code 3672: Printed Circuit Boards. This industry risk premium is calculated annually in Duff & Phelps' *Valuation Handbook*. There are several problems with utilizing an industry risk premium in this instance.

First, Mr. Smith uses a guideline public company method to value DEF. If that is the case, why doesn't Mr. Smith utilize these guideline companies to estimate DEF's cost of equity, rather than the 18 companies that were selected by Duff & Phelps? The Duff & Phelps data includes many companies that are not comparable to DEF. Mr. Smith believes that the valuation multiples for their guideline companies were comparable enough to derive indications of value under a market approach for DEF, but for some reason, does not believe that these companies can be utilized to calculate the cost of equity for The Company. The industry risk premium for SIC Code 3672 that is included in the Duff & Phelps publication contains data for 18 companies, most of which are not comparable to DEF. A summary of the 18 companies that comprise the 4.08 percent industry risk premium that Mr. Smith relied on is presented in table 1.

Company Name	Guideline Company Selected by Smith?
API Technologies Corp.	No
Benchmark Electronics, Inc.	Yes
Cirtran Corp.	No
Compass Diversified Holdings	No
Elecsys Corp.	No
IEC Electronics Corp.	Yes
Jabil Circuit, Inc.	Yes
LSI Industries, Inc.	No
Methode Electronics, Inc.	No
Multi-Fineline Electronics, Inc.	No

*(Table continued)*

### Exhibit 17.1 Critiquing the Opposing Expert's Report

**TABLE 1** (continued)

Company Name	Guideline Company Selected by Smith?
Park Electrochemical Corp.	No
Plexus Corp.	Yes
Probe Manufacturing, Inc.	No
Sanmina Corp.	No
Sigmatron International, Inc.	Yes
SMTC Corp.	No
TTM Technologies, Inc.	No
Viasystems Group, Inc.	No

As indicated in the data in table 1, Mr. Smith selected only 5 of the 18 companies tracked by Duff & Phelps as guideline companies that were comparable to DEF. Two of the companies included in the preceding table, Cirtran and Probe, were penny stocks, and the stock prices of these companies as of December 31, 2015 were \$0.01 and \$0.10 per share, respectively. Furthermore, 6 of the 18 companies incurred net losses during the 12-month period ended December 31, 2015. If DEF is such a financially healthy and well-managed company, why are unprofitable companies being used as a benchmark to quantify the risk of an investment in DEF?

Another issue with Mr. Smith's industry risk premium is that Mr. Smith is basing this industry risk premium on data that is a year old. The valuation date used in The Smith Report is December 31, 2015. However, the Duff & Phelps data that Mr. Smith is relying on only runs through December 31, 2014, and, as a result, Mr. Smith is ignoring an entire year of industry data. The stock price information for the public companies that are utilized to calculate the industry risk premium would have been known or knowable as of December 31, 2015, if this was the correct valuation date. If Mr. Smith had used information through its valuation date of December 31, 2015, the results would have been materially different. According to Duff & Phelps' *2016 Valuation Handbook*, with data through December 31, 2015, the industry risk premium for SIC code 3672 was only 1.03 percent, which is substantially lower than the 4.08 percent utilized by Mr. Smith. If Smith had utilized the correct industry risk premium, the WACC would have been as follows:

Risk-Free Rate	2.67%		
Equity Risk Premium	6.21%		
Industry Risk Premium	1.03%		
Small Stock Premium	5.78%		
Additional Risk Premium	1.00%		
Total Cost of Equity	16.69%		
	<b>Rate of Return</b>	<b>Weight</b>	<b>WACC</b>
Cost of Equity	16.69%	75%	12.5%
Cost of Debt	3.80%	25%	1.0%
<b>WACC</b>			<b>13.5%</b>

(continued)

**Exhibit 17.1 Critiquing the Opposing Expert's Report** *(continued)*

As indicated previously, Mr. Smith's WACC would have been 13.50 percent, as opposed to 15.80 percent. This is in line with the WACC calculated in our report of 13.30 percent. Using a higher WACC results in an understatement of value. In fact, the primary reason why the WACC differs in our report versus The Smith Report is because Mr. Smith uses an incorrect and outdated industry risk premium. This further substantiates our discount rate.

Another factor that needs to be considered is whether the capital structure of the 18 companies used in Duff & Phelps' industry risk premium is consistent with the capital structure utilized by Mr. Smith. The industry risk premium is based on what is known as a "full-information beta" and, as a result, reflects the capital structure of the companies that were used in the composite. Therefore, this beta needs to be unlevered using the capital structures of the companies in the composite and re-levered using DEF's capital structure. No such analysis was discussed in The Smith Report and, as a result, this further makes the industry risk premium less relevant to DEF.

With respect to the company-specific risk premium, The Smith Report states the following:

We then applied an additional (company specific) risk premium to the cost of equity. Given factors such as the Company's reliance on a high customer concentration, contract specific non-recurring work and supplier concentration, we have determined that an additional risk premium of 1.0% is warranted to best reflect the inherent risks associated with operations.

Mr. Smith applies a company-specific risk premium of 1 percent based on customer concentration, nonrecurring contract work, and supplier concentration. There are several issues with the derivation of the company-specific risk premium. Although DEF's revenues are largely concentrated with few customers, many of the guideline public companies that Mr. Smith relies on have similar risks. In our report, we provided detailed descriptions of the guideline public companies that we utilized, and customer concentration risk was a common risk factor among all of them. Therefore, some of this risk has already been captured in the industry risk premium. Furthermore, although Raytheon accounts for a significant portion of DEF's revenues, The Company sells to various independent divisions of Raytheon, each of which has its own programs. This somewhat mitigates the level of customer concentration risk.

Another factor that Mr. Smith discusses is supplier concentration. This should not be considered as a risk factor because DEF is a contract manufacturer and, as a result, The Company has to purchase materials from vendors that are specified by its customers. Mr. Smith also considers contract-specific nonrecurring work as a risk factor related to DEF. However, this risk factor is applicable to all contract manufacturers. If Mr. Smith used guideline public companies that were also contract manufacturers, this is another risk factor that is being double-counted.

In the derivation of the company-specific risk premium, Mr. Smith does not list any positive factors related to DEF that may mitigate the company-specific risk premium. Mr. Smith notes that DEF is a well-managed company based on its financial performance but does not indicate how that factor was considered in its risk analysis. All factors considered, it appears that Mr. Smith overstates the company-specific risk premium attributable to The Company.

*PAGE 18.* The Smith Report continues with the derivation of the WACC by discussing the cost of debt:

To estimate the cost of debt, we examined information on commercial borrowing rates. Based on this data, we estimated the pre-tax cost of debt at 5.5%, which assuming a 31.1% tax rate, results in an after-tax cost of debt of 3.8%.

Mr. Smith estimates the cost of debt at 5.5 percent. This is in spite of the fact that the interest rate on DEF's line of credit is equal to the London-Interbank Offered Rate (LIBOR) plus 167 basis points. In our analysis, we determined that The Company's average borrowing rate was only 1.37 percent. Because the standard of value in this engagement is fair value, the issue is what Mr. Brown is giving up, which, in this case, is an interest in a financially healthy company that is able to borrow at low rates. By using a significantly higher borrowing rate, Mr. Smith is further overstating the WACC and undervaluing the fair value of Frank Brown's interest in The Company.

The impact of the errors in Mr. Smith's calculation of the WACC is substantial. If everything else is held the same and if we simply adjust the industry risk premium and the cost of debt, Mr. Smith's WACC decreases from 16.0 percent to 12.8 percent. Based on this lower WACC, the indication of value under the income approach would increase from \$65,156,648 to \$88,277,325, a difference of 35.5 percent. If we also add back Jerry Harris' salary, the value derived by Mr. Smith would further increase to \$93,488,516. These adjustments do not consider Mr. Smith's mistake of completely ignoring DEF's internally prepared budgets and forecasts.

## Exhibit 17.1 Critiquing the Opposing Expert's Report

PAGE 19. After the discussion about the derivation of the WACC, The Smith Report discusses DEF's buyout of Robert Roberts as follows:

Chris Harris had originally offered Mr. Roberts \$11.0 million in September 2014. Mr. Roberts expressed concern that \$9.8 million of the \$11.0 million was made up of unsecured future payments. Further, Mr. Roberts testified that his valuation of the Company was \$81 million and .... 'Because I'd gone through all these numbers and I had a valuation. This was my valuation of \$81 million, but I had an expert (Mr. Trugman) come back with \$81 million also. So I had the value of the company, and I was taking the position, willing to talk about dilution and so forth to come down to 13 and a half million dollars.'

Mr. Smith utilizes Mr. Roberts' buy-out price as an indication of value. The problem with utilizing this value is that Mr. Roberts agreed to a settlement with The Company in an attempt to settle a litigation. Settling litigation frequently considers the ongoing time and energy, as well as the cost and risks of litigation; therefore, litigation settlements are not an indication of a true negotiated value. In fact, Mr. Roberts' value was based on a valuation done almost a year earlier. As a result, this transaction was not considered to be indicative of a sale between an unmotivated buyer and seller. According to Mr. Roberts' deposition,

Q: About right. Okay. So just to conclude this discussion of value, in November you thought the value really should have been 81 million. Ultimately you agreed to a value—a valuation of 60—

A: I agreed to a value differently than that because the pressures that I was feeling and—and basically I settled for something that I didn't think was equitable and I didn't think was fair, but I just wanted to get the thing over with.

Q: But you agreed to it?

A: I did, but I didn't—

Q: Right.

A: I feel I agreed to it under duress.<sup>9</sup>

Mr. Roberts testified that he settled for a value that he did not feel was equitable and agreed to a value under duress. Not only does this transaction not meet the definition of *fair market value*, but it is inconsistent with the case law that we reviewed that states that a shareholder should be entitled to be paid the fair value of what has been taken away from him. As previously discussed, Mr. Smith was advised by legal counsel to define *fair value* as fair market value without discounts. The definition of *fair market value* assumes that a transaction takes place between a willing buyer and a willing seller with neither party being compelled to buy or sell. Mr. Roberts' testimony indicates that this was not the case with the buyout of his interest.

Aside from the transaction not being consistent with the appropriate standard of value, it should also be noted that the transaction was based on the value of The Company as of August 31, 2014. Since that date, DEF has experienced significant growth and improved profitability. A comparison of select financial metrics for DEF for the latest 12 months ended August 31, 2014 and 2015 is summarized in table 2.

**TABLE 2**

	LTM 8/31/2014	LTM 8/31/2015	% Change
Revenues	\$97,222,530	\$126,201,145	29.8%
Net Income	9,792,851	13,686,911	39.8%
Gross Fixed Assets	21,729,438	24,847,174	14.3%
Total Assets	39,537,389	48,601,430	22.9%
Total Debt	8,060,325	6,729,506	-16.5%

### Exhibit 17.1 Critiquing the Opposing Expert's Report *(continued)*

As indicated in table 2, since the valuation date of Mr. Roberts' shares, DEF has experienced double-digit growth in revenues, earnings, and assets. In addition, The Company paid off approximately \$1.3 million in debt over that one-year period. In 2014, The Company made significant capital expenditures related to a new assembly line, and the impact of these expenditures was not included in the figures for the latest 12-month period ended August 31, 2014. With increasing revenues, profits, and assets, and less debt, it makes sense that The Company has become more valuable since the buyout of Mr. Roberts. Not considering the changes in the business from August 31, 2014 to August 31, 2015 causes Mr. Smith to further understate the value of Mr. Brown's shares.

*PAGE 20.* The Smith Report begins with a discussion of the market approach. Mr. Smith performs the guideline public company method under the market approach but does not discuss why a merger and acquisition transaction method was not performed. If Mr. Smith had done a proper industry analysis, it would have found that a considerable amount of acquisition activity was taking place within this industry, and many of the guideline companies that Mr. Smith utilized made several acquisitions in the years leading up to the valuation date.

On page 90 of our report, we summarized seven transactions from which we were able to obtain enough financial information in order to calculate multiples. The Smith Report states that its analysis was performed in accordance with Statement on Standards for Valuation Services (SSVS) No. 1, as promulgated by the AICPA. SSVS No. 1 requires valuation analysts to consider all relevant approaches and methodologies in performing business valuations. In this instance, given the amount of acquisition activity that was taking place in this industry and the number of acquisitions that were made by the public companies that Mr. Smith deemed comparable to DEF, a merger and acquisition method should have been performed.

With respect to the guideline public company method, The Smith Report states the following:

A search for guideline companies was made utilizing Capital IQ's Quick Comps. This search revealed eleven companies in this industry. We then removed two companies and added Sparton Corp. Of the two excluded companies, one is private and the other has operations that are too dissimilar from DEF.

Footnote 10 of The Smith Report states "Sparton Corp. was utilized in Mr. Trugman's analysis." Considering that Sparton is the most comparable company to DEF in terms of size and operations, it does not make much sense that this company would not appear in Mr. Smith's search results. The guideline companies that were selected by Mr. Smith appear in exhibit F of The Smith Report and are listed as follows:

- Jabil Circuit, Inc.
- Celestica, Inc.
- IEC Electronics Corp.
- Plexus Corp.
- Kimball Electronics, Inc.
- Benchmark Electronics, Inc.
- TTM Technologies, Inc.
- Sparton Corp.
- SigmaTron International, Inc.

Three of the guideline companies that Mr. Smith utilized were also used as guideline companies in our report. We had eliminated the other six companies for reasons summarized in the following:

Jabil Circuit Inc.

- Revenues are 146 times those of DEF.
- Market capitalization over \$4.5 billion.

Celestica Inc.

- Revenues are 44 times those of DEF.
- Market capitalization over \$1.5 billion.
- Located in Canada.

IEC Electronics Corp.

- Negative pretax income

Plexus Corp.

- Revenues are 21 times those of DEF.
- Market capitalization over \$1.2 billion.

Kimball Electronics, Inc.

- Initial public offering (IPO) date was October 31, 2014. Company was traded for less than one year prior to the valuation date of August 31, 2015.

## Exhibit 17.1 Critiquing the Opposing Expert's Report

Benchmark Electronics, Inc.

- Revenues are 21 times those of DEF.
- Market capitalization over \$1 billion.

As indicated previously, Mr. Smith utilized companies that were either significantly larger than DEF, had recently gone through an IPO, or had negative earnings. The multiples of these companies would have to be adjusted by such a significant margin based on size alone to make them comparable to DEF. No such size adjustments were discussed in The Smith Report, nor was there any discussion on how these significant size differences were accounted for. Although size alone is not a reason to eliminate a company, there comes a point in which a company is so much larger than the subject that a comparison becomes unreasonable. According to PPC's *Guide to Business Valuations*

The consultant should not reject a guideline company, however, merely because it is larger than the company being valued. The exception would be if the guideline companies are much larger than the subject company. For example, a guideline company that is five times larger (in revenues) than the subject company may still be a useful guideline company with the appropriate adjustments for size. However, it is doubtful that a guideline company that is fifty times larger would be useful and supportable.

In this instance, Mr. Smith is utilizing guideline companies that are 21–146 times the size of DEF in terms of revenues. Without making the proper adjustments to account for these differences, the multiples derived from these much larger companies have little relevance to DEF. Using the unadjusted multiple assumes that the market would price a company such as Jabil, which generated \$18.6 billion in revenues, in the same manner as DEF, which is a closely held company that generated approximately \$127 million in 2015.

*PAGE 21.* In the discussion about the comparative financial analysis that was performed between DEF and the guideline companies, The Smith Report states the following:

Relevant financial ratios for the comparable companies were calculated compared to those of DEF. After this comparative data was compiled, it was reduced to value indicators. As shown on Exhibit F, DEF generally ranks anywhere from the middle to the bottom of the comparable companies in regards to size and five-year annual compounded growth, and are also one of the least leveraged. DEF ranks at, or near, the top of their peer group in profit margins and liquidity ratios.

Mr. Smith states that DEF ranks anywhere from the middle to the bottom in terms of five-year compounded annual growth. However, Smith makes no note of DEF's future growth prospects in comparison to those of the guideline companies. Valuation is a forward-looking process, and as an investor in DEF, or in any company, the investor would mostly be concerned with The Company's future growth prospects, as opposed to what happened historically. Historical performance cannot be ignored, but future prospects are what gives a company value. Smith also states that DEF ranks at or near the top in terms of profit margins and liquidity ratios and is the least leveraged. Despite DEF's outperforming the guideline companies in these categories, Smith proceeds to value The Company using a median multiple. If The Company is a strong performer, a multiple in excess of the median should be considered.

The Smith Report goes on to state the following:

A comparison of various market multiples for the publicly-traded guideline companies is presented on Exhibit F and shows a wide variation in value multiples. For example, the trailing Enterprise Value (EV) to Revenue multiple ranges from a low of 0.23 to a high of 0.94, with a median of 0.33 while the trailing EV to EBITDA multiple ranges from a low of 3.9 to a high of 8.7 with a median of 5.6.

In applying relevant market multiples to the Company, the median multiples exhibited by the guideline companies provide the most reasonable comparisons to the Company.

- The guideline companies are more diversified with respect to business segments, product lines and geographic dispersion of customer base.
- The depth of DEF's management is somewhat less than that of the guideline companies.
- DEF has historically had higher profit margins than the comparable companies.

The Smith Report acknowledges that the multiples of the guideline public companies had very wide ranges. Instead of performing a proper analysis to determine the reason for these wide dispersions, Mr. Smith blindly selects a median multiple without making any adjustments for size, growth, leverage, profitability, turnover, and liquidity. With such wide dispersions, Mr. Smith should have questioned the reliability of using a statistical median. Taking this into consideration, we analyzed the multiples that were utilized by Mr. Smith. The results are presented in table 3.

(continued)

**Exhibit 17.1 Critiquing the Opposing Expert's Report** *(continued)*
**TABLE 3 Guideline Company Multiples**

	EV to EBITDA	EV to Revenues	EBITDA Margin
Jabil Circuit, Inc.	4.50	0.30	6.60%
Celestica, Inc.	6.40	0.24	3.80%
IEC Electronics Corp.	nm	0.50	3.50%
Plexus Corp.	6.40	0.40	6.30%
Kimball Electronics, Inc.	4.70	0.33	7.10%
Benchmark Electronics, Inc.	3.90	0.23	5.80%
TTM Technologies, Inc.	nm	0.94	12.90%
Sparton Corp.	8.70	0.81	9.30%
SigmaTron International, Inc.	5.60	0.23	4.10%
DEF			11.90%
Average	5.74	0.44	6.60%
Standard Deviation	1.62	0.26	2.29%
Coefficient of Variation	0.28	0.59	0.45
Median	5.57	0.33	6.30%

DEF had the second highest EBITDA margin of the entire peer group. However, despite having a favorable level of profitability in comparison to its peers, Mr. Smith selects multiples that are less than Celestica, IEC and SigmaTron, which are the least profitable companies in the group. Furthermore, Sparton is the most comparable company to DEF in terms of size, profitability, and operations. Sparton has the highest multiples in the entire peer group, so why should DEF's multiples deviate so much from its closest comparable? The R-squared statistic between the enterprise-value-to-revenue multiple and the EBITDA margin is 67 percent. This indicates that 67 percent of the variation in enterprise-value-to-revenue multiples can be explained statistically by the variation in profitability. This makes sense intuitively because a more profitable company should warrant a higher revenue multiple. Mr. Smith ignores this relationship and does nothing to adjust the enterprise-value-to-revenue multiple upwards for this profitability. If we were to utilize this statistical linear relationship to estimate the multiple for DEF, the implied multiple would be 0.82, which is right in line with Sparton.

These various issues demonstrate the deficiencies in Mr. Smith's analysis. It blindly relies on median multiples without performing a thorough analysis in the application of the market approach. The multiples selected by Mr. Smith make little sense, and this is the major reason why Mr. Smith was unable to reconcile the values derived under the market approach. The simple reliance on a median multiple is one of the common errors that is discussed in *Valuing a Business*, which states the following:

Unless the guideline and subject companies are extremely homogeneous in their financial characteristics, the mean or median of the guideline company pricing multiples may not be the most appropriate pricing multiples for the subject company. Yet analysts often use the mean or median guideline company pricing multiple with no explanation to justify the implied notion that the subject company's characteristics indicate that it should be valued right at the average of the guideline companies.

### Exhibit 17.1 Critiquing the Opposing Expert's Report

A section of this chapter was devoted to selecting the pricing multiple for the subject company relative to guideline company pricing multiples. Such analysis is little more than common sense, yet it is surprising how often it is ignored!<sup>10</sup>

At the bottom of Page 21, The Smith Report states the following:

Based upon the application of the market approach, the indicated value of the equity of DEF, as of December 31, 2015, is \$72,234,317 (Exhibit G)

The calculations in exhibit G show that Mr. Smith derived an enterprise value of \$42,102,245 when using an enterprise-value-to-revenue multiple and a value of \$89,812,239 using an enterprise-value-to-EBITDA multiple. These values are 113 percent apart. Instead of reconciling the differences, Mr. Smith weights the values by placing 75 percent of the weight on the enterprise value to EBITDA multiple and 25 percent of the weight on the enterprise value to revenue multiple. When indications of value under the same valuation approach are this wide apart, it is an indication that at least one of them is wrong. The role of the valuation analyst is to explain why the indications of value are so different and possibly eliminate the one in error, rather than merely applying unexplained weights to the indications. Overall, the market approach performed by Mr. Smith is fatally flawed, lacks reasoning, and derives indications of value that do not make sense and cannot be reconciled.

PAGES 22–25. The Smith Report begins its discussion on valuation discounts and states the following:

The method Mr. Trugman employed to value 100% of DEF reflects the value of the Company on a non-controlling, marketable basis. This is the same basis used in our analysis and also used as an estimate of Fair Value. Mr. Brown's interest being valued reflects a non-controlling, non-marketable interest in the Company. Non-controlling interests tend to be less valuable than controlling interests. Exhibit H presents a chart taken from *Guide to Business Valuations, 10th Edition*, and reflects the levels of value and illustrates the application of discounts depending on characteristic of ownership.

In order to calculate the fair market value of Mr. Brown's specific ownership interest, if necessary, we completed our analysis on a non-controlling basis and then applied discount for lack of marketability.

First, it should be noted that we did not value DEF on a non-controlling basis, as The Smith Report describes. Our value was derived on a control basis, which is consistent with the guidance from the Pennsylvania case law that we were provided with. Second, the preceding quote from The Smith Report is inconsistent with both fair value as described in the Pennsylvania case law and the definition of *fair value* that is cited in The Smith Report (fair market value without discounts).

As discussed previously, in *Glosser Bros, 382 Pa. Super at 185* (citing *Tri-Continental Corp. v. Battye, Del., 74 A.2d71, 76 (Del. 1950)*), The court stated that “the basic concept of value under the appraisal is that the stockholder is entitled to be paid for that which has been taken from him, viz, his proportionate interest in a going concern.” By definition, a “proportionate interest” is a pro rata share of the whole (control value) and excludes discounts. This is nothing more than another attempt by Mr. Smith to lower the value of Mr. Brown's interest in The Company.

It should also be noted that The Smith Report references the 10th edition of PPC's *Guide to Business Valuations*. Considering that this publication is now in its 26th edition, one has to question whether the author of The Smith Report is up to date with current business valuation topics and issues.

At the bottom of page 22, The Smith Report states the following:

In valuing privately-held companies, recognition must be given to the fact that the value of an ownership interest in a privately-held company is not equivalent to its underlying economic worth in the public market place because there is a lack of liquidity in the ownership interest, which detracts from its value to a potential investor. This lack of liquidity gives rise to a discount for lack of marketability. We considered restricted stock studies in our calculation of the appropriate marketability discount for an ownership interest in DEF.

In deriving the discount for lack of marketability, The Smith Report relies on restricted stock studies. We have already established that the application of a discount is inconsistent with the definition of *fair value* as discussed in Pennsylvania case law. Therefore, we do not believe any discounts should be applicable in this matter. However, even if The Court should decide that discounts in this matter are appropriate, there are still technical errors in the manner in which Mr. Smith selected a discount for lack of marketability for DEF.

<sup>10</sup> *Valuing a Business*, 305.

(continued)

**Exhibit 17.1 Critiquing the Opposing Expert's Report** *(continued)*

The restricted stock studies that Mr. Smith relies on are listed in exhibit I. The most recent study listed was the Trugman Valuation Associates, Inc. Study that covers the years 2007–2008. Mr. Smith ignores our most recent study with data through 2010, which had an average discount of only 15.9 percent, as well as the SRR Restricted Stock Study that covers the period September 2005 to May 2010 and had an average discount of only 9.3 percent. By excluding the more recent studies, The Smith Report is misleading because it does not reflect what has actually gone on in the marketplace for restricted securities since 2008. This is another example of The Smith Report relying on outdated valuation literature.

The Smith Report also contains no analysis that compares the financial performance of DEF to that of the companies included in the various restricted stock studies. The companies included in the various studies include start-ups, unprofitable companies, and companies that do not pay dividends. In fact, the median net profit margin for the 778 companies that issued restricted stock that are contained in the FMV Restricted Stock Study database (which is available on the Business Valuation Resources website) was negative 12.9 percent (indicating that the median company had a loss). Of the 778 companies, 258 (or 33 percent) had revenues under \$5 million. Seven hundred and four (over 90 percent) did not pay dividends, and 515 companies (66 percent) were not profitable. The average volatility for the companies in the sample was 88.6 percent and 193 of the companies had volatilities over 100 percent. Earlier in The Smith Report, Mr. Smith performed a financial analysis of DEF and concluded that DEF was a well-managed company. If this is the case, how can one justify comparing DEF to financially distressed companies such as these?

Another major flaw in The Smith Report is that all the restricted stock studies involve minority shares in the public companies. This means that these studies are only applicable to minority interests and not controlling interests. Therefore, the application of these discounts to DEF penalizes Mr. Brown even further for his lack of control in DEF. This is the very point that the case law tries to avoid.

On page 24, The Smith Report discusses the basis for the selection of the discount for lack of marketability and states the following:

There are several factors present in this matter that indicate a lower than average discount for lack of marketability could be appropriate for a non-controlling interest in DEF:

1. DEF has made significant historic distributions.
2. DEF generates operating income from which to make distributions.

There are also several factors present in this matter that indicate a higher than average discount for lack of marketability could be appropriate for a non-controlling interest in DEF:

1. DEF does not have a shareholder's agreement or readily available market place to sell its shares.
2. There are no plans for an IPO.
3. The length to liquidity is longer than the term of the restricted stocks.

Based upon the restricted stock studies on Exhibit I, the discount for lack of marketability for The Company would be in the middle of the indicated range. The Company has made distributions to its owners, which would tend to decrease the applicable marketability discount, but that is offset by the risk of adverse tax implications to the shareholder if distributions are not received. There is no shareholder's agreement which could make selling an ownership interest more difficult than if an agreement existed. The location of The Company may present additional challenges for potential buyers as it is approximately three hours away by automobile from the nearest major metropolitan area.

The Smith Report states that DEF has no readily available market place to sell its shares and The Company has a longer time to liquidity than the terms of the restricted stocks. However, what Mr. Smith does not consider is the acquisition activity that was taking place in the industry. For example, since 2012, Sparton Corporation has made 12 acquisitions. Several of the other guideline companies have made acquisitions in recent years, as well. Given the amount of acquisition activity that was taking place in this industry, DEF would be a potential acquisition target, which would make The Company more marketable, especially as the well-managed firm that Mr. Smith describes in its own report. In fact, it is our understanding that The Company has actually received offers to be acquired.

The Smith Report states that DEF's location presents additional challenges for potential buyers because it is located three hours away by automobile from the nearest major metropolitan area. It is unclear what relevance this has because DEF's largest customers, Raytheon and UTC Aerospace, are headquartered in Waltham, Massachusetts and Charlotte, North Carolina, respectively, and The Company has been doing business with these customers for a number of years. Furthermore, this contradicts statements in DEF's Business Continuity Plan for the years 2013, 2014, and 2015 which states the following:

Contract manufacturing is not 100% geographically or region dependent but it plays a higher degree of importance today as the large EMSI providers continue their push for regional and strategic placements of multiple facilities. However, DEF understands the targeted customer base embedded within the Northeast Corridor of the United States and continues to focus on the key industries within this sector.

## Exhibit 17.1 Critiquing the Opposing Expert's Report

As the preceding quote indicates, DEF targets key industries within the Northeast Corridor of the United States. Therefore, its location can actually be viewed as an advantage. The deposition transcripts indicate that management has considered selling DEF. Mr. Roberts testified as follows:

Based on some experience that I had had with past valuations and just kind of a normal practice. When we talked—when we talked specifically back in the time frame where I said Chris went to New York to sell the company, he lined up three firms and we had interaction and interface with these three firms to sell the company.<sup>11</sup>

According to Christopher Harris, he had no interest in selling The Company because he felt it had a bright future. His deposition transcript reads as follows:

Q: What if they don't agree to sell their shares—or strike that. If you don't agree to sell your shares and you won't agree to buy their shares, which choice do they have? There's no threat there, is there?

A: They did not present an option three, and they very clearly presented two options. They gave me an ultimatum. There's nothing else—no other word to call it, Greg. And in those two options, option A, soon after it came off the table. Because we talked about it and said, you know what, we kind of don't feel like selling this company. We like this company. We see a great future with this company.

Based on what was stated in DEF's Business Continuity Plan and the deposition testimony of company management, there is no indication that The Company's location would be a barrier to a potential sale. In fact, Sparton acquired Onyx EMS, LLC, which is headquartered in Watertown, South Dakota. There is no industry analysis or any support for the assumption that DEF's location negatively affects its potential to be acquired.

Despite the poor financial condition of the companies included in the various restricted stock studies, on page 25, The Smith Report states the following regarding the selection of the discount for lack of marketability:

Based on my analysis of the restricted stock studies discussed above and the characteristics specific to the interest owned, a 30% discount for lack of marketability is appropriate to reflect the specific attributes of an ownership interest in DEF. The 30% is consistent with both the median restricted stock study of 31.3% and the mean of 28.5% as reflected on Exhibit I.

The Smith Report blindly selects the median discount for lack of marketability of 30 percent, which is based on the various studies included in exhibit I, with many of the more recent studies being omitted.

The benchmark average approach to developing discounts for lack of marketability have been heavily scrutinized. The following is an excerpt from *A Companion Guide to the FMV Restricted Stock Study 2016 Edition*:

Exhibit 1, excerpted from Shannon Pratt's *Valuing a Business: The Analysis and Appraisal of Closely Held Companies*, shows the type of discounts arrived at over the years through various restricted stock studies.

Exhibit 1 is representative of the benchmark average approach in that, other than the average discount, there are no other characteristics from which a comparative analysis with the subject company can be performed. Recently, the benchmark average approach has come under stark criticism by the courts. In an appeal for more detailed data, the *McCormick* court stated, "Respondent relied on third party studies for her . . . base [discount]. We are unable to analyze the specifics of respondent's base." In other words, the courts are seeking "first-party studies" with sufficient data available underlying the discounts so that they may ensure valuers make appropriate comparisons.

This complaint was echoed in *Peracchio*, as the court dismissed the discount determined by the use of the benchmark average approach, stating, "[The valuation expert] simply lists the average discounts observed in several such studies, effectively asking us to accept on faith the premise that the approximate average of those results provides a 'reliable benchmark for the transferred interests.' And *Temple* picked up the complaints of the *Peracchio* court, stating, 'Rather than taking restricted stock sale data and explaining its relation to the gifted interests, [the taxpayer's expert] simply listed the studies and picked a discount based on the range of numbers in the studies.'

<sup>11</sup> Deposition Transcript of Robert Roberts, April 8, 2016, Page 195, Lines 13–19.

(continued)

**Exhibit 17.1 Critiquing the Opposing Expert's Report** *(continued)*

By simply selecting a benchmark median, The Smith Report is performing the exact same analysis that was rejected in the Tax Court cases discussed in the preceding quote. Furthermore, given DEF's favorable financial condition in comparison to these companies, one has to question the appropriateness of a median. In deriving its discount for lack of marketability, Mr. Smith fails to perform a proper analysis, fails to consider numerous important factors that affect the marketability of a company and, as a result, makes another adjustment that further reduces the value of The Company.

*PAGE 27.* The Smith Report begins its critique of our report with a discussion of the guideline public company method used in our valuation and states the following:

Mr. Trugman used a single forward revenue multiple in his report. Mr. Trugman opines that the forward multiples per Yahoo Finance were 0.68x for TTM Technologies, Inc. and 0.74x for Spartan Corporation. There was not a forecast to calculate a forward revenue multiple for Sigmatron International, Inc.; however, as of the Valuation Date, their trailing twelve months' revenue multiple was 0.25x. Mr. Trugman then concluded that Spartan Corporation was the most similar, but DEF should be valued at a higher multiple than Spartan Corporation so he applied a subjective 20.0% premium to Spartan Corporation's 0.74x forward revenue. The resulting revenue multiple selected was 0.88x.

Given that 0.88x is a forward multiple, it was applied to the forecasted revenue of DEF for the next twelve months.

Mr. Trugman appears to have not included the remaining four months of 2015 in the calculation as he applied the 0.88x multiple to his 2016 forecasted revenue figure of \$142,550,000. The resulting value of equity Mr. Trugman concludes on after accounting for the debt is \$120,100,000. (Footnotes omitted).

The statement in The Smith Report indicates that Mr. Smith misunderstood what the forward multiple represents. The forward multiple was based on the guideline company's revenue estimates for the next fiscal year, not the next 12 months. This is the manner in which the valuation profession calculates these multiples. Therefore, in order to appropriately match the multiple with the correct benefit stream, we utilized DEF's revenue estimate for the next fiscal year, not the next 12 months. Therefore, the calculation in our report is correct and we stand by it.

*PAGE 28.* The Smith Report critiques the guideline search and elimination process in our report as follows:

The guideline company method, while an appropriate method, as used by Mr. Trugman, appears to ignore, or in my opinion, not adequately consider, the other relevant data points within the publicly available information. The limitation of search results may suggest the exclusion of the method from consideration rather than the selective use of a data point to support his income approach. Additionally, the single data point (sales multiple) was further subjectively increased 20% which, by itself, added approximately \$24 million to the indication of value.

The Smith Report states that we did not adequately consider other relevant data points within the publicly available information. This statement is ironic considering that Mr. Smith did not locate Spartan Corporation through its own independent research but relied on our report to locate this company. Furthermore, Mr. Smith only utilized one database, whereas we utilized three. Therefore, this criticism is unsupported. The Smith Report offers no specific examples of what we did in our search for guideline companies that was not in full compliance with professional standards. The criticism is merely a "trust me" item, with absolutely no substance behind it. We indicate on page 69 of our report what our search criteria was and the results of the search.

The Smith Report also references the 20 percent premium as being subjective, even though the reasoning was fully explained in our report, and the adjustment was necessary to account for DEF's favorable financial condition. As previously discussed, the valuation treatises favor adjusting the guideline public company multiples to make them more applicable to the subject company, as opposed to blindly selecting a median. Unlike The Smith Report, we explained everything that we did and included our analysis in our report.

The Smith Report goes on to list several criticisms of our market approach. The first criticism is as follows:

Through his search criteria he eliminates all companies with market capitalizations in excess of one billion dollars.

Because of a Company's size, this may make sense if firms with a higher market capitalization commanded a higher multiple; however, in this industry it appears that larger companies do not command higher multiples.

The Smith Report states that a size limitation should not have been utilized because larger companies in this industry do not appear to command higher multiples. However, the variation in the multiples can be attributable to a number of factors, including growth prospects, profitability, liquidity, degree of leverage, and asset utilization efficiency. The Smith Report included no analysis that compares the future growth prospects of DEF to the guideline companies, so we have to question how Mr. Smith can make a determination about how size affects the various multiples when there does not appear to be such an analysis in his report. In this instance, the larger companies had numerous locations, hundreds of thousands of employees, and operations that expanded across the globe. Given these differences, it was determined that the business operations of these companies were not comparable to DEF, a company with a single location, with sales concentrated in a few customers.

## Exhibit 17.1 Critiquing the Opposing Expert's Report

The second criticism in The Smith Report is as follows:

As discussed above, within the guideline company method you can use many different data points (multiples) to create value indications. Mr. Trugman relies on only a multiple of forward revenue, which is further limited by the fact that he eliminates all of the multiples except for one and applies a subjective premium to the one remaining multiple.

The reasons for the use of a forward multiple was discussed in our report on pages 88 and 89. The guideline companies had made several acquisitions over the years that contaminate their historic financial results. Furthermore, the guideline companies had considerable growth expectations. Analysts estimated earnings growth of 30 percent and 70 percent for Sparton and TTM Technologies, respectively, for the next fiscal year. Given these considerable earnings growth expectations, multiples based on historic data are less meaningful.

As previously discussed, The Smith Report utilized historic multiples and ended up with values that were 113 percent apart. This, in itself, should demonstrate how utilizing historic multiples for these companies provides meaningless results.

Next, The Smith Report states the following:

Mr. Trugman's forecast expects 11.2% growth in 2016. The industry is only expected to grow by 0.4% annually over each of the next five years. In using only the forward multiple, which appears to be inconsistently applied as discussed above, he is picking up both the 11.2% growth and applying a subjective single multiple with a 20% premium.

The 11.2 percent revenue growth rate was not "Mr. Trugman's forecast." It was based on DEF's internally prepared budget, which was approved by Mr. Smith's own client. Furthermore, The Smith Report references a 0.4 percent growth rate that was contained in an IBISWorld report (as described in footnote 14 of The Smith Report) for the Circuit Board & Electronic Component Manufacturing industry. This report referenced by Mr. Smith has little relevance to DEF.

Page 5 of the IBISWorld report relied upon in The Smith Report states the following:

The Circuit Board and Electronic Component Manufacturing industry produces inputs that are essential in the downstream production of consumer electronics. As a result, demand for industry products is often tied to production levels and demand from downstream industries.

As the preceding quote indicates, demand for this industry is tied to production levels and demand for end-user markets. In this instance, the demand for DEF's products will be tied to the growth expectations for its major customers and the various industries that The Company contract manufactures for. The Smith Report completely ignores its own industry report and contains no analysis of any of DEF's end-user markets or customers. The industry analysis section of our report contained growth projections for all of DEF's major customers, end-user markets, and the Electronic Manufacturing Services' Industry overall. These industry growth outlooks are much more relevant to DEF than the IBISWorld report that was relied upon by Mr. Smith. Using this single report, instead of performing a meaningful analysis, is one more instance of the poor analysis performed by Mr. Smith.

Furthermore, page 9 of the IBISWorld report states the following:

Industry demand is typically determined by production levels in electronic equipment, appliances and computers, which require circuit boards and electronic components as inputs. In turn, demand for these products is affected by broader economic factors, such as consumer confidence and per capita disposable income.

DEF is a contract manufacturer primarily for the defense industry. However, the IBISWorld report states that demand for the Circuit Board & Electronic Component Manufacturing industry is determined by production levels in electronic equipment, appliances, and computers, as well as broader economic factors such as consumer confidence and disposable income. This further demonstrates the irrelevance of this research report. The data systems and computer market only accounts for 3.5 percent of DEF's sales. Furthermore, as a defense contractor, consumer confidence and per capita disposable income do not affect DEF, as much as factors such as military, aerospace and defense budgets, and government spending. All of these factors were discussed in our report and considered in the derivation of the growth rates used in our projections and in assessing the reasonableness of management's budgets and forecasts. In fact, IBISWorld actually has a chart that shows the primary end-user markets of the companies included in its research report. An example based on this chart is presented as follows:

*(continued)*

### Exhibit 17.1 Critiquing the Opposing Expert's Report (continued)

As indicated in the chart, the major markets served by the companies tracked by IBISWorld are communications equipment, computer equipment, and automotive. Communications equipment is not a major industry that DEF serves. DEF's major end-user markets are aerospace and defense (54 percent of total revenues), industrial controls and automation (14.9 percent), transportation and rail (14.6 percent), and medical (13 percent). None of these industries are listed in the IBISWorld report.

Another factor that should be considered is the major companies that were listed in the IBISWorld industry report, which include the following:

- TE Connectivity
- Flextronics International, Ltd.
- Sanmina-SCI Corporation

None of these companies was considered to be a guideline company in The Smith Report. Clearly, this IBISWorld report and the growth outlook contained in the report is of little relevance to DEF and is the major reason why the growth outlook in this report differs from the analyses contained in our report.

The final criticism of our guideline public company method states the following:

As discussed in my report, it would appear that Mr. Trugman's sample size is too small to produce a reliable indication. Given that SigmaTron International, Inc., trades at a revenue multiple far less than TTM Technologies, Inc. and Sparton Corp. it should cause doubt as to the reliability of the sample of guideline companies.

The Smith Report basically states exactly what was discussed in our valuation report on page 96, when we stated, "The values derived under the market approach support the income approach, but were not used as a primary indication of value as the sample sizes were not large enough to derive conclusions with a high degree of statistical confidence." We placed no weight on the market approach due to the small sample size and discussed how Sparton's higher multiples could be attributed to the company's favorable growth prospects and profitability in comparison to the other public companies.

PAGE 29. The Smith Report discusses the critique of the transaction method utilized in our report and states the following:

Again, like the guideline transaction method above, Mr. Trugman relied solely on revenue multiples. The median revenue multiple of the transactions was 0.90x. He then applied a subjective 10% premium to that amount to end up with a revenue multiple of 1.00x. Then, Mr. Trugman applied this multiple to trailing twelve months' revenue of \$126,201,245. The resulting value of equity Mr. Trugman concludes on after accounting for the debt is \$119,500,000.

Our report contains a discussion about why we utilized revenue multiples. In fact, we stated, "The analyst focused on the MVIC to revenue multiple as this metric had the lowest coefficient of variation." The market value of invested capital (MVIC)-to-EBITDA multiples for the acquired companies ranged from 5.85–15.48, whereas the MVIC-to-EBIT multiples ranged from 6.35–25.35. Given these wide ranges and the fact that little information was available regarding the financial information for some of the companies, these multiples were considered to be less reliable. The revenue multiples were much more consistent and had the lowest coefficient of variation. Mr. Smith is criticizing us for doing exactly what we are supposed to have done: analyze the data and make a determination about its reliability.

## Exhibit 17.1 Critiquing the Opposing Expert's Report

The Smith Report continues as follows:

1. Mr. Trugman relies solely on (sic) revenue multiple. The data points from the transactions have a substantial standard deviation and no other implied multiples were utilized in his analysis.

The Smith Report states that the data points for the revenue multiples had a “substantial standard deviation.” It is impossible to know what a “substantial standard deviation” is unless it is compared to an average. In this case, the average and the standard deviation were 0.87 and 0.27, respectively. This results in a coefficient of variation of 0.31, which is not “substantial.” One reason for the variation in the multiples was due to the presence of an outlier. One acquisition had a multiple of 0.38. Other than this one transaction, the multiples ranged from 0.70–1.19. Utilizing the median removes the impact of this outlier in this particular instance. When outliers exist, the average and the standard deviation are less meaningful. More appropriate statistical measures are the median and the semi-interquartile range (one-half of the difference between the third quartile and the first quartile). In this instance, the median was 0.90 and the semi-interquartile range was only 0.18 or 20 percent of the median. Either way, outside of one outlier, the variation in the data set was not determined to be an issue.

*PAGE 30.* The Smith Report continues with a critique of the transaction method in our report and states the following:

He applied a subjective 10% premium to the median multiple. Given the high standard deviation mentioned above, it would appear that Mr. Trugman took an indication that lacked firm basis and added additional subjectivity to it.

We have already addressed the criticism of a “high standard deviation.” The Smith Report proceeds to criticize the use of a premium to the median multiple. However, as discussed in our report on page 94, we stated the following:

In comparison to the acquired companies, DEF outperformed with respect to liquidity and profitability, underperformed with respect to turnover ratios and was overall less leveraged. Based on these factors, the analyst increased the median MVIC to revenue multiple by 10 percent to account for DEF's favorable financial performance in comparison to the acquired companies.

The final criticism of our transaction method as discussed in The Smith Report is as follows:

He fails to account for the synergistic motivations of buyers and the fact that the buyers are acquiring controlling positions.

Because our valuation was performed on a control basis, which is consistent with Pennsylvania case law, this factor is not an issue. A potential purchaser of DEF would be considering the exact same items as considered for the acquisition of the target companies. Also, we did not apply any weight to the transaction method because we only used it to help corroborate the value that we determined under the income approach.

The Smith Report then proceeds with a critique of our income approach and states the following:

According to IBISWorld, the industry is in the decline phase and is only forecasted to have 0.4% nominal revenue growth over the next five years (2016–2021). IBISWorld directly contradicts Mr. Trugman's revenue growth assumptions. The cornerstone of Mr. Trugman's growth assumptions are “budgeted” sales from a five to six year old 2010 Business Plan. The below discussion of the 2010 Business Plan and IBISWorld's industry forecast demonstrate the unreasonableness of Mr. Trugman's growth assumptions forming the basis of his valuation.

As previously discussed, the IBISWorld report that Mr. Smith is referencing is largely irrelevant to DEF. Furthermore, The Smith Report falsely accuses us of relying on sales from a 2010 business plan. In fact, we used DEF's budgets and forecasts for 2015–2017, which we discuss in great detail on pages 59–66 of our report. As indicated previously, The Company prepares budgets on an annual basis and these budgets are approved by Mr. Smith's own client. Therefore, this entire criticism is unwarranted.

*PAGE 31.* The Smith Report begins a two-page discussion about DEF's business plan. First, it should be noted that this entire section of The Smith Report is meaningless because we did not rely on a 2010 business plan in our valuation.

*PAGE 32.* The Smith Report makes several points about DEF's budgeted revenue figures. We will address each of them individually.

1. “The Company's revenue is currently beneath the levels reached in 2011.”

This statement is irrelevant because the important factor to consider is a company's future growth prospects. Our valuation considers management's expectations, as well as the outlooks for the economy, industry, DEF's end-user markets, and DEF's customers.

(continued)

### Exhibit 17.1 Critiquing the Opposing Expert's Report *(continued)*

2. "No apparent analysis of the Company's shrinking backlog in 2015 to support such growth."

On page 85 of our report, we analyzed DEF's backlog as a percentage of sales, and this figure was in line with the guideline companies. Furthermore, The Company's backlog has not been declining as demonstrated in the following:

Year	Backlog (\$000s)
2012	\$45,006.3
2013	33,139.1
2014	69,523.2
31-Aug-15	75,712.0

At August 31, 2015, DEF's backlog was 68 percent higher than it was in 2012. This information was readily available in DEF's internal monthly financial reports.

3. "The 2016 and 2017 budgets are built-up based on customer relationships and projects that existed in 2010 and have not been updated."

This statement is incorrect as demonstrated from the following quotes from DEF's meeting minutes. According to the minutes from the January 6, 2014 meeting:

In addition, to the above critical next steps, the general discussion of the economy and the state of affairs, due to confidence not in place in the economy, doubt about a full economic recovery and a government that is not moving the state of the US out of recession was discussed in great length and the focus is to remain on various cost controls, revenue enhancements and leveraging profitability and immediate action on sales. DEF must stay focused, keep its house in order, enhance quality and aggressively gain new customers and business. **The Sales Plan for the year and targets and objectives were laid out as follows** (bolded for emphasis):

QUARTER 1 (JAN, FEB, MARCH)	\$ 24,800K
QUARTER 2 (APRIL, MAY, JUNE)	\$ 28,500K
QUARTER 3 (JULY, AUG, SEPT)	\$ 31,200K
QUARTER 4 (OCT, NOV, DEC)	\$ 33,000K
TOTAL 2014	\$117,500K

This clearly demonstrates that The Company's budgets have been updated since 2010.

4. "In addition to missing budgeted revenue in 2013, 2014 and 2015, the Company's EBITDA projections were off by -46.8%, -22.2% and -20.6% for the years ended December 31, 2013 through December 31, 2015 respectively;"

The Company does not prepare EBITDA or net income projections. As discussed in our report, we relied upon DEF's sales budgets and forecasted operating expenses and cost of goods sold based on The Company's historic trends.

Clearly, the criticisms contained in The Smith Report are the result of either misunderstanding the analysis performed in our report, or it is being used to put up a smokescreen to avoid the fact that The Company was expecting solid results in the near future demonstrated by its own internal budgeting process.

*PAGE 33.* The Smith Report references previous valuation reports that were prepared for DEF for general business planning and gift tax purposes. These valuations are outdated because one was performed as of December 19, 2005, and the other was performed as of November 30, 2011. Furthermore, these valuations were performed for different purposes and under different standards of value. Because these valuations were performed for gift tax purposes, one has to question whether they are on the low end considering that there is an incentive to derive a lower value. Based on these factors, these valuations were determined to be irrelevant to this litigation.

## Understanding the Weaknesses in the Valuation Process

There are generally two schools of thought when it comes to preparing a valuation report, particularly for litigation. The first is to never admit to having weaknesses in your report. Many attorneys feel that if a valuation analyst includes a discussion about weaknesses in his or her report, or if the valuation analyst points out weaknesses, he or she is giving the opposition too much ammunition with which to attack the report. On the other hand, admitting that valuation is not an exact science and that the process sometimes requires a valuation analyst to use information that is potentially flawed can help demonstrate the level of knowledge of the business valuation analyst, not to mention the objectivity.

The other school of thought is to take the wind out of the opponent's sails and address each area that the valuation analyst expects to be subject to an attack upon cross-examination. If the valuation analyst addresses those areas that he or she knows will be attacked, the valuation analyst will not provide the opposing attorney with the opportunity to raise these issues as if they are a surprise. You saw some of this in exhibit 17.1. Attorneys love to make a judge or jury think that they have caught the expert doing something deceitful. If the valuation analyst admits that there are shortcomings with the report, there is little surprise, and it becomes no big deal. For example, if the valuation analyst uses industry composite data from Risk Management Association (RMA) *Annual Statement Studies*, and the valuation subject is not a "great" match for that Standard Industrial Classification (SIC) code, the valuation analyst can acknowledge that the information should be used with caution. Any experienced business valuation analyst knows that he or she can be attacked because of the weaknesses in certain parts of his or her reports. Think about defending a capitalization rate. Unless the valuation analyst has excellent market data, he or she probably cannot totally support the rate selection. This is a subjective process that is frequently attacked.

The experienced valuation analyst recognizes that a capitalization rate can be justified only by comparing the rate used with other rates available in the marketplace or by testing the conclusion reached for reasonableness. Admitting the subjectivity of the process is not going to be harmful if the valuation analyst proves that the answer makes sense. I frequently testify that I am not hired to determine a capitalization rate but, rather, to opine on the value of the business. Quite frankly, if the value makes sense, who cares how I got there? If the valuation analyst concentrates on supporting his or her overall conclusion of value, the component parts of how he or she got there are not as important.

## Valuation Analyst, Protect Yourself!

When preparing any type of business valuation report, the valuation analyst must think about the potential liability that can arise from this type of engagement. Unlike many of the conventional accounting engagements that a CPA is asked to perform, a business valuation assignment is calling for a conclusion of value. A disclaimer on page 1 of the report will not get the valuation analyst too many jobs. Imagine how the client would feel getting a 100-page report that starts out by stating, "I am not responsible for the conclusion that I am about to give."

The valuation analyst must pay careful attention to each assignment. If I am a CPA-valuation analyst, the last thing that I want a client to think is that a business valuation is an audit. In fact, our engagement letter specifically indicates that we are not doing an audit. In addition, so many of our litigation jobs involve forensic accounting (you know, playing hide-and-seek with unreported income in a divorce) that we must be very careful in that type of engagement.

Because valuation is a prophecy of the future, forecasts are frequently included in our reports. Valuation analysts should include some language to clearly indicate that they are not guaranteeing the outcome, nor have they audited the forecasts, unless they have. Then, they have to consider if their independence will become impaired if they do the valuation. We will accept the forecast from management, perform some due diligence purely with respect to the valuation assignment, and put any and all caveats in our report.

It is also a good idea to restrict the use of the valuation report. Our firm's limiting conditions make it clear that the report can be used only for the purpose that is outlined in the introduction section. The report also states that only the definition of value defined in the report is the applicable definition of value for that assignment. This prevents the client from taking a report that was performed for estate planning and turning it into an offering memorandum for potential investors.

A final suggestion in this regard: if you issue a less than detailed report, put in restrictive language such as the following:

This report does not contain all of the required disclosures of a detailed valuation report. Therefore, only those individuals who have complete knowledge about the valuation subject may be aware of all the facts and circumstances that are not contained herein. Therefore, this report should not be used by others because they may be misled by its incomplete contents.

If that does not scare them away, make them read the report when it is tied around the neck of a Bengal tiger.

## Defending the Business Valuation Report

In any assignment, the valuation analyst may be called on to defend the business valuation report. For litigation engagements, this may take place at depositions or in the courtroom. Many attorneys will tell you that the valuation analyst cannot score any points in a deposition, and there is little reason to try to defend the report at this stage of the proceedings. At the deposition, the opposing attorney is generally trying to find out what the valuation analyst did, why he or she did it, and how it was done. Our firm's experience is that a well-written report often means a short deposition. When we issue a detailed report, there is little left to the imagination. Other than wanting to review our underlying documentation and possibly question us about our assumptions, the other side does not have many questions.

Once we have explained what we did in the report, how we did it, and why we did it, there is little left that can be asked. Always discuss your deposition technique with your client's attorney beforehand. Most attorneys will tell you to give the other side nothing. Others, on rare occasions, will tell you to give them everything in the hopes that your knowledge and thoroughness will help the parties settle the case. Never take the latter for granted! That is not the job of the valuation analyst.

At the time of the trial, the expert will once again have an opportunity to defend the report. The testimony will generally be divided between the direct examination and the cross-examination. On direct examination, I like to use my report as a selling tool. Although the report is rarely entered into evidence, the judge in a bench trial will usually accept a copy of the report to help him or her follow along with my testimony. In these cases, the use of clear tables and graphs is an exceptional way to educate the judge.

The report's appearance is important. It should look as professional as the job that the valuation analyst did. A nice cover, dividers, and good presentation will help. Window dressing works wonders! During the direct examination, take the opportunity to invite the judge to follow along with the chart on page 10, the graph on page 21, or anything else that will give the judge a reason to review this well-structured document. Even if the judge does not read the report, the appearance will indicate professionalism, as long as the valuation analyst's testimony does not negate it.

When preparing for trial with a client's attorney, I ask the attorney to allow me to testify in the sequence of my report. Because the report is written to tell a story, my testimony follows the same pattern. It is much easier to follow a familiar format than having to learn a new routine just before trial.

Cross-examination can also be used by the expert to defend his or her report. I like to refer to my report before answering certain questions. First, it acts as a refresher of what I have done, and second, it allows me to think about the question and also about the answer that I am about to give.

Using the valuation report during cross-examination can also be an effective demonstration of the valuation analyst's thoroughness. When the attorney states, "You didn't consider this in your analysis, did you?" it gives the valuation analyst a great opportunity to respond, "With all due respect, if you turn to page 39 of my report, you will see that I did consider that very issue." Needless to say, a well-prepared attorney will rarely give the expert the opportunity to embarrass him or her that way. Don't be surprised, however, if this opportunity presents itself, and be prepared to take advantage of it.

## Common Errors in Business Valuation Reports

After reviewing numerous business valuation reports, both those in actual engagements as well as those that have been submitted by applicants who have applied for accreditation to some of the valuation organizations, I have compiled a list of what not to do in a valuation report. You have seen many of these items throughout the book when I showed you the other side's work product. I have included some of the most common errors that I have seen in box 17.6.

### BOX 17.6 Common Errors in a Business Valuation Report

- **Definition of value.** Frequently, valuation reports refer to a particular standard of value (that is, fair market value), but the definition is missing from the report. The definition of fair market value has varied considerably in different jurisdictions and must be clearly defined so that the reader can be certain of its meaning.

Another common error regarding the definition of value occurs when the valuation analyst defines the standard of value that was supposed to be used in the assignment but applies a different standard of value during the valuation process.

- **Choice of valuation method(s).** One of the common errors seen in valuation reports is the use of only one or two valuation methods in the assignment, as opposed to all appropriate methodologies. Considering all the appropriate valuation methods act as a good check on each of the methods used and should always be part of a full valuation.

Relying on a “favorite” method is another common error made by inexperienced valuation analysts. Some individuals take a liking to a particular method and always use it. The excess earnings method is one of the favorite methods. This practice should be avoided. The correct valuation methods should be based on the availability of information and the facts and circumstances of the valuation.

Another common error is using methods that contradict each other. For example, the capitalization of income method is generally used if the income in the numerator is stable, whereas the discounted future earnings method is used when the income being forecast is unstable. The use of each of these methods in the same valuation is an indication that the income stream is both stable and unstable. How can that be?

- **Market data.** A major flaw in many valuations occurs when the valuation analyst is so sure that market data cannot be located that he or she never bothers to look for it. This is absolutely wrong! Market data should be looked for in every valuation.
- **Selection of guideline companies.** Many problematic reports include guideline companies that are poor comparables: The guideline companies chosen are not similar and relevant enough to the valuation subject to make them good companies to use in the valuation. This often occurs when the valuation analyst uses guideline companies that are so much larger than the valuation subject that a true comparison cannot be made. Imagine comparing the local hardware store to The Home Depot.

Another problem with the selection process occurs when the valuation analyst does not look far enough to find good guideline companies. A company does not necessarily have to be in the same SIC code to be a good guideline company. Revenue Ruling 59-60 suggests “same or similar.”

- **Financial Analysis.** This is often missing from valuation reports. Other than using historical financial information for the valuation calculations, some individuals forget to perform a trend or comparative company analysis to make the appropriate determinations of risk.

Another common error is the inclusion of financial ratios in the valuation report without any discussion about the meaning or relevance of the ratios. We also frequently see normalization adjustments made in reports that are not adequately explained. There should be an explanation for all adjustments made. Avoid arbitrary adjustments that cannot be properly supported.

- **Discount and capitalization rates.** The problem in this area could fill up an entire book on valuation. The general problem in this part of the report is usually that there is an inadequate amount of support for the determination of the rates used. The risk analysis may be inadequate to support the valuation analyst's conclusion of the appropriate rates.

Another problem is applying a rate for a particular benefits stream to another benefits stream (for example, applying a discount rate for net cash flow to earnings or applying a pretax rate to an after-tax stream).

A frequent error is the use of the 15 percent to 20 percent capitalization rates from Revenue Ruling 68-609, regardless of the risk associated with the benefits stream, particularly the excess earnings attributable to intangibles.

- **Premiums and discounts.** Similar to discount and capitalization rates, the biggest problem is that the report does not include enough support for these items. The percentages used should be supported by a well-thought-out analysis of the factors that affect premiums and discounts.

*(Box continued)*

**BOX 17.6** Common Errors in a Business Valuation Report *(continued)*

- **Typographical errors.** There is nothing worse than seeing a valuation analyst charge a client thousands of dollars and not take the time to proofread the report properly. Typos are an indication of carelessness and should be avoided whenever possible. Spelling errors are unacceptable, especially in light of the spell-check features of most word-processing software packages.
- **Illogical conclusion.** Another error, and the most fatal, is reaching a conclusion that does not make sense; the valuation analyst does not perform any sanity tests, and the end result defies logic. Often, we see that the value conclusion is so high that the cash flow from the business could never support a purchase price in a transaction. My favorite example of this is the time when our client's attorney cross-examined the other side's expert and asked, "Mr. Smith, would you pay that much for this business?" Mr. Smith responded, "Why no, never." How can a valuation analyst expect anyone to believe in the estimate of value if he or she does not?

## The Reconciliation Process

At the end of the valuation process, the valuation analyst must choose a value based on the various methodologies that were used. In a perfect world, all the methods used would result in the same value, making the choice easy. Unfortunately, we do not live in a perfect world. The likelihood of all the values even coming close to one another is slim. This is the part of the assignment that will determine if the valuation analyst understands valuation. The pros and cons of each method should be considered. For example, the adjusted book value method may not have considered any intangibles that the business may have and, therefore, may result in an understatement of the value. On the other hand, the Picasso painting is not generating any cash flow but may have a market value of \$42 million.

Each method should be carefully scrutinized for areas that could have resulted in an error (or less confidence), and a determination should be made about how much weight will be placed on the method in light of the other methods used in the valuation. One set of example data showing the process of weighting various valuation methods is shown in table 17.1.

**TABLE 17.1** Weighting Different Methods

Method	Value	Weight	Calculated Value
<b>MARKET APPROACH</b>			
Price/Earnings	\$4,400,000	30%	\$1,320,000
Percent of sales	4,700,000	10%	470,000
Multiple of book value	4,400,000	30%	1,320,000
Dividend payout ratio	4,200,000	10%	420,000
<b>ASSET-BASED APPROACH</b>			
Adjusted book value	1,200,000	0%	0
Liquidation value	430,000	0%	0
<b>INCOME APPROACH</b>			
Capitalization of benefits method	4,800,000	20%	960,000
<b>ESTIMATE OF VALUE</b>			<b>\$4,490,000</b>
<b>ROUNDED</b>			<b>\$4,500,000</b>

There is no magical formula to the weighting process. It is entirely up to the valuation analyst's judgment regarding where the final value estimate will come in. Some valuation analysts do not like to show the preceding computations, whereas others do. Either way is acceptable as long as the valuation analyst can explain his or her conclusion.

Avoid a common error, which is to take a straight mathematical average of all methods. Most often, the result will be incorrect. In fact, Revenue Ruling 59-60 specifically tells us not to just average the numbers.

The valuation analyst should round the conclusion. The number of places to round to will depend on the materiality of the conclusion. Rounding to the nearest \$1,000 may be appropriate for smaller valuations, whereas rounding to the nearest \$100,000 may be appropriate in others. Rounding the conclusion illustrates to the reader that valuation is not an exact science. Though the valuation analyst wants to be accurate, he or she does not have to be precise.

After reaching the conclusion, the valuation analyst should test the result for reasonableness. The analyst should ask himself or herself two key questions:

- *If I were the buyer, would I pay this much for the business?*
- *If I were the seller, would I sell it for that much?*

If the answer to either of these questions is no, the valuation analyst should go back to the drawing board and see where he or she went wrong. Another test that works particularly well for the income approach and should be considered for the market approach, as well, is known as the *justification for purchase test*. A good friend and mentor of mine, Ken McKenzie, former co-executive director of The Institute of Business Appraisers, taught me this test at the first business valuation seminar that I attended almost 35 years ago. This is also known as the *business broker's method* because it is used by business brokers to price a business for sale.

The justification for purchase test is designed to determine if the cash flow that is forecast to be generated by the business will adequately cover the debt payments that will result from the acquisition of the business, assuming normal business terms. This test, as it was included in a valuation report, is demonstrated in exhibit 17.2 on the following page.

The example in exhibit 17.2 illustrates a simple test that is designed to determine whether the buyer could afford to pay for the business based on the value that was determined by the valuation analyst. Most small- to medium-sized businesses do not have the ability to use creative financing techniques to pay for the acquisition. The two major concerns of the buyer consist of making payroll at the end of the week and being able to pay off the debt service that exists as a result of the acquisition. In fact, if the cash flow of the business is not adequate to pay down the debt, most of these types of transactions cannot take place.

Some valuation analysts (and some software programs) suggest that there needs to be a cash-on-cash return (return on the down payment) in order for the test to work properly. This is incorrect because the valuation analyst's role is to determine a cash equivalent value. If there is a cash return on the down payment, the seller is providing the buyer with an extra return above the required rate of return. This means that the seller is leaving too much money on the table as part of the transaction. The optimal situation is for the cash return to be a break-even, or at least, reasonably close to it.

The justification for purchase test should attempt to simulate a real transaction using a realistic down payment, interest rate, and term for the financing. Certain businesses require larger down payments than others. Speak to a business broker, and he or she can probably give you some guidance. The interest rate that we use is generally anywhere from prime rate to 3 points above the prime rate depending on the risk of the business. The term rarely goes out more than 5 or 6 years. Don't do something silly like using a 15-year payback. The buyer cannot get that type of financing. The results should make sense.

Even after testing the justification for purchase test, the illustration shows additional sanity checks that were performed to support our conclusion.

### EXHIBIT 17.2 Justification for Purchase Test

In order to test our value for reasonableness, we performed a “justification for purchase” test based on a hypothetical acquisition of the company. A willing buyer would be concerned with the ability to pay off the acquisition from the cash flow of the business. We performed a justification for purchase test using a five-year payback period. Our test results are as follows:

	Year 1	Year 2	Year 3	Year 4	Year 5
Annual payments	\$1,561,139	\$1,561,139	\$1,561,139	\$1,561,139	\$1,561,139
Interest	436,623	352,334	261,722	164,319	59,618
Principal	\$1,124,516	\$1,208,805	\$1,299,417	\$1,396,820	\$1,501,521
Cash flow					
Pretax income	\$2,198,907	\$2,286,863	\$2,378,338	\$2,473,471	\$2,572,410
Interest expense	436,623	352,334	261,722	164,319	59,618
Taxable income	\$1,762,284	\$1,934,529	\$2,166,616	\$2,309,152	\$2,512,792
Tax	704,914	773,812	846,646	923,661	1,005,117
Net income	\$1,057,370	\$1,160,717	\$1,269,970	\$1,385,491	\$1,507,675
Principal payments	1,124,516	1,208,805	1,299,417	1,396,820	1,501,521
Cash flow	\$ (67,146)	\$ (48,088)	\$ (29,447)	\$ (11,329)	\$6,154
Return on down payment	-2.06%	-1.47%	-0.90%	-0.35%	0.19%

The preceding calculations indicate a payback period of five years. In other words, a willing buyer who puts down 33 percent and finances the remainder at 1 percent above the prime rate can expect to have the loan paid off in five years. In this case, neither the buyer nor the seller is leaving too much money on the table for the benefit of the other party. This demonstrates the reasonableness of the value that we determined.

As a sanity check, we looked in the Business Reference Guide, which contains rules of thumbs on pricing of businesses. For manufacturing of wood kitchen cabinets and countertops, the pricing rule of thumb is 2.5 times seller’s discretionary earnings. For this company, this would be approximately \$8.7 million. The entity value on a control, nonmarketable basis was calculated to be approximately \$9.8 million. The higher value reflects the better-than-industry performance of the company and further demonstrates the reasonableness of the value we determined.

It was mentioned earlier that there was not enough market data to apply the market approach. However, as an additional sanity check, we compared the company’s price-to-revenue ratio to the price-to-revenue ratios of the transactions. The price-to-revenue ratios from the transactions ranged from 0.09–0.47. The subject company’s price-to-revenue ratio is 0.39. This is within the range of the ratios of the transactions and, again, supports the reasonableness of our conclusion.

## Conclusion

At this point, you now have more of an idea about the valuation report. There are several sample reports as downloadable materials included with this book. Now you even have some samples that you can plagiarize. How do you think we all get started? Thank you, Dr. Pratt, for that great sample report in your first book! Just remember that there is only a small amount of boilerplate, and that the rest will have to be created from scratch each time. Also, remember that a good report will be understandable to the reader. With all of that in mind, I’ll see you in court!

# Chapter 18

# Valuation of Pass-Through Entities

## Learning Objectives

In this chapter, I will attempt to explain the following:

- Characteristics of pass-through entities
- The issues surrounding the valuation of pass-through entities
- Theoretical and empirical evidence of a premium for pass-through status
- Key court cases
- Models developed to measure the value of pass-through entities

## Introduction

One of the more controversial subjects to hit our profession over the past two decades has been the topic of premiums related to pass-through entities. For many years, the pass-through tax status was generally ignored in the valuation process. Pass-through entities were tax affected as if they were tax-paying companies. Near the end of the 1990s and early 2000s, a number of court case decisions (both in and out of the U.S. Tax Court) were issued that forever changed the way we look at pass-through entities. This chapter will discuss the various theoretical issues and provide a working knowledge of a number of techniques available to the valuation analyst when valuing a pass-through entity.

Pass-through entities come in many shapes and sizes, whether an S corporation, limited liability company, or partnership. Although I will primarily focus on S corporations, the same economic theory can be applied to other pass-through entities, as well. I could write an entire book on this subject, but I am not going to. Nancy Fannon, CPA/ABV, MCBA, ASA, already wrote *Fannon's Guide to the Valuation of Subchapter S Corporations*, and she co-authored *Taxes and Value: The Ongoing Research and Analysis Relating to the S Corporation Valuation Puzzle* with Keith Sellers, DBA, both published by Business Valuation Resources, LLC.

## What Is an S Corporation?

Although this is not a treatise on income tax laws, a good place to begin a discussion about the value of an *S corporation* is to understand the rules regarding this type of entity. The term *S corporation* means a small business corporation for which an election to be taxed under Subchapter S of the IRC is in effect for that year.<sup>1</sup> Once made, this election remains in effect until it is revoked. To be classified as a small business corporation for purposes of Subchapter S, a corporation must meet all the following requirements:

- The corporation must be a domestic corporation.
- It must not be an ineligible corporation.
- It must not have more than 100 shareholders.
- Only individuals, decedents' estates, estates of individuals in bankruptcy, and certain trusts may be shareholders. Partnerships, corporations, and many types of trusts may not be shareholders.
- No shareholder may be a nonresident alien.
- The corporation may have only one class of stock, but different voting rights are allowed.<sup>2</sup>

1 IRC Section 1361(a)(1).

2 IRC Section 1361(b).

A corporation can elect to become an S corporation by filing the appropriate form with the commissioner of the IRS. This election can also be revoked, voluntarily or involuntarily, under certain circumstances. Once elected, a corporation will remain an S corporation until such time as a revocation takes place. One thing worth noting is that the election is free. Therefore, why would a willing buyer pay more for the S corporation if he or she could elect it for free?

Keeping this discussion of the tax law simple, an S corporation is a pass-through entity. This means that the profits and losses are passed through to the shareholders, and any tax that is payable will be paid by the shareholders and not the corporation. The original purpose of an S election was to allow these small business corporations to be treated as partnerships while continuing to provide the shareholders with the legal protection of operating in a corporate form.

Being an S corporation provides the shareholders with certain tax benefits. These include, but are not limited to, the following:

- Not being questioned by the IRS about reasonable compensation for shareholder employees (this pertains to excess compensation and not payroll taxes)
- Not being subjected to the accumulated earnings tax if dividends are not paid to the shareholders
- Avoids double taxation upon sale of the corporation's assets (other than those assets that may be subject to the built-in gains tax—see discussion that follows)

Although there are certain tax advantages to electing S corporation status, there are also disadvantages. The major disadvantage relates to C corporations that convert to S corporations. Any gain that the corporation recognizes within the five years after the election is made to convert a C corporation to an S corporation is taxed as if the asset was owned by a C corporation at the time of the conversion to an S corporation. This is known as the *built-in gains tax*. Not only does the corporation pay tax on these items, but the shareholders will also be taxed on the income that flows through after corporate taxes are paid. This constitutes double taxation. Some folks say that this is really not a disadvantage but merely defers the advantage for five years to escape the built-in gains tax. I guess they have a point.

Another tax consideration relating to the S election is the shareholder's income tax basis in the corporation's stock. Whereas in a C corporation, the income tax basis is generally the purchase price of the stock, an S corporation's shareholders will constantly be adjusting the income tax basis of their shares. The S corporation's shareholders will increase their basis for all earnings reported by the company that are not distributed. A simplified basis calculation is as follows:

	Original Investment	\$1,000
+	Profit—year 1	500
–	Distributions—year 1	(200)
=	Basis—end of year 1	\$1,300
+	Profit—year 2	800
–	Distributions—year 2	(400)
=	Basis—end of year 2	\$1,700

The tax implication of the adjusted basis is that the amount of tax that is paid by the shareholder upon the eventual sale of the corporate stock will depend on whether the sale is for a greater or lesser amount than the tax basis. Although a tax basis adjustment, in and of itself, does not affect the value of the corporate stock, the shareholder's return will be affected. Investment decisions may vary depending upon the shareholder's goals relating to a particular investment. This will be discussed later.

## Key Court Cases

Why does the issue of S corporations deserve this much attention in a business valuation textbook? The reason is simple. Various court cases have made our profession think differently about the valuation of these entities than we used to. So, let's briefly discuss some of those court cases. The Tax Court decided the following cases:

- *Gross v. Commissioner*, T.C. Memo. 1999-254, affd. 272 F.3d 333 (6th Cir. 2001)
- *Heck v. Commissioner*, T.C. Memo. 2002-34, Filed February 5, 2002
- *Wall v. Commissioner*, T.C. Memo 2001-75, March 27, 2001
- *Adams v. Commissioner*, T.C. Memo. 2002-80, Filed March 28, 2002
- *Dallas v. Commissioner*, T.C. Memo 2006-212, September 28, 2006

There have been some other Tax Court cases in recent years, but the rulings effectively said the same thing as those cases cited previously. Therefore, there is no point in discussing them here.

Two important non-Tax Court cases that you should be aware of are the following:

- *Delaware Open MRI Radiology Associates, P.A., Petitioner, v. Howard B. Kessler, et al., Respondents, and Howard B. Kessler, et al., Plaintiffs, v. George J. Broder, et al., Defendants*, in the Court of Chancery of the State of Delaware, in and for Newcastle County, Consolidated, C.A. No. 275-N
- *Judith E. Bernier v. Stephen A. Bernier, Dukes Division of the Probate and Family Court Department (July 28, 2003); Judith E. Bernier v. Stephen A. Bernier, 873 N.E.2d 216 (Mass. 2007); and Judith E. Bernier v. Stephen A. Bernier, 970 N.E. 2d 363 (Mass. App. Ct. 2012).*

*Gross v. Commissioner*: In this case, the taxpayer's expert argued that the S corporation earnings of G&J Pepsi-Cola Bottlers, Inc. (G&J) should be tax affected and that its C corporation equivalent earnings should be capitalized with an after-tax discount rate based on the Capital Asset Pricing Model. The expert for the IRS argued that G&J's earnings were after corporate taxes, particularly because an S corporation does not pay any taxes, and before personal taxes of the shareholders. Consequently, according to this expert, the appropriate discount rate applicable to the S corporation's earnings was an after-tax discount rate. The court agreed with this argument in its written opinion. The valuation subject consisted of small, minority interests of G&J.

*Wall v. Commissioner*: This case involved several small gifts of S corporation stock. Both experts tax affected the income stream in the application of the income approach, although at different rates. The Tax Court cited *Gross* and determined that the income stream should not be tax affected.

*Heck v. Commissioner*: In this case, the expert for the taxpayer used a discounted cash flow method in which the pretax flow-through earnings of F. Korbel & Bros., Inc. (Korbel) were considered. The discount rate that he used was an after-tax weighted average cost of capital. The expert for the IRS used a similar discounted cash flow methodology and an after-tax weighted average cost of capital. The court's opinion cited *Gross* on the issue of the cost of capital. The finding of the court in this case was based on discounting the pretax earnings of Korbel with an after-tax cost of capital. (If you remember from chapter 13, I indicated that it was important to match the benefit stream with the discount rate; pretax to pretax, after tax to after tax, and so on) In this instance, a 39.6 percent minority interest was valued.

*Adams v Commissioner*: In this case, the tax affecting issue became extremely important. In this case, the taxpayer's expert, rather than proposing that the S corporation earnings of Waddel Sluder Adams & Co., Inc. (WSA) be tax affected, developed an after-tax discount rate using a build-up method and converted the corresponding capitalization rate (after subtraction of expected growth) to a pretax capitalization rate. He deemed this discount rate applicable to the S corporation earnings of WSA. This stream of income was before corporate taxes and any distributions that may have been distributed to the shareholders to pay their personal income taxes. The IRS expert argued that an after-tax discount rate was applicable to the S corporation earnings of WSA. Although this seems to be consistent with *Gross* and *Heck*, with respect to the issue of pretax earnings and an after-tax discount rate, the valuation subject in WSA was a 61.6 percent controlling interest.

*Dallas v. Commissioner.* After a lengthy hiatus in cases involving S corporations, this case hit our radar. In this case involving Dallas Group of America, Inc. (DGA), one of the issues related to tax affecting the income. The first taxpayer valuation analyst tax affected S corporation earnings using a 40 percent tax rate and the second taxpayer valuation analyst used a 35 percent tax rate. According to the court, the testimony of the taxpayers' analysts was that they tax affected under the assumption that DGA would lose its S corporation status after or as a result of the hypothetical sale of its stock. The court said there was no evidence that DGA expected to lose its S corporation status. The court also noted that DGA had a history of distributing sufficient cash for the shareholders to pay their taxes on their share of S corporation earnings, and there was no evidence that this practice would change. The court gave little weight to the taxpayers' valuation analysts' testimony. The bottom line, as the court said, "We conclude there is insufficient evidence to establish that a hypothetical buyer and seller would tax affect DGA's earnings and that tax affecting DGA's earnings is not appropriate."

*Delaware Open MRI Radiology Associates, P.A., Petitioner, v. Howard B. Kessler, et al., Respondents. and Howard B. Kessler, et al., Plaintiffs, v. George J. Broder, et al., Defendants.* This non-Tax Court case is a fabulous learning tool. In fact, I like it so much that I have included it in "My Favorite Cases" for you to be able to read in chapter 27. To make a long story short, the Chancellor found that tax affecting should not be an all or none decision. He used one of the models that I will talk about soon to calculate the benefit, if any, by being an S corporation. This deviates from the Tax Court rulings, but know that different courts will rarely allow themselves to be bound by court decisions of a different court.

In fact, an argument raised in *Dallas* was that the *Delaware Open MRI* case argued that it was not an all or none situation, but the Tax Court stated that it was not bound by the decision of another court.

*Judith E. Bernier v. Stephen A. Bernier.* This case eventually ended up with three decisions as it bounced between the probate court and the Supreme Court in Massachusetts. The court followed the guidance from *Delaware Open MRI* in deciding this case. If the valuation analyst practices in Massachusetts, this is a case that he or she needs to be familiar with.

## So, Where Do We Go From Here?

Every valuation analyst faces the question of what to do about taxes when valuing an entity that has elected to be treated as an S corporation under the IRC. Some analysts believe that being an S corporation adds value to the entity because it does not pay income taxes. Others believe that making an S election reduces the value of an ownership interest because of personal taxes that will be paid on profits that are allocated to the shareholder, without the benefit of receiving distributions that enable the individual to pay personal taxes when they come due. Let's take a look at the specific issues that come into play when valuing an S corporation.

## Valuation Issues

In the valuation of an interest in an S corporation, two main issues arise. First, do the income tax advantages of the S election create value? This gets carried one step further by raising the questions of value to whom, and how do we account for the incremental value in the valuation process. The second issue is, if we value an S corporation by comparing this entity to non-S corporation entities, what adjustments are necessary in the valuation process?

As I said before, for many years, valuation analysts felt that an S corporation should be valued in the same fashion as a C corporation. This was because

1. C corporations are, in substance, nearly identical to S corporations.
2. S corporations may lose their S status in the future and convert to C corporations.
3. most measures of corporate performance used in valuation models, such as growth and discount rates, are derived from C corporations; therefore, S corporations should be valued as C corporations to maintain consistency with these measures.<sup>3</sup>

<sup>3</sup> William E. Simpson and Peter D. Wrobel, "Income Tax Issues in Valuing S Corporations," *CPA Expert* (Spring 1996).

According to the IRS:

S Corporations lend themselves readily to valuation approaches comparable to those used in valuing closely held corporations [C corporations]. You need only to adjust the earnings from the business to reflect estimated corporate income taxes that would have been payable had the Subchapter S election not been made.<sup>4</sup> [Bracketed material added for clarification.]

Some valuation analysts believe that the tax benefits of having made an S election should increase the value of the entity. Many of the fundamental issues that affect the valuation process must be considered, as well, for the determination of whether or not an S corporation election adds value. Some of these factors include the following:

- Standard of value
- Control versus minority
- Distributing versus non-distributing
- Holding period of the investment
- Time value of S corporation benefits

## Standard of Value

The standard of value in any business valuation assignment can have a significant effect on the final estimate of value. We discussed this earlier in the book. Valuing an entity that has elected S status is no different. Probably the more significant differences will arise between fair market value and investment value.

If the purpose of the valuation assignment is to determine the fair market value of a controlling interest in an S corporation for purchasing, selling, or merging the corporation, the corporation's tax structure may have little or no effect on value. If the most probable willing buyer is an ineligible shareholder (that is, a C corporation), then that shareholder will not pay for income tax benefits that it cannot take advantage of. Therefore, corporate income taxes should be a part of the valuation calculations. Conversely, if the willing buyer can qualify for the S election, that buyer may pay for the benefits that will be received, and no corporate income taxes may be appropriate in the determination of the benefit stream to the investor.

An important component of determining fair market value is the determination of who will be the willing buyer. This became evident in the *Estate of Samuel Newhouse*<sup>5</sup> (another case that is worth reading, so I have included it in the downloadable materials with this book), where it was demonstrated that different classes of investors would pay different amounts under a fair market value scenario. Following this logical foundation, a valuation analyst must make certain assumptions about who the most likely purchaser will be. However, care must be exercised to not fall into a tax trap by identifying a specific buyer. The Tax Court has gone on record to state the following:

We need not identify directly who the buyer would be or even what class of investors the buyer would belong to. The "willing buyer" is supposed to be a hypothetical amalgam of potential buyers in the marketplace. Although we have, in prior opinions, identified types of hypothetical buyers, we did so only to determine which valuation approach, among several reasonable approaches, would result in the highest bid, and therefore the one most acceptable to a willing seller. The question is not so much "who" but "how."<sup>6</sup>

The issue of who the most likely purchaser of the property will be is an essential element of the determination of the highest price that would be offered to a prudent seller. During periods of industry consolidation, companies are offered greater amounts (higher premiums) than they might get from "nonsynergistic" buyers. If there is an expectation by the seller that his or her company will sell to one of the industry players, then it seems that this must be considered when the valuation analyst performs the valuation. This argument can be carried

<sup>4</sup> IRS, *Valuation Guide for Income, Estate and Gift Taxes* (Commerce Clearing House).

<sup>5</sup> *Estate of Samuel Newhouse*, 94 T.C. 193.

<sup>6</sup> *Estate of Mueller v. Commissioner*, T.C. Memo No. 1992-284 at 1415, 63 TCM 3027-16 (citations omitted).

one step further by stating that when a valuation analyst reviews market data, a determination is generally made regarding who is buying up these companies. Therefore, the issue of who the willing buyer is most likely to be needs to be addressed.

For smaller valuation subjects, this determination will be made more easily. Small businesses are frequently purchased by an individual, or a group of a few individuals, who will most likely continue to qualify as S corporation shareholders. For these types of businesses, the continuity of an S election appears to be a reasonable assumption. However, even small businesses may not qualify to be an S corporation if they are purchased. As the melting pot of the United States continues to grow, a large influx of nonresident aliens (no, not Martians) are entering the marketplace as possible purchasers of these businesses. It may no longer be a reasonable assumption that the S election will continue after the acquisition.

Larger corporations are even more problematic than small corporations when the valuation analyst must make assumptions about the willing buyer. Larger entities are more likely to be purchased by a C corporation, which would immediately negate the S election. Therefore, it may not be reasonable to assume that the target company will be able to continue with its present tax status.

## Purpose of the Assignment

In addition to the standard of value, the purpose of the assignment may also cause the valuation analyst to make certain assumptions. For example, if the valuation is being performed for the determination of fair market value to be used in a matrimonial litigation, it may be considered unfair to the nonbusiness-owner spouse to make the assumption that the S election will be lost. However, because matrimonial courts are courts of equity, it may be equally unfair to the business owner not to assume taxes will be paid because they are paid at the personal level, even if no distributions are made.

As previously stated, in *Judith E. Bernier v. Stephen A. Bernier*, the Massachusetts Supreme Court addressed the issue of tax affecting an S corporation. I truly commend the court for taking on this controversial issue. Following the methodology in *Delaware Open MRI Radiology Associates, P.A. v. Howard B. Kessler, et al.*, the court applied a methodology to determine the tax effect that I really like.

When the standard of value is investment value, the notion of whether the specific buyer will qualify as an S corporation should be considered. The specific buyer's goals regarding rates of return or whether he or she wants current cash flow or capital appreciation must be considered when deciding on an S election. More often than not, valuations performed for transaction purposes use pretax earnings streams because it is the buyer's expected tax status that should be considered in place of the seller's historical tax structure.

## Control Versus Minority

If the business interest being valued is a minority ownership interest—that is, the valuation of an ownership interest not having the prerogatives of control—then a direct comparison with values of other minority interests is the most appropriate method of valuation. In essence, if the minority interest cannot effectuate a change in the company's tax structure, no such change should be assumed.

An argument could be made that a minority shareholder could, in fact, cause a change to an S election by selling the shares to a nonqualified shareholder of the S corporation. This violation of the rules regarding ownership could kill the election, therefore, changing the status involuntarily. However, a valuation analyst should also consider the likeliness of the shareholder's actions. It would seem that the shareholder would have to have special motivations to intentionally kill the S election for the balance of the shareholders. These special motivations may be enough to violate the definition of *fair market value*.

The S election may have been made by the shareholders for reasons that have nothing to do with value. For example, an S election may be made so that the issue of reasonable compensation may be avoided upon audit by the IRS. Another reason for an S election may be to avoid double taxation at the time that the company is sold. For a shareholder to want to intentionally violate the S election, the company could be ex-

posed to greater risk of loss, thus, reducing its value. The prudent shareholder would not want to diminish the value of the investment.

Although the minority shareholder can cause the S election to be involuntarily terminated, it does not seem logical to assume that this will occur. However, the facts and circumstances of the situation must dictate whether or not to make such an assumption.

## Distributing Versus Non-Distributing

An S election may be favorable or unfavorable depending on whether the corporation has the ability to distribute its earnings to its shareholders. If only some, or possibly none, of the earnings can be distributed, the result can be extremely unfavorable to the investor. Let me illustrate this point by using a real example, which appears in exhibit 18.1. Our firm did a critique of another valuation analyst's work for a litigation. One of the many issues was that we tax affected the earnings, and he did not. This is an excerpt from our critique. (Names have been changed to protect the guilty!)

### EXHIBIT 18.1 To Tax or Not to Tax—Critiquing Another's Report

#### TAX AFFECTING EARNINGS

The issue of tax affecting the earnings of S corporations or other pass-through entities, such as general partnerships, limited partnerships, or limited liability companies, is a highly debated issue in business valuation. The conventional wisdom used to be that you would tax affect the earnings of a pass-through entity because the willing buyer may not be able to avail itself of the nontaxable status of the seller. Valuation theory has stated that it is essential to match the earnings stream being capitalized, when using the income approach, with the correct capitalization rate. Because publicly traded companies report their earnings on an after-tax basis, sources that compile this data for use by valuation analysts in determining discount and capitalization rates consider these rates to be applicable to after-tax earnings streams (or cash flow). The most widely used source in the valuation field is data published by Duff & Phelps (D&P). D&P data is clearly after-tax at the entity level.

The argument first started to be raised about after-taxes to the entity in the Tax Court case *Estate of Gross*. I will address this shortly. It is not uncommon for a valuation analyst to tax affect the earnings of S corporations by applying marginal C corporation tax rates to their earnings. This is consistent with the approach employed in our reports.

Contrary to Mr. Smith's assertion that we reduce available cash flow by a "hypothetical" corporate income tax, this adjustment does not assume that the companies will indeed incur a tax, but, rather, is a necessary adjustment when applying historical D&P return data (which is presented on an after-tax basis) to the subject earnings stream. The following are additional reasons for tax affecting S corporation earnings:

1. The S election has no effect on the operating cash flows of the business.
2. The benefits of the S election are shareholder benefits and, therefore, capitalizing these benefits would overstate the value of the enterprise because the benefits can be taken away involuntarily if the S election is broken.
3. S corporations usually pass through a sufficient portion of their earnings to their shareholders to allow them to pay their taxes, which leaves the S corporation in almost the same position after taxes as if it were a C corporation.
4. The public stock markets tend to price the earnings of publicly traded partnerships on a basis equivalent to the after-tax earnings of publicly traded C corporations in the same lines of business.
5. Most of the likely buyers of S corporations are C corporations or groups of investors who may need to organize as C corporations. There is no apparent advantage for S corporation buyers to C corporation buyers.
6. Every C corporation (with eligible shareholders) would either make the S election or would have the option to convert if this was desirable. If a higher value is attainable following the S election, corporate sales of companies would reflect this value. There is no logic for the existence of two levels of corporate value for eligible entities when there are no logical or practical barriers prohibiting election to obtain the higher value.
7. It has been suggested that buyers will pay no more for an S corporation than an equivalent C corporation; therefore, there are no S corporation premiums.

To address the tax treatment of pass-through entities from an independent perspective, we consulted textbooks and articles written and published by some of the leading practitioners in the business valuation field. In general, well-known business valuation authorities, including Shannon Pratt, Christopher Mercer, and Roger Grabowski, all agree that there is no hard-and-fast rule that applies to treatment of pass-through entities in all cases. There is a general consensus among these individuals that the issue of whether or not to tax affect the earnings of a pass-through entity is one that must be addressed on a case-by-case basis.

(continued)

## EXHIBIT 18.1 To Tax or Not to Tax—Critiquing Another’s Report *(continued)*

This debate has also been highlighted in four recent Tax Court cases:

1. *Gross v. Commissioner*, T.C. Memo.1999-254, affd. 272 F.3d 333 (6th Cir. 2001)
2. *Wall v. Commissioner*, T.C. Memo.2001-75, filed March 27, 2001
3. *Heck v. Commissioner*, T.C. Memo.2002-34, filed Feb. 5, 2002
4. *Adams v. Commissioner*, T.C. Memo. 2002-80, filed March 28, 2002

In all four of these cases, the court ultimately determined that it was appropriate to capitalize S corporation earnings using an after-tax rate. In each case, the valuation conclusion was reached without tax affecting earnings, which is consistent with Mr. Smith’s approach.

However, in response to the Tax Court rulings, Christopher Mercer argues that in *Gross*, *Heck*, and *Adams*, “The Tax Court has rendered opinions based on unsound economic and financial theory.” Mercer, with agreement from Dr. Shannon Pratt, concludes the following:

- S corporations are worth the same as otherwise identical C corporations at the level of the enterprise. Their operating cash flows are identical, and there is no rationale that suggests that their enterprise values should be anything but identical.
- Interests in S corporations may be worth more or less than otherwise identical interests in otherwise identical C corporations. The cash flows to shareholders may be different between S and C corporations, and these differences, considered in the context of the riskiness of their receipt, can create differences in value.

In determining the appropriate discount rate for capitalizing pretax earnings, an analogous situation may be drawn to municipal bonds. Yields on municipal bonds are significantly lower than yields on taxable bonds. This is due to the favorable tax treatment received by investors holding municipal bonds (that is, no federal taxes and, in some cases, no state or municipal taxes). In order to convert the yield on a municipal bond to its taxable equivalent for comparison purposes, analysts divide the tax-free yield by  $(1 - \text{tax rate})$ , where the tax rate is the investor’s effective personal rate for both state and federal taxes. The term  $(1 - \text{tax rate})$  is simply the factor used to convert pretax dollars to after-tax dollars.

Upon issuance, both municipal bonds and taxable bonds are issued at par value. Thus, the trading price (or par value) of a municipal bond is a function of its tax-free yield because investors discount the present value of future cash flows at the tax-free rate. In essence, the investment community prices municipal bonds as if taxes have been prepaid on interest and principal payments received by investors. Thus, if a business is valued using pretax earnings as the applied earnings measure, rather than after-tax earnings, then an additional adjustment is also necessary to the discount or capitalization rate. Accordingly, the future cash flows of the business should be discounted or capitalized at a pretax rate, which is calculated by dividing the after-tax discount rate by  $(1 - \text{tax rate})$ . Mr. Smith does not make any such adjustment.

In addressing the issue of taxation in light of recent tax legislation, we conducted our own analysis of the differences between holding stock in the companies under a tax-affecting scenario (C corporation assumption) versus the current pass-through taxation of the entities. The argument against tax-affecting the earnings of an S corporation or other pass-through entity is predicated upon the belief that the shareholder of an otherwise identical C corporation is burdened by “double-layer” taxation at both the entity and the shareholder levels. Mr. Smith claims that because the ABC Organization will end up owning the companies, the S corporation assumption should be continued into the future. The argument here is that although the ABC Organization may be an S corporation, there is no guarantee that it will ultimately be sold to a buyer that can qualify as an S corporation; therefore, it is a flawed assumption to think that a buyer will pay for a benefit that it will not realize.

Another argument going forward pursuant to the Jobs and Growth Tax Relief Reconciliation Act of 2003, effective January 1, 2003, is that dividend income to C corporation shareholders is taxed at the same rate as capital gains (at a maximum rate of 15 percent), **[Author’s Note: Today, that rate is now 20 percent.]** whereas shareholders in pass-through entities continue to be taxed at personal tax rates on S corporation earnings,<sup>1</sup> thus, minimizing differences in tax liabilities at the shareholder level, regardless of the level of earnings distributed to shareholders. Although this reduction was not in effect as of the valuation date in this case, given the ongoing litigation associated with this assignment and the anticipated transfer of ownership interests in the companies, we believe this factor is particularly relevant.

For each company, we incorporated the recent decline in dividend tax rates and examined the cash flows available to a shareholder or member under the two scenarios. For taxable income, we used the adjusted income from our reports before taxes, while the assumed payout ratio of distributions is based on actual distribution levels for each entity.

### EXHIBIT 18.1 To Tax or Not to Tax—Critiquing Another’s Report

The importance of this calculation is that distributions make a big difference in determining the difference in value of these two types of entities. In this case, the level of indebtedness, and the need for reinvestment into new assets, does not enable the shareholders to receive significant distributions. It is important to note that in the *Estate of Gross*, distributions to shareholders were at about 100 percent.

#### Author’s Note

The tax scenarios that you are about to review address the issue of whether the various entities that were the subject of the valuation would be a benefit to the shareholders after considering the level of distributions that the companies were able to make as well as the taxes that would be paid at both corporate and personal levels. At the time this was done, the capital gains rate was 15 percent. If we did the same analysis today, we would substitute the 20 percent capital gain rate into our calculations.

#### Company One, Inc.—Comparison of tax scenarios

		C Corporation		S Corporation
Debt-free pretax income		\$ 84,166		\$ 84,166
Corporate income tax	26%	(21,866)		0
Net income available to shareholders		\$ 62,300		\$ 84,166
Less: Addition to retained earnings		(62,300)		(62,300)
Distributions	0%	\$0	26%	\$ 21,866
Less: Personal taxes	15%	0	40%	(33,666)
Net cash flow to shareholders		\$ 0		\$ (11,800)
<b>Net disadvantage to Company One’s shareholders</b>				<b>\$(11,800)</b>

Corporate income tax	24%	(16,848)		0
Net income available to members		\$ 51,965		\$ 68,813
Less: Addition to retained earnings		0		0
Distributions	100%	\$ 51,965	100%	\$ 68,813
Less: Personal taxes	15%	(7,795)	40%	(27,525)
Net cash flow to members		\$ 44,170		\$ 41,288
<b>Net disadvantage to Company Four’s members</b>				<b>\$ (2,882)</b>

As shown in three out of the four scenarios, the shareholders would actually receive less cash, assuming that the company was not taxed at the entity level. By tax affecting the earnings of the companies, cash flow to owners is not reduced on an aggregate basis. In fact, cash flow to owners is higher after tax affecting earnings. Mr. Smith fails to consider this in his analysis by ignoring the effect of personal taxes on the shareholders and by ignoring the recent reduction in tax rates on C corporation dividends, which has seriously weakened the argument that double-layer taxation is a detriment to C corporation shareholders.

In the preceding example, the analyst on the other side of the case thought that by not tax affecting the earnings, he could support a higher value for his clients. By the way, the difference in our valuations due to the taxes alone was \$14 million.

As previously stated, it is readily accepted that an investor in common stock of any corporation makes an economic investment for three reasons. They are as follows:

1. Immediate cash flow (dividends)
2. Future cash flow (capital appreciation)
3. A combination of 1 and 2

The total expected return to the shareholder consists of a part that is currently taxable and a part that is tax-deferred until the time of sale. Under the current tax law, the deferred portion may be subject to favorable capital gains tax rates. Although the discount rate used in the application of a discounting model ignores personal tax rates, the investor does not.

If the shareholders of an S corporation have control of the company, they will generally do everything possible to ensure that distributions are made in sufficient amounts to cover personal taxes. They do not want to reach into their own pockets to pay taxes on profits that they did not receive. Shareholders of a C corporation will usually take the opposite position because they generally want to avoid paying tax on dividend distributions. However, the current tax law favors the tax treatment of dividends from a C corporation versus the distributions from an S corporation.

Because shareholders of an S corporation will frequently attempt to pass-through dividends to themselves in an amount at least equal to their estimated tax obligation, the actual dividend distributions may appear to be attractive. This could give the appearance of a company that is a “great” dividend payer, and it makes the investment appear as if it has excellent liquidity. The opposite is true with the shareholders of a C corporation. They will generally do everything possible to avoid dividends. This would give the appearance of an investment with far less liquidity. This contrasting position of the shareholders makes dividend-paying capacity a more attractive manner in which to assess value.

David C. Dufendach raises an interesting point about these returns.<sup>7</sup> He states

Research has shown that the slope of the actual security market line is less than predicted by the CAPM.<sup>8</sup> Riskier stocks have lower required returns than predicted, whereas less risky stocks suffer from higher required returns. One possible explanation is that riskier stocks provide relatively more of their return in the form of nontaxable price appreciation. One study suggests that this is the case.<sup>9</sup> If true, then investors who wish to avoid current tax liability on dividend income would prefer higher risk/lower dividend stocks, driving down their required return below that predicted by the CAPM. Another study supported this view, implying that dividends are undesirable (presumably because of their immediate taxability), and that stocks with higher dividends are penalized in the form of higher required returns.<sup>10</sup>

The various studies cited by Dufendach lead to the conclusion that given all other risk factors being equal, a stock that pays a dividend, causing an immediate tax consequence, is worth less than a stock that provides capital appreciation, which is tax-deferred and then possibly taxed at more favorable rates. The factor that causes the difference in value is apparently personal taxes. Because we accept the premise that a prudent investor considers personal income taxes in investment decisions (otherwise, if all else were equal, why would anyone buy tax-free bonds?), we should not ignore the personal tax effect of the investment. The difficulty is determining which tax rates to use.

## Corporate or Personal Income Tax Rates

One of the difficulties that the valuation analyst faces is the determination of which set of income taxes is appropriate to use in valuing the S corporation. This will most likely depend on the standard of value. However, this can be more trouble than it's worth.

If the standard of value is fair market value, the appropriate income tax rates should be those rates that will be applicable in the hands of the willing buyer. The problem is that we do not know who that specific buyer will be. Will it be an individual, another S corporation, or a C corporation? Once again, there is no distinct answer. Depending upon the facts and circumstances, the valuation analyst may be able to make an assumption about the most probable willing buyer (or category of buyer). The other problem that we face is that in fair market value, the buyer and seller are hypothetical parties, rather than actual parties. Our assumptions could convert our valuation results into an investment standard of value.

If the standard of value is investment value, the valuation analyst should consider the tax rates of the specific buyer. In this instance, the valuation analyst is estimating value to a particular buyer. This makes this task a little bit easier.

Once the standard of value has been identified, the valuation analyst is still faced with the choice of which rates to use. If corporate tax rates are used, the valuation analyst, with or without the help of the local CPA, can calculate the taxes based on the rates applicable at the time.

However, if personal rates are to be used, this calculation can become even more complicated due to factors such as personal exemptions, itemized deductions, phase out rules, and other income or losses from unrelated activities that could affect the income tax rates that may be applicable. This could be a nightmare.

The practical application of income tax rates is up to the valuation analyst. If the rates can be calculated in a relatively straight forward manner, the analyst should do so. If personal tax rates are involved, most analysts believe that there is little to be gained by factoring in personal exemptions and itemized deductions. If the valuation analyst represents a specific individual, these items may be taken into consideration if they are material. Common sense and reasonableness should prevail.

## Holding Period of the Investment

Many valuation analysts feel that both S and C corporations should be valued on an after-tax basis. Many subscribe to the premise that the "after tax" is to the corporation and not the individual.

Because capitalization rates are determined from market evidence, usually on a pretax basis to the individual, more comparability can be achieved in the selection of these rates. Adjusting the income returns for personal taxes would make the discount rate selection more difficult particularly because rates of return reported in the empirical literature are based on pretax returns to the investor.

Some analysts adjust the benefit stream of an S corporation for the amount of distribution needed to make the shareholders whole after paying personal taxes. It is fairly common to see distributions being made in at least the amount necessary to pay the personal taxes so that the shareholders do not pay taxes from monies that they have not received. The problem with this approach is that the tax law provides that the shareholders of an S corporation can increase their income tax basis in the S corporation for monies that are taxed and not distributed. Therefore, comparability cannot truly be achieved between the S corporation shareholders and the C corporation shareholders.

Another consideration related to this is that S corporation shareholders are permitted to take subsequent distributions from the S corporation without current tax implications. Shareholders' undistributed taxable income from previous years is available for distribution because the shareholders have already paid tax on the profits in the year that it was earned. This also causes a significant difference in the timing of the cash flows between the shareholders of these different types of entities.

An argument can be made that the difference between a perpetual S corporation and a C corporation is the present value of the annual corporate tax savings. In each valuation assignment regarding an S corporation, the analyst faces the question of what the holding period of the investment will be while the corporation keeps its S election. Some authors believe that a corporation will lose its S election at some point.<sup>11</sup> This means that the interest in the corporation being valued will be an S corporation for certain years and then a C corporation for its remaining life.

When a valuation analyst is requested to determine the fair market value of an enterprise, one of the factors to be determined by the analyst is who, or what group of investors, would be the most likely “willing buyer.” Another factor to be considered in the “willing buyer” scenario is will the willing buyer qualify to be an S corporation. Once it is determined that the willing buyer can be an S corporation, the next question to be answered is for how long? As with many other decisions confronting the valuation analyst, there is no clear-cut answer.

### Timing of the Valuation

Conventional wisdom dictates that when a business valuation is performed for an interest in a corporation, the value determined is based on the value of the interest without regard to the investor. This means that when we value shares of stock in a corporation, it does not matter who the shareholder is, nor do we consider the tax implications of a sale of the interest by that shareholder. Personal taxes generally have no effect on the valuation of corporate stock (assuming that the shareholder is an individual). Obviously, not all shareholders are individuals, and not all shareholders are tax-paying entities. Pension plans, for example, do not pay taxes. Therefore, should the value of a share of IBM be different if an individual owns it or if a pension plan owns it?

### So, What Do We Do?

At this point, we have come almost full circle in our discussion about willing buyers. The investing public calculates rates of return on an after-tax basis. Because different classes of investors have different tax structures, the required rates of return will vary among the classes. In determining an appropriate discount rate for the net cash flow of an S corporation versus a C corporation, it is reasonable to assume that there is an increased risk relative to the net cash flow of the S corporation that the enterprise may, at some point in time, pay taxes and have a lower cash flow. This could be justification for a different discount rate for the two entities. The question to be raised is by how much? Without empirical data in the marketplace, it becomes difficult, if not impossible, to quantify the exact level of adjustment. Mathematical quantification cannot be used as readily as it is for the conversion of pretax and after-tax discount rates. Valuation analysts continue to struggle with the notion of whether the corporate cash flows from an S corporation are after tax. Authors have argued that there should be a tax equivalency made to reflect the personal taxes that will have to be paid by S corporation shareholders.<sup>12</sup> The reality of the situation is that personal taxes will be paid whether distributions are made to the shareholder or not. It seems reasonable to consider these taxes in a similar fashion as corporate taxes. Either way, the government is going to get paid. The exception is that there may be a tax rate differential that could additionally benefit the shareholder in the form of an adjustment to his or her basis in the corporate stock.

Arguments have been raised for years regarding the built-in gains tax. For a long time, the position of the Tax Court has been that no discount would be permitted for a built-in gains tax, even though investors in the real world consider this tax in making investment decisions. In *Estate of Artemus D. Davis v. Commissioner*,<sup>13</sup> part of the discount for lack of marketability was attributed to the built-in gains tax. This could influence future valuations of S corporations, particularly those that have exposure to the built-in gains tax in the post-conversion period. This raises the issue of the S election having a possible discount associated with it because of the taxes that potentially could be paid at the corporate level. In fact, the Tax Court allowed the deduction of taxes in this situation in *Litchfield*, TCM 2009-21.

11 Robert E. Duffy and George L. Johnson, “Valuation of ‘S’ Corporations Revisited: The Impact of the Life of an ‘S’ Election Under Varying Growth and Discount Rates,” *Business Valuation Review* (1993): 155–167.

12 George G. Cassiere, “The Value of S-Corp Election—The C-Corp Equivalency Model,” *Business Valuation Review* (1994): 84–91.

13 *Estate of Artemus D. Davis v. Commissioner*, 110 T.C. 35.

Valuation in the hands of the owner of the investment in an S corporation may result in a more realistic valuation. However, that is clearly not fair market value. Personal tax rates may vary depending upon too many factors that have nothing to do with the investment. A valuation analyst cannot be expected to consider items such as personal exemptions and itemized deductions. Certainly, the value of smaller S corporations can be affected by these items, although larger S corporations may not be influenced by these items because the shareholders are more likely to be in higher tax brackets where these items do not matter. Does this mean that valuation analysts should have two methodologies, one for small companies and one for large companies?

## Empirical Evidence of an S Corporation Premium

There are two commonly referenced studies that attempted to test the existence of the S corporation premium for controlling interests. In September 2002, a study was published by Merle Erickson and Shiing-wu Wang that showed that S corporations were purchased at higher relative values than the comparable C corporation. In their study, Erickson and Wang looked at 77 pairs of stock acquisitions of S and C corporations that occurred between 1994 and 2000. Companies were paired based on their one-digit SIC code and then compared with one another based on 6 purchase price multiples, including price-to-pretax income; earnings before interest, taxes, depreciation, and amortization (EBITDA); operating cash flows; and operating cash flows before working capital adjustments. This analysis led Erickson and Wang to conclude that the organizational structure of S corporations is worth 12 percent to 17 percent more than that of the comparable C corporation.

A second study was published by Michael J. Mattson, Donald S. Shannon, and David E. Upton in the November and December 2002 editions of *Business Valuation Update*. This study analyzed approximately 2,500 asset and stock transactions contained within the *Pratt's Stats*<sup>®</sup> database that occurred between January 21, 1991 and March 19, 2002. Mattson, Shannon, and Upton determined through their research of the 2,500 transactions that there was no evidence that S corporations sold for premiums over C corporations. In fact, C corporations generally sold at higher price-to-sales multiples than S corporations.

In order to test the conclusions of the Erickson and Wang study, Mattson, Shannon, and Upton conducted a separate analysis on the stock transactions (totaling 1,227 transactions). This analysis also concluded that S corporations did not consistently sell for higher price-to-sales multiples than C corporations. However, the results of this analysis were not necessarily inconsistent with those of the Erickson and Wang study. The largest companies within the Mattson, Shannon, and Upton study's data set showed that S corporations sold for higher price-to-sales multiples than C corporations. The companies analyzed by Erickson and Wang were generally within the same size range, indicating that although the largest S corporations might sell for higher multiples than their C corporation counterparts, the relationship does not exist universally.

Further evidence of the inconsistency of the S corporation premium was obtained by Erickson and Wang through interviews with various buyers and sellers of S corporations. In numerous cases, sellers and buyers were either unaware of the acquired pass-through benefits or simply didn't consider them. On the other hand, a number of buyers and sellers reported that a premium was incorporated in the purchase price for the S corporation. So, what does all of this mean? The studies show that sometimes there may be a premium paid for the pass-through status of an S corporation, and sometimes, no consideration is given to it. (What a surprise, no clear-cut conclusions!) This tells us to use discretion in measuring the pass-through benefits for every valuation.

## Back to the Future

Now that we have gone through numerous illustrations that tell us to look at the facts and circumstances of each situation on its own, let's step back to where the Tax Court has taken us and where the future needs to be. In *Adams*, the court stated, "The net cash flow and the capitalization rate used to compute the fair market value of the WSA stock should have the same tax character; i.e., before corporate tax or after corporate tax."<sup>14</sup> The opinion stated the following:

.....  
 14 *Adams*, p. 13.

We disagree that Shriner (the taxpayer's expert) properly converted the capitalization rate because there was no need to do so. The parties agree that Shriner's estimated capitalization rate (before he converted it to before corporate tax) is an after tax corporate tax rate. Thus, as in Gross, the tax character of Shriner's estimate of WSA's prospective net cash flows matches that of the unconverted capitalization rate because both are after corporate tax. It follows that Shriner should not have converted the capitalization rate from after corporate tax to before corporate tax because the tax character of both his estimated net cash flows for WSA and unconverted capitalization rates is after corporate tax.<sup>15</sup>

Every valuation treatise that I have read or course that I have taken discusses the importance of properly matching the benefit stream with the discount or capitalization rate. In fact, I discussed this very fact in chapter 13. The reason for this, simply stated, is consistency. If the numerator is changed in a capitalization model, the denominator must also change in order to maintain the same value. Clearly, the value should not change as a result of using a different benefit stream.

However, the Tax Court has taken the position through its opinions that although they are not disputing our theory, they find that the benefit stream of an S corporation is higher than the benefit stream of a similar C corporation due to the nonpayment of taxes at the entity level. Because we are attempting to reach an economic value, shouldn't we consider all economic activities that affect value? In almost every case, S corporations distribute at least enough of their earnings so that their shareholders can pay their taxes based on the amount of profits that flow through to the shareholders. This can almost be thought of as entity-related taxes. If S corporations did not distribute cash flow to pay individual income taxes, the shareholders would most likely revoke the S election, assuming that they had the ability to do so.

If anything can be gained thus far as a result of reading this chapter of the book, it is probably that the question of adding a premium or a discount to the value of an investment in an S corporation does not have an easy answer. Although there appears to be a possible benefit if the willing buyer can continue the S election into the future, there is no guarantee that this will happen. Consideration should be given to all the factors that influence value when making a determination. The premium or discount issue must be examined on a case-by-case basis because there is no other way to do it. In many instances, the increase or decrease in value will be based on the manner in which the benefit stream is taxed. With that in mind, let's talk about some models we can use to deal with the pass-through issue.

## S Corporation Models

Over the past decade, various S corporation models have surfaced. The purpose of these models is to calculate the tax differential relating to the S corporation. Valuation analysts seem to agree that there is little or no difference in the market values of controlling interests in S and C corporations under most circumstances. If there is a difference in the values, it is based on finding a buyer that can take advantage of the potential tax savings. However, the valuation community also seems to agree that there may be differences in value at the shareholder level for noncontrolling interests. All the models have been constructed to address the valuation of noncontrolling shareholder interests in S corporations.

The three models that I have seen most often include those that were designed by Roger Grabowski, Dan Van Vleet, and Chris Treharne. Although some articles also address a model by Chris Mercer, it is actually a variation of his Quantitative Marketability Discount Model (QMDM) model that is discussed in chapter 15. By his own admission, the QMDM is not an S corporation model. Let's walk through these models. In addition, Nancy Fannon provides a simplified approach to valuing S corporations, which will also be explained in this chapter. Finally, I will show you an example of how our firm dealt with the S corporation issue in one valuation. Each model is solid in its quest to determine the tax affecting of an S corporation. Some are much more complicated than others.

<sup>15</sup> *Ibid.*, pp. 14-15.

So that we may compare the output of each model, the assumptions used in each of the examples is contained in box 18.1.

## The Grabowski Models

Roger Grabowski has stated that interests in S corporations and other pass-through entities should have a higher value than an otherwise identical taxpaying entity. According to Grabowski, there are three major benefits to owning a business as a pass-through entity: (1) income is only taxed once (that is, no dividend tax); (2) owners receive a step up in their investment basis when income exceeds distributions; and (3) owners may realize more proceeds in the event of a sale due to a step up in basis for the buyer of the entity's assets. This last point refers to a lower tax liability for the purchaser when the target company is eventually sold to another buyer and only exists for the controlling shareholder. The first two points, however, are applicable to both minority and controlling shareholders.

### BOX 18.1

	Year 1	Year 2
Income Before Taxes	\$100,000	\$103,000
Depreciation	20,000	20,000
Capital Expenditures	(20,000)	(20,000)
Working Capital Requirements	(10,000)	(10,000)
Debt Repayments	—	—
Annual Growth		3%
Growth in Terminal Year		3%
Personal Income Tax Rate		35%
Corporate Income Tax Rate		40%
Dividend Tax Rate		20%
Capital Gains Tax Rate		20%
Discount Rate to Equity		20%
Distributions as a Percentage of Net Cash Flow		85.0%
Value of Subject Company as C Corporation		\$296,814

Grabowski offers three models to value S corporations: the C corporation equivalent model, the modified traditional model, and the modified Gross model.<sup>16</sup> These models all look to measure the benefits in avoiding dividend taxes and the step up in investment basis when income exceeds distributions. Importantly, each Grabowski model assumes the sale of the subject company as a C corporation at the end of the projection period.

## C Corporation Equivalent Model

The C corporation equivalent model is the easiest (I think) of the three Grabowski models to understand. This model assumes a sale of the subject company at the end of the projection period to a C corporation buyer. The calculation itself is divided into two separate parts. The first calculation values the subject company's cash flow and tax-avoidance benefits to the S corporation shareholder, assuming a sale as a C corporation at the end of the projection period. The second calculation measures the tax savings in capital gains taxes due to the build up in basis. This model takes into consideration personal income taxes through the projection period, which eliminates the need to account for the difference in personal and corporate income taxes later. An example of the C corporation equivalent method is provided in table 18.1.

<sup>16</sup> The modified traditional model expands the traditional S corporation valuation model used prior to the court cases discussed earlier in this chapter. Similarly, the modified Gross model expands on the Tax Court's S corporation valuation model utilized in the Gross case.

**TABLE 18.1 Valuation of S Corp Applying C Corp Equivalent Method**

		Year 1	Year 2	Residual Value as if C Corp	
<b>Key Calculations</b>	Income before tax	\$100,000	\$103,000	\$106,090	
	Corporate income tax	—	—	42,436	
	Corporate level net income	\$100,000	\$103,000	\$ 63,654	
	Cash Flow Adjustment				
	Depreciation	20,000	20,000	—	
	Capital expenditures	(20,000)	(20,000)	—	
	Change in net working capital	(10,000)	(10,000)	(10,000)	
	A	Pretax free tax cash flow	\$ 90,000	\$ 93,000	\$ 53,654
	B	A x 35%	35,000	36,050	
	C	A – B	Free cash flow after personal income taxes \$ 55,000	\$ 56,950	
D	C/(1 – 20%)	C Corporation-equivalent free cash flow	68,750	71,188	
	Present value factor	0.8333	0.6944		
	Discounted cash flow	\$ 57,292	\$ 49,436		
	Sum of discounted cash flow	106,727			
	PV terminal value as if C Corp	219,175			
	Value of pass-through basis adjustment	8,238			
	<b>Indicated Value</b>	<b>\$334,140</b>			

Terminal Value	
Capitalization rate	17.0%
Terminal Value	\$315,612
Present Value Factor	0.6944
PV of Terminal Value	\$219,175

**Capital Gains Tax Savings from Build up in Basis**

		Year 1	Year 2	
<b>Key Calculations</b>	S Corp net income	\$100,000	\$103,000	
	S Corp distributions as percentage of pretax free cash flow	76,500	79,050	
	Retained net income	\$ 23,500	\$ 23,950	
	E	Total build up in basis	47,450	
	F	E x 20%	9,490	
	G	F/(1 – 20%)	Pretax equivalent of avoided capital gains taxes	11,863
		Present value factor	0.6944	
		PV of capital gains tax savings from build up in basis	8,238	
		<b>Value of pass-through basis adjustment</b>	<b>\$8,238</b>	

In table 18.1, we first calculate pretax free cash flow (line A). Just to be clear, the figures on line A in years 1 and 2 represent the amount of cash flow to shareholders of the subject S corporation. Line A for the terminal year represents the cash flow available to shareholders of the subject company as if it is a C corporation at the date of the sale. In line B, the model takes personal income taxes into consideration. This eliminates the need to separately account for any difference in corporate and personal income tax rates. Because this model is attempting to arrive first at a C corporation-equivalent value, in line D, we “convert” S corporation free cash flow to a C corporation basis by adding the benefit of avoided dividend taxes. In other words, because a C corporation would not bear the burden of dividend taxes, we make this adjustment to arrive at a pre-dividend tax level of cash flow. From here, the remaining calculations involve a typical discounted future cash flow analysis.

To calculate the tax savings from the build up in basis, we sum up the total excess of income over distributions over the projection period (line E), calculate the avoided capital gains taxes (line F), and then calculate the C corporation-equivalent of the avoided taxes (line G). Because the benefit of avoiding capital gains taxes occurs when an S corporation is sold, the pretax equivalent of avoided taxes is discounted from the end of the projection period (year 2 in table 18.1). After adding up the results of our preceding calculations, we arrive at the aggregate value of the subject company on a marketable basis.<sup>17</sup>

## Modified Traditional Model

The modified traditional model completes the same overall analysis as the C corporation equivalent model but takes a different route. This model first values the subject company as if it were a C corporation and then breaks out each component of value (or detriment) generated by the subject company's status as an S corporation. An example of this model is provided in table 18.2.

As you can see in table 18.2, the modified traditional model starts with a discounted cash flow analysis to arrive at a C corporation-equivalent value. Benefits and detriments associated with the subject company's S corporation status are then accounted for in separate calculations.

**TABLE 18.2 Modified Traditional Method**

		Year 1	Year 2	Residual Value as if C Corp
Key Calculations	Income before tax	\$100,000	\$103,000	\$106,090
	Entity level tax rate (C Corp)	40.0%	40.0%	40.0%
	Entity level tax	(40,000)	(41,200)	(42,436)

Terminal Value	
Capitalization rate	17.0%
Terminal Value	315,612
Present Value Factor	0.6944
PV of Terminal Value	\$219,175

(Table continued)

<sup>17</sup> For the sake of simplicity, we have not calculated the asset sale amortization benefit (or tax amortization benefit) associated with the step up in basis to the subject company's assets upon its sale. The purchaser of the subject company would recognize a tax benefit generated from the additional amortization expense associated with acquired intangible assets. Theoretically, this benefit should be added to the total indicated value of the subject company. This calculation will be explained in detail in chapter 19.

**TABLE 18.2 Modified Traditional Method** (continued)**Plus: Entity Level Tax Saved with S Election**

		Year 1	Year 2
<b>Key Calculations</b>	Entity level taxes for S Corp	\$ —	\$ —

	Present value factor	0.8333	0.6944
	Discounted tax savings of S Corp election	\$41,667	\$35,764
C	<b>Tax savings of S Corp election</b>	<b>\$77,431</b>	

**Plus: Pass-Through Basis Adjustment**

		Year 1	Year 2
<b>Key Calculations</b>	S Corp net income	\$100,000	\$103,000
	Distributions as a percentage of free cash flow	76,500	79,050
D	Net income less free cash flow	\$ 23,500	\$ 23,950
E	Sum of cash flow differential	47,450	
F	$E \times 20\%$ Benefit of avoided capital gains tax	9,490	
G	$F/(1 - 20\%)$ Pre-tax equivalent of avoided capital gains taxes	11,863	
	Present value factor	0.6944	
H	<b>Pass-through basis adjustment</b>	<b>\$ 8,238</b>	

**Less: Out of Pocket Tax Payments**

		Year 1	Year 2
<b>Key Calculations</b>	Tax on income in excess of free cash flow	\$ 8,225	\$8,383
	Pre-tax equivalent (owner dividend tax rate)	10,281	10,478
I	$D \times 35\%$	0.8333	0.6944
J	$1/(1 - 20\%)$	\$ 8,568	\$7,276
K	<b>Tax on income in excess of free cash flow</b>	<b>\$15,844</b>	

**Less: Higher Shareholder Level Tax v. Dividend Tax**

		Year 1	Year 2
<b>Key Calculations</b>	Owner level taxes if C Corp	\$10,000	\$10,360
	Owner level taxes if S Corp	26,775	27,668
L	Income tax differential	16,775	17,308
M	$L/(1 - 20\%)$ Pre-tax equivalent	20,969	21,634
	Present value factor	0.8333	0.6944
	Discounted tax adjustment	\$17,474	\$15,024
N	<b>Tax increase due to tax rate differential</b>	<b>\$32,498</b>	

The first of these adjustments accounts for the amount of corporate income taxes avoided due to the subject company's S election. Because the lack of corporate taxes increases the amount of cash available for distribution to shareholders, the difference in entity-level taxes is adjusted to account for the lack of dividend taxes paid by the S corporation shareholder (line B). This pretax figure is then discounted to the present.

Next, the model calculates the capital gains tax savings due to the build up in basis. The total benefit of the tax savings (line F) is converted to a pretax equivalent (line G) and then discounted to the present value. Because the benefit from the build up in basis will be realized when the company is sold (after year 2 in this example), the present value factor for year 2 is used. We then calculate any out-of-pocket tax payments due to the excess of income over distributed free cash flow. The value determined here will be accounted for as a detriment to the subject company because shareholders obviously would not want to use personal money to pay taxes on undistributed income. Again, the pretax equivalent of this detriment is calculated (line J) and discounted to the present.

Finally, the model accounts for the difference in the level of taxes paid by the shareholders in the subject company as if it were an S corporation or C corporation. Taxes to the C corporation shareholder are a function of C corporation dividends and dividend taxes. This figure is a detriment to overall value as the level of taxes paid at the shareholder level for the S corporation (personal income taxes) exceeds taxes paid by shareholders of a C corporation (dividend taxes).

## Modified Gross Model

The modified Gross model starts by calculating the pretax net present value of the subject company's cash flow during the projection period. The terminal value again is calculated on a C corporation basis. The model then makes various adjustments to account for value attributable to various differences in S corporation and C corporation taxes and the build up of basis. An example of the modified Gross model is shown in table 18.3.

**TABLE 18.3 Valuation of S Corp Applying Modified Gross Method**

	Q	<b>Tax increase due to tax rate differential</b>	<b>\$32,498</b>		

As shown in table 18.3, the modified Gross model starts with a pretax discounted cash flow analysis over the projection period. The terminal value is calculated as if the subject company was a C corporation. The build up in basis, out-of-pocket tax payment, and personal versus dividend tax differential are the same calculations as seen in the modified traditional model. However, the amount of entity-level taxes saved through the S election is slightly different. In the modified Gross method, the avoided C corporation taxes are calculated (line A) and then converted to their pretax equivalent. Under the assumption that this difference would be distributed to shareholders, the amount of dividend tax avoided by the S corporation shareholder is calculated and discounted to the present.

If you look at tables 18.1, 18.2, and 18.3, you will notice that the indicated values in each of the models are identical. Like I said earlier, each of these models does the same thing. The C corporation equivalent model achieves in two steps what the modified traditional and modified Gross models do in five steps. When using Grabowski's models, remember that they assume the sale of the subject company at the end of the forecast period. If the valuation analyst is valuing a minority interest, he or she must be careful when applying these models because a minority shareholder cannot force the sale of a company. Either way, the valuation analyst is forced to make an assumption about when the interest will be sold. Good luck with that!

### The Van Vleet Model

This model, otherwise known as the S Corporation Economic Adjustment Model (SEAM), was developed by Dan Van Vleet and calculates the net economic benefit to shareholders of the subject company in C corporation and S corporation form. In this case, economic benefits include the after-tax dividend income and after-tax capital gains recognized by shareholders in the subject company. With these calculated economic benefits, we can derive a multiple that converts a C corporation-equivalent value to an S corporation value. To illustrate this, table 18.4 shows the derivation of economic benefits to the C corporation and S corporation.

The calculations in table 18.4 are relatively straightforward. In this example, we used the same assumptions as used in the previous examples. The model accounts for the net dividend income and net capital gains received by shareholders of the subject company in C corporation and S corporation form. The net economic benefits are used to derive an economic adjustment multiple through the following calculation:

$$S \text{ Corp Economic Adjustment Multiple} = \frac{(\text{Net Economic Benefit to Shareholders of S Corp})}{(\text{Net Economic Benefit to Shareholders of C Corp})}$$

In our example, the economic adjustment multiple would be 1.3542 (or \$65,000/\$48,000). This multiple is then applied to the value of the subject company as if it were a C corporation. One of the key strengths of the Van Vleet model is that the economic adjustment multiple can be applied to a value derived under the income and market approaches. Keep in mind, though, that this multiple is to be applied to equity values and not invested capital.

**TABLE 18.4 Van Vleet Model Determination of Net Economic Benefit to Shareholders**

		85% of Free C Corp	Cash Flow S Corp
Income before income tax		\$100,000	\$100,000
Corporate Income tax @	40%	(40,000)	n/a
Net Income		60,000	100,000
Dividends to S corp shareholders		n/a	76,500
Income tax due by shareholders @	35%	n/a	(35,000)
Net cash flow to S corp shareholders		n/a	41,500
Dividends to C corp shareholders		42,500	n/a
Income tax on dividends @	20%	(8,500)	n/a
Net cash flow to C corp shareholders		34,000	n/a
Net Income		60,000	100,000
Dividends to shareholders		(42,500)	(76,500)
Net capital gains		17,500	23,500
Effect of increase in tax basis		—	(23,500)
Net taxable capital gains		17,500	0
Capital gains tax liability @	20%	(3,500)	—
Net capital gains benefit to shareholders		14,000	23,500
Net cash flow to shareholders		34,000	41,500
Net capital gains benefit to shareholders		14,000	23,500
<b>Net economic benefit to shareholders</b>		<b>48,000</b>	<b>65,000</b>

Using the assumptions relied on in previous examples, the value of the subject company on a C corporation basis is \$296,814. Applying the economic adjustment multiple (1.3542) to this figure results in an S corporation-equivalent value of \$401,936.

Simple, right? Well, a few assumptions behind the model are important to discuss. First, the Van Vleet model assumes that an investor would place equal value in current distributions and retained net income. This may be true for an investor in a public company, who can collect dividends and have the ability to sell the stock to recognize any appreciation in value. However, for the minority interest shareholder in a privately held company with an indefinite holding period, this may not be the case. Thus, the model somewhat overcompensates for the economic benefit generated by capital gains to the private company investor. An analyst using this model would have to account for the longer holding period with a larger discount for lack of marketability.

Another important point to consider is that the Van Vleet model assumes no change in future corporate, personal, dividend, and capital gains taxes. In reality, effective tax rates change given the amount of income being taxed, as well as changes in marginal tax rates.

Finally, the Van Vleet model, unlike the Grabowski models, assumes that the S corporation benefit is realized into perpetuity. Although this may be an appropriate assumption for a minority interest valuation in a company that has no prospect of a sale, it would not be appropriate in a controlling interest valuation of a company whose owners could be looking to sell the business within a few years.

## The Treharne Model

Chris Treharne believes that S corporations have three primary benefits over C corporations: (1) distributions are made to shareholders before any taxes are paid; (2) the avoidance of dividend taxes; (3) and the differential between personal and corporate income taxes. Treharne's model is composed of four separate calculations, the first of which calculates the value of the subject company's retained cash flow on a C corporation basis. Not surprisingly, the remaining three calculations are designed to account for each of the S corporation benefits listed previously. Let's work through an example, starting in table 18.5.

**TABLE 18.5 Treharne Model**

Year	Tax rates	Year 1	Year 2	Terminal Year	Present Value
<b>Distributions:</b>		76,500	79,050	81,677	
<b>Retained Cash Flow</b>					
S corporation net income		100,000	103,000	106,090	
Depreciation		20,000	20,000	—	
Capital expenditures		(20,000)	(20,000)	—	
Changes in working capital		(10,000)	(10,000)	(10,000)	
Debt principal changes		—	—	—	
<b>Net cash flow</b>		90,000	93,000	96,090	
S corp tax distribution paid	35%	35,000	36,050	37,132	
S corp "excess distributions"		41,500	43,000	44,545	
<b>Retained cash flow</b>		13,500	13,950	14,414	
C corp valuation adjustment		(5,000)	(5,150)	(5,305)	
<b>Retained cash flow to C corp</b>		8,500	8,800	9,109	
<b>Terminal value</b>				53,582	
<b>Total</b>		8,500	8,800	53,582	
<b>Net retained cash flow to investors (C corp)</b>		7,083	6,111	37,210	50,404

The first calculation determines the value of the subject company's retained cash flow as if it were a C corporation. Notice, however, that distributions have been estimated on an S corporation basis. (Year 1 distributions of \$76,500 have been calculated as 85 percent of year 1 net cash flow prior to any corporate taxes.) The model calculates the subject company's net cash flow to equity and removes distributions in each year to arrive at the cash flow retained by the business in each year. Next, the model adjusts retained cash flow to account for the difference in corporate and personal tax rates. Assuming that corporate and personal tax rates are different, the level of retained cash flow in each year needs to be adjusted to a C corporation basis. The benefit (or detriment) generated by the difference in corporate and personal tax rates will be accounted for in a separate calculation. Retained cash flow to the C corporation is then discounted to the present and summed. Next, the model considers the value of cash received by the investor (table 18.6).

Cash flow received by the investor is calculated net of personal income taxes then discounted to the present. This calculation accounts for the higher level of distributions received by an S corporation shareholder because the subject company pays no income taxes at the corporate level. Next, the model tackles the double taxation issue (table 18.7).

**TABLE 18.6 Treharne Model**

Year	Tax rates	Year 1	Year 2	Terminal Year	Present Value
<b>Distributions:</b>		76,500	79,050	81,677	
<b>Net Cash Flow to Investor</b>					
S corp tax distribution paid		35,000	36,050	37,132	
S corp "excess distributions" paid		41,500	43,000	44,545	
Personal taxes on S corp income	35%	(35,000)	(36,050)	(37,132)	
Net cash flow to investor		41,500	43,000	44,545	
Terminal value				262,029	
Total		41,500	43,000	262,029	
Present Value		34,583	29,861	181,965	246,409

**TABLE 18.7 Treharne Model**

Year	Tax rates	Year 1	Year 2	Terminal Year	Present Value
<b>Distributions:</b>		76,500	79,050	81,677	
<b>Double Taxation Adjustment:</b>					
Total S corp distributions		76,500	79,050	81,677	
C corp entity-related taxes		(40,000)	(41,200)	(42,436)	
S corp "excess distributions" paid		36,500	37,850	39,241	
S corp "excess dist." Tax benefit	20%	7,300	7,570	7,848	
Terminal Value				46,166	
Total		7,300	7,570	46,166	
Present Value (double tax adj.)		6,083	5,257	32,060	43,400

In table 18.7, the model first calculates the amount of S corporation distributions in excess of corporate income taxes as if the subject company was a C corporation. The excess in distributions paid represents the amount of actual distributions that would be subject to dividend taxes if the subject company was a C corporation. Dividend taxes are then calculated and discounted to the present. The net present value of this calculation represents the value of avoided dividend taxes due to the subject company's S election. Finally, we account for the difference in corporate and personal income taxes (table 18.8).

The final adjustment illustrated in table 18.8 is identical to the "C corporation valuation adjustment" made in the calculation of retained cash flow on a C corporation basis (see table 18.5). The difference in corporate and personal taxes is calculated and discounted to its present value.

**TABLE 18.8 Treharne Model**

Year	Tax rates	Year 1	Year 2	Terminal Year	Present Value
<b>Distributions:</b>		76,500	79,050	81,677	
<b>Tax Rate Differential Adjustment:</b>					
S corp entity related taxes	35%	(35,000)	(36,050)	(37,132)	
C corp entity related taxes	40%	(40,000)	(41,200)	(42,436)	
S corp benefit (detriment)		5,000	5,150	5,305	
Terminal value				31,203	
Total		5,000	5,150	31,203	
Present value (tax rate diff adj.)		4,167	3,576	21,669	29,412

Summing the net present value of each of the calculations completed previously brings us to the value of the subject company on an S corporation basis. In our example, this amounts to \$369,625.

As with the Grabowski and Van Vleet models, there are important considerations in determining when this method is appropriate for use. First, this model does not explicitly calculate the build up in basis for an S corporation. Treharne states that the build up in basis should be considered on a case-by-case basis. Treharne's model also assumes that the avoided dividend tax and difference in corporate and personal income taxes will continue indefinitely. Thus, the model assumes a long-term holding period. If you are valuing a minority interest in a company that has a sale date planned three years from now, there may be a material benefit generated by the build up in basis and you might want to consider a different model. In addition, if the subject company was sold and lost its status as an S corporation, it would be incorrect to reflect the impact of avoided dividend taxes and the differential between corporate and personal income tax rates in the company's value.

### The Fannon Model

In *Fannon's Guide to the Valuation of Subchapter S Corporations*, Nancy Fannon identifies the difficulty that analysts run into when attempting to explain the models presented earlier in this chapter. As a solution to this issue, Fannon developed what she considers to be a simplified model using a discounted cash flow analysis to measure the benefit of avoided dividend taxes and consider the benefit of the build up in basis. When using this model, an assumption must be made regarding when the subject company will be sold (or if it will continue indefinitely as an S corporation), as well as the likelihood that a purchaser would benefit from the S election. These assumptions necessitate the identification of potential buyers for the company. Analysts using this model need to investigate the facts and circumstances of each case (restrictions in the shareholder agreement, transaction data, and so on) in order to estimate whether or not the buyer would benefit from the subject company's S election.

Many of these calculations will look familiar because this model essentially completes the same calculation as the three models already discussed. Let's take a look at an example in table 18.9.

In the first calculation in table 18.9, a discounted net cash flow analysis of the subject company is conducted using personal income tax rates. The resulting figure is adjusted by the benefit from avoided dividend taxes and the build up in basis to arrive at the indicated value of 100 percent of the subject company on a marketable basis. This particular example assumes a sale after year 2 of the projection period.

The calculation of avoided dividend taxes is based on the difference in annual distributions and personal income tax liabilities in each year. Because the company is sold after year 2, there are no dividends or taxes to be paid in the terminal period. Depending on who the most likely buyer is, a probability percentage is applied to the net present value of avoided dividend taxes.

**TABLE 18.9 Fannon Model**

	<u>Year 1</u>	<u>Year 2</u>	<u>Terminal Year</u>
Pretax income	100,000	103,000	106,090

Debt principal changes	—	—	—
Net cash flow	55,000	56,950	58,959
Terminal value			346,815
Present value factor	0.8333	0.6944	0.6944
Discounted cash flow	45,833	39,549	240,844
Sum of discounted cash flow	326,225		
Benefit from avoided dividend taxes	12,888		
Benefit from build up in basis	6,590		
<b>Total indicated value, marketable</b>	<b>345,704</b>		
<b>Benefit from Avoided Dividend Taxes</b>			
	<u>Year 1</u>	<u>Year 2</u>	<u>Terminal Year (Assumed Exit)</u>
Annual distributions	76,500	79,050	
Personal income taxes	(35,000)	(36,050)	—
Equivalent C corporation dividends	41,500	43,000	—
C corporation dividend taxes	8,300	86,00	—
Present value factor	0.8333	0.6944	0.6944
Present value	6,917	5,972	—
Net present value	12,889		
Likelihood of buyer benefitting from S corp benefits	100%		
<b>Total estimated benefit from avoided dividend taxes</b>	<b>12,889</b>		
<b>Benefit from Build Up in Basis</b>			
	<u>Year 1</u>	<u>Year 2</u>	<u>Terminal Year (Assumed Exit)</u>
S corp net income	100,000	103,000	—
S corp distributions	76,500	79,050	—
Income in excess of distributions	23,500	23,950	—
Total income in excess distributions over projected period	47,450		
Capital gains taxes	9,490		
Present value factor	0.6944		
Present value	6,590		
Likelihood of buyer benefitting from S corp benefits	100%		
<b>Estimated benefit</b>	<b>6,590</b>		

The benefit from the build up in basis is determined based on the excess of pretax income over distributions to shareholders in each year. Capital gains taxes are calculated based on the total amount of income retained over the projection period.

The biggest strength of Fannon's simplified model is that it is relatively straightforward. It takes into account personal taxes, avoided dividend taxes, and the build up in basis. It also allows the analyst to consider the likelihood of a buyer being able to benefit from the subject company's S corporation status. However, this model (like the previous models) has its weaknesses as well. One of the biggest issues with the model is the fact that it can be difficult to explain when using it for an assignment in which the analyst must determine fair market value. The concept of identifying the most likely buyer may conflict with the concept of the hypothetical willing buyer. Identifying the probability of a buyer benefitting from the S election can also be an issue. Care must be taken when using this and all the models used to measure the S corporation benefit.

### How Our Firm Handled the S Corporation Issue

The model that I like the most, probably because to me it is the most simplistic, is Treharne's model. It was also the model that was referenced in *Delaware Open MRI*. The judge in that case did a fabulous job of explaining what he did. In fact, a footnote in the opinion cites a presentation that Treharne gave at an American Society of Appraisers conference as his source. Because I like this so much, let's look at table 18.10 and follow the calculations as the court did.

**TABLE 18.10**

#### Comparison of C Corporation to Pass-Through Entity

		<u>C Corporation</u>		<u>Pass-Through</u>
Debt free pre-tax income		100.00		100.00
Corporate income tax	40.0%	(40.00)	0.00%	—
Net income available to shareholders		60.00		100.00
Less: Addition to retained earnings	23.5%	14.10		23.50
Distributions	76.5%	45.90	76.5%	76.50
Less: Personal taxes	20.0%	(9.18)	35.0%	(35.00)
Net cash flow to shareholders		<u>36.72</u>		<u>41.50</u>

#### Net Increment to Shareholder

**4.78**

#### Calculation of Effective S Corporation Tax Rate

	<u>C Corp.</u>	<u>Pass-Through</u>	<u>Pass-Through Valuation</u>
Income before tax	100.00	100.00	100.00
Corporate rate	40.00%	0.00%	32.19%
Available earnings for distribution	60.00	100.00	67.81
Distributions	45.90	76.50	51.88
Dividend or personal income tax rate	20.00%	35.00%	20.00%
Available after dividends	<u>36.72</u>	<u>41.50</u>	<u>41.50</u>

Assuming the same facts and figures from previous examples, the model used in the *Delaware Open MRI* model calculates the difference in distributed cash flow to shareholders in a C corporation and S corporation. To stay consistent with previous examples, we have assumed a distribution rate of 76.5 percent of net income (equivalent to 85 percent of net cash flow). If the difference between the C corporation and pass-through cash flow is negative (meaning that the pass-through entity shareholder receives less cash flow), then there is a detriment to the subject company being an S corporation and no benefit exists. If the differential is positive, then there is a benefit to being an S corporation.

In the bottom portion of table 18.10, the model calculates the corporate level rate (32.19 percent) under the assumption that the subject company continues to generate cash flow to shareholders on an S corporation equivalent basis. In other words, the model works backwards from the pass-through level of cash flow to shareholders to arrive at the corporate level income tax rate. This methodology accounts for the benefit associated with avoiding dividend taxes and the differential in corporate and personal income tax rates. The only complaint that I have heard other analysts make about this and the Treharne model is that it does not consider the potential value that is attributable to the reduced taxes that the shareholder will pay due to the build up in the tax basis of the stock. My attitude about that is—does it really matter when the underlying assumption is that the willing buyer has a long-term horizon for the investment? The present value of the tax savings 20 or 30 years from now will be relatively small. I really do not believe that this is a major concern, but who am I to decide that?

## How Do the Models Compare?

By now, you probably have been keeping track of which models yield the highest (or lowest) values. Fortunately, we used the same assumptions throughout all of our examples in this chapter and can now draw a broad comparison of the models. The output of each model is summarized in table 18.11.

**TABLE 18.11 Summary of Methodologies**

Grabowski Models	\$334,140
Van Vleet Model	401,936
Treharne Model	369,625
Fannon Model	345,704
<i>Delaware Open MRI</i> Method	342,758

The preceding table shows that the range of indicated values can vary, but they are not all that far off from one another. The Van Vleet model generated the highest indicated value and is actually the most sensitive to a change in the tax rates. As discussed before, this model assumes that an investor would place equal value on distributions and retained net income. Because an investor in a privately held company is unable to immediately realize the benefit of retained net income (due to a long holding period), some additional discount for lack of marketability would be warranted to arrive at fair market value. The *Delaware Open MRI* method resulted in the second lowest value but did not include any value attributable to a build up in basis. It goes without saying that the selection of a methodology should be dependent on the facts and circumstances of the company the valuation analyst is valuing (and not on which model will yield the lowest or highest value). Thus, the analyst needs to understand all the assumptions and theories underlying these models before using them.

## Some Points to Consider

The models described previously are sensitive to changes in distributions and taxes. These factors affect each model differently. However, to illustrate the impact distributions have on a pass-through entity's value, we have changed an assumption within the model used in the *Delaware Open MRI* model.

As can be seen in table 18.12, when changing the level of distributions to 50 percent, cash flow to shareholders of an S corporation is negative (compared to a positive result in table 18.10). This means that given a 50 percent distribution rate, shareholders of an S corporation would have to reach into their own pockets to pay for the subject company's tax liabilities. Thus, it would be better for the subject company to be organized as a C corporation. Under the assumption that management would seek to maximize profits to shareholders, an analyst would then apply C corporation rates to the subject company's earnings.

A change in the tax rates, specifically dividend taxes, can make a major difference in the amount of benefit associated with the S election. In table 18.13, I have changed the level of dividend taxes to 35 percent (equal to personal taxes). Take a look at what happens.

When dividend taxes equal personal taxes, the benefit of the S election increases and the corporate-level income tax rate declines substantially. When the *Gross* decision was issued, dividends were taxed as regular income at marginal federal rates. The avoidance of additional taxes at the marginal federal rates resulted in substantial benefits to S corporation shareholders. Changes in the tax law in 2003 reduced federal dividend taxes to 15 percent and brought total taxes to the C corporation and S corporation shareholder much closer.

**TABLE 18.12****Comparison of C Corporation to Pass-Through Entity**

		<u>C Corporation</u>		<u>Pass-Through</u>
Debt free pre-tax income		100.00		100.00
Corporate income tax	40.0%	(40.00)	0.00%	—

Available after dividends	<u>29.84</u>	<u>41.50</u>	<u>41.50</u>

**Some New Thoughts on the Issue**

The models described throughout this chapter are cash-flow-based models because the benefits of the pass-through entity are adjusted for in the calculation of cash flow. These models require estimates of corporate and personal income tax rates to compare the cash flow that would flow through to an investor in a C corporation versus the cash flow that would flow through to an investor in a closely held pass-through entity. These tax rates are often based on the statutory corporate and personal income, dividend, and capital gains tax rates that are in effect as of the date of the valuation. However, many practitioners question the appropriateness of using such tax rates in these models. Research suggests that publicly traded companies and their investors have effective tax rates that are well below the statutory rates that are often used by practitioners. This can be due to a variety of factors, including the ability of certain investors to avoid and defer taxes, the presence of nontaxable institutional investors, and so on.<sup>18</sup> If a valuation analyst looks at an income statement of a publicly traded company, he or she will often see that the company's effective tax rate is far less than the corporate tax rates that are being used in the S corporation models. Furthermore, due to the diversity of the tax status of the investing public, the average tax rates incurred by the investing public are often below the 39.6 percent personal income tax rate for the highest income bracket.

In *Taxes and Value*, published by Business Valuation Resources, Nancy Fannon and Keith Sellers discuss an alternative methodology that addresses this issue. Although I will not go into complete detail regarding this revised model and its assumptions, it is important for valuation analysts to at least be aware of these issues when performing the valuation of a pass-through entity. According to the authors, one manner in which to adjust for the tax differences between the pass-through entity and the C corporation is by making an adjustment to the discount rate. The logic behind this is that the rates of return that are used in the derivation of the

18 Nancy J. Fannon and Keith F. Sellers, *Taxes and Value*, (Portland, OR: Business Valuation Resources, 2015): 62–63.

cost of capital have certain shareholder-level tax rates embedded in them. Therefore, the valuation analyst can remove the effect of these embedded shareholder-level taxes from the discount rate so that it better matches the tax rate utilized in the calculation of the subject company's after-tax cash flows. The Fannon/Sellers model deducts the income taxes that would be incurred by a shareholder in a pass-through entity and adjusts the cost of capital to reflect the same tax rate that was used in the income stream. This publication contains research that shows that shareholder-level taxes negatively affect stock prices.

Although the concept seems plausible, starting to adjust the discount rate may get the valuation analyst in trouble if the calculations are not done correctly. I previously discussed discount rates in chapter 13, and if that discussion wasn't confusing enough, now consider making another change that would have to consider the various tax rates that took place over the period of time for the companies in the specific industry that the subject company is in. This entire concept is sure to blow whatever budget the valuation analyst may have to perform the valuation. My suggestion is that the valuation analyst study this entire concept in greater detail before leaping of the cliff!

## Other Pass-Through Entities

Although I have mainly addressed the pass-through status of S corporations, there are other types of pass-through entities, including partnerships (limited and general partnerships), limited liability companies, real estate investment trusts (REITs), and closed-end investment funds. The profits and losses of these entities (like S corporations) are passed through to the owners and subject to personal tax rates. These entities must also meet certain criteria in order to maintain their pass-through tax status. For example, REITs must make distributions totaling at least 90 percent of their taxable income each year. The theory and models shown in this chapter can be adapted to these other pass-through entities, as well. However, the valuation analyst needs to be aware of other tax code sections that could affect what he or she is doing. For example, a partnership may have an IRC Section 754 election available. I am purposely not going to explain what this means. If it is not known already, the valuation analyst, needs to make sure that he or she is working with a CPA or a tax attorney about the tax issues.

## Conclusion

By this point, an analyst should have some understanding of why valuations of pass-through entities can be problematic and how to deal with this issue. Remember that the need to account for a premium associated with a company's pass-through status depends on the data used to derive value. If the valuation analyst is using a discount rate derived from C corporations, he or she needs to account for the subject company's pass-through tax status. If the analyst compiled market multiples from REITs, which are pass-through entities, no adjustment for the subject company's pass-through status is necessary. As with any other step in the valuation process, common sense should prevail when selecting a model to apply in any valuation. Let's forge on to the next chapter on financial reporting (which is sure to give anyone a headache)!

# Chapter 19

# Valuation in Financial Reporting

## Learning Objectives

Because performing valuation assignments for financial reporting purposes has become increasingly important, I decided to include it as a separate chapter in this book. If I did my job properly, at the conclusion of this chapter, the following should be clear (or, more confusing):

- The primary reasons for fair value measurements in financial reporting
- The accounting standards that are applicable to fair value measurements
- How to apply fair value measurements in business combinations
- How to apply fair value measurements in impairment testing
- Where to find the profession's best practices in this area
- How to work with management's outside auditor in defending the reasonableness of your conclusions
- The new Mandatory Performance Framework
- Identifying intangible assets for financial reporting

## Introduction

An area of valuation that has been growing over the past decade is valuations for financial reporting. Certain accounting standards require individual assets and liabilities acquired as part of a business combination to be measured on the opening balance sheet as of the date of the acquisition at their relative fair values. Other accounting standards require that these assets be subsequently tested for impairment in future periods, which often requires additional fair value measurements for the impairment test. This is an area that has become a specialization within the business valuation profession. There are many firms that only perform these types of valuations and many firms that will not touch them. The rules are very complex and subject to scrutiny at several different levels. Therefore, the scope of this chapter is not intended to be an end-all that one needs to know to practice in this area; it is intended to provide you with an introduction to this specialized area and refer you to additional resources. I will provide examples of valuing certain individual intangible assets in chapter 20.

Measuring fair value is one of the more controversial topics in financial accounting because the measurement inherently requires some judgment. Consequently, it is a complex area of practice for valuation analysts (we are actually referred to as *valuation specialists* in the accounting literature). Valuation specialists not only have to be experienced in valuation itself but also have a fundamental understanding of the accounting standards that require fair value. Often, the accounting standards require assumptions in the measurement that, at first glance, seem counterintuitive to valuations for other purposes. Before I explain how to measure fair value, I will provide an overview of the accounting standards themselves to provide a basis for the actual valuation measurement. Now don't get too excited.

## Background of Valuation in Financial Reporting

Although measuring fair value has been a requirement in many accounting pronouncements for decades, the use of outside valuation specialists to assist management with fair value measurement has recently become more widespread. One reason for the increase is the requirement in financial reporting to measure assets and liabilities acquired in a business combination at fair value and to test impairment of long-lived assets. FASB issued *Accounting Standards Codification (ASC) 805, Business Combinations* (formerly FASB Statement No. 141R), for fiscal years beginning after December 15, 2008. FASB Statement No. 141 was originally issued

in 2001. FASB ASC 350, *Intangibles—Goodwill and Other* (formerly FASB Statement No. 142), was issued shortly thereafter.

As the valuation analyst will soon realize, fair value measurement requires unique valuation skills. Management often retains an outside valuation specialist to assist them with the measurement. The use of an outside valuation specialist creates a new dynamic in the measurement process in financial reporting, and the valuation specialist has to understand his or her role in the process. Not only is the valuation specialist providing an opinion on the fair value of the assets, and sometimes the liabilities, of an acquired company in a business combination, but the valuation specialist's work product is also used as audit evidence for management's representations about the fair value measurement. Valuation specialists working in this area must realize that auditors have to be comfortable with the reasonableness of the methods and assumptions used by the specialist. This is a very different process than providing a valuation for tax reporting purposes or providing expert testimony in a dispute.

Another factor that valuation specialists have to understand when practicing in this area is that best practices related to fair value measurement continue to evolve within the accounting and valuation professions. To understand the best practices, it is helpful to understand the recent history of fair value measurements. Another history lesson—just what you were looking forward to! I'll keep it brief, I promise.

## FASB ASC 820, *Fair Value Measurement*

In 2006, FASB introduced a new accounting standard that provides a framework of how FASB would like fair value to be measured in financial reporting. This standard is now codified as FASB ASC 820, *Fair Value Measurement* (formerly FASB Statement No. 157). I will refer to it just as FASB ASC 820. FASB ASC 820 provides guidance and information about fair value measurement in financial reporting.

FASB ASC 820 does not create any new requirements for *when* fair value should be used. Instead, it provides additional guidance to preparers of financial statements about *how* fair value should be measured whenever it is required in financial reporting. FASB issued the standard to provide information about the assumptions that should be used when measuring fair value if required by any other accounting standard. FASB ASC 820 actually describes certain valuation concepts, provides a uniform definition of *fair value*, sets forth a “hierarchy” of input assumptions to be used in the measurement of fair value, and requires specific disclosures about the inputs and the assets and liabilities measured at fair value.

### Definition of Fair Value

We already covered the definitions of *value* in chapter 3, but, here we go again. FASB ASC 820 provides additional details on several concepts that should be considered in fair value measurements in financial reporting. The most important is the definition of *fair value*. *Fair value* is defined as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.<sup>1</sup>

Note that this definition of *fair value* is used exclusively in financial reporting. The definition of *value* in shareholder disputes is sometimes also referred to as *fair value*; however, the definition of *value* in those matters is completely different than the concepts I am discussing here. I will discuss shareholder fair value in chapter 24.

The first concept that is interesting in this definition is that *fair value* is the price to “be received to sell an asset.” Fair value is an exit notion, meaning that it is not necessarily the price that was paid for the asset, but, what would be received if the assets were to be sold in the market place. This definition does not presume that the asset is expected to be sold or even considered to be sold, just if it *were* to be sold. The second concept embedded in this definition is that the measurement is for a particular asset or liability, meaning the measurement should consider attributes specific to the asset or liability. For example, the measurement should consider the condition and location of the asset or liability and any restrictions on its potential sale or use.

<sup>1</sup> See FASB Accounting Standards Codification (ASC) 820, *Fair Value Measurement*, at [www.fasb.org](http://www.fasb.org).

The definition of *fair value* is somewhat similar to the concept of *fair market value* as defined for tax purposes in Revenue Ruling 59-60. If these concepts seem familiar, it's because FASB had considered using the same definition of fair market value from Revenue Ruling 59-60 (see FASB Statement No. 157, *Fair Value Measurements and Disclosures*, paragraph C50). However, FASB did not want to inadvertently bring all the court decisions about fair market value into the financial reporting area. The FASB definition of *fair value* has some differences from *fair market value*, particularly concerning the process that the valuation specialist should undergo when making assumptions in the measurement, which I will explain as we continue.

One of the important considerations in measuring fair value is something that is referred to in accounting literature as the *unit of account*. *Unit of account* means that when measuring the fair value of an asset or liability, the assumptions that the valuation specialist uses may be as if the asset is sold or liability transferred by it. Or, if value is maximized by selling in conjunction with other assets or liabilities, it is okay to assume a sale of the group of different assets if that assumption maximizes value from a market participant perspective. You need to consider how the maximum value to market participants would be achieved, whether as a "stand alone" (if the asset would provide maximum value to market participants principally on a stand-alone basis) or as a "combined use" (if the asset would provide maximum value to the market participants principally through its use in combination with other assets as a group).<sup>2</sup>

As an example, let's say the valuation specialist is measuring the fair value of three intangible assets acquired in a business combination: technology, a trade name, and a customer list. First, we assume what the price would be in the marketplace if we sold these three assets (despite the fact we are measuring their fair value because we just bought them). If the fair value of these individual assets would be maximized if sold as a group, rather than individually, then we can make that assumption.

The second consideration is where the asset would most likely be sold or where the liability would be transferred to. Well, FASB also answers that question in FASB ASC 820. First, the analyst is supposed to look at the potential market where the asset could be sold. A fair value measurement assumes that the transaction to sell the asset or transfer the liability occurs in the principal market for the asset or liability or, in the absence of a principal market, the most advantageous market for the asset or liability. The FASB ASC glossary defines these terms as follows:

The *principal market* is the market in which the reporting entity would sell the asset or transfer the liability with the greatest volume and level of activity for the asset or liability.

The *most advantageous market* is the market in which the reporting entity would sell an asset or transfer a liability with the price that maximizes the amount that would be received for the asset or minimizes the amount that would be paid to transfer the liability, considering transaction costs in the respective market(s).<sup>3</sup>

In measuring fair value, the principal market for the asset or liability should be considered first. If there is no market that meets the criteria of the principal market, then the asset is assumed to be sold in the most advantageous market. The most advantageous market is where the seller would receive the highest price. Now, doesn't this seem circular? Hey, I don't make these crazy rules. Even I am not that dysfunctional (I hope).

One twist to receiving the highest price is that FASB ASC 820 asks us to ignore transaction costs in fair value measurement because transactions costs are not an attribute of the asset or liability; rather, they are specific to the transaction and will differ depending on how the reporting entity transacts.<sup>4</sup> One simple way to think of this concept is to think about the value of your house. People typically think about the value of their homes in terms of what price they could sell their houses for, not the amount they could realize after real estate commissions.

2 FASB Accounting Standards Update (ASU) No. 2011-04, *Fair Value Measurement (Topic 820): Amendments to Achieve Common Fair Value*.

3 See FASB ASC 820 at [www.fasb.org](http://www.fasb.org).

4 *Ibid.*

However, FASB does allow the consideration of transportation costs in the measurement, if any market participant would do so. I mentioned briefly that location is an attribute of the asset or liability. Consequently, the fair value of the asset or liability must be adjusted for any costs that would be incurred to transport the asset or liability to or from its principal or most advantageous market. So, if you have to ship the machine to Mexico, include that cost. An example of this stuff follows.

### Example of Principal and Most Advantageous Markets

Banana Company acquires Tangerine Company in a business combination. On its balance sheet, Tangerine has an investment in the common stock of Grape Company, a publicly traded company that is listed on the New York Stock Exchange (NYSE) and London Stock Exchange as follows:

Exchange	Price	Transaction Costs	Net
NYSE	\$21	\$3	\$18
London	\$20	\$1	\$19

The accounting standards require a fair value measurement of the common stock of Grape held by Tangerine. What is the fair value of the common stock of Grape? The answer would be \$21 if the principal market is the NYSE. The answer would be \$20 if the principal market is London.

The answer would be \$20 if neither NYSE nor London is the principal market. This is based on the most advantageous assumption, which results in a net of \$19. Note that in order to determine the most advantageous market, one considers the net price to be received if the stock of Grape is sold in the open market. However, FASB ASC 820 asks us to ignore transaction costs in the fair value measurement itself. So, transaction costs can be considered in determining the most advantageous market but not in the conclusion of fair value. Ain't that a kick? How is anyone supposed to get this stuff right?

### Market Participants Assumptions

The key concept in FASB ASC 820 is that fair value is based on how a market participant would view the price of the asset using market-based assumptions in its pricing and not necessarily entity-specific assumptions. The FASB ASC glossary defines *market participants* as buyers and sellers in the principal (or most advantageous) market for the asset or liability that has all the following characteristics:

- Independent of the reporting entity (that is, they are not related parties).
- Knowledgeable (having a reasonable understanding about the asset or liability and the transaction based on all available information, including information that might be obtained through due diligence efforts that are usual and customary).
- Able to transact for the asset or liability.
- Willing to transact for the asset or liability (that is, they are motivated but not forced or otherwise compelled to do so).<sup>5</sup>

Doesn't this really sound like fair market value? It is truly close, but not exact.

As I discussed previously, the fair value of the asset or liability is based on the assumptions that market participants, not necessarily the entity, would use in pricing the asset or liability. In developing these assumptions, the reporting entity does not have to identify specific market participants. Rather, the reporting entity should identify characteristics that distinguish market participants generally, considering factors specific to (a) the asset or liability, (b) the principal or most advantageous market for the asset or liability, and (c) market participants with whom the reporting entity would transact in that market. Typically, these market participants fall into two broad groups: strategic acquirers or financial acquirers.

<sup>5</sup> *Ibid.*

A staff person in the Office of the Chief Accountant at the SEC provided guidance concerning market participants when markets are inactive.<sup>6</sup> In a speech at an AICPA conference, the SEC staff person outlined what should be considered when making assumptions from a market participant viewpoint. Some of the considerations outlined in the speech were as follows:

- What are the potential exit markets for an asset, and what is the asset's principal or most advantageous market?
- Whether the market is active, inactive, or recently inactive.
- Whether there are distinct groups of market participants (strategic versus financial buyers).
- Whether there are clusters within the groups (small versus large and profitable versus unprofitable).
- The competitive nature of the market (perfect competition versus monopoly and fragmented versus unfragmented).
- What is the highest and best use for the asset?
- Must identify all potential uses for the asset.
- Who are the potential market participants, and what are their distinguishing characteristics?
  - Financial versus strategic buyers
  - National versus regional competitors
    - o Financial capacity
    - o Acquisition strategy
    - o Marketplace synergies
    - o Market share
    - o Complimentary assets
    - o Management capabilities
- How do the market participant characteristics compare to the reporting entity's own characteristics?

## Highest and Best Use Application Criteria Applied in Fair Value Measurements

In a preceding chapter of this book, I discussed the concept of highest and best use. Well, guess what? It's here again, but this time in the context of fair value. Measuring the fair value of nonfinancial assets (both tangible and intangible) also assumes the highest and best use of the asset by market participants. FASB suggests that highest and best use is physically possible, legally permissible, and financially feasible at the measurement date. Highest and best use assumes that market participants would maximize the value of the asset, or the group of assets within which the asset would be used. Highest and best use is determined by how market participants would likely use the asset, even if the intended use of the asset by the reporting entity may be different than a market participant's use.

To illustrate the concept of highest and best use, suppose Big Technology Company (Big Tech) makes an acquisition of Little Technology, Inc. (Little Tech). To keep it simple, assume that in the business combination, Big Tech acquires just three assets: developed technology, customer relationships, and a trade name. Also assume that the reason Big Tech acquired Little Tech was for the customer relationships and did not plan to use the technology acquired because Big Tech believes that the technology it already has is far superior. The question under fair value measurements is what is the fair value of the technology if Big Tech decides not to use it? In order to answer that question, you have to think about how market participants would use the technology. If market participants would act in the same manner as Big Tech and not utilize it, the fair value of the acquired technology would likely be minimal. However, if market participants would likely exploit the technology and use it in products, then the fair value measurement would be modeled upon that assumption, even if Big Tech has no plans to do so. Are you beginning to understand why many business valuers will not touch this stuff?

<sup>6</sup> Evan Sussholtz, Speech by SEC Staff: Remarks Before the 2009 AICPA National Conference on Current SEC and PCAOB Developments, December 7, 2009.

## FASB ASC 805, *Business Combinations*

FASB ASC 805 changed the way business combinations are recorded in financial reporting. Many of us are familiar with the purchase method of accounting which used to be used for all business combinations. FASB ASC 805 changed the concept of accounting for business combinations through the introduction of the acquisition method. Applying the acquisition method under FASB ASC 805 requires the following:

1. Identifying the acquirer
2. Determining the acquisition date
3. Recognizing and measuring the identifiable assets acquired, the liabilities assumed, and any noncontrolling interest in the acquiree
4. Recognizing and measuring goodwill or a gain from a bargain purchase<sup>7</sup>

There are some interesting differences in measuring fair value under FASB ASC 805 than there were under the old purchase accounting rules. First, under the acquisition method, the fair value of the consideration paid is independent from the fair value of what was received in the combination. That is why FASB no longer requires allocating to a particular price. Another significant difference is that under the acquisition method, the fair value of contingent consideration (earnouts) is to be measured at its relative fair value.<sup>8</sup>

Also, FASB ASC 805 requires an acquirer to recognize assets or liabilities arising from contingencies as of the acquisition date, measured at their acquisition date fair values, only if it is probable that an asset existed or that a liability had been incurred as of the acquisition date and if the amount of the asset or liability can be reasonably determined.

### Recognizing Identified Assets in Business Combinations

An intangible asset is recognized as an asset apart from goodwill if it meets one of two criteria:

1. The asset arises from contractual or other legal rights (regardless of whether those rights are transferable or separable from the acquired entity or from other rights and obligations).
2. If it is separable (that is, it is capable of being separated or divided from the entity and sold, licensed, exchanged, rented, or transferred (SLERT)) regardless of whether there is intent to do so. An intangible asset that cannot be sold, transferred, licensed, rented, or exchanged individually is considered separable if it can be sold, transferred, licensed, rented, or exchanged in combination with a related contract, asset, or liability.<sup>9</sup>

So now that the analyst is probably confused (I know I am), let's illustrate some of this stuff. A brief case study in measuring fair value in a business combination is provided in exhibit 19.1.

#### EXHIBIT 19.1 Example of the Acquisition Method

##### ALPHATECH, INC

On December 31, 20X1, the publicly traded technology company Alphatech, Inc. (Alphatech) acquired 100 percent of the equity of Betatech, Inc. (Betatech). The acquisition price was \$500,000 in cash, \$16,000,000 in Alphatech common stock, and an additional \$2,200,000 in cash if certain technology under development is completed and beta tested within one year of the acquisition date. Alphatech is very confident that the technology under development will be successfully implemented in a second generation product. In addition, Alphatech will assume a \$1,900,000 note payable owed to a Betatech investor. Betatech was founded in January 20X0 by two individuals named Bill Meridian and Roger Eckert. Bill and Roger developed a new technology that allows wireless Internet access over much greater distances than currently available.

<sup>7</sup> See FASB ASC 805 at [www.fasb.org](http://www.fasb.org).

<sup>8</sup> For additional information on measuring the fair value of contingent consideration, see "Valuing Contingent Consideration: Challenges and Solutions" *Journal of Accountancy* (November 2011): 28.

<sup>9</sup> See FASB ASC 805 at [www.fasb.org](http://www.fasb.org).

**EXHIBIT 19.1 Example of the Acquisition Method**

1. Discuss the steps in the acquisition method required under FASB ASC 805, *Business Combinations*. What are the criteria for determining the acquirer and the acquisition date? In this example, which entity is the acquirer, which is the acquiree, and what is the date of the business combination?

Alphatech hired an outside valuation specialist to estimate the fair value of the assets and liabilities acquired as part of the acquisition under FASB ASC 805. The valuation specialist summarized the fair value of the acquisition price and requested historical financial statements as a starting point in the analysis.

The calculation of the acquisition price appears in table 1, and the historic financial statements appear in tables 2 and 3.

The valuation specialist analyzed Betatech's working capital requirements. Because fair value measurements in business combinations are from the perspective of market participants instead of specific entities, the valuation specialist analyzes industry working capital requirements. The working capital computation appears in table 4.

Notes: (1) RMA Annual Statement Studies 2002–2003.

As part of the acquisition due diligence, Alphatech developed a set of forecasts which were prepared with the assistance of Bill and Roger and represent their best estimate of the future performance of Betatech as of the acquisition date. The outside valuation specialist used these forecasts as a basis for a discounted cash flow analysis. The valuation specialist also analyzed Betatech's weighted average cost of capital for use as a discount rate in a discounted cash flow analysis. The working capital requirement and a perpetual growth rate are other key assumptions in the discounted cash flow analysis. The weighted average cost of capital and discounted cash flow analysis appear in tables 5 and 6.

- (5) Operating expenses projection provided by management did not include depreciation.
- (6) Terminal year value is calculated based on the Gordon Growth model.

**EXHIBIT 19.1 Example of the Acquisition Method**

2. How does the valuation specialist identify and measure the fair value of the company's intangible assets?

Alphatech's management indicated that they believed that in addition to the net working capital and various fixed assets, several identified intangible assets were acquired. These intangible assets include the following:

- Developed technology
- In-process research and development
- Customer relationships
- Trade name
- An assembled workforce
- Non-competition agreements with the selling shareholders

3. How is goodwill or the gain from a bargain purchase recognized and measured?

A summary of the Betatech acquisition is provided in table 7. It shows how the fair value of the acquisition price is allocated to the acquired tangible and intangible assets and illustrates the calculation of goodwill as a residual value. In this example, the fair value of the assembled workforce is shown separately. However, it would be recorded as goodwill and would not be recognized as a separate asset in the financial statements.

**TABLE 7 Betatech, Inc.—Date of Valuation: December 31, 20X1—

### EXHIBIT 19.1 Example of the Acquisition Method *(continued)*

Now, let's go over some suggested answers to the questions raised.

1. FASB ASC 805, *Business Combinations*, requires that a business combination be accounted for by applying the acquisition method. Applying the acquisition method requires all of the following steps:
  - Identifying the acquirer
  - Determining the acquisition date
  - Recognizing and measuring the identifiable assets acquired, the liabilities assumed, and any noncontrolling interest in the acquiree
  - Recognizing and measuring goodwill or a gain from a bargain purchase

Under the acquisition method, one entity acquires another, and a business combination occurs when one business entity gains control over another business entity. The entity that gains control of the acquiree is considered to be the acquirer. Control generally means a controlling financial interest in another entity, which is usually indicated by the ownership of a majority voting interest. The acquirer is usually the entity that transfers the cash or other assets or is the entity that incurs the liabilities in order to effect the business combination.

The acquisition date is the date on which the acquirer obtains control of the acquired company. Control is typically demonstrated when the acquirer transfers consideration, acquires the assets, and assumes responsibility for the acquired liabilities, which usually occurs on the closing date of the transaction.

In this example, Alphatech is the acquirer, Betatech is the acquired entity, and the acquisition date is December 31, 20X1.

2. A good starting point for identifying acquired intangible assets is discussion with management. Because the costs to develop intangible assets are generally expensed as research and development, some assets that were not previously recognized by the acquired company may have to be recognized as a result of the business combination.

Under FASB ASC 805, the acquirer is required to recognize identifiable intangible assets separate from goodwill. An intangible asset is considered to be identifiable if it meets either the separability criterion or the contractual legal criterion contained in the FASB ASC master glossary's definition of *identifiable*. According to the master glossary, an asset is identifiable if:

- (1) It is separable, that is, capable of being separated or divided from the entity and sold, transferred, licensed, rented, or exchanged, either individually or together with a related contract, identifiable asset, or liability, regardless of whether the entity intends to do so. Or,
- (2) It arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations.

The fair value of the intangible assets is measured through a variety of methods under the cost, market, and income approaches to valuation.

3. Generally, goodwill is recognized when the fair value of the consideration transferred exceeds the sum of the fair value of assets acquired and liabilities assumed. If the sum of the fair value of assets acquired and liabilities assumed is greater than the fair value of the consideration transferred, then the business combination is considered a bargain purchase and a gain is recognized. Goodwill is a residual value or the difference between the fair value of the acquisition price and the sum of the fair values of all identifiable tangible and intangible assets and liabilities.

The fair value of the identified intangible assets in exhibit 19.1 was measured using valuation techniques that are discussed in more detail in the next chapter. I wanted to demonstrate that in a business combination, there are several ways that valuation specialists can assist management in measuring fair value. First, the consideration paid in the transaction is measured at fair value, including the contingent component. Second, a valuation specialist can assist management with the fair value of the acquired business enterprise. Third, a valuation specialist can assist management with measuring the fair value of the identified intangible assets.

## Fair Value Measurements in Impairment Testing

The accounting using fair value measurements in business combinations is as of the date of the acquisition. However, there are also fair value measurements specifically for testing various assets previously recorded on the balance sheet in the business combination for potential impairment that may require a valuation specialist in periods subsequent to the date of the acquisition.

In financial reporting, specifically under FASB ASC 350 (originally FASB Statement No. 142), goodwill is no longer amortized for financial statement reporting purposes but, rather, is tested at least annually to determine if its carrying value has been impaired. Testing goodwill for impairment is a two-step process that begins with the measurement of the fair value of a reporting unit. The first step is to determine if there is potential impairment, and the second step actually measures the amount of any impairment. However, FASB issued guidance under Accounting Standards Update (ASU) No. 2011-08, *Intangibles—Goodwill and Other (Topic 350): Testing Goodwill for Impairment*, which says that if certain qualitative criteria are met, the requirement to test goodwill for impairment annually can be satisfied without going through the original two-step process. The qualitative assessment is sometimes referred to as *step zero*. FASB's decision to add a step zero is for companies who have goodwill, and it is more likely than not that there is no impairment of the goodwill. Step zero helps those companies limit when they have to go through the sometimes costly and time-consuming impairment testing process.

The qualitative factors outlined in ASU No. 2011-08 are not intended to be all inclusive and are not intended to represent stand-alone events or circumstances that would require the entity to perform the first step of the impairment test. In addition, an entity should consider positive and mitigating events and circumstances that may affect its conclusion. Examples of events and circumstances that would require assessment follow. This list is not exhaustive:

- General macroeconomic conditions
- Deterioration in general economic conditions
- Limitations accessing capital
- Fluctuations in foreign exchange rates
- Other developments in equity and credit markets
- Industry and market considerations
- Deterioration in the operating environment
- Increased competition
- A decline in market-dependent multiples
- A change in the market for the entity's products or services
- A regulatory or political development
- Cost factors that have a negative effect on earnings
- Increases in raw materials, labor, or other costs
- Decline in overall financial performance
- Negative or declining cash flows
- A decline in actual or planned revenues or earnings
- Entity-specific events
- Changes in management or key personnel
- Changes in strategy or customers
- Bankruptcy or litigation
- Events affecting a reporting unit
- A change in the carrying amount of net assets (write-offs)
- Plans to sell or dispose of a portion or all of a reporting unit
- Testing for recoverability of a significant asset group within a reporting unit
- Recognition of goodwill impairment in a component of the reporting unit
- A sustained decrease in share price, both absolutely and relative to peers.<sup>10</sup>

This qualitative assessment provides a better cost benefit for preparers of financial statements. Although this list is not exhaustive, after an analysis of these and other material factors, if the preparer of the financial statements believes it is more likely than not that the goodwill is not impaired, then the preparer can forgo the test described in FASB ASC 350.

In addition to testing goodwill for impairment, FASB ASC 350 also provides guidance on testing identifiable intangible assets that are indefinite-lived and, as such, are not amortized for impairment. Intangible assets that are not amortized are tested for impairment by comparing the fair values of those assets with their recorded amounts. Finally, FASB ASC 360 describes testing of long-lived assets, which are currently being amortized, for impairment.

.....  
 10 ASU No. 2011-08, *Intangibles—Goodwill and Other (Topic 350): Testing Goodwill for Impairment*.

Under FASB ASC 350 (FASB Statement No. 144), the asset or asset group has to be tested for impairment if the asset or the asset group has a “triggering event,” such as the following:

- A significant decrease in the market value of the asset
- A significant change in the extent or manner in which the asset is used or significant physical change to the asset
- A significant adverse change in legal factors or in the business climate that could affect the value of an asset, or an adverse action or assessment by a regulator
- An accumulation of costs significantly in excess of the amount originally expected to acquire or construct an asset
- A current-period operating or cash flow loss combined with a history of operating or cash flow losses or a projection or forecast that demonstrates continuing losses associated with an asset used for the purpose of producing revenue

The test is simple in concept. If a triggering event occurs, then as of that date, you need to measure all the future expected cash flows that the asset or asset group is expected to generate and add it up. The cash flow is not discounted but simply summed. If the sum of the undiscounted cash flows is greater than the carrying value (the amount recorded on the financial statements), then the asset or group is not impaired. If the sum of undiscounted cash flows is less than the carrying amount, then the asset is measured at its fair value as of the test date. The difference between the fair value and the carrying value is the amount of impairment.

There are a lot of fair value measurement requirements in financial reporting on an ongoing basis. This can help the valuation analyst obtain a recurring engagement.

## When to Test for Ongoing Impairment

The following table should provide a basic understating of when to test for an impairment.

	Frequency of Testing	Standard for Impairment Testings
Goodwill	Annually or if indicated	FASB ASC 350-20 (FASB Statement No. 142)
Intangible assets with indefinite lives	Annually or if indicated	FASB ASC 350-20 (FASB Statement No. 142)
Intangible assets subject to amortization	If indicated	FASB ASC 350-30 (FASB Statement No. 144)

If assets under each of these categories are tested for impairment on the same test date, then they are tested in reverse order from the preceding list. For example, if they fail the triggering event, intangible assets subject to amortization are tested for impairment first, then indefinite-lived assets are tested for impairment, followed by testing goodwill for impairment.

## Developing Best Practices in Valuation for Financial Reporting

One aspect of measuring fair value that valuation specialists have to understand when practicing in this area is that best practices related to fair value measurement continue to evolve within both the accounting and valuation professions. Fortunately, there are many resources currently available to help practitioners.

## Valuation Resource Group

Shortly after FASB Statement No. 157 was issued, FASB created a Valuation Resource Group (VRG) to provide advice to FASB staff about implementation issues related to fair value measurements. The VRG comprises preparers, auditors, and valuation specialists. The members of the VRG provide alternative viewpoints about implementation issues. Valuation specialists should follow the summaries of discussions of

issues considered to be of importance by the VRG so that the specialists can be aware of current best practices in applying fair value measurements. Issues discussed by the VRG can be found on FASB's website at [www.fasb.org](http://www.fasb.org).

## AICPA

The AICPA is also at the forefront of providing its members with best practices on several topics related to fair value. One such initiative is an update of the practice aid titled *Assets Acquired in a Business Combination to be Used in Research and Development Activities: A Focus on Software, Electronic Devices, and Pharmaceutical Industries*, which is sometimes referred to as the IPR&D practice aid. One useful aspect of the updated practice aid is that the methodologies included have a wide application to other types of intangible assets, not just in-progress research and development. The revised practice aid will consider the impact of FASB ASC 820 and the new revised business combinations statement in FASB ASC 805.

The AICPA has also revised the practice aid *Valuation of Privately-Held Company Stock Issued as Compensation*, taking into consideration the financial reporting impact of FASB ASC 820 on the measurement of equity issued as compensation. The updated practice aid addresses several issues related to fair value measurement of an equity interest, including consideration of marketability restrictions, controlling versus noncontrolling interests, and the treatment of debt in the measurement. One tricky issue that is addressed is the application of what is known or knowable when measuring fair value. For example, when a company undergoes an initial public offering (IPO), the filings must include three years of audited financial statements. Sometimes, the financial statements for each of the three years are prepared in anticipation of the IPO. When measuring fair value, the question the new guide considers is how the valuation specialist should consider the impact of the now more likely IPO on a discount for lack of marketability in previous reporting periods.

A third AICPA guide addresses issues in testing goodwill for impairment. The guide provides discussion about the first step of the two-step goodwill impairment test, such as identifying and assigning assets and liabilities to reporting units. The guide also discusses the impact of FASB ASC 820 on goodwill impairment testing and provides detailed examples of valuation techniques related to step one of goodwill impairment testing. The guide also discusses the qualitative factors in testing goodwill for impairment under ASU No. 2011-08.

## Working With the Client's Outside Auditing Firm

In the introduction, I mentioned that there are several unique aspects of valuations used for financial reporting. One aspect is that the measurement, particularly with intangible assets, often requires judgment. A second aspect is that the preparer of the financial statement assumes responsibility for the conclusion of the work product of the outside valuation specialist retained to assist them with the measurement. A third aspect is that the valuation specialist's work product (a report or working papers, or both) is often used as audit evidence of the reasonableness of the measurement. A fourth aspect is that the preparer's outside auditing firm may have another valuation specialist, usually from the same firm, as part of the audit team to test the reasonableness of management's fair value measurements. Each of these aspects creates what I referred to in the introduction as a *unique dynamic* in the measurement process. In other words, there are so many other people who are going to scrutinize your work that you may find yourself justifying what you did to others who have little or no knowledge about the intricacies of business valuation.

In dealing with this unique dynamic, one important suggestion is to have open and frequent communication with your client and, if at all possible, its outside auditor. This includes an initial meeting or conference call with all parties to make sure that the various roles in the engagement are understood. The specific intangible assets that are identified by management should also be addressed. The audit firm should address any issue related to the timing of the results of the engagement and the work product expected for the audit process. The valuation specialist should be prepared to discuss at least preliminarily the methods of valuation that are being considered and any important assumptions that will be used in the measurement process. The initial communication helps set expectations by each party. I cannot begin to tell you how often I have received a call that goes something like this: "I need to have an allocation of purchase price done because my auditors

are in and need it for our SEC filing next week.” After I stop laughing, I usually suggest that they find a very large firm that could put an army of appraisers on the job at a cost that will be much more than I can consider charging for my time. It is bad enough that the client expects the valuation specialist to drop what he or she is doing to take on this last-minute assignment; but the client also wants it cheap. Good luck!

## The New Mandatory Performance Framework

As a result of the SEC’s apparent dissatisfaction with the valuation for financial reporting work that it sees, several valuation organizations got together (AICPA, ASA, and RICS<sup>11</sup>) to create a Mandatory Performance Framework (MPF) that can lead valuation analysts to becoming Certified in Entity and Intangible Valuations (CEIV™). The Fair Value Quality Initiative is a collaboration among the three valuation professional organizations (VPOs) to develop a professional credential and a quality framework for valuation analysts who perform fair value measurements for financial reporting of public companies.

The MPF is a practical nonauthoritative framework that defines the level of documentation and performance that is necessary to provide supportable and auditable fair value measurements. By design, the MPF and the application sections of the MPF do not provide illustrative examples that might otherwise be interpreted as requirements for “how to” perform a valuation. Instead, the purpose of the MPF is to provide valuation professionals with guidance on “how much” documentation is required when performing fair value measurements for U.S. public company financial reporting.

CEIV™ credential holders will be required to comply with the MPF to ensure confidence in the consistency and transparency of their work for the public interest. The group started with a task force that addressed governance and operational issues relevant to developing, implementing, and maintaining an infrastructure to support the new Fair Value Quality Initiative credential. The task force’s work streams are as follows:

- Governance and coordination
- Qualifications
- Performance requirements
- Quality control

It was the task force that was charged with developing the MPF, which was designed to establish a minimum threshold to the question of “how much” for valuation professionals who obtain this credential.

The following definitions are intended to differentiate professional standards and technical standards from the performance framework for the purposes of the MPF:

- *Professional Standards.* Standards that encourage professional behavior.
- *Technical Standards:* Standards that address the “how to” of work that must be done to prepare a “professional” work product.
- *Performance Framework.* Contains requirements that cover “how much” work should be performed in order to prepare a “professional” work product.

The MPF consists of the following:

- Section 1: *Preamble.* Provides an overview of the MPF’s purpose and scope
- Section 2: *Evaluation Engagement Guidance.* Establishes parameters of the documentation requirements that CEIV™ credential holders must abide by
- Section 3: *Mandatory Performance Framework Glossary.* Sets forth definitions of terms that may be unique to the MPF
- Section 4: *Authoritative and Technical Guidance.* Includes a list of accounting, audit, and valuation standards and references to certain technical literature applicable to the guidance presented in the MPF

At the time that I was writing this edition of the text, the VPOs were getting ready to release training programs and guidance on the MPF. The examination was going to be administered in the near future. Stay tuned! For more information about this, visit the AICPA’s website.

11 RICS = Royal Institute of Chartered Surveyors. This organization has a large international presence mainly in the real estate world but is very big in international valuation standards.

## Identification of Intangible Assets for Financial Reporting

Because this chapter is intended to address valuations for financial reporting purposes, this would be a good time to discuss the identification of intangible assets. I will address valuing them in the next chapter, but this is a good time to at least get you familiar with the various groupings under financial reporting.

FASB ASC 805 lists five principal classes of intangible assets:

- Contract-based intangibles
- Marketing-related intangibles
- Customer- or supplier-related intangibles
- Technology-related intangibles
- Artistic-related intangibles

Contract-based intangible assets are established by contracts and include the following:

- Licensing, royalty, and standstill agreements
- Advertising, construction, management, service, or supply contracts
- Lease agreements
- Construction permits
- Franchise agreements
- Operating and broadcast rights
- Servicing contracts such as mortgage servicing contracts
- Employment contracts
- Use rights such as drilling, water, air, timber cutting, and route authorities<sup>12</sup>

Marketing-related intangible assets are primarily used in the marketing or promotion of a company's products or services. Some examples include the following:

- Trademarks, trade names, service marks, collective marks, and certification marks
- Trade dress (unique color, shape, or package design)
- Newspaper mastheads
- Internet domain names
- Non-competition agreements<sup>13</sup>

Customer- or supplier-related intangible assets arise from relationships with or knowledge of the company's customers or suppliers. Examples include, but are not limited to, the following:

- Advertising, construction, management, service, or supply agreements
- Licensing and royalty agreements
- Servicing contracts
- Order books
- Employment contracts
- Use rights, such as drilling, water, air, timber cutting, and airport landing slots
- Franchise agreements<sup>14</sup>
- Customer relationships
- Customer lists<sup>15</sup>

Customer-related intangible assets may include several different categories of assets. Some of these include the following:

- *Order or production backlog:*
  - Arises from contracts or specific sales orders.
  - Time, volume, price, and quality are fixed.
  - Contractual-legal basis would lead to recognition and valuation.
- *Customer contracts and related customer relationships:*
  - Time volume, price, and quality are stipulated.
  - Contractual-legal basis would lead to recognition and valuation.

12 FASB ASC 805-20-55-31 (non-exhaustive list).

13 International Valuation Standards Council (IVSC), Guidance Note (GN) 4 paragraph 3.3 and FASB ASC 805-20-55-14 (non-exhaustive list).

14 Franchise agreements are included in separate categories under IVSC and generally accepted accounting principles.

15 IVSC GN 4, paragraph 3.4, and FASB ASC 805-20-55-20 provide a similar listing.

- *Noncontractual customer relationships:*
  - Absence of legal rights to protect or control the relationship.
  - Customer relationships where there is meaningful contact generally lead to recognition and valuation (exception is walk-in retail customers).

Technology-based intangible assets protect or support technology and include the following:

- Patented technology
- Computer software and mask works
- Unpatented technology
- Databases, including title plants
- Trade secrets, such as secret formulas, processes, and recipes<sup>16</sup>

Artistic-related intangible assets are those intangible assets of an artistic nature reflecting the creativity of the creator. These can include such items as the following:

- Plays, operas, and ballets
- Books, magazines, newspapers, and other literary works
- Musical works such as compositions, song lyrics, and advertising jingles
- Pictures and photographs
- Video and audiovisual material, including motion pictures, music videos, and television programs<sup>17</sup>

## Conclusion

Valuations performed for financial reporting make up a relatively new area that often requires the use of outside valuation specialists. The process of these types of valuations is unique, and the valuation specialist should fully understand his or her role in the process. The process requires frequent and open communication with all interested parties about expectations and presentation of the results because the work product has to be auditable for reasonableness. This work has become a subspecialty within the business valuation field and may not be for everyone. If you are going to take on this type of work, you need to be fully aware of all the accounting pronouncements and unique aspects of the job.

16 FASB ASC 805-20-55-38 (non-exhaustive list) and IVSC GN 4, paragraph 3.5, provide a similar listing of technology-related intangibles.

17 FASB ASC 805-20-55-29 (non-exhaustive list) and IVSC GN 4, paragraph 3.6, provide a similar but abbreviated listing of artistic-related intangibles.

## Chapter 20

# Valuing Intangible Assets: An Overview

### Learning Objectives

In this chapter, I am going to explain some stuff about separable intangible assets and why this area is emerging as a bona fide specialty area of business valuation and financial reporting. At the conclusion of reading this chapter, the following should be clear:

- The basic types of intangible assets
- How intangible assets are used by the owners of these assets
- Some of the common valuation assignments requiring this type of analysis
- Some legal cases addressing royalty rate calculations for patent infringement cases
- Some of the background of valuing intangibles independently
- Issues of remaining useful life (RUL) and intangible life cycles
- Where to look for market information for royalty rates
- Some of the emerging concepts of fair value in financial reporting
- How an allocation assignment of separable intangible assets is distinguished from unallocated goodwill
- Personal goodwill for income tax purposes (divorce is covered in chapter 22)

You should not consider yourself to be a valuation specialist in this area simply because you've read this chapter. In the last edition of this book, I said that "a specialist requires at least two chapters (and probably more)." After you read the last chapter and this one, you have met the two-chapter requirement. If you believe that you are a specialist after reading these two chapters, get a refund for this book, and put it towards some really good therapy. Clearly, you are insane.

Intangible asset valuation for financial reporting is a dynamic and changing arena with emerging terminology and interaction between U.S. and international accounting standards. If the plan to play in the fair value for financial reporting playground, look for additional classes and specialized work experience. A number of resources for determining the fair value of intangible assets are listed in box 20.1.

This area of valuation is not for everyone. The valuation analyst really needs to know what he or she is doing. To help even more, some of the books that I have in my library include the following:

- *Valuing Intangible Assets*
- *The Handbook of Business Valuation and Intellectual Property Analysis*
- *Valuation of Intellectual Property and Intangible Assets*

#### BOX 20.1

#### Resources for Determining Fair Value for Intangible Assets

1. Several organizations offer continuing professional education classes for determining fair value for intangible assets.
  - a. The AICPA offers a two-day, in-person interactive Fair Value Measurements Workshop. See CPA2Biz.com
  - b. The AICPA offers a live course that is offered through various state societies titled "Fair Value Accounting" as well as a self-study course with the same name.
  - c. The American Society of Appraisers offers two, three-day classes, BV 301, "Valuation of Intangible Assets for Financial Reporting," and BV 302, "Special Topics in the Valuation of Intangible Assets."
2. Guidance Note 4: *The Valuation of Intangible Assets* is available as a PDF from the International Valuation Standards Council and can be downloaded at no charge from [www.ivsc.org/pubs/index.html](http://www.ivsc.org/pubs/index.html).

- *Intellectual Property: Valuation, Exploitation, and Infringement Damages*
- *Valuation for Financial Reporting*
- *Fair Value Measurements: Practical Guidance and Implementation, 2nd Edition*

See the bibliography in appendix 15 for the full details on these books.

## Introduction

*Intangible assets* (intangibles) are long-lived assets used in the production of goods and services. They lack physical properties and represent legal rights or competitive advantages (a bundle of rights) developed or acquired by an owner. In order to have value, intangible assets should generate some measurable amount of economic benefit to the owner, such as incremental revenues or earnings (pricing, volume, and better delivery, among others), cost savings (process economies and marketing cost savings), and increased market share or visibility. Owners exploit intangibles either in their own business (direct use) or through a license fee or royalty (indirect use). *The International Glossary of Business Valuation Terms* (IGBVT)<sup>1</sup> defines intangible assets as “non-physical assets such as franchises, trademarks, patents, copyrights, goodwill, equities, mineral rights, securities and contracts (as distinguished from physical assets) that grant rights and privileges, and have value for the owner.” There are other sources for definitions, as well, and if the valuation analyst is going to work in this area of practice, he or she should probably become familiar with them. Other definitions are as follows:

- International Valuation Standards Council Guidance Note (GN) 4, *Valuation of Intangible Assets*. Paragraph 3 defines an intangible asset as “a non-monetary asset that manifests itself by its economic properties. It does not have physical substance but grants rights and economic benefits to its owner or the holder of an interest.”
- International Accounting Standard 38, *Intangible Assets*. Paragraph 8 defines an intangible asset as an “identifiable non-monetary asset without physical substance.”
- FASB *Accounting Standards Codification* (ASC) Master Glossary. Intangible assets are defined as “assets (not including financial assets) that lack physical substance. (The term intangible assets is used in this statement to refer to intangible assets other than goodwill.)”
- Intellectual Property (IP) (a type of intangible asset) from the U.S. Patent and Trademark Office Glossary. IP is defined as “creations of the mind—creative works or ideas embodied in a form that can be shared or can enable others to recreate, emulate, or manufacture them. There are four ways to protect intellectual property—patent, trademark, copyright, or trade secrets.”

We also find various definitions of *goodwill*. In fact, the term *goodwill* is defined by some of these sources in ways that differ significantly. We often consider goodwill to be either all intangible assets of a business (even though we know that there are other types of intangible assets), or a residual set of undefined intangibles after all other assets (including many intangibles) have been valued. In accounting speak, this is the “plug” after everything else has been identified and valued. Definitions of goodwill include the following:

- IGBVT. “That intangible asset arising as a result of name, reputation, customer loyalty, location, products, and similar factors not separately identified.”
- IRS *Glossary to Publication 551*. “The value of a trade or business based on expected continued customer patronage due to its name, reputation, or any other factor.”
- FASB *Master Glossary*. This resource distinguishes goodwill from other intangible assets. FASB Master Glossary defines goodwill as “an asset representing the future economic benefits arising from other acquired assets in a business combination or an acquisition by a not-for-profit entity that are not individually identified and separately recognized.”

For financial reporting, the definition of *intangible assets* is simply, “assets (not including financial assets) that lack physical substance, other than goodwill.” This definition excludes *goodwill*, which is separately defined. Financial goodwill also includes any other intangible assets that do not meet the recognition criteria in the financial reporting standards.

Let’s discuss goodwill a little bit more. As valuation analysts, we are concerned with the determination of goodwill value. It is not enough to just say that the business has goodwill because a business can have

<sup>1</sup> Available at [www.aicpa.org/interestareas/forensicandvaluation/membership/downloadabledocuments/intl%20glossary%20of%20bv%20terms.pdf](http://www.aicpa.org/interestareas/forensicandvaluation/membership/downloadabledocuments/intl%20glossary%20of%20bv%20terms.pdf) or see appendix 2\_\_\_ of this book.

goodwill and not have goodwill value. Let me give you an example. Suppose I own a hardware store. I run an advertisement that says for every customer who comes in this Tuesday, I will give them a \$5 bill with no purchase necessary. Based on the traditional concept of goodwill, which is the expectation of repeat patronage, I will probably generate a lot of goodwill because customers will keep coming into my hardware store to pick up a \$5 bill. If they do not buy anything, how much value will there be to the goodwill that I generate? In fact, how soon before I go bankrupt?

Now, let me give you an illustration with numbers. The application of the different definitions of goodwill under normal business valuation practices and financial reporting is illustrated in exhibit 20.1.

### EXHIBIT 20.1 Comparative Balance Sheets Differing Definitions of Goodwill

	Under IGBVT Definition	Under Financial Reporting Definition
Current Assets	\$20,000,000	\$20,000,000
Net PP&E	\$15,000,000	\$15,000,000
Intangible Assets		
Favorable Contract (Lease)	\$ 2,000,000	\$ 2,000,000
Customer Relationships	N/A	17,000,000
Developed Technology	N/A	7,000,000
Trade Name	N/A	6,000,000
Goodwill	50,000,000	20,000,000
Total Intangible Assets	\$52,000,000	\$52,000,000
Other Assets	—	—
Total Assets	\$87,000,000	\$87,000,000
Current Liabilities	\$ 9,000,000	\$ 9,000,000
Long-Term Debt	23,000,000	23,000,000
Total Liabilities	\$32,000,000	\$32,000,000
Shareholders' Equity	55,000,000	55,000,000
Total Assets and Current Liabilities	\$87,000,000	\$87,000,000

**Notes:**

For financial reporting balance sheet, goodwill is a residual amount after all recognizable intangible assets have been valued. For traditional goodwill balance sheet, the value of all traditional intangibles is grouped together. Favorable contract essentially represents a "non-operating" asset and has been reported separately in both balance sheets.

Increasingly, intangibles—ranging from IP (discussed in the following section) and brands to licenses and research and development pipelines—dwarf the tangible book assets of all sorts of companies in all sorts of industries. It is not unusual to see operating companies bought and sold that are in the primary business of

owning and managing intangibles, particularly IP. Most of the value in service companies that are “tangible asset light” comprises intangible value.

Apart from tangible assets that have *financial substance* (things like cash, accounts receivable, or prepaid expenses) or *physical substance* (fixed assets, such as equipment), intangible assets have several characteristics that are described in box 20.2.

Of these characteristics, the two most commonly seen factors of intangibles are that they are *identifiable* and *transferable*. Ask yourself if the subject asset will meet the SLERT (sold, licensed, exchanged, rented, or transferred) factors that we discussed in chapter 19.

**BOX 20.2****Intangible Asset Characteristics**

- *Identifiability.* Intangible assets can be specifically identified with reasonably descriptive names and have some evidence or manifestation of existence, such as a written contract, license, diskette, procedural documentation, or customer list, among others. The intangible assets should have been created at an identifiable time (or event) and be subject to termination at an identified time (or event).
- *Manner of acquisition.* Intangible assets can be purchased or developed internally.
- *Determinate or indeterminate life.* A determinate life will usually be established by law or contract or by economic behavior and should have come into existence at an identifiable time as the result of an identifiable event.
- *Transferability.* Intangible assets may be bought, sold, licensed, or rented and are subject to the rights of private ownership, ensuring a legal basis for transfer.

If at least one of the SLERT criteria can be met by an asset lacking substance, chances are that you are dealing with an intangible asset that can be distinguished from overall goodwill, particularly if the rights to this asset can be separated legally. For financial reporting, the asset will be allocated apart from goodwill if it has legal or contractual standing, regardless of the ability to separate the asset. The types of assets that are commonly seen in a business enterprise are shown in box 20.3. They were listed at the end of chapter 19, but I figured that it would not hurt to see them again.

**BOX 20.3****Common Assets Within a Business Enterprise**

Tangible assets within a business enterprise include the following:

- Financial assets (cash, accounts receivable, prepaid expenses, or sometimes net working capital [current assets less current liabilities])
- Plant, property, and equipment
- Other generally accepted accounting principles defined assets

Intangible assets within a business enterprise include the following:

- Recorded and separable
  - Marketing-related
    - Trademarks
    - Trade names
    - Brand names
    - Logos or marks
    - Internet domain names
    - Newspaper mastheads
    - Trade dress
  - Technology-related
    - Proprietary computer software products (external market)
    - Operating or application software, or both (internal use)
    - Software copyrights
    - Automated databases (including title plants)
    - Integrated circuit masks and masters (mass works)
    - Industrial designs, formulas, processes, and recipes
    - Product patents and applications
    - Process patents and applications
    - Trade secrets
    - Engineering drawings and technical documentation
    - Blueprints or proprietary documentation
    - In-process research and development

(Box continued)

**BOX 20.3****Common Assets Within a Business Enterprise** *(continued)*

- o Customer-Related
  - Customer lists (prior customers, existing customers, and customer leads)
  - Customer contracts
  - Customer relationships (short term or long term)
  - Order or production backlogs
  - Favorable supplier contracts
- o Contract or Location Related
  - Supplier contracts (unfavorable supplier contracts may be a liability)
  - License and franchise agreements
  - Operating and broadcast rights
  - Non-compete agreements (employment contracts) Leasehold interests
  - Mineral exploitation rights
  - Easement rights
  - Air and water rights
- o Artistic-Related
  - Literary works and copyrights
  - Musical compositions
  - Copyrights
  - Maps, pictures, and photographs
  - Engravings
  - Video and audiovisual materials (including marketing materials)
  - Name, likeness, and voice (which can be licensed—consider the new “I Dream of Jeannie” slot machines)
- Unallocated and Not Separable (Overall Goodwill)
  - o Human-capital-related (collection of experience, skill, and education for future performance)
    - Trained and assembled workforce
    - Customer service capability
    - Labor relations, including union contracts or nonunion status
    - Ongoing training or recruiting programs
  - o Strategic- or enterprise-related
    - Intellectual capital
    - Organizational infrastructure
    - Network synergies
    - Growth opportunities
    - Unidentifiable walk-in customers
    - Presence in geographic markets or locations
    - Credit ratings and access to capital markets
    - Favorable governmental relations

## What Is Intellectual Property?

IP is a subset of intangible assets created by human intellect or inspiration. Intangible assets that receive legal protection become IP patents, trademarks, trade secrets, and copyrights, among other things, and fall into this category. Some economic phenomena do not qualify as IP, such as high market share, profitability, monopoly position, and market potential. A specialized subset of law has developed around IP that is transferred between owners or is the subject of a lawsuit for misuse. Four legal sources give rise to this field:

1. *Patents* (U.S. Code Title 35). A patent is a document that describes an invention that can be developed, used, and sold with the authorization of the owner. A patent is an agreement between the inventor and a country with exclusionary rights (usually 15–20 years) defined by the claims, divulged to prevent others from making, using, importing, or selling, or some combination of these, whatever it is that is included in the claims. This does not give rights to do anything, just *negative* rights to exclude others from doing those things claimed. In the total absence of any other subject patents that would otherwise block the original patent holder, patents to enter the product into a commercial endeavor would not block the patent holder. Patents have to be new (which includes original). Only the inventor is allowed to get a patent.

2. *Trademarks or brands* (U.S. Code Title 15). Trademarks are distinctive names, symbols, sounds, colors, mottos, or emblems that identify and distinguish a product or firm from others to indicate the source of the goods or services. Unlike patents, trademarks can be renewed forever as long as they are being used in commerce.

Trademarks include such items as the following:

- a. Trade dress, design, or image of products.
- b. Trade names.
- c. Service marks (service firms).
- d. Collective marks (manufacturers and others not providing services).
- e. Certification marks (Professional Engineer (PE), Certified Business Adviser (CBA), “union made”).

Trademarks have a 10-year registration with the U.S. Patent Office.

#### Author's Note

According to the United States Patent and Trademark Office, “registrations granted prior to November 16, 1989 have a 20- year term, and registrations granted on or after November 16, 1989, have a 10-year term.” You can search for characteristics of intangible assets at [www.uspto.gov/main/faq/](http://www.uspto.gov/main/faq/).

3. *Trade secrets* (Uniform Trade Secrets Act, although governed by state laws). Trade secrets are things that get value from being kept secret and are subject to reasonable efforts to being kept secret. A trade secret may be information, a formula, a pattern, a method, a process or a technique that (1) derives actual or potential independent economic value from not being generally known or readily ascertainable by other persons who can obtain economic value from its disclosure or use, and (2) is the subject of reasonable efforts to maintain its secrecy. Examples include customer lists, research and development, recipes and food formulas, patterns, or anything that gains value from being kept secret (proprietary) and lasts forever as long as it keeps its utility and is kept secret.
4. *Copyrights* (U.S. Code Title 17; 1976 Copyright Act). A copyright is a form of protection to the authors of expressive ideas such as literary, dramatic, musical, artistic, and certain intellectual work, both published and unpublished. Copyrights have to be original. Registered copyrights are enforceable. Unregistered copyrights are enforceable only upon registration. Statutory damages (up to \$70,000) are only possible for registered copyrights. It is hard to prove—unless it's a direct copy—economic damages beyond the statutory damage level, and Internet stuff may be particularly hard to prove. Copyrights for works created on or after January 1, 1978, protect the work from the moment of creation until 70 years after the author's death. Works for hire and anonymous and pseudonymous works have copyright protection that lasts for 95 years from the date of publication or 120 years from the date of creation, whichever is shorter.

## Conducting a Valuation of Intangible Assets

Valuation assignments must estimate the value of intangibles, recognizing the volatility, ongoing creation, and problems with protection and enforcement. Business valuation analysts have been independently valuing intangible assets for many years, usually in the context of an exchange between owners (transaction), for estate and gift tax purposes, or as part of a litigation assignment. Knowledge underlies the creation of value. Some of the questions that need to be answered include the following:

- What would a willing buyer pay to employ the intangible asset?
- What is the useful life of this asset?
- What portion of the operating income does this asset generate?

New financial reporting concepts require measurement of these separable intangible assets from the overall goodwill in a purchase price allocation, attributable to an acquisition (price paid over tangible assets and assumed tangible liabilities), and periodic testing of unallocated residual goodwill for impairment. I discussed this in the last chapter. I've included some of the most common types of assignments in box 20.4.

**BOX 20.4** Common Intangible Assignments

In financial reporting, intangible assets are valued on a control basis, and the total value of the intangible is estimated rather than the equity in the intangible. In other assignments, some proportion or fractional interest of the rights or total ownership in equity may be the subject being valued.

- Financial reporting (goodwill allocation, goodwill impairment, and intangible asset impairment)
  - Purchase price allocation goodwill impairment
  - Accounting for impairment or disposal of long-lived assets
- Taxation (Federal, state, and local)
  - Charitable contribution
  - Gift or estate
  - Compensation paid (intellectual property)
  - Basis of transferred assets in partnership
- Transaction, merger, contribution to joint venture, acquisition, and fairness opinion
- Financing, loan collateral, or securitization
- Litigation (infringement damage, contract breach, marital dissolution, anticompetitive behavior, and attorney malpractice)
- Transfer pricing (IRC Section 482 studies—related intercompany parties in different tax jurisdictions)
- Licensing and royalty rate decisions
- Bankruptcy and reorganization analysis

Is an intangible asset valuation assignment different from a more standard, or traditional, business valuation assignment? Well, *yes* and *no*. I just want you to know that I am being very decisive here. Although it is true that one particular valuation method might be precisely wrong for a particular intangible asset, there are usually several valuation methods that would be approximately right, and although arguments exist for the use of each of these methods, there may be no clear winner. Doesn't that make you feel better?

In undertaking the intangibles assignment, there are common planning elements for all valuation assignments, such as the following:

- Purpose and objective of the analysis
- Defining the subject intangible asset
- Understanding the legal rights subject to analysis
- Date of value
- Highest and best use considerations
- Report writing—telling a story; analysis should be replicable<sup>2</sup>

Data collection, however, will probably be different in the intangibles assignment. We need to consider the following:

- History and development of the intangible asset
- Owner or operator, or both
- Licensee or licensor, or both
- Industry operations and pricing data
- Competitive environment
- Commercial comparative intangible assets, cost, and treatment

With regard to the approaches and methods to be used in these types of assignments, the same ones that I discussed in chapters 9–12 will be used here also. The minor exception is that the asset-based approach will be referred to as the *cost approach*. There will be a few minor twists in the application of these approaches, but they are similar. As in all valuations, all three approaches should be considered. Here are a few ideas on methodologies and the inherent struggles in using each one.

<sup>2</sup> Robert Reilly, "Effective Intangible Asset Valuation Reports." *Business Appraisal Practice* (Spring 2007).

## Market Approach

Observable (one might say “findable”) market-based transactions of identical or substantially similar intangible assets recently exchanged in an arm’s length transaction are often difficult to obtain. Publicly traded data usually represents a market capitalization of the enterprise, not single intangible assets. Market data from market participants is often used in income-based models, such as determining reasonable royalty rates and discount rates. Direct market evidence is usually available in the valuation of Internet domain names, carbon emission rights, and Federal Communications Committee licenses (for radio stations, for example). Consider the following:

1. Search for sale and license transactional data
2. Issue of comparability and timing
3. Selecting and adjusting price multiples
4. Selecting and adjusting royalty rates

## Income Approach

Income-based models are best used when the intangible asset is income-producing or when it allows an asset to generate cash flow. Just as in other valuation assignments, an income approach technique converts future benefits (such as cash flows or earnings) to a single, discounted amount, usually as a result of increased revenues or cost savings. We have the traditional two choices of either *capitalizing* a single period of benefits or *discounting* a future stream of benefits. One of the primary difficulties within an income approach method is distinguishing the cash flows uniquely related to the intangible asset from the cash flows related to the entire company. Income models examine a discount rate from either (1) a weighted average cost of capital (WACC, or the right side of the balance sheet reflecting debt plus equity), (2) a weighted average return on assets (WARA, or the left side of the balance sheet), or (3) an internal rate of return to the investor. Among the most common income-based methods is the *relief from royalty method*, in which one directly estimates cost savings (or income enhancement) from using an intangible such as a trademark or patent. Under the relief from royalty method, value is based on the avoided third party license payment for the right to employ the asset to earn benefits. A multiperiod excess earnings model begins with an estimate of total income reduced by contributions from all other tangible and intangible assets, yielding residual income (or excess) that is then discounted to present value. Income-based methods are usually employed to value customer-related intangibles, trade names, and covenants not to compete. Consider the following with regard to the income approach:

- Separation of revenue streams and related expenses
- The expected useful life of the intangible asset
- Alternative measures of income
- Operating earnings of the intangible asset
- Royalty rate income that might be earned by the intangible asset
- Direct capitalization methods
- Residual value considerations
- Discount rate selection
- Alternative valuation methods, including real options techniques and Monte Carlo models
- Tax amortization benefit (more controversial)

## Cost Approach

Cost-based analyses are based on the economic principle of substitution and usually ignore the amount, timing, and duration of future economic benefits, as well as the risk of performance within a competitive environment. *Historical cost* only includes the actual costs that had been incurred to develop the asset. *Reproduction cost new* implies the current cost of an *identical* new property. *Replacement cost new* implies the current cost of a *similar* new property having the nearest *equivalent utility* to the property being valued. In most cases, replacement cost new is the most direct and meaningful cost-based means of estimating the value of an asset. Once replacement cost new is estimated, various forms of obsolescence must be considered, such as functional, technological, and economic. Physical deterioration is common for tangible assets, but not for intangibles, although overuse or deterioration of tangible assets could affect the values of specific intangibles and the business enterprise. You might reflect upon the following formula:

**Reproduction Cost New**

Less	Curable functional and technological obsolescence
Equals	Replacement cost new
Less	Incurable functional and technological obsolescence
Less	External economic obsolescence
Less	Physical deterioration
Equals	Pretax value of the intangible asset (absent any amortization benefit)

Cost-based models are best used for valuing an assembled workforce, engineering drawings or designs, and internally developed software in which no direct cash flow is generated. Consider the following:

- Hard and soft costs are included.
- Cost measurements.
- Reproduction cost new (exact duplicate).
- Replacement cost new (equal utility).
- Measuring functional and economic obsolescence.
- Replacement cost new less depreciation.

Although different valuation analysts may approach the valuation assignment differently, how you might consider approaching the valuation of certain types of intangibles is included in table 20.1.

**TABLE 20.1 Intangible Valuation Approach Summary**

ASSET	PRIMARY	SECONDARY	TERTIARY
Patents	Income	Market	Cost
Technology	Income	Market	Cost
Copyrights	Income	Market	Cost
Assembled workforce	Cost	Income	Market
Internally developed software	Cost	Market	Income
Brand names	Income	Market	Cost
Customer relations	Income	Cost	Market

**What Is a RUL Analysis?**

Every separable intangible asset carries the concept of *utility*, or effective use, over a time horizon. Like fixed assets, intangibles wear out, too. Market forces, obsolescence, replacements, and operational enhancements eat away at the value of existing intangibles. Legal, regulatory, or contractual provisions may limit the asset's useful life. This concept relates to asset attrition (a decay or retirement pattern) similar to mortality tables that are used in insurance. Separable intangible assets require estimates of their RULs, which, technically, are management's responsibility, although valuation analysts should understand the mechanics and assist management in developing an estimate of the economic life of the asset. In other words, the amortization of the asset's value for financial reporting purposes is an accounting estimate and not a valuation estimate. The value of a non-compete agreement, for example, may be reflected over the life of the agreement (for example, three years). At the end of the third year, the agreement has no basis or distinguishable competitive advantage, so the value following the expiration of the agreement would be zero. The same type of argument is sometimes made for separately identifiable supplier agreements. Yet, the asset carries one additional advantage—the opportunity for the existing business to attempt to extend the agreement, perhaps under new terms.

I hate to do this, but a valuation analyst working in this area should be familiar with the term *Iowa curves*. This original analysis was developed in the 1930s by academics studying characteristics of industrial properties.<sup>3</sup> These professors studied the attrition of units of property and placed them into curves representing expected trends with convergence to zero survivors at some future point. As a result, the range of survivor characteristics usually experienced by utility and industrial properties was encompassed by a system of generalized survivor curves known as the Iowa curves. As seen in figure 20.1, the key lines represent the percentage of survivors (Y-axis) with aging over time (X-axis). At time zero, 100 percent of the asset utility (survivors) exists, with the most probable life curve at 30 years. As time advances, however, the asset decays, offering smaller and smaller utility to the owner.

**Figure 20.1 A Typical Survivor Curve and Derived Curves**

Other theoreticians have pointed out the importance of survival analysis for valuation assignments.<sup>4</sup> In case this stuff is not bad enough, the valuation analyst may be confronted with the term *Weibull distributions*. Similar to the Iowa curves analysis, in 1951, Professor Waladdi Weibull developed statistical methods that were used to estimate the RUL of many industrial items, such as ball bearings, vacuum tubes, and electrical insulation. In addition, a survival curve can be estimated based on turnover information. The first question that the analyst should have already raised is what would motivate someone to do this stuff? Clearly, the guy did not have much of a life. It is almost as bad as people who write books. The statistical methods and processes for performing a lifeing analysis can fill a whole book and are beyond the scope of this chapter. Thank goodness!

## What Is a Reasonable Royalty Rate and Where Do I Get This Stuff?

A number of methods used in valuing intangibles require the use of reasonable (or comparable) royalty rates to judge the discounted value of costs saved, as if the intangible asset (such as a patent) was licensed for use through a royalty requirement. Usually royalty rates are stated as a percentage of sales or payment to the licensor per product divided by the product sales price. Factors affecting selection of appropriate royalty rates include the following:

<sup>3</sup> Robley Winfrey, "Statistical Analysis of Industrial Property Retirements," Iowa State College, Engineering Experiment Station, Bulletin 125, 1936.

<sup>4</sup> M. P. Dandekar, "Estimate of Remaining Useful Life," *Valuation* (June 1996).

- Profitability
- Investment necessary
- Life or obsolescence, or both
- Government restrictions
- Terms (such as infringement penalties, geographic limits, time limits, and exclusivity)

I am about to mention some court cases, but as a reminder, the valuation analyst should always, and I mean always, check with the attorney about any cases that he or she is going to follow. There may be newer cases or the jurisdiction that you are working in may not follow these cases, so do yourself a favor and ask the attorney before you possibly commit a fatal error.

One key court case you should be familiar with is *Panduit Corp. v. Stahl Bros. Fibre Works, Inc.*, 575 F.2d 1152 (6th Cir. 1978). This was a patent infringement case that outlined good reasoning to either calculate lost profits directly or estimate damages based on a royalty rate model. In order for a patent holder to receive damages in the form of lost profits, four questions must be answered:

1. Is there a demand for the patented products?
2. Are available non-infringing substitute products not available (for example, in a two-supplier market, the customer must purchase either the patent holder's product or the infringing product)?
3. Did the patent owner have manufacturing and marketing capabilities to exploit the demand?
4. Can the lost profits be quantified?

If the answer is "yes" to all of these questions, lost profits may be calculated directly. If any of the questions results in a "no" answer, reasonable royalty rates should be used to quantify the value of infringement.

A second court case is *Georgia Pacific v. U.S. Plywood*, 318 F. Supp 1116, 6 USPQ 235 (SD NY 1970) concerning a hypothetical royalty rate for patent infringement. The legal reasoning in this case listed 15 factors that should be considered in estimating damages from alleged misuse. When actual damages in the form of lost profits cannot be proven, the patent owner is entitled to receive a reasonable royalty as payment for infringement by the defendant. Conceptually, a *reasonable royalty* is an amount that a person, desiring to manufacture and sell a patented article, as a business proposition, would be willing to pay as a royalty and yet be able to make and sell the patented article, in the market, at a reasonable profit.

The setting of a royalty rate after infringement, however, undermines the assumption of ordinary arm's length negotiations between a truly willing patent owner and a potential licensee. If the setting of a reasonable royalty after the fact did not take into account the distressed nature presented by forced litigation, it would make an election to infringe a handy means for competitors to impose a compulsory license upon every patent owner. In fact, except for the limited risk that the patent owner might meet the heavy burden of proving the four elements required for recovery of lost profits (see the preceding *Panduit* case), the infringer would have nothing to lose and everything to gain if he could count on paying only the normal, routine royalty noninfringers might have paid.

The 15 factors shown in box 20.5 have become known as the *Georgia-Pacific factors*. They were first set out in *Georgia-Pacific Corp. v. U.S. Plywood Corp.* by Judge Tenney of the District Court for the Southern District of New York. Although it is rare for the U.S. Court of Appeals to defer to any court, let alone a district court, time and time again, the Federal Circuit has endorsed these factors as the appropriate factors to consider in making a determination regarding the appropriateness of any award of reasonable royalties.

**BOX 20.5****Georgia-Pacific 15 Factors in Determining Reasonable Royalty Rates**

The amount of a reasonable royalty after infringement turns on the facts of each case, as best as they may be determined. Among the relevant facts cited in the case *Georgia-Pacific Corp. v. U.S. Plywood Corp.*, are the following:

1. The royalties received by the patentee for the licensing of the patent in suit, proving or tending to prove an established royalty
2. The rates paid by the licensee for the use of other patents comparable to the patent in suit
3. The nature and scope of the license, as exclusive or nonexclusive, or as restricted or non-restricted in terms of territory or with respect to whom the manufactured product may be sold
4. The licensor's established policy and marketing program to maintain his patent monopoly by not licensing others to use the invention or by granting licenses under special conditions designed to preserve that monopoly
5. The commercial relationship between the licensor and licensee, such as whether they are competitors in the same territory, in the same line of business, or whether they are inventor and promoter
6. The effect of selling the patented specialty in promoting sales of other products of the licensee, the existing value of the invention to the licensor as a generator of sales of his non-patented items, and the extent of such derivative or conveyed sales
7. The duration of the patent and the term of the license
8. The established profitability of the product made under the patent, its commercial success, and its current popularity
9. The utility and advantages of the patent property over the old modes or devices, if any, that had been used for working out similar results
10. The nature of the patented invention, the character of the commercial embodiment of it as owned and produced by the licensor, and the benefits to those who have used the invention
11. The extent to which the infringer has made use of the invention and any evidence probative of the value of that use
12. The portion of the profit or the selling price that may be customary in the particular business or in comparable businesses to allow for the use of the invention or analogous inventions
13. The portion of the realizable profit that should be credited to the invention as distinguished from non-patented elements, the manufacturing process, business risks, or significant features or improvements added by the infringer
14. The opinion testimony of qualified experts
15. The amount that a licensor (such as the patentee) and a licensee (such as the infringer) would have agreed upon (at the time the infringement began) if both had been reasonably and voluntarily trying to reach an agreement, that is, the amount that a prudent licensee—who desired, as a business proposition, to obtain a license to manufacture and sell a particular article embodying the patented invention—would have been willing to pay as a royalty and yet be able to make a reasonable profit, and that amount would have been acceptable by a prudent patentee who was willing to grant a license

Even though royalty rates are frequently used in calculating economic damages, the selection of reasonable royalty rates is also necessary for “relief from royalty” calculations to estimate value in a discounted cash flow analysis. This type of analysis is a blend of the market and income approaches. This evidence is scattered throughout SEC submissions, newspaper articles, and other company information and is especially difficult to gather for a one-time use. Most valuation analysts inquire of one or more databases available via the Internet (with a credit card) that have been compiled for IP experts. Cost can vary according to the number of transactions selected and the amount of information available, from less costly (\$) to more costly (\$\$\$):

- Royalty Source ([www.royaltysource.com](http://www.royaltysource.com)) (\$)
- Licensing Economic Review (Smith & Parr) ([www.ausinc.com](http://www.ausinc.com)) (\$\$)
- Intellectual Property Research Associates ([www.ipresearch.com](http://www.ipresearch.com)) (\$\$)
- Consor Intellectual Asset Management ([www.consor.com](http://www.consor.com)) (\$\$\$)
- ktMINE (available through BV Resources at [www.bvresources.com](http://www.bvresources.com)) (\$\$\$\$)

Selections among the various royalty rate transactions require judgment in order to match the selection to the subject intangible. Most initial scans from the previously mentioned databases will result in dozens of transactions, and some selection winnowing must take place. An example of a winnowed peer group list is noted in table 20.2, showing 13 sample royalty rate transactions for a trademark valuation.

**TABLE 20.2 Trademark—Relief from Royalty Calculations**

Date of Value, December 31, 2007 Detailed Royalty Rate Data—Trademark/Business Services (Selection based on business services, consumer orientation, and name recognition)									
Licensee	Licensor	Upfront Fee	Royalty Rate % (Low Range)	Royalty Rate % (High Range)	Basis	Annual Minimum Fee	Licensed Property	Notes	
<b>Trademark: Business Services</b>									
1 CHC International, Inc.	Carnival Corp.	\$ —	1.00%	1.00%	sales	\$ 100,000	Use of “Carnival” trademark in hotels and casinos.	1997 agreement allows for minimum \$100,000 annual payment; 20-year term.	
2 Uffman & Associates, Inc.	Credit Bureau of Baton Rouge	\$ —	5.00%	5.00%	sales	\$ —	Use of name.	1997 transaction.	
3 Various advertising agencies	AdsOnly Group, Inc.	\$ 19,500	5.00%	5.00%	sales	\$ —	Planned advertising franchisees. Licensor plans to assist in location, operations, legal and accounting work, and training.	Additional 1.5% is charged for continuing national advertising costs. agencies The \$19,500 typically covers training manuals and additional materials.	
4 Various advertising agencies	Resourcenet	\$ 50,000	5.00%	5.00%	sales	\$ —	Support services for creative service companies.	The \$50,000 typically covers materials and additional set-up expenses. Franchisees also pay an initial audit fee of \$10,000 and \$7,500 for initial training.	
5 Various services agencies, computer integrated systems design	USWeb Corp.	\$ —	5.00%	5.00%	sales	\$ —	Non-exclusive right to maintain an office and advertise in designated territory. Fee includes rights to use intellectual property, proprietary information, and development methodologies.	Licensees pay royalties equal to the greater of a minimum monthly fee or 5% royalty plus 2% promotion payment (expenses) based on adjusted gross revenues.	

*(Table continued)*

**TABLE 20.2 Trademark—Relief from Royalty Calculations** (continued)

Date of Value, December 31, 2007 Detailed Royalty Rate Data—Trademark/Business Services (Selection based on business services, consumer orientation, and name recognition)									
Licensee	Licensor	Upfront Fee	Royalty Rate % (Low Range)	Royalty Rate % (High Range)	Basis	Annual Minimum Fee	Licensed Property	Notes	
<b>Trademark: Business Services</b>									
6 Various advertising agencies	Adventures in Advertising Franchise, Inc.	\$ 27,500	4.00%	4.00%	sales	\$ —	Imprinted promotional products to be used in trade shows, product introductions, safety programs, and various awards. Licensed property includes customer-designed computer software program and total market support.	Initial franchise fee of \$27,500 may include sample products and training.	
7 Various accounting, auditing, and bookkeeping services	E.K. Williams	\$ 35,000	2.00%	8.00%	sales	\$ —	Accounting franchises, including support materials.	Royalty will vary on a sliding scale based on volume and longevity. Royalty percentages drop as gross revenue increases and as practice ages.	
8 (affiliate)	Minnegasco	\$ —	1.00%	1.00%	sales	\$ —	Use of utility's name and reputation.	Utility regulators ordered gas utility to pay its customers the royalty fee; 1996 order by the Minnesota Public Utilities Commission.	
9 Sodexho Marriott Services, Inc.	Sodexho Alliance, S.A.	\$ —	0.05%	0.05%	sales	\$ —	Use of name "Sodexho" in connection with food services.	1998 transaction through 2001; extended at same rate thereafter.	
10 SUSA Partnership LP (Storage USA, Inc. is a general partner)	Storage Development Portfolio, LLC	\$ —	5.00%	5.00%	sales	\$ —	Use of trade name "Storage USA" for self-storage facilities.	1999 agreement.	

**TABLE 20.2 Trademark—Relief from Royalty Calculations**

Date of Value, December 31, 2007									
Detailed Royalty Rate Data—Trademark/Business Services									
(Selection based on business services, consumer orientation, and name recognition)									
Licensee	Licensor	Upfront Fee	Royalty Rate % (Low Range)	Royalty Rate % (High Range)	Basis	Annual Minimum Fee	Licensed Property	Notes	
<b>Trademark: Business Services</b>									
11 (affiliate)	Washington Natural GasCompany	\$ —	1.50%	1.50%	sales	\$ 150,000	Use of parent company's name, reputation, and public image.	1994 order of the Washington Utilities and Transportation Commission.	
12 Vitaminshoppe. Com, Inc. (retail stores)	The Vitamin Shoppe (catalog and mail-order house)	\$ —	1.00%	5.00%	sales	\$ 1,000,000	Exclusive use of name, logo, and marks for online sales.	2000 agreements between affiliated entities; 5% royalty for sales up to \$25 million; declining royalties to 1% for sales over \$100 million.	
13 ftd.com, Inc. (affiliate) Delivery, Inc.	Florist Transworld (subsidiary of FTD Corporation)	\$ —	1.00%	1.00%	sales, net of discounts	\$ —	Nonexclusive right to use parent company's trademarks in sales through Internet.	1999 agreement; 99-year term.	
<b>Analysis of Data:</b>									
	Low		0.05%	0.05%					
	Mean		2.81%	3.58%					
	Median		2.00%	5.00%					
	High		5.00%	8.00%					
	Standard Deviation		0.0201	0.0239					
	Coefficient of Variation		0.7153	0.6676					

Although some of these transactions include upfront fees or minimum annual fees, the analyst must sift through all of this and choose a reasonable rate from the data to apply in a discounted cash flow model.

Let me put in a plug for a really good product that I mentioned previously, ktMINE. This product is not cheap (\$495 for a one-day pass—even Disneyworld is cheaper!), but it is easy to use (even I was able to use it when I had the opportunity to do so). As I was writing this section, this database had over 16,000 license agreements with nonredacted royalty rates and over 60,000 royalty rate agreements that were searchable. New agreements are being added regularly. ktMINE offers one-day database access, with unlimited searches, for one price, as compared to paying the hefty annual subscription price. The valuation analyst can always pass along the cost to his or her client. The idea is to download everything that might be needed within the day that the valuation analyst subscribes and then do the analysis afterwards. This way it is only a single charge for the day.

What I really like about this database is that the valuation analyst has control of the search, with direct access to royalty rates, license agreements, statistical analyses, and related information. The royalty rate data comes from the licensing agreements only, and analysts have full access to those agreements. This provides the valuation analyst with a full set of working papers to support the analysis. The analyst also has the ability to refine the searches and save search and agreement sets for future use. I really like this product because it allows me to do the research, as opposed to having to depend on someone else who is not working under my supervision.

Once the reasonable royalty rate is selected (let's say 3 percent, based on the analyst's judgment of the peer group evidence), it is applied to sale projections (let's say the royalty is based on revenues) to arrive at the pretax-affected discounted royalties "avoided" or "saved."

In table 20.3 on the following page, a simple model is shown using a tax rate of 40 percent and a discount rate of 18 percent with a mid-year convention. We will assume 100 percent usage of the trade name, although some adjustments for unbranded products, maintenance expense, and future probability of continued use might also be included. Summing the present values for the discrete periods and adding a terminal value provides a combined cash flow savings of \$1,163,764. An amortization benefit is added (I will explain this in a little while) to suggest a fair value of the trade name of \$1,365,000. Because the royalty rate is derived from market evidence and used in an income-based discounted future earnings projection, most valuation professionals consider the relief from royalty method to be a hybrid methodology of market and income approaches.

## What Is an Amortization Benefit?

FASB ASC 805 and FASB ASC 740 requires the recognition of a *deferred tax liability* in the opening balance sheet for identified intangibles that have no tax basis or other assets with a greater book basis than tax basis. Except for *goodwill* and *going concern value*, these are usually class VI assets as described in IRC Section 197. A detailed discussion about the tax amortization benefit is beyond the scope of this book. However, it is something that the valuation analyst needs to know about. For reference, the common formula for the tax amortization benefit is as follows:

$$PVCF * (n/n - ((PV(k, n, -1) * (1-k)^{0.5 * t}) - 1))$$

where,

- PVCF = Present value of cash flows from the asset
- $n$  = 15 years (or finite amortization period)
- $k$  = Discount rate
- $t$  = Tax rate
- $PV(k, n, -1) * (1-k)^{0.5}$  = Present value of a \$1 annuity over 15 years, at the given discount rate (which assumes mid-period receipt of benefit)

Cool formula, huh? The tax amortization benefit should only be included for assets in which the benefit is appropriate and the asset is subject to taxation. Assets in foreign countries should reflect conditions of the local tax code.

**TABLE 20.3 Trademark—Relief of Royalties Calculations**

For the 12-month periods in the future:						
	Year 1	Year 2	Year 3	Year 4	Year 5	Terminal Year
Sales	\$6,000,000	\$8,000,000	\$10,000,000	\$10,500,000	\$10,815,000	\$11,139,450
Sales growth rate in model		33.33%	25.00%	5.00%	3.00%	
Proportion of trade name revenues	100.00%	100.00%	100.00%	100.00%	100.00%	100.00%
Total revenue	\$6,000,000	\$8,000,000	\$10,000,000	\$10,500,000	\$10,815,000	\$11,139,450
Royalty (3%)	180,000	240,000	300,000	315,000	324,450	334,184
Total royalties	\$ 180,000	\$ 240,000	\$ 300,000	\$ 315,000	\$ 324,450	\$ 334,184
Tax effected royalty savings	40.0%					
Periods (mid-year convention)	0.5	1.5	2.5	3.5	4.5	4.5
Present value factor (WACC)	0.9206	0.7801	0.6611	0.5603	0.4748	1,336,733
Present value of royalty savings	\$ 99,425	\$ 112,334	\$ 118,998	\$ 105,897	\$ 92,429	\$ 0.4748
Terminal year value						\$ 634,681
Sum of present values						\$ 529,083
Terminal year value						634,681
Combined value of cash flows						\$ 1,163,764
<b>Amortization benefit</b>						
Discount rate						18.0%
Tax rate						40.0%
Tax amortization period						15
Present value of annuity over period						5.53087
Amortization benefit						201,339
Fair value of trade name						\$ 1,365,103
Rounded						\$ 1,365,000

**Author's Note**

The amortization benefit factor is  $201,346 / 1,163,808 = .1730062$ , or 17.3%.

## How About Some More Examples

Because I know this stuff is as exciting as it can possibly be, let's throw in a few more examples. Here are some unrelated examples of various methods that valuation analysts have used to estimate the fair value of specific intangibles.

### Create a Lead Schedule for Your Analysis

Let's suppose that we are engaged to undertake an allocation assignment to determine the fair value of separable intangible assets and unallocated residual goodwill. The *structure of the transaction* is the first issue, which will suggest an overall value of the total intangible component of the transaction. The example in table 20.4 shows a lead schedule of a sample acquisition costing \$2,600,000, with \$1,920,000 comprising the intangible amount to be allocated.

Because it is a lead schedule, we can use this schedule as a sanity check of our ultimate conclusions regarding the separable intangibles and the unallocated goodwill component by using a weighted average return on assets. In this example, if the discount rate is 18 percent for the entire company, the working capital and fixed assets would require a smaller rate of return because of their tangible nature, and the discount rates for the combined intangibles must be higher. This is similar to the example about the rates of return when using the excess earnings method as described in chapter 12.

In table 20.4 on the following page, we find the rates concluded for the separate intangibles (customer list, software, trademarks, non-compete contracts, and unallocated goodwill). A proof of the appropriateness of the rates can be derived by calculating the return on the asset categories as a percentage of the purchase price, suggesting a target for allocation. Similarly, computing the return on the separate intangibles suggests an approximate proof of the overall intangible assets to be allocated. Although the algebra of this methodology may appear somewhat constrained, it, nonetheless, offers mathematical support for the conclusions reached if you chose to select different after-tax rates of return for the separate intangible assets.

#### Author's Note

The remaining examples do not relate to this schedule.

### Fair Value of the Customer List

The example in table 20.5 on page 830 shows a simple replacement cost method for assessing the value of a customer list, based on acquisition costs invested to attract each customer. For purposes of these models, we will assume that the judgments reflect unobservable, but objective, entity-specific data reflecting assumptions that market participants would use.

Following the model, total selling costs attributable to attracting new customers during the prior four years totaled \$366,839. After tax affecting this amount, the replacement cost per customer is gauged to be \$1,378. Extending by the number of customers in the business and allowing for an amortization benefit suggests that the fair value of the customer list is \$1,550,000.

**TABLE 20.4 Lead Schedule—Summary**

<b>Structure of the Acquisition</b>		
Cash paid at closing	\$2,500,000	Per asset purchase agreement
Plus: Liabilities assumed	100,000	
Total consideration (adjusted purchase price)	\$2,600,000	
Less: Net working capital assets assumed	(160,000)	Per closing statement
Less: Net fixed assets assumed	(520,000)	Per market appraisal
Net amount to be allocated (rounded)	\$1,920,000	
Goodwill and other intangible assets	\$1,920,000	

**Discount Rate Attributable to Overall Assets**

	Fair Value	% of Enterprise Value	Weighted Average Return on Assets (Discount Rate)	Total Return	Return as % of Purchase Price
PURCHASE PRICE	\$2,600,000	100.0%	18.0%	\$468,000	18.0%
Working capital	160,000	6.2%	8.0%	12,800	0.5%
Fixed assets	520,000	20.0%	10.0%	52,000	2.0%
Intangibles	1,920,000	73.8%	21.0%	403,200	15.5%
				\$468,000	18.0%

***Intangibles discount rate in total must be higher than the enterprise overall!***

**Discount Rate Attributable to Identified Intangibles**

	Fair Value	% of Enterprise Value	Weighted Average Return on Assets (Discount Rate)	Calculated Total Return	Return as % of Purchase Price
Purchase price	\$2,600,000	100.0%	18.0%	\$468,000	18.0%
Customer list	800,000	30.8%	20.0%	160,000	6.2%
Software	500,000	19.2%	20.0%	100,000	3.8%
Trademarks	300,000	11.5%	22.0%	66,000	2.5%
Non-compete contracts	130,000	5.0%	22.0%	28,600	1.1%
Unallocated goodwill	190,000	7.3%	26.0%	49,400	1.9%
Fair value of intangibles	\$1,920,000	73.8%		\$404,000	15.5%

\* Note: May change with new rules

**TABLE 20.5 Fair Value of Customer List/Customer Base Replacement Cost Method**

Year	Reported Revenues	Selling Costs to Reported Revenues	Proportion of Estimated Independent Selling Costs	% Selling Costs Allocated to New Customers	New Customer Selling Costs	Number of New Customers
Jan–Dec 2016	\$3,000,000	\$110,000	3.67%	90.0%	\$ 99,000	23
Jan–Dec 2015	2,500,000	103,000	4.12%	90.0%	92,700	45
Jan–Dec 2014	2,200,000	97,500	4.43%	90.0%	87,750	37
Jan–Dec 2013	2,000,000	56,339	2.82%	90.0%	50,705	40
		\$366,839			\$ 330,155	145
		Total pretax selling costs, new customers			\$ 330,155	
		Less taxes at 39.5%			(130,411)	
		After-tax selling costs, new customers			199,744	
		Divided by new customers			145	
		Replacement cost per new customer			1,378	
		Number of existing customers			1,000	
		Total replacement cost of customers			1,378,000	
		<b>Amortization Benefit</b>				
				Discount rate	25.00%	
				Tax rate	39.5%	
				Tax amortization period	15	
				Present value of annuity over period	4.31479	
				Amortization benefit	176,643	
				<b>Fair value of customer list (rounded)</b>	<b>\$1,554,643</b>	
				<b>Fair value of customer list (rounded)</b>	<b>\$1,500,000</b>	

## Fair Value of Acquired Software

A simple replacement cost for existing software less an obsolescence factor is shown in table 20.6. The key elements are the number of lines of code, productivity ratings based on time to recreate lines of code, and estimated hours required to reproduce this software. Generally, software does have some obsolescence, requiring a judgment factor derived from technical management personnel. In this example, using a 20 percent obsolescence adjustment plus adjustments for taxes and the amortization benefit, the software intangible is estimated at \$175,000.

## Fair Value of Customer-Related Intangibles With an Excess Earnings Model

A multiperiod excess earnings model (EEM) is an income-based method using, in most cases, a discounted cash flow analysis. Theoretically, the value of the subject intangible is equal to the present value of the discounted incremental after-tax cash flows attributable only to the subject intangible. EEM is most commonly used to value the most essential, or primary, asset responsible for generating income in the enterprise, such

as customer-related intangibles or technology, or both (that is sold to third parties). The net cash flows attributable to the subject intangible are those in excess of fair returns on all other contributory assets. Be careful when using an EEM model, however. Complex issues arise in possible cross charges and indirect (or related) benefits to related assets.

**TABLE 20.6 Fair Value of Acquired Software Replacement Cost Method Less Obsolescence**

Module in Place	Lines of Code	Productivity Rating*	Adjusted LOC Basis	Std LOC Per Hour	Hours to Recreate
1	15,000	4	3,750	4	938
2	2,100	3	700	4	175
3	18,000	3	6,000	4	1,500
Total	35,100				2,613
		Blended hourly rate			\$ 125
		Reproduction cost			\$326,625
		Less obsolescence factor			20%
		Replacement cost			\$ 261,300
		Less taxes			39.5%
		After tax value, before amortization			\$ 158,086
		<i>Amortization benefit</i>			30.00%
		Discount rate Tax rate			39.5%
		Tax amortization period			15
		Present value of annuity over period			3.72633
		Amortization benefit			17,200
		<b>Fair value of software</b>			<b>\$175,286</b>
		<b>Fair value of software (rounded)</b>			<b>\$175,000</b>

\*Productivity rating based on code generation tools as discussed with technical operations management.

In table 20.7, the projected net income of the enterprise is adjusted for the contribution of the tangibles and all other intangibles (as derived from different methods). After-tax cash flows are discounted using a 28 percent discount rate (mid-year convention). Adjusting for an amortization benefit of 12 percent (let's say as previously calculated), the fair value of the residual customer-related intangibles is \$45,000.

## Fair Value of Non-Compete Agreements Using a “With and Without” Model

I am going to provide you with an example here, but I am also going to address this topic further in chapter 22. Valuing a non-compete agreement is commonly accomplished using an income method to demonstrate the economic difference in future operational income *without competition* and *with competition*. A discounted cash flow model is constructed for the length of the term of the non-compete. There is no residual value once the non-compete agreement expires. The projections should reflect the probability of competition, although some valuation analysts prefer to multiply the difference finding by a percentage probability factor (generally, 10 percent to 90 percent, reflecting capacity, desire, and ability to effectively compete) that the competition will occur if the non-compete agreement was not in place. An example of valuing a 3-year non-compete agreement, with an amortization factor (previously determined) added at the end, is shown in table 20.8. The analysis concludes that the employment agreement carries a fair value of \$76,000.

**TABLE 20.7 Fair Value of Customer-Related Intangibles Excess Earnings Method**

Year (Period)	Year 1	Year 2	Year 3
Income from operations before tax	\$40,000	\$52,000	\$45,000
Less taxes at 39.5%	(15,800)	(20,540)	(17,775)
Enterprise projected net income (loss)	\$24,200	\$31,460	\$27,225
Less charge for contributory assets*			
Working capital	\$900	\$ 1,100	\$ 800
Fixed assets	5,000	7,500	7,000
Assembled workforce	700	700	400
Trademarks	500	800	100
Non-compete agreements	100	50	
Total contributory charges	\$ 7,200	\$10,150	\$ 8,300
After-tax cash flows	\$17,000	\$21,310	\$18,925
Periods (mid-year convention)	0.50	1.50	2.50
Discount rate based on asset category	28.00%	28.00%	28.00%
Discount factor based on asset category	0.8839	0.6905	0.5395
Present value of cash flows	\$15,026	\$14,715	\$10,210
Sum of three-year impact			\$39,951
Tax amortization factor			1.12
<b>Calculated fair value of residual customer-related intangibles</b>			<b>\$44,745</b>
<b>Calculated fair value of residual customer-related intangibles (rounded)</b>			<b>\$45,000</b>

\*Note: Derived from other sources

## Fair Value of the Assembled Workforce

Overall, goodwill is what is left over from the fair value paid in exchange, after removing the fair value of the tangible assets and the separable intangible assets. We accountants call it the “plug” number. Although we typically do not independently recognize human capital assets as separable, most valuation assignments in this arena require that we estimate the fair value of the workforce itself as a contributory asset. The assembled workforce component is usually less than the remaining portion of goodwill, which we label as unallocated. Occasionally, the calculation of the workforce value is greater than the residual unallocated portion, suggesting that the buyers may, in fact, have gotten themselves a deal.

To put it simply, in doing an allocation assignment, a valuation analyst is expected to prepare an estimate of the fair value of the assembled workforce. An example of one model is shown in table 20.9. It shows a variety of costs that market participants would expect to absorb in order to attract, train, and assume a full productive status. With assumptions regarding fringe benefits, hiring and relocation costs, and training costs, the after-tax projected expense to recreate the workforce is slightly more than \$480,000. Adjusting for an amortization benefit suggests a value of \$528,000.

## Personal Goodwill

Because this chapter addresses intangible assets, and we have discussed the concept of goodwill, I thought that this would be a good time to touch on another subject, *personal goodwill*. I am going to discuss this further in chapter 22 because this subject comes up more often in divorce litigations than in any other type of situation. However, it also comes up in the tax allocations of a purchase price.

The amount of intangible value of an entity that relates to the entity, rather than the individual, can affect the value of many entities and the structure of an acquisition transaction. This will especially be the case for smaller businesses in which the contribution of a key person or group of people can be of great importance. For a very small professional practice or many smaller businesses, much of the intangible value would relate to the individual as opposed to the enterprise. This is the difference between the client who goes to John Smith, CPA and PricewaterhouseCoopers.

When a business is being sold, the buyer wants to be able to realize as much of the goodwill as possible. This is why covenants not to compete become a crucial part of the transaction. This is intended to provide the buyer with confidence that the intangible value will be transferred and remain with the business. Some of the things that we see in closing documents that are intended to protect the value of transferred personal goodwill include the following:

- Non-competition agreement (covenant not to compete)
- Transition agreement
- Contingent consideration in transaction structure—earnout, note payment; other transaction elements to create shared objectives of the buyer and seller for the success of the entity

A non-competition agreement may represent evidence of personal goodwill for many businesses. For tax valuations, personal goodwill valuations may arise in the context of the sale of the assets of a C corporation. The shifting of value between the corporation and the individual can create a significant tax savings. Two relevant cases that an analyst should read include *Norwalk v. Commissioner*, T.C. Memo 1998-279, and *Martin Ice Cream Company v. Commissioner*, 110 T.C. No. 18. These are really good cases to become familiar with because he or she can assist clients in saving a significant amount of money in the allocation of a purchase price for income tax purposes. An excerpt of a report that we performed allocating personal goodwill as part of a \$7 million transaction is included in exhibit 20.2. I wish that we could have charged what we saved the client!

### EXHIBIT 20.2 Personal Goodwill Report

March 2, 2016

The Law Firm P.A.  
888 Main Avenue  
City, ST 12345  
Attn: Jack Henry, Esq.

Re: Tax allocation of purchase price relating to the acquisition of certain assets of XYZ Corporation

Dear Mr. Henry:

Pursuant to your request, we have performed a tax allocation of the purchase price relating to the acquisition of certain assets of XYZ Corporation as of June 30, 2015. The purpose of this analysis is to determine the fair market value of the transferred assets as a basis for determining the appropriate amount of consideration to be allocated between corporate and personal assets that were part of the transaction.

The scope of work for this assignment was that of a valuation engagement as defined in the SSVS No. 1 promulgated by the AICPA. The report is in summary format (letter report). As such, this report is restricted to the use of the clients (and respective counsel) only and may not be distributed to any other person other than the acquirer so that consistency can be maintained for tax reporting requirements.

(continued)

## EXHIBIT 20.2 Personal Goodwill Report *(continued)*

### DEFINITION OF FAIR MARKET VALUE

The most commonly used definition of fair market value is located in Revenue Ruling 59-60. This revenue ruling defines fair market value as

...the price at which the property would change hands between a willing buyer and a willing seller when the former is not under any compulsion to buy and the latter is not under any compulsion to sell, both parties having reasonable knowledge of relevant facts.

We have considered all applicable approaches to value, and found that the income approach is the most applicable in this assignment. We will discuss this in more detail shortly.

### DOCUMENTS REVIEWED IN THIS ASSIGNMENT

Our allocation of purchase price has been based on the following information:

1. Closing documents for the transaction between Big Publishing Company and XYZ Corporation dated August 10, 2015.
2. Form 1120, U.S. Corporation Income Tax Return for XYZ Corporation for 2006–2014.
3. Internally prepared financial statements for XYZ Corporation for the six months ended June 30, 2015 and 2014.
4. Accounts receivable aging report for XYZ Corporation as of June 30, 2015.
5. Credit Agreement and Disclosure between XYZ Corporation and Southwest Capital Bank, N.A. dated November 3, 2013.
6. Promissory Note Agreement between XYZ Corporation and Southwest Capital Bank, N.A. dated November 3, 2013.
7. Change in Terms Agreement between XYZ Corporation and Southwest Capital, Bank, N.A. dated October 13, 2014.
8. Organizational chart for XYZ Corporation.
9. Top two largest suppliers for XYZ Corporation.
10. Top five largest customers for XYZ Corporation.
11. Lease Agreement for Prospect Building between Management Company, Inc. and XYZ Corporation dated August 31, 2014.
12. Lease Agreement for Johnson Commons between Johnson Commons, LLC and XYZ Corporation dated July 11, 2014.
13. Articles of Incorporation of ABCedu.com, Inc. executed on April 27, 2005.
14. Articles of Amendment to the Articles of Incorporation of ABCedu.com, Inc. dated November 15, 2010.
15. Distinct Proposal for e-Learning Course Development Project dated September 11, 2014.
16. Software Development Agreement between XYZ Corporation and Rapid Information Technology, Pvt. Ltd. dated June 19, 2014.
17. Mutual Non-Disclosure Agreement between XYZ Corporation and Rapid Information Technology Pvt. Ltd. dated June 17, 2014.
18. Work Order #2 Technology and Support Partner between XYZ Corporation and Rapid Information Technology Pvt. Ltd. dated October 1, 2014.
19. Work Order #3 Tutor Mobile between XYZ Corporation and Rapid Information Technology Pvt. Ltd. dated April 1, 2014.
20. Value Added Reseller Agreement between XYZ Corporation and Big Publishing Company dated October 1, 2013.
21. Resume and letters of reference for John Smith.
22. Career summary for Robert Smith, PhD.
23. Resume for George Johnson.
24. Tutor Positioning Plan and Justification for a Merger between Tutor and XYZ Corporation prepared by John Smith.
25. XYZ Corporation Contract with Software Co-op for R2D2 Operations.
26. Memorandum of Understanding Between a Co-op and the Arkansas Department of Education.
27. Arkansas Juvenile Education Status and Proposal.
28. Software Co-op Supplemental Educational Services profit and loss information for fiscal years 2013–2014, 2014–2015 and 2015–2016.
29. Software 2 Revenue Model.
30. Answers to various questions provided by management.
31. Other items referenced throughout this report.

In addition to the documentation provided, a management interview took place. Information gathered at this interview became an integral part of this report.

### BRIEF HISTORY OF THE COMPANY

XYZ Corporation (XYZ or The Company), a Florida C Corporation, was formed on March 19, 2005. The Company provides educational software and consulting services to public education organizations. XYZ Corporation was founded by John Smith and his father, Dr. Robert Smith. As of June 30, 2015, ownership of The Company was as follows:

**EXHIBIT 20.2 Personal Goodwill Report**

Shareholder	# Shares	Percent
Robert Smith	1,445,986	53.83%
John Smith	600,000	22.34%
Nancy Smith	600,000	22.34%
George Johnson	10,000	0.37%
Child 1	5,000	0.19%
Child 2	5,000	0.19%
Child 3	10,000	0.37%
Child 4	10,000	0.37%

Prior to the formation of XYZ, Dr. Smith had owned an education software company called SkillsCo, which he co-founded in 1986. Throughout the 1980s and 1990s, SkillsCo earned a reputation as one of the leading basic skills instructional software programs on the market. As a result, Dr. Smith was able to grow SkillsCo and eventually sell it to The Education Company in 1997.

In 2004, The Education Company was purchased by the giant toy maker Mattel. However, this acquisition eventually fell apart, and the SkillsCo source code was purchased by Michael Brown, then Chairman and Chief Executive Officer of The Education Company. Shortly thereafter, a web-based version of the SkillsCo Software called Tutor was developed.

In 2004, John Smith was working on Wall Street as an institutional broker for J.P. Morgan. During this time period, the dot-com era was reaching its peak, and Mr. Smith was looking to capitalize on this growth opportunity. As a result, Mr. Smith returned to his home in City, Florida and formed a company with his father called ABCedu, which later changed its name to XYZ Corporation.

The initial plan for XYZ was a business-to-business model in which The Company would sell educational software over the internet. However, this business model proved to be unsuccessful as school board administrators and officials prefer to buy products from people they know. In 2005, XYZ became a distributor for Tutor, which was still in its initial stages and did not have an inside sales force.

In 2006, the Arkansas special education department decided to pilot software for juvenile detention centers. Mr. Smith was able to capitalize on this opportunity and creatively position Tutor as part of the Arkansas Juvenile Education Initiative (R2D2). The R2D2 model was so successful in the juvenile detention centers that local education agencies (LEA) began to adopt the model. Eventually, XYZ Corporation would account for one-third of the total revenue generated by Tutor.

In 2010, Tutor grew and built an inside sales force. During this process, all Tutor distributors were cut, except for XYZ. However, XYZ's territories were limited to Arkansas, Florida, and Missouri. In May 2011, Tutor was acquired by Big Publishing Company (BPC).

In 2012, Dr. Smith retired and Mr. Smith took over as Chief Executive Officer of The Company. At the time, The Company was heavily in debt and spent much of the year paying down debt principal.

A year later, Mr. Smith approached BPC to see if they were willing to sell its Tutor division. This proposal was turned down around June 2014 as the private equity firm involved in the potential transaction offered too low of a price. However, a few months later, after witnessing the success Mr. Smith had with Tutor, BPC decided to purchase XYZ Corporation in a \$7 million transaction and appoint Mr. Smith as the President of BPC's Tutor division.

## EXHIBIT 20.2 Personal Goodwill Report *(continued)*

### THE ASSET PURCHASE AGREEMENT

On August 10, 2015, BPC entered into an Asset Purchase Agreement (The Agreement) with XYZ, Mr. Smith, and Dr. Smith. Pertinent sections of The Agreement are discussed below.

### PURCHASED ASSETS

The assets purchased as part of The Agreement are as follows:

- a) To the extent assignable, all contracts used in the operation of the business.
- b) The lease agreement for XYZ's Arkansas office.
- c) All equipment supplies and personal property used or held for use in the business.
- d) All books and records.
- e) All proprietary rights.
- f) All government authorizations.
- g) To the extent assignable, all rights or chose in action relating to XYZ including all rights under express or implied warranties relating to the purchased assets.
- h) All rights and claims under insurance policies with respect to the purchased assets.
- i) All accounts receivable relating to sales made by the business on or after July 1, 2015 ("The Purchaser A/R").
- j) Goodwill.

### EXCLUDED ASSETS

The following assets were not assumed by BPC as part of The Agreement:

- a) all cash on hand and cash equivalents;
- b) all prepaid expenses;
- c) all accounts receivable, with the exception of the Purchaser A/R;
- d) all real property owned or leased by Seller except the Arkansas Lease;
- e) the following assets owned by XYZ:
  1. All minute books, organizational documents, stock registers and such other books and records of Seller as pertain to ownership, organization or existence of Seller and duplicate copies of such records as are necessary to enable Seller to file tax returns and reports.
  2. The name XYZ Corporation and all derivatives thereof.
  3. Proceeds of insurance received or receivable, whether prior to or after the date hereof, in respect of any Excluded Liability.
  4. Tax identification numbers from the Arkansas Department of Revenue and California Department of Revenue.
  5. Any tax refunds: (i) of the Business relating to any taxable periods, or portions thereof, ending or deemed to end on or prior to June 30, 2015 as provided in the Pro Ration Statement; or (ii) relating to the Excluded Assets or Excluded Liabilities.
  6. Any records, documents or other information relating to any Seller Employees who will not be hired by purchaser.
  7. Any materials containing information about any Seller Employees, disclosure of which would violate applicable Law.
  8. Any Seller Benefit Plan or any right, title or interest in any asset of or relating thereto, or any assets relating to Excluded Liabilities.
  9. Any and all life insurance policies on shareholders, officers and directors of Seller.
  10. All of the Contracts that are not part of the assumed Contracts.

### ASSUMPTION OF LIABILITIES

No liabilities were assumed by BPC.

### NON-COMPETITION

According to Section 8.01 of The Agreement:

- (a) For a period commencing on the date hereof and terminating on the date that is five (5) years after the Closing Date, XYZ, J. Smith and R. Smith shall not, and each shall use their reasonable efforts to cause their respective Affiliates to not, without Purchaser's prior written consent, directly or indirectly own, have an interest in (other than as a less than 3% equity owner of any Person traded on any national, international or regional securities exchange or in the over-the-counter market), join or in any manner participate in (including by way of providing consulting services), any Restricted Business (the '**Non-Compete**'). During the Non-Compete Period, the Restricted Persons shall not, and each shall use their reasonable efforts to cause their respective Affiliates to not, directly or indirectly:

## EXHIBIT 20.2 Personal Goodwill Report

- (i) cause, induce or attempt to cause or induce any customer, licensee, licensor, employee, consultant or other business relation of the Business (whether such party did business with Seller as of the Closing Date or does business with Purchaser, or both) to cease doing business with Purchaser, to deal with any competitor of the Business or any Restricted Business or in any way interfere with its relationship with Purchaser; or
- (ii) hire, retain or attempt to hire or retain any employee or former employee of Purchaser (or the Business as of the Closing Date) or in any way interfere with the relationship between Purchaser and any of its employees or independent contractors.

For the avoidance of doubt, the obligations in this Section 8.01 are in addition to and do not in any way diminish, supersede or otherwise affect the non-competition and non-solicitation provisions included in the Letter of Employment.

“Restricted business” means any business or any division of a business that is directly or substantially competitive with the combined business, of BPC and XYZ.

### ALLOCATION OF PURCHASE PRICE

The first step in the allocation of purchase price was to determine the fair market value of XYZ as a stand-alone entity. We began by normalizing XYZ’s historic income statements for the year 2014 and the latest 12-month period ended June 30, 2015. These periods were deemed to be the most pertinent time periods to consider in this valuation due to the vast change that took place in XYZ after 2013. We believe that the earlier periods would not be relevant at the valuation date.

The process of normalization is intended to determine the economic income of The Company that a hypothetical willing buyer can expect The Company to generate on a consistent basis going forward. The income statement adjustments appear in Table 1.

**TABLE 1 Normalization Of Income**

	December 31, 2014	LTM June 30, 2015
Historic Net Income (Schedule 2)	\$ (10,872)	\$ (14,989)
Adjustments		
Officers’ Compensation—Addback <sup>1</sup>	494,046	492,242
Officers’ Compensation—Replacement <sup>2</sup>	(341,800)	(350,345)
Historic Income Taxes <sup>3</sup>	530	(7,536)
<b>Adjusted Pretax Net Income</b>	<b>\$ 141,904</b>	<b>\$ 119,372</b>
Income Taxes <sup>3</sup>	43,353	33,810
<b>Adjusted Historic Net Income</b>	<b>\$ 98,551</b>	<b>\$ 85,562</b>

1. Officers’ compensation was added back as an allowance for replacement compensation was deducted in number 2 below.

2. In order to determine the appropriate level of officers’ compensation, we consulted the Economic Research Institute’s database of executive compensation (ERI). Based on discussions with management, we determined that a Chief Executive Officer would be needed to run The Company.

We searched the ERI database in order to determine the appropriate market level amount of total cash compensation that would be necessary to pay a CEO who would replace Mr. Smith. Our search parameters were as follows:

- SIC 7372: Computer Software Services.
- City, Florida.
- \$4 Million in Revenues.

In selecting the amount of compensation necessary to replace Mr. Smith, we determined that 75th percentile figures were appropriate due to his importance to The Company and his various job responsibilities. Based on our search parameters, the 75th percentile level of total compensation was \$350,345 as of June 30, 2015. This amount was reduced by 2.5 percent in 2014 which approximates historical inflation.

3. Income taxes were recalculated using the federal and state corporate income tax rates that were in effect as of the valuation date.

After normalizing the income statement, XYZ’s adjusted net income was \$98,551 and \$85,562 for 2014 and the latest 12-month period ended June 30, 2015, respectively. We determined that the latest 12-month period was best reflective of the amount of earnings that XYZ can generate on a consistent basis going forward as The Company had increased its research and development spending during this period related to the development of new software programs.

(continued)

**EXHIBIT 20.2 Personal Goodwill Report** *(continued)*

The next step in the analysis is to calculate the fair market value of XYZ as a stand-alone entity. In determining the value of XYZ, we considered each of the three general approaches to valuation. The market approach was eliminated due to the lack of publicly-traded companies and acquisitions of companies that could be used as a surrogate for XYZ. The asset-based approach was eliminated as The Company had a negative net asset value as of June 30, 2015 and this would not capture any intangible value.

The income approach was performed using the capitalization of benefits method. In performing this valuation we performed a debt-free (invested capital) analysis. The reason for this is because XYZ has a large amount of debt in its capital structure compared to industry composite data that we compared The Company to. After normalizing XYZ's income statement for the latest 12-month period, The Company's adjusted net income on an invested capital basis was \$106,448.

Therefore, performing the capitalization of benefits method results in the following estimate of value for XYZ:

**TABLE 2 Capitalization of Latest 12-Month—Net Operating Profit After Tax**

Net Operating Profit After Tax	\$106,448
One Plus the Long-Term Rate of Growth	× 1.025
NOPAT for Capitalization	\$109,109
Capitalization Rate	÷ 15.40%
Market Value of Invested Capital	\$708,500
Less Interest Bearing Debt	(651,302)
<b>Fair Market Value of XYZ</b>	<b>\$ 57,198</b>
<b>Rounded</b>	<b>\$ 57,000</b>

The single period capitalization methodology requires the use of a capitalization rate. This rate is derived from a discount rate that represents the return that an investor would receive from a comparable investment. The appropriate rate at which to capitalize debt-free future earnings is the weighted average cost of debt and equity capital. This incorporates the returns demanded by both debt holders and equity holders because debt-free income is capitalized (i.e., income on which both debt and equity holders have claims). The weighted average cost of capital for XYZ was determined to be 17.90 percent. Subtracting a long-term sustainable growth of 2.5 percent resulted in a capitalization rate of 15.40 percent.

At this stage in the analysis we have calculated the fair market value of XYZ as \$57,000. This represents the fair market value of all of The Company's net tangible and intangible assets as of June 30, 2015. However, not all of The Company's assets and liabilities were transferred to BPC as part of the transaction that took place. Therefore, the next step in the allocation is to determine the fair market value of the assets that were actually transferred. This was accomplished by adding the liabilities and subtracting the assets that were retained by XYZ to the fair market value of The Company as a whole. These represent assets that were not purchased and liabilities that were not assumed by BPC. All related party receivables and Dr. Smith's vehicle were excluded from our conclusion of value of XYZ as these items were considered to be non-operating assets that are not part of XYZ's core operations. The value of the transferred assets is calculated as follows:

**EXHIBIT 20.2 Personal Goodwill Report****TABLE 3 Value of the Transferred Entity**

Fair Market Value—XYZ	\$ 57,000
Plus Retained Liabilities	
Accounts Payable	1,029,197
Notes Payable	651,302
Accrued Expenses	136,415
Income Taxes Payable	129,573
Less Retained Assets	
Cash	(121,619)
Accounts Receivable	(1,387,626)
401K Escrow Account	(2,668)
<b>Value of Transferred Assets</b>	<b>\$ 491,574</b>
<b>Rounded</b>	<b>\$ 490,000</b>

As shown in the calculations in Table 3, the value of the assets that were purchased by BPC was determined to be approximately \$490,000. The next step in the analysis is to allocate this amount across the tangible and identifiable intangible assets that were purchased as part of the transaction.

The assets purchased by BPC were discussed in an earlier section of this report. Based on discussions with management and an analysis of each of these categories of assets, we determined that the only categories of assets that had value were XYZ's fixed assets, contracts and proprietary rights. The amount allocated to each of these categories is as follows:

**FIXED ASSETS**

XYZ's fixed assets consist of furniture and fixtures, computer equipment and other miscellaneous fixed assets. Each of these assets was re depreciated using straight line depreciation over their respective class asset lives to arrive at their estimated fair market values. Salvage values of 15 percent were assumed for each of these assets. Performing these calculations resulted in a total fair market value of \$40,000 for XYZ's fixed assets.

**CONTRACTS**

The contracts assumed by BPC as part of the transaction included the lease agreement to XYZ's Arkansas office, various purchase orders and cancelled purchase orders and software licenses for Microsoft Office and other products. No value was allocated to any of these contracts as they generate no revenue and provide no expense savings.

Additional contracts assumed by BPC included the "Rapid Agreements" and the "Software Cooperative Documents." The Rapid Agreements relate to XYZ's relationship with Rapid Information Technology for the outsourcing of software development and technical support services. No value was allocated to these agreements as they generate no income or significant cost savings, as the outsourcing of these services is necessary in order to price products competitively in the marketplace.

*(continued)*

**EXHIBIT 20.2 Personal Goodwill Report** *(continued)*

The Software Cooperative Documents relate to grants paid by the Arkansas Department of Education to XYZ. These grants can be discontinued at any time and are received due to Mr. Smith's relationship with Arkansas school board officials. Therefore, we determined that these contracts have value due to their cash flow generating nature. However, there is an additional amount of risk, as they can be terminated at any time and are dependent upon John Smith's relationship with the Arkansas school board.

Taking this into consideration, a five-year forecast of the earnings generated by the Software Cooperative Contracts was constructed using the historic revenues and profitability of these contracts. A projection through 2020 was used as Mr. Smith's non-compete agreement with BPC ends in that year, which would allow him to take these cash flows away due to this relationship with Arkansas school officials. In addition, if Mr. Smith were to leave BPC after five years, there is the risk that the Arkansas school officials could discontinue the funding.

The earnings forecast for the Software contracts is presented in Table 4.

**TABLE 4 Software Cooperative Contracts**

	Actuals			Projected			
	2013-2014	2014-2015	2015-2016	2016-2017	2017-2018	2018-2019	2019-2020
Total Program Income	\$ 60,000	\$ 200,000	\$ 300,000	\$ 400,000	\$ 400,000	\$ 400,000	\$ 400,000
Program Expenses:							
Tutors	27,300	\$ 31,500	\$ 52,500	\$ 87,500	\$ 89,688	\$ 91,930	\$ 94,228
Snacks/Supplies	4,830	9,310	11,340	13,813	14,158	14,512	14,875
Equipment	15,000	5,000	250	250	256	263	269
XYZ Direct Svcs	71,250	50,000	58,750	69,031	70,757	72,526	74,339
Software Indirect Svcs	25,000	25,000	25,000	25,000	25,000	25,000	25,000
Travel	8,750	8,750	8,750	8,750	8,750	8,750	8,750
Software	16,500	16,500	16,500	16,500	16,500	16,500	16,500
Total Program Expenses	\$ 168,630	\$ 146,060	\$ 173,090	\$ 220,844	\$ 225,109	\$ 229,480	\$ 233,961
Program Pre-Tax							
Income (Loss)	<u>\$(108,630)</u>	<u>\$ 53,940</u>	<u>\$ 126,910</u>	<u>\$ 179,156</u>	<u>\$ 174,891</u>	<u>\$ 170,520</u>	<u>\$ 166,039</u>
Effective Tax Rate			× 40.0%	× 40.0%	× 40.0%	× 40.0%	× 40.0%
Program Net Income			<u>\$ 76,146</u>	<u>\$ 107,494</u>	<u>\$ 104,935</u>	<u>\$ 102,312</u>	<u>\$ 99,623</u>

The assumptions used for this forecast are as follows:

*Total Program Income:* According to the Software Contract, the \$300,000 payment for the 2015/2016 fiscal year was expected to be paid in September 2015. Therefore, this was the first period included in the projection. Going forward, income was set to \$400,000 based on discussions with management.

## EXHIBIT 20.2 Personal Goodwill Report

*Program Expenses:* In year one of the forecast, tutors, snacks and supplies, equipment and direct services were increased by the same percentage increase as the previous period. This assumes that these expenses will increase again due to the increased amount of funding. After the 2016/2017 fiscal year, these expenses were assumed to increase by 2.5 percent which approximates future inflation. All other expenses were held constant going forward based on their historical trends.

*Tax Rate:* A tax rate of 40 percent was assumed to estimate the combined federal and state tax rates paid on income generated by BPC.

Once the income generated from the Software Contracts has been forecasted, the selection of a proper discount rate becomes necessary. In this instance, a discount rate of 15 percent has been deemed applicable. According to *Cost of Capital Yearbook*, the weighted average cost of capital (WACC) for the 19 companies contained in SIC 27: Printing, Publishing and Allied Industries was 12.60 percent. This 12.60 percent was used to estimate BPC's WACC as the forecast represents expected future cash flows to be generated by BPC.

However, these particular contracts have an additional amount of risk associated with them as the grants can be discontinued at any time and are dependent on Mr. Smith's relationship with the Arkansas school officials. Therefore, a WACC of 15 percent was assumed to account for these additional risk factors. This results in the value estimate of the Software Contracts being calculated as follows:

Fiscal Year	Program Net Income	×	15% Present Value Factors	=	Present Value Future Cash Flows
2015–2016	\$ 76,146		0.9770		\$ 74,935
2016–2017	107,494		0.8109		87,167
2017–2018	104,935		0.7051		73,990
2018–2019	102,312		0.6131		62,727
2019–2020	99,623		0.5332		53,119
Value of Software Contracts					\$351,397
<b>Rounded</b>					<b>\$350,000</b>

### PROPRIETARY RIGHTS

The proprietary rights assumed by BPC as part of the transaction include various domain names and unregistered trademarks. No value was allocated to these items as they do not generate any revenue and the trademarks have no protection.

BPC also assumed various software programs developed by XYZ. These include the following:

- R2D2 Data Analysis and Reporting System
- Ark R2D2
- Software 2
- Tutor Mobile

No value was allocated to the R2D2 Data Analysis and Reporting System or Ark R2D2 as these items do not generate any revenue. In addition, it is our understanding that the buyer had some concern regarding the use of the name "R2D2" due to trademark and branding issues. As a result, we believe that these software programs do not have any brand value.

According to management, the Tutor Mobile program was still in the process of being developed as of June 30, 2015. Therefore, no value was allocated to this item either. Based on these factors, we determined that the only software program that had any value as of June 30, 2015 was the Software 2 module.

(continued)

**EXHIBIT 20.2 Personal Goodwill Report** *(continued)*

We received a five-year revenue forecast for the Software 2 module from management. According to management, this program has a 66.3 percent pretax profit margin and an estimated shelf life of approximately five years. In addition, declining revenues were forecasted over the five-year period as management states that BPC will still have to make a significant amount of capital investment into the program going forward in order to achieve certain revenue targets. Taking this into consideration, a discount rate of 10 percent was used for the Software 2 module as there is a certain amount of risk already built into management's forecast. Therefore, the value of the Software 2 module was calculated as follows:

	2016	2017	2018	2019	2020
Projected Revenues	\$ 32,989	\$ 23,303	\$ 19,589	\$ 11,460	\$ 4,189
Pretax Margin	66.30%	66.30%	66.30%	66.30%	66.30%
Pretax Income	\$ 21,872	\$ 15,450	\$ 12,987	\$ 7,598	\$ 2,778
Effective Tax Rate	40.0%	40.0%	40.0%	40.0%	40.0%
Net Income	\$ 13,123	\$ 9,270	\$ 7,792	\$ 4,559	\$ 1,667
10% Present Value Factors	0.9535	0.8668	0.7880	0.7164	0.6512
Present Value of Cash Flows	\$ 12,513	\$ 8,035	\$ 6,140	\$ 3,266	\$ 1,085
Value—Software 2	\$ 31,039				
<b>Rounded</b>	<b>\$ 30,000</b>				

At this stage in the analysis, we have determined the fair market value of the transferred assets and have valued all of the tangible assets and identifiable intangible assets that were purchased as part of the transaction. Therefore, we can now allocate the fair market value of the transferred assets across these various asset categories and determine the amount of goodwill, if any. This calculation is presented in Table 6.

**TABLE 6 Allocation of Fair Market Value of the Transferred Assets**

Fair Market Value of Transferred Assets	\$490,000
Fair Market Value of Fixed Assets	(40,000)
Value of Software Contracts	(350,000)
Value of Software 2 Module	(30,000)
<b>Goodwill</b>	<b>\$ 70,000</b>

As the calculations in Table 6 indicate, allocating the fair market value of the transferred assets across fixed assets and identifiable intangible assets results in \$70,000 of goodwill. Due to the fact that both Messrs. Smith have all of the relationships with customers and suppliers, have been the driving force behind XYZ's operation, and have no non-compete agreement in place with XYZ, we believe that this \$70,000 consists primarily of personal goodwill and the amount of enterprise goodwill is negligible at best.

**EXHIBIT 20.2 Personal Goodwill Report**

Therefore, thus far in the analysis, the purchase price of \$7 million is allocated as follows:

Purchase Price	\$7,000,000
Fixed Assets	(40,000)
Value of Software Contracts	(350,000)
Value of Software 2 Module	(30,000)
Remaining Unallocated Amount of Purchase Price	<u>\$6,580,000</u>

The final step in the analysis is to allocate the remaining \$6.58 million between the non-compete agreement and personal goodwill. In order to determine the value of the non-compete, we performed a lost sales analysis over a period of five years which is the term of the covenant.

The first step is to determine the level of sales that would be lost if the covenant was not in place. Based on discussions with management, we estimate that if Messrs. Smith were to compete with BPC, The Company would lose between 10 to 20 percent of its revenues during the first year. Thereafter, we assumed that this percentage will increase by 5 percent annually as it will take time for the customers that leave BPC to convert to new software programs.

Once lost revenues were forecasted, they were reduced by the amount of expenses that BPC would save from Mr. Smith's absence. Our assumption is that a breach of the non-compete by either XYZ, Robert or John Smith would result in the same end result, a complete breach of the agreement. Therefore, any competition that would cause lost revenues would result in the same expenses being saved by BPC. These expenses include Mr. Smith's direct expenses, as well as other expenses related to in-service and technical support.

Mr. Smith's direct expenses consist of salary and fringe benefits. Therefore, we estimated Mr. Smith's direct expenses at \$325,000 per year which consists of his base salary of \$250,000, increased by an additional 30 percent to account for other fringe benefits and perquisites paid to him. Expenses related to in-service and technical support were estimated at 10 percent of lost revenues per year, which was determined based on discussions with management, as well as information provided to us by BPC.

The lost sales analysis consists of three separate scenarios:

- lost sales of 10 percent in Year 1.
- lost sales of 15 percent in Year 1.
- lost sales of 20 percent in Year 1.

A summary of each of the lost sales scenarios is presented in Tables 7 through 9.

**TABLE 7 Competition Scenario Assuming 10 Percent Lost Business in Year 1**

	1	2	3	4	5
Revenues	\$3,994,457	\$3,994,457	\$3,994,457	\$3,994,457	\$3,994,457
Percentage of Customer Base Assumed to be Lost	10.00%	15.00%	20.00%	25.00%	30.00%
Revenues Assumed to be Lost	\$ 399,446	\$ 499,169	\$ 498,891	\$ 498,614	\$4,198,337

Revenues Assumed to be Lost	\$ 599,169	\$ 798,891	\$ 998,614	\$1,198,337	\$1,398,060
Direct Expenses	325,000	325,000	325,000	325,000	325,000
Other Expense Savings (10%)	59,917	79,889	99,861	119,834	139,806
Pretax Income	\$ 214,252	\$ 394,002	\$ 573,753	\$ 753,503	\$ 933,254
Marginal Tax Rate	40%	40%	40%	40%	40%
Net Income	\$ 128,551	\$ 236,401	\$ 344,252	\$ 452,102	\$ 559,952

**TABLE 9 Competition Scenario Assuming 20 Percent Lost Business in Year 1**

	1	2	3	4	5
Revenues	\$3,994,457	\$3,994,457	\$3,994,457	\$3,994,457	\$3,994,457
Percentage of Customer Base Assumed to be Lost	20.00%	25.00%	30.00%	35.00%	40.00%
Revenues Assumed to be Lost	\$ 798,891	\$ 998,614	\$1,198,337	\$1,398,060	\$1,597,783
Direct Expenses	325,000	325,000	325,000	325,000	325,000
Other Expense Savings(10%)	79,889	99,861	119,834	139,806	159,778
Pretax Income	\$ 394,002	\$ 573,753	\$ 753,503	\$ 933,254	\$1,113,005
Marginal Tax Rate	40%	40%	40%	40%	40%
Net Income	\$ 236,401	\$ 344,252	\$ 452,102	\$ 559,952	\$667,803

Having presented these analyses, the lost income calculated under each scenario is summarized in Table 10.

**TABLE 10 Summary of Lost Income from Seller Competition**

	2016	2017	2018	2019	2020
10 percent	\$ 20,701	\$128,551	\$236,401	\$344,252	\$452,102
15 percent	128,551	236,401	344,252	452,102	559,952
20 percent	\$236,401	344,252	452,102	559,952	667,803

**EXHIBIT 20.2 Personal Goodwill Report** *(continued)*

As can be seen in Table 10, the greater the loss of sales, the greater the loss of income. The next step in the analysis is to determine the most likely loss of revenue that would result from the competition of XYZ or either of The Smiths. Based on our discussion with management, we believe that a 20 percent loss of revenue would be too high in Year 1 as it would take significant time and investment for the lost customers to learn and adapt to new software programs. Furthermore, since many of the customers have already spent money on the software and licensing agreements, they would not consider making a switch until the term of the license agreement is over. As a result, it is likely that the percentage of lost revenue would be smaller in Year 1, before gradually increasing over the non-compete period.

However, we also believe that a 10 percent loss of revenue would be too low in Year 1 as the relationship with school board officials is the primary driver of XYZ's revenues. These relationships increase the likelihood that a significant portion of the customer base would make efforts to follow The Smiths if they were to compete with BPC.

Taking these factors into consideration, we have selected 15 percent as the percentage of sales that could possibly be diverted from BPC in Year 1. Discounting these lost earnings by BPC's estimated WACC of 12.60 percent results in the value of the non-compete being calculated as follows:

Year	Lost Income	×	12.60% Present Value Factors	=	Present Value Future Cash Flows
1	\$128,551		0.9424		\$ 121,146
2	236,401		0.8369		197,844
3	344,252		0.7433		255,882
4	452,102		0.6601		298,433
5	559,952		0.5862		328,244
<b>Value of Non-Compete</b>					<b>\$1,201,550</b>
<b>Rounded</b>					<b>\$1,200,000</b>

**CONCLUSION**

After accounting for all tangible and identifiable intangible assets, the \$7 million purchase price of XYZ Corporation is allocated as follows:

Fixed Assets	\$ 40,000
Software Contracts	350,000
Software 2 Module	30,000
Non-Compete Value	1,200,000
Personal Goodwill	5,380,000
<b>Price Paid by BPC</b>	<b>\$7,000,000</b>

The schedules and appendices attached to this report are an integral part thereof and should be considered to be part of this report.

## Conclusion

I have tried to provide some basics about intangible asset valuations. Keep in mind that this was really basic. In order to play in this sandbox, get out a big shovel because this is truly an area of specialty. Although techniques used follow traditional business valuation approaches and methods, application can vary in the models and assumptions. Should you choose to undertake these types of assignments, a lot more training and studying is needed beyond this chapter. Hopefully, this will at least be a starting point.

# Chapter 21

# Estate and Gift Valuations

## Learning Objectives

In this chapter, I will attempt to explain the following:

- Valuation rules for estate and gift tax purposes
- Valuing family limited partnerships (and similar entities) for estate and gift tax purposes
- How the valuation analyst should do the job the right way

## Introduction

I started this chapter in the last edition by writing “Although the rumors continue to circulate (and they have for years) that discounts for family limited partnerships (FLPs) and other similar entities are going to be legislated out of existence, the legislation never seems to get too far in Congress.” Toward the end of 2016, there were more hearings, this time, trying to change Section 2704 of the IRC. In English, they are at it again! By the time this edition of the book is published, who knows what these folks will be up to. Therefore, I am going to tell you about this topic as of late 2016/early 2017.

Not much has changed that affects how we perform valuations for estate and gift tax purposes. But with that being said, if the valuation analyst is going to work in this arena, he or she must know the rules. And there are definitely rules.

Business valuation assignments performed for estate and gift tax purposes are subject to the laws found within the IRC and regulations. This is not optional. It is the law. But as with all laws, there always seems to be interpretations that are questioned. Though it is not my intent to turn this book into a tax treatise, the valuation analyst needs to be aware of the rules. If the valuation analyst is not an accountant, he or she should work with an accountant, a tax attorney, or someone who knows the rules. If the valuation analyst is an accountant, find someone who understands the rules.

Besides the IRC and regulations, it is also a pretty good idea for the valuation analyst to be familiar with revenue rulings, private letter rulings, Tax Court decisions, and all types of other stuff that relate to this area. The valuation analyst should also know that there are various penalties included in the tax law that penalize taxpayers and sometimes valuation analysts for substantially understating a tax liability. Besides the malpractice issues that I addressed earlier in this book, the valuation analyst certainly does not want to end up in a position where he or she or the firm is laying out money in the form of penalties.

## Penalties for Undervaluation on Estate and Gift Tax Returns

If the valuation analyst is going to work in this arena, he or she should be aware of the potential penalties that he or she and the client face. IRC Section 6662 provides for penalties against taxpayers for undervaluation of assets on estate and gift tax returns. These penalties are based on the percentage difference between the value reported on the estate or gift tax return and the value finally determined. The client faces the following possible penalties:

Value Per Tax Return as a Percentage of the Final Value	Penalty
More than 65%	0%
More than 40%, but less than 65%	20%
40% or less	40%

So, what does this mean? It means that if the valuation analyst's client gets whacked with a penalty, he or she or his or her insurance carrier may have to write a check. Valuation analysts are subject to IRC Section 6701 penalties when it is determined that the valuation analyst aided and abetted the taxpayer in understating the tax. The maximum penalty that can be assessed against the valuation analyst is \$1,000. However, with the passage of the 2006 Pension Protection Act (PPA), the rules changed. Although this seems to be a long time ago, those who have not worked in this profession before are not familiar with The Act, and so I am going to spend a little time discussing it.

## 2006 Pension Protection Act

One of the provisions of the PPA is that for valuations for charitable contribution purposes, the appraisal<sup>1</sup> has to be a "qualified appraisal" performed by a "qualified appraiser." These definitions were expanded to apply to all fair market valuations for all purposes in the Technical Correction Act of 2007. In IRS Notice 2006-96, the IRS defined these two terms. An appraisal is considered to be a qualified appraisal if

it complies with all of the requirements of Reg. § 1.170A-13(c)—the preexisting regs—(except to the extent the regs are inconsistent with Code Sec. 170(f)(11)), and is conducted by a qualified appraiser in accordance with generally accepted appraisal standards. For example, the appraisal is consistent with the substance and principles of the *Uniform Standards of Professional Appraisal Practice* (USPAP), as developed by the Appraisal Standards Board of the Appraisal Foundation.

A qualified appraiser is an individual who has earned an appraisal designation from a recognized professional organization or has otherwise met minimum education and experience requirements under IRS regs; regularly performs appraisals for compensation; and meets any other such requirements prescribed by the IRS (Code Sec. 170(f)(11)(E)(ii)). An individual won't be considered a qualified appraiser for any specific appraisal unless he demonstrates verifiable education and experience in valuing the type of property subject to the appraisal, and hasn't been prohibited from practicing before IRS at any time during the three-year period ending on date of the appraisal (Code Sec. 170(f)(11)(E)(iii)).

Final regulations have not been issued under IRC Section 170 or any other IRC section relating to these definitions. One thing that the CPA-valuation analyst should note is that *Statement on Standards for Valuation Services* (SSVS) No. 1, Valuation of a Business, Business Ownership Interest, Security, or Intangible Asset (AICPA, *Professional Standards*, VS sec. 100), is considered to be consistent with the substance and principals of the USPAP. Therefore, compliance with SSVS No. 1 would be the same as complying with the USPAP.

One relatively new penalty that is applicable to valuation analysts is the IRC Section 6694 penalty. According to Treasury Department Circular No. 230, appraisers are now considered to be non-signing tax preparers. The analyst is subject to the penalty if the appraisal is a substantial portion of the return or the claim for refund, and the applicable standards of care under IRC Section 6694 are not met. If this penalty is applicable, the valuation analyst is subject to a penalty that is in an amount greater than

- a. \$1,000, or
- b. 50 percent of the income derived (or to be derived) by the tax return preparer with respect to the return or claim.

<sup>1</sup> I am using the term appraisal here because the Pension Protection Act of 2006 uses this language. For this purpose, there is no distinction between an appraisal and a valuation. In addition, a valuation analyst is an appraiser in this discussion.

In addition, under IRC Section 6695A, there are substantial and gross valuation penalty tests for valuation understatements for returns filed after August 17, 2006. A substantial valuation penalty is applicable when the value of the property claimed on an estate or gift tax return is 65 percent or less of the amount determined to be the right amount. A gross valuation misstatement exists when the value of the property is 40 percent or less of the amount determined to be correct. The penalty is based on any additional tax due to an undervaluation exceeding \$5,000.

IRC Section 6695A codifies this appraisal penalty as the lesser of

- a. the greater of \$1,000 or 10 percent of the underpayment, or
- b. 125 percent of the gross income received by the appraiser for the appraisal services.

This penalty is in addition to the existing \$1,000 penalty under IRC Section 6701.

To avoid the IRC Section 6695A penalty, the appraisal must meet a “more likely than not standard,” which has yet to be defined by the IRS. The exception to this rule is that the appraisal was more likely than not the correct appraisal. According to the IRS, appraisers will avoid this penalty if they follow professional standards, perform due diligence, and follow commonly accepted methods. However, this has not been codified in any Treasury regulations.

Finally, valuation analysts may also incur sanctions under Treasury Department Circular No. 230, which governs the right of CPAs and others to practice before the IRS. The IRS can now institute proceedings to disqualify appraisers from practice before the IRS when the appraiser has been assessed a penalty under Sections 6694, 6695A, or 6701, or any other relevant penalty provisions. The IRS has established a standard that provides them with the ability to institute procedures to disqualify an appraiser if it is determined that the appraiser “acted willfully, recklessly or through gross incompetence with respect to the proscribed conduct.” This terminology seems to suggest that unless there is a pattern of negligence, the IRS would probably not start proceedings against an appraiser. However, if a disqualification does occur, the appraiser is barred from presenting evidence or testimony in any administrative proceeding before the IRS, regardless of whether the evidence or testimony would pertain to an appraisal made prior to or after the effective date of the disqualification. This information can also be shared with other government agencies. Now that I have created a sufficient amount of fear, let’s discuss valuations for estate and gift tax purposes.

## Revenue Ruling 59-60

All valuations that are performed for estate and gift tax purposes are guided by Revenue Ruling 59-60. Not only have I discussed this ruling throughout the book, but chapter 16 was devoted solely to it. There is also a copy of it in appendix 6. I am not going to repeat all of that stuff here. Just reread it and follow it for guidance.

## Chapter 14 Guidelines

Chapter 14 of the IRC (Sections 2701–2704) is an important part of the tax law to know if the valuation analyst performs this type of work for family entities. The rules are very complex and confusing. I will try to explain the more important provisions as we go along.

## Case Law

Although a valuation analyst should not necessarily perform his or her role by relying on case law, this is an area of practice in which having knowledge of the law certainly helps. There are plenty of resources available with lists of valuation court cases, as well as the full written decisions. Although the analyst should be familiar with the courts’ findings, he or she should not rely on specific court cases in the valuation analysis or report because more than likely, actual facts and circumstances will be different than those reported in the case law. It is the job of the attorney to make arguments and support them with case law, not the valuation analyst.

## The Valuation Report

Preparing a business valuation report for estate and gift tax purposes should really be no different from preparing a well-written report for other purposes in which fair market value is the standard of value. If the valuation analyst follows the guidance that I have tried to provide throughout this book, he or she should do fine.

Valuations performed for gift tax situations are subject to the *adequate disclosure* rules (see exhibit 21.1 later in this chapter). In fact, if a discount is taken in the valuation report, a box needs to be checked on the gift tax return that effectively says to the IRS “audit me.” In order for the statute of limitations to begin running, a gift tax return must meet the adequate disclosure requirements. These days, one of the most common types of reports is for the valuation of an interest in a family limited partnership. Although there are rumors that the IRS requires detailed reports to be attached to estate tax returns, this is not stated in the IRC or the regulations. However, there must be sufficient information provided in the report about any discounts (valuation adjustments) that are factored into the conclusion, so why not do a detailed report?

## The FLP Valuation

FLPs have grown in popularity as an estate planning tool and a way to reduce transfer tax values. Although this discussion refers to FLPs, many of the concepts discussed also apply to family limited liability companies (LLCs) created primarily as asset-holding companies. Business valuation analysts should be aware of the issues involved in valuing these types of interests and how to prepare a report that is less likely to be challenged by the IRS, or, if challenged, one that will more likely allow the challenge to be resolved in favor of the concluded value.

Valuation analysts need to do more than focus on what discounts they can use to reduce the value of an FLP interest. After all, this is usually the main fight with the IRS (see chapters 14 and 15 for a discussion on discounts). The FLP agreement and other partnership documents must be thoroughly analyzed before the valuation analyst can begin to render an opinion of value. The final report must at least contain certain information about the assignment—the nature of the interest being valued, the terms of the partnership agreement, and the financial condition of the entity.

This discussion is designed as an overview of the FLP valuation process and the items to consider. It is designed to help the valuation analyst prepare valuation reports more effectively and perhaps minimize the opportunity for the IRS to challenge his or her conclusion of value.

### What Is an FLP?<sup>2</sup>

Simply stated, an FLP is a nontaxable entity that is created and governed by statute and whose partners (both general and limited) and assignees consist mainly of family members.

It is nontaxable because, as a partnership, it is a pass-through entity. Unlike a corporation, which is subject to corporate-level income tax, a partnership does not pay any income taxes at the entity level. Partners will be liable for income taxes on their proportionate share of any partnership income, regardless of whether it is distributed in the form of cash.

A limited partnership is created under and governed by the Revised Uniform Limited Partnership Act of the state in which it is formed. Though they are similar in many respects, each state's Limited Partnership Act contains features that are different (although some states' acts are the same).

The FLP is also affected by various sections of the IRC, as is the valuation of interests in an FLP.

Even the term *family member* is carefully defined in IRS regulations. Members of the family are defined as the transferor or the transferor's spouse, the transferor or spouse's lineal descendants, and their spouses. This definition includes adopted children or offspring of the transferor's children but does not include aunts, uncles, cousins, and the like.

<sup>2</sup> Many attorneys are using limited liability companies (LLCs) instead of limited partnerships due to differences in the rights of members versus limited partners. Legally, these entities are different, but there are more similarities in the valuation of these two types of entities than differences. The valuation analyst must be aware of the rights (or lack of rights) that the various ownership interests have in order to prepare the valuation properly.

Many of the issues that arise in appraising FLPs become legal interpretations of the partnership agreement, rather than *pure* valuation issues. Although as valuation analysts it is important that we know and understand the issues, it is imperative that we leave the “lawyering” to the lawyers. I have said this over and over again. If there is any doubt in the valuation analyst’s mind regarding the nature of the assignment or the terms of the partnership agreement, the client’s attorney should be the one to explain it to the valuation analyst, not the other way around.

## Why Are FLPs Attractive?

FLPs are particularly attractive as estate planning tools because, through the creation of an FLP, the following apply:

- Parents or grandparents have the ability to indirectly transfer interests in family-owned assets without losing control of them.
- A high degree of protection against creditors can be achieved. This is because a partner’s creditor is legally unable to gain access to the assets in the partnership.
- The assets can be kept in the family, which is an objective of many families. This can be achieved by placing restrictions on the transfer of partnership interests, especially in the event of divorce, bankruptcy, or death of a partner.
- Problems pertaining to undivided or fractionalized interests when a property is gifted to several individuals can be avoided. This can be especially important in the case of real estate properties.
- When family-owned assets are placed in a partnership, advantages can arise through economies of scale and diversification.
- A great deal of flexibility can be achieved through the partnership agreement, which can provide broad investment and business powers. These can be amended as the family’s needs change, as long as all partners are in agreement.
- The partnership is a pass-through entity and does not pay income taxes.
- The gifting or transfer of an ownership interest in a limited partnership may be made at a lower value than that interest’s pro rata share of net asset value. The reason for this is because a limited partnership interest is likely to be both noncontrolling and nonmarketable.

## What Exactly Is the Assignment?

As stated early in this book, the valuation analyst should enter into a written contract with the client with the purpose of explaining the precise nature of the assignment that the valuation analyst is going to perform. The importance of having a clear understanding of what the valuation assignment is cannot be overemphasized. It is important that the parameters of the assignment found in box 21.1 become a part of the valuation report.

### BOX 21.1 Valuation Assignment Parameters

1. The name of the client (for instance, the person who engaged the valuation analyst). The client is responsible for identifying the nature of the interest to be valued.
2. The nature of the interest being valued (for example, general partner interest, limited partner interest, or assignee interest). It is important to note here that the thing being valued is not a percentage interest in any or all of the assets owned by the partnership but, rather, an interest in the partnership itself.
3. The size of the interest being valued. Size can be represented by a percentage interest amount, the number of units or shares, or even a dollar amount.
4. The valuation date and the purpose for which the valuation is being performed (for instance, whether it is for estate planning [gifting] or estate valuation purposes).
5. The standard of value. The retainer agreement should provide a definition of the standard of value that will be determined in the valuation. These standards are defined in the following tax regulations:

Estate planning (gifting)—Treasury Regulation 25.2512-1

Estate valuation (after death)—Treasury Regulation 20.2031-1(b)

Both of these sections define the standard of fair market value as follows:

The fair market value (of the property being valued) is the price at which the property would change hands between a willing buyer and a willing seller, neither being under any compulsion to buy or sell and both having reasonable knowledge of relevant facts.

This definition should appear in the report as well.

## What Documents Are Necessary for Preparing the Valuation Report?

The analyst should obtain the following documents before beginning the assignment:

1. The agreement of partnership (or other type of business agreement depending upon the form of the entity), as well as a copy of the certificate of limited partnership that has been filed with the state where the partnership was created. The certificate is an important document because it gives notice of the formation of the limited partnership and the limited liability of the limited partners and discloses some of the terms of the partnership agreement. Without this document, the possibility exists that the FLP will not be recognized by the IRS. If the valuation analyst is not familiar with the Limited Partnership Act of the state of formation, he or she should also obtain a copy of it.
2. A list of the assets that were initially contributed to the partnership, as well as documentation of any assets that were subsequently contributed.
3. Valuations of real estate and other assets held by the partnership as of the valuation date (for example, market values of marketable securities). If the partnership owns interests in other closely held businesses or partnerships, these interests must be separately appraised before the value of the FLP interest can be determined.
4. Financial statements and tax returns for the partnership for a reasonable number of years or since inception. If it is a new partnership, these will not exist.
5. The general partner's anticipated policies regarding distributions or an IRC Section 754 election. The IRC Section 754 election will be covered later.
6. If the FLP is ongoing, a history of distributions, if any, made to partners. If the entity is new, management's intended policy regarding distributions should be obtained.
7. Information such as minutes of meetings of partners or other documents, if they exist, may give the analyst some insight into the intent of the donor at the time of formation of the partnership.

## How Does Revenue Ruling 59-60 Help?

Revenue Ruling 59-60 provides basic guidelines for valuing shares of closely held corporations. It is also a valuable guide to valuing FLPs. Every valuation report of a family limited partnership interest should closely follow Section 4 of Revenue Ruling 59-60, which enumerates the factors the valuation analyst should consider in his or her valuation.

Most of the information necessary to describe the nature of the FLP and its history can be found in the certificate of partnership and the partnership agreement. This section of the report is often overlooked because many valuation analysts prefer to concentrate on the valuation calculations and the discounts selected. However, it is important to make a thorough review of the partnership agreement and to include a list of the pertinent aspects of it in the report.

Remember, our assignment is to determine the fair market value of an FLP interest, not the fair market value of the underlying assets. That is what the valuation analyst should be concentrating on in his or her report. Provisions in the agreement provide the rights (or lack of rights) of the general and limited partners and should be used, where possible, to support the analysis and quantification of the discounts.

## What Is Chapter 14?

Chapter 14 of the IRC was enacted in October 1990 and outlines the special valuation rules that must be adhered to when valuing interests in closely held companies and partnerships. The basic premise behind this section is that when valuing business interests that are to be transferred between family members, the valuation analyst should ignore restrictions that would not exist if the transaction was between unrelated third parties.

This chapter consists of four sections, three of which actually relate to FLPs. If the partnership does not comply with the provisions of this chapter, the IRS may determine that the partnership does not exist for tax purposes and value the underlying assets directly in calculating the applicable gift or estate tax.

The provisions of the partnership agreement should comply with the sections of Chapter 14. The major items contained in an FLP agreement are listed in box 21.2, along with the applicable sections of Chapter 14.

IRC Section 2701 addresses special valuation rules used for lifetime gifts when a junior equity interest (corporate, partnership, or LLC) is transferred from one family member to another and the transferor retains a senior equity interest in the company. In this instance, *senior* and *junior* interests refer to interests that are not equal economically, such as preferred stock versus common stock. They do not refer to *general* or *limited* partners as such because general and limited partners are often economically the same. Although they have disproportionate liability and management responsibilities, this, alone, does not make a general partner interest *senior* to a limited partner interest.

For this reason, the special valuation rules contained in IRC Section 2701 do not apply to a gift of a partnership interest in which all items of income and loss are shared in the same proportions by all partnership interests. A reading of the partnership agreement will determine whether or not the FLP is a *pro rata* partnership in which the only differences between the general partner interest and the limited partner interest are management rights and the extent of liability exposure. Not only should this provision be included in the agreement, but it should be followed by the entity. On audit, the IRS will request documents related to distributions, including cancelled checks, to see if the entity is complying with this provision.

Section 2703 deals with restrictions placed on the rights of the transferee in the partnership interest. This section provides that the value of any property is to be determined without regard to the following:

- Any option, agreement, or right to acquire or use the property at a price less than fair market value
- Any restriction on the right to sell or use the property

These rules do not apply when the following occurs:

- There is a bona fide business arrangement.
- It is not a device to transfer the property for less than full and adequate consideration.
- Its terms are comparable to similar arrangements entered into by persons in arm's length transactions.

What is the significance of IRC Section 2703? The term *property* in IRC Section 2703 does not mean the assets contributed to the FLP by the partners because those assets are 100 percent owned by the FLP. Once the assets have been contributed to the FLP, no partner or assignee has a right to receive, possess, or use the assets. What they do have is a right to possess their general and limited partner interests. Because it is the interest in the FLP that is the property for purposes of IRC Section 2703, whether this section applies depends upon the restrictions placed on the rights of the transferees in the partnership agreement.

Whether or not IRC Section 2703 applies is for the client or client's attorney to decide, not the valuation analyst. The valuation analyst is retained to determine a conclusion of value for a partnership interest (not a partnership asset). At most, the valuation analyst can be alert for provisions in the agreement and contact the client if anything appears questionable.

Under this IRC section, the IRS will argue that the restrictions in the agreement are more onerous than the restrictions would exist between two unrelated parties, and as a result, the agreement is not valid. If the IRS wins this argument, then a partnership does not exist, and the actual gift made was the underlying assets, rather than an interest in an FLP.

IRC Section 2704 deals with lapsed voting and liquidation rights. IRC Section 2704(a) treats certain lapsed voting or liquidation rights in an FLP as deemed transfers that become subject to gift or estate tax. Generally, this IRC section becomes applicable if there is only one general partner and this partner is an individual. Voting

**BOX 21.2****FLP Agreement Provisions  
with Chapter 14 Compliance**

Provision	Chapter 14 Section
Formation	2703
Purpose	2703
Term	2704(b)
Management	2704(a)
Capital contributions	2703
Allocations of profit and loss	2701
Distributions	2701
Transfer restrictions	2703 and 2704(b)
Dissolution	2703 and 2704(b)

rights lapse if, at the time of death, this general partnership interest becomes a limited partnership interest, and the general partner's rights to liquidate the partnership lapse as a result. The issue becomes how to measure that loss in rights.

Many experts conclude that the best way to avoid triggering IRC Section 2704(a) is to have a general partner that is a corporation or other entity. In the alternative, an FLP could have more than one general partner if the partners are individuals and there is a provision for succession from one to another should one die. These provisions must be spelled out in the partnership agreement.

IRC Section 2704(b) disallows consideration of certain restrictions (called the *applicable restrictions*) on liquidation rights in valuing the transfer of an interest in a family-controlled entity. An applicable restriction is any limitation on the ability to liquidate the entity, in whole or in part, that is more restrictive than the limitations that would apply under state law, if the restriction did not exist in the agreement. If the liquidation restrictions in an agreement are more restrictive than state law, under IRC Section 2704(b), the valuation analyst should value the interest utilizing state law provisions, rather than the more restrictive rights in the agreement.

There are a number of states that have changed their Limited Partnership Act to state that the provisions of the Partnership Agreement control liquidation restrictions; therefore, many LPs have been formed in these states. For this reason, it is imperative for the valuation analyst to understand the appropriate state law.

## How Does All This Affect the Valuation Assignment?

Many valuation analysts are concerned with the size of the discounts taken in an FLP valuation because they believe that this is the biggest concern to the IRS. Although the IRS is concerned with excessive discounts, there is case law that has dealt with the issue of whether the partnership truly exists. The IRS has raised this issue by either attacking the reason for the formation of the partnership or raising Chapter 14 issues, specifically IRC Sections 2703 and 2704.

Remember, if the IRS can win on these issues, then the FLP is not seen as a valid entity; therefore, the gifts become gifts of the underlying assets directly, rather than partnership interests (in other words, no discounts).

Some of the original cases that dealt with these issues are the following:

- *Baine P. Kerr, et ux. v. Commissioner*, 113 TC 449
- *Estate of Albert Strangi v. Commissioner*, 115 TC 35
- *Ina F. Knight v. Commissioner, et vir v. Commissioner*, 115 TC 36
- *Church v. United States*, 85 AFTR 2d 2000-804

This is not intended to be an exhaustive list; it is merely an example of some of the issues that the IRS has brought up on audit that have been decided by the courts. There are other, more recent cases, but in general, the taxpayers have prevailed in these cases because the facts and circumstances have not been egregious. In general, the courts have allowed the entities to stand because the partners understood the agreement when they signed it and the courts have chosen not to override that choice.

## Section 2036

This section of the IRC does not directly relate to valuation but has been used effectively by the IRS in fighting valuations of interests in FLPs that are included on estate tax returns.

The following is a reproduction of IRC Section 2036, "Transfers with Retained Life Estate."

### TRANSFERS WITH RETAINED LIFE ESTATE

**2036(a) General Rule.** The value of the gross estate shall include the value of all property to the extent of any interest therein of which the decedent has at any time made a transfer (except in case of a bona fide sale for an adequate and full consideration in money or money's worth), by trust or otherwise, under which he has retained for his life or for any period not ascertainable without reference to his death or for any period which does not in fact end before his death—

**2036(a)(1)** the possession of enjoyment of, or the right to the income from, the property, or

**2036(a)(2)** the right, either alone or in conjunction with any person, to designate the persons who shall possess or enjoy the property or the income therefrom.

**2036(b) Voting Rights.**

**2036(b)(1) In General.** For purposes of subsection (a)(1), the retention of the right to vote (directly or indirectly) shares of stock of a controlled corporation shall be considered to be a retention of the enjoyment of transferred property.

**2036(b)(2) Controlled Corporation.** For purposes of paragraph (1), a corporation shall be treated as a controlled corporation if, at any time after the transfer of the property and during the 3-year period ending on the date of the decedent's death, the decedent owned (with the application of section 318), or had the right (either alone or in conjunction with any person) to vote, stock possessing a least 20 percent of the total combined voting power of all classes of stock.

**2036(b)(3) Coordination with Section 2035.** For purposes of applying section 2035 with respect to paragraph (1), the relinquishment or cessation of voting rights shall be treated as a transfer of property made by the decedent.

**2036(c) Limitation on Application of General Rule.** This section shall not apply to a transfer made before March 4, 1931; nor to a transfer made after March 3, 1931, and before June 7, 1932, unless the property transferred would have been includible in the decedent's gross estate by reason of the amendatory language of the joint resolution of March 3, 1931 (46 Stat. 1516).

Although the IRS has not won every case on this issue, they have been relatively successful. When the IRS prevails on this issue, the amount of the gift, without discounts, is included in the decedent's estate. Some of the cases that have been decided under IRC Section 2036 are as follows:

- *Estate of Reichardt v. Commission*, 114 TC 144
- *Estate of Harper v. Commissioner*, TC Memo 2002-121
- *Kimbell v. U.S.*, 2003 WL 138081, Doc 2003 2946, 2003 TNT 22-12 (N.D.TX. 2003); vacated and remanded by 5th Circuit Court of Appeals (No. 03-10529)
- *Estate of Strangi v. Commissioner*, 115 TC 478 (2000), affirmed in part and revised in part 293 F.2D 279 (5th Cir. 2002), remand TC Memo 2003-145
- *Estate of Stone v. Commission*, TC Memo 2003-309

This is not an all-inclusive list of the IRC Section 2036 cases that have been ruled on, but these particular cases demonstrate the issues that the IRS is raising in this area. Since this list was compiled, there have been a number of additional cases. Some of the decisions have favored the IRS, whereas others have favored the taxpayer. IRC Section 2036 is a legal and tax argument, not a valuation issue. However, because many of us advise clients on these issues or work with attorneys in setting up or maintaining FLPs, some key things to keep in mind are provided in box 21.3.<sup>3</sup>

**BOX 21.3**

**IRC Section 2036 Considerations**

1. Select FLP assets carefully.
  - a. Do not transfer a personal residence to an FLP.
  - b. To avoid the appearance of an implied agreement, do not transfer substantially all the decedent's assets to the FLP. Make sure the decedent retains, OUTSIDE of the FLP and in the client's own name, sufficient assets to meet his or her own personal needs.
  - c. Transfer business assets to an FLP. A closely held business makes a great asset to contribute to an FLP. The active involvement of the FLP in a legitimate business activity may be the best way to avoid inclusion under IRC Section 2036.

(Box continued)

<sup>3</sup> Adapted from "A Practical Approach to FLPs: It's Not All Gloom and Doom," a presentation made by David Aughtry Esq. at the 2004 AICPA National Business Valuation Conference. Copyright 2008 by David D. Aughtry. Used with Permission.

**BOX 21.3****IRC Section 2036 Considerations** *(continued)*

2. Avoid certain patterns of distributions.
  - a. Avoid timing distributions to coincide with personal expenditures. It makes the FLP look like the decedent's personal pocketbook.
  - b. If possible, do not make distributions and allow the FLP to accumulate its income.
  - c. If distributions are necessary, have the FLP agreement provide for distributions at the same time each period, for example, quarterly distributions can be made. Another option is to determine distributions on the basis of the profitability of the FLP's assets.
  - d. When distributions are made, make sure they are proportionate to the interest owned by the partners.
  - e. Always keep detailed records of distributions—approval process used, reasons, and so on.
3. Avoid giving the client “control” over the contributed assets.
  - a. Avoid placing the client in a position where he or she has control over the partnership distributions.
  - b. Do not make the client general partner or allow the client to have enough power to remove the general partner and place himself or herself or another person in the role of general partner.
  - c. Avoid placing the client in a position where he or she can dissolve the FLP.
  - d. Avoid giving the client's attorney-in-fact management responsibilities.
  - e. Do not waive general partner's fiduciary duties. Do NOT provide that the general partner will be relieved of normal fiduciary responsibilities.
  - f. Consider hiring an unrelated party to handle the day-to-day management of the FLP and the general partner entity. This also supports the legitimate business purposes of the FLP.
4. Structure the FLP to include other interest holders.
  - a. If possible, have other family members contribute property to the FLP to enhance the bona fide status of the FLP. This supports the FLP's legitimate business purpose.
  - b. Include unrelated interest-holders. The inclusion of unrelated interest-holders may help prevent a court from disregarding the general partner's fiduciary duties.
  - c. Always involve other partners and general partner entity owners in negotiation and implementation process. Documenting the involvement of the other interest-holders may help establish the applicability of the bona fide sale exception to IRC Section 2036.
5. Observe formalities.
  - a. Observe all the formalities. Don't just rely on accounting entries. Avoid accruing certain payables; leave a paper trail.
  - b. Get the books made promptly after the FLP is created.
  - c. Open the FLP checking account promptly after FLP formation.
  - d. Retitle assets in FLP's name promptly.
6. Don't treat an FLP like a testamentary arrangement.

Be aware and cautious of setting up an FLP with a widow or widower who is on his or her death bed. This could be problematic because there would only be limited post-transfer history, and it creates the impression that the transaction is testamentary in nature.

## More Court Cases

Because IRC Section 2036 is only effective for estate tax returns, the IRS needed a different mechanism to challenge gift tax returns when the Chapter 14 arguments did not work. The arguments they have raised are indirect gifts of the assets and the step transaction doctrine.

The indirect gift argument arises when a gift is made before the agreement is executed or the assets are transferred to the FLP. In this case, the IRS has been able to argue that the transfer is not a gift of an FLP interest, but a gift of the underlying assets. There have been several cases on this issue, both victories and defeats for the IRS, including the following:

- *Senda v. Commissioner*, T.C. Memo 2004-160 (affirmed by 8th Circuit Court of Appeals, 97 AFTR 2d 2006-419)
- *Linton v. U.S.*, 104 AFTR 2d 2009-5176, 638 F Supp 2d 1277 (DC WA, 2009) (affirmed in part, reversed and remanded in part by 9th Circuit Court of Appeals, 107 AFTR 2d 2011-565, 630 F3d 1211)
- *Holman v. Commissioner*, 130 TC 170 (affirmed by 8th Circuit Court of Appeals, 105 AFTR 2d 2010-1802)
- *Bianca Gross v. Commissioner*, T.C. Memo 2008-221

The step transaction argument arises when the entity is formed and the gifts are made shortly thereafter. The IRS has argued that these are essentially one transaction (formation and transfer) and, therefore, an indirect gift of the underlying assets. This issue was raised in the *Linton* and *Holman* cases referenced previously.

Court cases should probably be reviewed on a fairly regular basis if the valuation analyst is going to work in this area because there are frequently new cases and new issues. The preceding lists of cases are only a brief sample, not an all-inclusive list.

## Things to Consider in the Valuation Process

The basic characteristics of the transferred interest in the FLP, combined with specific provisions in the FLP agreement and state law, form the foundation for the valuation adjustments used in arriving at the fair market value of the transferred interest in the FLP. I have included some of the factors to be considered in determining appropriate valuation adjustments in box 21.4.

### BOX 21.4 Factors to Consider Affecting Valuation

#### Factors to be considered that are found in the partnership agreement:

- A provision (term-of-years provision) in the partnership agreement that the partnership shall continue to exist for a definite term of years, unless it is dissolved or liquidated prior to this date.
- No guarantee by the managing general partner or general partners of the return of any partner's capital contributions, nor any allocations of profits or losses, nor any distributions of distributable cash (not even enough to cover the annual taxes of the partners).
- Approval rights of limited partners required for certain major decisions; otherwise limited partners and assignees are excluded from participation in management.
- How the election of new managing general partners is accomplished.
- A provision that distances the limited partners and assignees from the assets of the FLP.
- The right of the managing general partner(s) or general partner(s) to determine distributable cash.
- Capital call provision obligating partners and assignees.
- Limitations on the voluntary and involuntary transferability of general partner, limited partner, and assignee interests.
- The presence of rights of first refusal.
- Consent of all partners required for a transferee or assignee of an interest in the partnership to become a substituted limited partner.
- Whether the managing general partners or general partners are required to make an IRC Section 754 election.
- Limitations on the right of the general partner to withdraw from the partnership prior to the expiration of its stated term and provision that, should the general partner exercise his or her power to withdraw early, his or her general partner interest shall become a limited partner interest and he or she may also be subject to damages for breach.
- Limitations on the right of a limited partner and assignee to withdraw from the partnership prior to the expiration of its stated term.
- Provisions for dissolution of the partnership mirroring state law.

#### Factors to be considered but may not be found in the partnership agreement:

- The reputation, integrity, and perceived competence of the partnership management and general partner(s)
- The number of investors in the partnership
- The type of assets owned by the partnership
- Whether or not the assets of the partnership are well-diversified
- The amount of financial leverage inherent in the partnership's capital structure
- The caliber of the information flow from the partnership and the general partner(s)
- The current and historical amount of cash actually distributed to partners and assignees
- Underlying cash flow coverage of yearly distributions made to partners and assignees
- The size of the interest
- The universe of interest buyers
- The default rules under state law

## What About Methodology?

What is the best approach for valuing an FLP interest? Which methods can and should be used? Section 4 of Revenue Ruling 59-60 states the following:

(a) ...in general, the appraiser will accord primary consideration to earnings when valuing stocks of companies which sell products or services to the public; conversely, in the investment or holding type of company, the appraiser may accord the greatest weight to the assets underlying the security to be valued.

(b) The value of the stock of a closely held investment or real estate holding company, whether or not family owned, is closely related to the value of the assets underlying the stock. For companies of this type the appraiser should determine the fair market values of the assets of the company. Operating expenses of such a company and the cost of liquidating it, if any, merit consideration when appraising the relative values of the stock and the underlying assets. The market values of the underlying assets give due weight to potential earnings and dividends of the particular items of property underlying the stock, capitalized at rates deemed proper by the investing public at the date of appraisal. A current appraisal by the investing public should be superior to the retrospective opinion of an individual. For these reasons, adjusted net worth should be accorded greater weight in valuing the stock of a closely held investment or real estate holding company, whether or not family owned, than any of the other customary yardsticks of appraisal, such as earnings and dividend paying capacity.

This seems to imply that some type of asset-based approach would be the most appropriate and, indeed, the only approach to valuing an FLP interest. Whereas an asset-based approach might be a frequently used approach to valuing such an interest, it is by no means the only one. Often, an income approach may be used, as well. The approach to be used should be determined based on the underlying assets of the FLP, whether or not there is a history of distributions to the partners, and how extensive and consistent the distributions were. Depending on the assets held by the partnership, a market approach could also be utilized. Depending on the circumstances of the case, more than one method may be appropriate.

In *Estate of Etta H. Weinberg, et al. v. Commissioner* (TC Memo 2000-51), the court accepted both an income approach and an asset-based approach for determining the value of the decedent's minority interest in a limited partnership that owned and operated an apartment complex. The court found that the taxpayer's use of the net asset value method under the asset-based approach was warranted because the property would retain most of its inherent value regardless of rental income production. Furthermore, the court found that the capitalization of the three-year average of distributions under the income approach was also appropriate. The findings of the court illustrate that the reliance on one approach (particularly the asset-based approach) for the valuation of FLPs is not always sufficient or relevant.

In deciding on the methodology to apply to the valuation of partnership interests, the valuation analyst must consider many different facts.

The IRS' argument to disregard the partnership agreement is made easier when the consultant uses only an asset-based approach to value an FLP interest, and the discounts applied by the appraiser are justified solely on the restrictions in the partnership agreement, without comparison to terms in similar arm's length transactions. In addition, the numerous studies on discounts for lack of control and lack of marketability are often cited, but consultants draw vague, if any, comparisons of the subject interest to the averages found in the studies [see *Charles T McCord, et ux v. Commissioner*, 120 TC 358 (2003)]. Although the averages in the studies may be used as a starting point, consultants should determine what, if any, adjustments to the averages are necessary based on the subject FLP interest and thoroughly explain this logic in the valuation report. Ultimately, both the discount for lack of control and the discount for lack of marketability require an appraiser's objective support by demonstrating that the application of a discount increases the rate of return to the investor to offset the risks of lack of control and lack of marketability. Several U.S.

Tax Court cases, such as *Estate of Norman L. Bell v. Commissioner* [TC Memo 1987-576 (1987)] and *Nancy N. Mooneyham v. Commissioner* [TC Memo 1991-178 (1991)], discuss the importance of supporting discounts with applicable evidence.<sup>4</sup>

A more recent case is that of *Estate of Natale B. Giustina v. Commissioner*. This case was originally heard in the Tax Court (T.C. Memo 2011-141) and was ultimately overturned and remanded back to the Tax Court by the 9th Circuit Court of Appeals in 2014 (No. 12-71747). A summary of these cases follows:

At the time of his death, the decedent owned a 41.128 percent interest in Giustina Land and Timber Company Limited Partnership. The estate reported the value of his interest at \$12,678,117 on the estate's tax return, and the Tax Court determined the value to be \$27,454,115.

The decedent's expert used an asset-based approach as well as an income approach. In its final decision, the Tax Court put 25 percent of the weighting on the asset-based approach because it believed that there was only a 25 percent likelihood that the assets would be sold. The remainder of the value was based on the discounted cash flow method (going concern).

On appeal, the Ninth Circuit reviewed the Tax Court's determinations for "clear error." It first looked at the weighting of the methodologies that was used to determine the value and concluded that the Tax Court's weighting of 25 percent on the asset-based approach was incorrect. The Ninth Circuit stated the following:

Although the Tax Court recognized that the owner of the limited interest could not unilaterally force liquidation, it concluded that the owner of that interest could form a two-thirds voting bloc with other limited partners to do so, and assigned a 25% probability to this occurrence. This conclusion is contrary to the evidence in the record. In order for liquidation to occur, we must assume that (1) a hypothetical buyer would somehow obtain admission as a limited partner from the general partners, who have repeatedly emphasized the importance that they place upon continued operation of the partnership; (2) the buyer would then turn around and seek dissolution of the partnership or removal of the general partners who just approved his admission to the partnership; and (3) the buyer would manage to convince at least two (or possibly more) other limited partners to go along, despite the fact that "no limited partner ever asked or ever discussed the sale of an interest." Alternatively, we must assume that the existing limited partners, or their heirs or assigns, owning two-thirds of the partnership, would seek dissolution. We conclude that it was clear error to assign a 25% likelihood to these hypothetical events.

The court went on to state, "the Tax Court engaged in 'imaginary scenarios as to who a purchaser might be, how long the purchaser would be willing to wait without any return on his investment, and what combinations the purchaser might be able to effect' with the existing partners. We therefore remand to the Tax Court to recalculate the value of the Estate based on the partnership's value as a going concern."

## Asset-Based Approach

Obtain the fair market values of all assets and liabilities on the balance sheet and apply appropriate discounts (for lack of control and marketability).

## Income Approach

Determine cash flow available to partners and capitalize or discount as appropriate.<sup>5</sup> If a sale of the underlying assets is contemplated, the sales price might be the applicable terminal value. Apply discount for lack of marketability in most cases (no discount for lack of control necessary because cash flow capitalized or discounted is the amount available to the minority owner and, therefore, the result is a minority value).

<sup>4</sup> Jay E. Fishman *et. al.*, *PPC's Guide to Business Valuations*, 26th ed. (Fort Worth, TX: Thomson Practitioners Publishing Company, 2016): 14–15.

<sup>5</sup> Sources of rates of return include *The Wall Street Journal*, Morningstar, and the National Association of Real Estate Investment Trusts (NAREIT).

## Market Approach

Determine valuation multiples by looking for comparable publicly traded interests. The appropriate multiple could be price to dividends, adjusted for the risks associated with your specific valuation assignment.<sup>6</sup> Because this data is based on dividends or distributions to the minority interests, the result is a minority value. Therefore, only a discount for lack of marketability needs to be applied.

## Valuation Adjustments

Valuation adjustments are supposed to reflect the lack of control inherent in limited partnership interests and the lack of marketability any type of closely held partnership interest endures. These are two separate issues that usually result in two separate adjustments. The courts recognize the necessity for these discounts but often disagree about how much of a discount should be allowed.

Fair market value is determined by the nature of the interest transferred. Unless the partners agree to admit the transferred interest as a partner, it is an *assignee interest*. Therefore, the hypothetical willing buyer might consider whether or not the other partners would admit him or her as a partner with all the rights that go with being a partner as significant.

An assignee interest has only an economic interest in the partnership. That is, he or she has a right to receive distributions, if any, and a right to distributions on liquidation. An assignee interest has fewer rights than a limited partner.

A limited partner, like a minority shareholder, does not have the ability to “get at” the partnership assets to either manage them or dispose of them. A limited partner probably has little or no say in partnership management issues. And, like a minority shareholder, a limited partner does not control distributions. These are all prerogatives of management or, in the case of the limited partnership, the general partner or the general partner who has been designated as the managing partner.

The hypothetical willing buyer most likely would not pay a liquidation price (pro rata of the underlying assets) for a limited partner or assignee interest in a limited partnership. What a willing buyer would pay would be something less than liquidation value in order to receive a return on his or her investment. This is the basis for valuation adjustments or discounts.

The valuation analyst must read the partnership agreement carefully to determine what the rights and duties of both types of partners are. The voting rights of the limited partners should be determined. These are the types of things that will help to support the size of the discount for lack of control.

## Discount for Lack of Control

Although I provided you with some of this stuff in chapter 14, it is important enough to repeat. The types of assets owned by the partnership must be considered when finding a starting point for this discount. As previously discussed, the valuation analyst may not need a discount for lack of control if he or she uses an income or market approach for this type of assignment. Although an FLP could hold almost any type of asset, most FLPs own either marketable securities, real estate, or some combination of both.

## Marketable Securities

A logical reference point when valuing an interest in such an FLP is a closed-end investment fund. It is best to use closed-end investment funds that hold publicly traded securities that are similar to the securities held by the FLP, such as domestic stocks, foreign stocks, specialty funds, corporate bonds, municipal bonds, or government bonds. There are many other types of funds.

<sup>6</sup> Sources for comparable (guideline) data are Closed End Mutual Funds (*The Wall Street Journal* and Morningstar) and *Direct Investment Spectrum* (published by Partnership Profiles Inc.).

Typically, these funds trade at discounts to their net asset values (NAVs). Statistical efforts to determine a definitive explanation for these discounts have failed to reveal a reason for the discounts. In any event, the discounts (and premiums) observed in the marketplace serve as a proxy for the lack of control discount. The reason that they serve as a proxy is that holders of closed-end funds have the same lack of control over the underlying assets that a limited partner in an FLP has. It is presumed that these discounts represent the market's decrease in value for not having access to the assets and not having any control over them.

Whether the valuation analyst adjusts these discounts before applying them to his or her FLP interest is a question of specific facts and circumstances of the particular valuation assignment. If the valuation analyst believes that the interest he or she is valuing has less control, then he or she might increase the discount, and vice versa. Another issue relates to the similarities of the portfolios. The valuation analyst might believe that his or her subject portfolio would trade at a higher or lower discount. Whatever position the valuation analyst takes, the discussion should include all the reasoning behind the adjustments. However, there is at least one Tax Court case that frowned on changing the size of the discount because there was no empirical evidence to support the adjustment.<sup>7</sup>

This discount only pertains to the issue of lack of control. It has nothing to do with marketability factors. The perceived riskiness of any individual security in the FLP's portfolio will be reflected in the market value of that security. Any adjustments the valuation analyst might be tempted to make because the partnership interest is not as easily traded as a share in a closed-end mutual fund should be avoided. That is a different discount.

There are several factors (see box 21.5) that might be considered when adjusting the starting point for the discount for lack of control. Remember that adjustments should be reasonable and reflect the facts of the particular FLP interests.

#### BOX 21.5 Discount for Lack of Control Adjustment Considerations

**Professional management.** Many FLPs do not have professional management, whereas closed-end funds do. This would drive the discount higher.

**Regulation.** Closed-end funds are regulated by the SEC; the FLP investor enjoys no such protection.

**Diversification and size.** The FLP portfolio may not have the same level of diversification as a closed-end fund. One can look at specialized funds that invest in one industry as a comparison. FLPs are often very tiny compared to closed-end funds. This might increase the discount.

**Investment objective.** An FLP portfolio may reflect no defined investment policy or objectives. This may be a lack of professional management.

**Quality.** Speculative versus investment grade. Recall, however, that the security's market price should reflect the market's opinion about its overall quality. Avoid double counting in the discount.

**Performance.** If the FLP has been in existence for a while, its total return might be compared with that of various similar closed-end funds.

**Average maturity.** For fixed income portfolios, average maturity of the bonds will affect their market values. Again, this factor should be addressed in the price of the security.

## Real Estate

Very often, an FLP will hold one or more pieces of real property. These might range from the family home to vacation property, vacant land, a farm, or some income-producing real property, such as apartments, retail, or office space. The valuation analyst should review these assets carefully in order to determine the nature of each because this will affect the selection of discounts.

<sup>7</sup> See *Peter S. Peracchio v. Commissioner*, T.C. Memo 2003-280.

A starting point for determining lack of control discounts for FLPs owning real estate would be real estate limited partnerships (RELPs) and real estate investment trusts (REITs). These partnerships have been in existence for a number of years and a body of data has been accumulated on many aspects of them. A fairly liquid secondary market for RELPs exists. It is nowhere near as liquid as a stock exchange, but enough transactions take place that there is good data on the discounts at which these securities trade to their NAVs.

Data on this market has been gathered by Partnership Profiles, Inc., since 1990.

Partnership Profiles makes its data available through its Minority Interest Database, which is available by subscription at [www.partnershipprofiles.com](http://www.partnershipprofiles.com). In addition, annually, the company publishes an executive summary entitled, xxxx<sup>8</sup> *Executive Summary Report on Partnership Re-Sale Discounts, Special Addendum Covering Real Estate Programs in Executive Summary Report*. This report contains information about some of the partnerships that Partnership Profiles follows, along with information regarding historic summary discounts.

The factors outlined in box 21.6 can influence the price of a RELP in the secondary market. These factors can be considered by the analyst in determining a value for the FLP interest.

According to Partnership Profiles, Inc., the discount derived using this data is primarily a discount for lack of control but also includes some discount for lack of marketability. Be careful not to double count!

Whether or not an FLP has a history of making distributions is an important consideration in determining the discount. Generally, partnerships that make distributions trade at lower discounts to their NAVs, all other things being equal. The amount of debt is important as well. If the FLP that is being valued has no debt, it should be compared to partnerships that have little or no debt, as well.

Consider as many comparable partnerships from this study as possible. Courts have maintained that more comparables are better than fewer, and certainly better than only one.

As with a discount obtained using closed-end funds, this discount for real estate limited partnerships is also a starting point. It may be adjusted—either upward or downward—by factors that differentiate the FLP being valued from the comparable real estate limited partnership. These are similar to the ones enumerated under the marketable securities section.

## Discount for Lack of Marketability

An additional adjustment is often made to account for the fact that there is no secondary market for FLP interests. These interests lack marketability, that is, they cannot be liquidated or converted to cash quickly. If one owns shares of a publicly traded corporation, one may call a broker, sell the shares, and have the cash proceeds within a few business days. Not so with FLP interests, and this is the basis for the discount for lack of marketability (DLOM). In addition to the lack of a secondary market for FLP interests, certain provisions are often written into FLP agreements restricting the transfer of interests, especially to individuals or entities outside of the family circle. These restrictions create an additional lack of marketability factor. Some of them include the following:

### BOX 21.6 RELP Factors for Valuation Consideration

1. The type of real estate assets owned by the partnership
2. The amount of financial leverage inherent in the partnership's capital structure
3. Underlying cash flow coverage of yearly distributions made to partners
4. The caliber of the information flow from the partnership and the general partner
5. Whether or not the assets of the partnership are well-diversified
6. The reputation, integrity, and perceived competence of the management and general partner
7. Liquidity factors such as how often a partnership interest trades, the number of investors in the partnership, the time period until liquidation, the universe of interested buyers, whether the partnership is publicly or privately syndicated, and the presence of rights of first refusal

.....  
8 xxxx = year of study.

- With some exceptions, a general partner, limited partner, or an assignee may not transfer all or any part of his or her interest without the prior written consent of the general partners, which consent may be given or withheld at the discretion of the general partners.
- A transferee of an interest in an FLP shall only be entitled to the rights of an assignee unless the consent of all general partners and a majority in interest of the limited partners is given to make the transferee a substitute limited partner.
- No partner or assignee shall have the right to withdraw from the FLP prior to its dissolution and liquidation.
- No partner or assignee may withdraw or reduce his or her capital contribution or capital account without the consent of the general partner.

### Other Provisions Affecting Marketability

In addition to provisions in the agreement that restrict transfer, a history of little or no dividends or distributions from the FLP to the partners is a factor that affects marketability. A willing buyer might be more inclined to ignore restrictions on the transfer of his or her interest in exchange for a stream of cash benefits. However, little or no distribution history is common with FLPs, which often retain income and gains in order to fulfill the long-term investment goals of the partnership.

Another factor that might affect the marketability of an FLP interest is the *754 election*. This is an election that the partnership might make under IRC Section 754, which provides that the partnership may elect to adjust the inside basis of the partnership's underlying assets. In other words, the partnership can adjust its internal books to show that a new partner paid a higher price for assets that are worth more at the time of the purchase (transfer). This election would not affect the existing partners, but it would have positive tax consequences for a new partner.

If there is nothing in the agreement that addresses the 754 election, it does not mean that the partnership cannot make the election. It still can. However, a willing buyer might wish to have assurance that such an election will be made. This is especially critical if the fair market value of the underlying assets of the partnership have increased in value over their original basis. Because there is considerable record keeping involved once this election is made, an FLP may be reluctant to make the election. However, there is at least one Tax Court case<sup>9</sup> that expressed skepticism when the valuation analyst increased the discount because there was nothing in the agreement guaranteeing that the election would be made. The judge stated that he did not believe that a transaction would take place without the guarantee of a 754 election. However, I've seen many partnership tax returns in which a transfer of an interest takes place without a corresponding election!

When valuing a general partner interest, some consideration may be given to an additional marketability factor reflecting the liability exposure assumed by the general partner and that under many states' partnership statutes, a majority of the limited partners may remove a general partner that assigns all the general partner's interest in an FLP to a third party. Here, the valuation analyst must read the partnership agreement carefully to determine under what circumstances a general partner interest may be transferred or whether, after withdrawal of a general partner, that general partner interest becomes a limited partner interest. In this case, the DLOM might be increased.

An FLP can require additional capital from the partners in order to meet operating expenses and have extra capital for partnership requirements. This type of provision is not included in every FLP agreement, but its presence may warrant an additional lack of marketability factor. Capital calls might require that an interest-holder remain liquid in order to meet them, rather than place funds in a higher yielding, but less liquid, investment. A willing buyer would give this additional liability exposure and potential loss of a more favorable investment rate of interest consideration in determining value and so does the valuation analyst when valuing the interest in the FLP.

<sup>9</sup> See *Estate of W.W. Jones II v. Commissioner*, 116 TC 121.

## Sources of Marketability Discounts

The sources for discounts for lack of marketability for FLP assignments are the same as for all valuation assignments and were discussed in detail in chapter 15. The valuation analyst starts with the restricted stock and pre-initial public offering studies and the quantitative models and then addresses the facts and circumstances of the specific valuation assignment to determine the adjustments to the discount that will be utilized in the assignment at hand. There are several lists of factors to consider that have been published. The first list can be found in box 21.7, which comes from *PPC's Guide to Business Valuations* (pages 14–41 and 42).

The second list comes from an article published by Robert E. Moroney titled, “Why 25% Discount for Nonmarketability in One Valuation, 100% in Another?” I presented this stuff in chapter 15.

### BOX 21.7 Marketability Discount Factors

Some of the factors that would cause an interest to trade at a low marketability discount include the following:

- Minimal volatility in the value of the underlying assets
- Above-average expectations for future yield
- A proven and stabilized history of income
- Certainty of distributions or expectation of capital appreciation
- Limited time period on restriction of ability to sell the interest
- Favorable outlook for future growth of the entity
- Imminent prospect of liquidation of the partnership

Factors that would cause an interest to trade at a higher discount include the following:

- High degree of volatility in the value of the underlying assets
- Questionable ability to generate a satisfactory return on assets
- Inability to generate sufficient earnings for distributions or to support future growth in operations
- Small size in relation to other investments and lack of diversification
- Involvement in industries or activities viewed unfavorably by the investing public

## Other Potential Adjustments

There are several other adjustments that may be included in determining a final value. Some of these adjustments may apply to the value of the underlying assets, rather than to the value of an FLP interest. Some of these discounts are discussed in more detail in other chapters in this book.

## Fractional Interest Adjustment

The fair market value of an undivided ownership interest in real property is worth something less than the percentage of ownership multiplied by the fair market value of the real property as a whole. Fractional interest adjustments should not be limited to undivided interests in real property, but should be considered any time a fractional interest is held in any type of property. Some of the factors considered by the willing buyer at arriving at a fractional interest adjustment are the following:

- Lack of control associated with a minority interest in the property
- Lack of marketability of a fractional interest
- Procedural burdens, possible delays, and costs involved in severance proceedings
- Lack of certainty about what portion of the property would be awarded to each party upon severance
- The nature of the property
- The difficulty of obtaining mortgage financing for the purchase of a fractional interest
- Declining economic conditions
- Loss of a major tenant

Most real estate appraisers will not apply these fractional interest discounts. However, the valuation analyst should check the real estate appraisal, if there is one, to see if this has already been done, in order to avoid double discounting. See *Ludwick v. Commissioner*, TC Memo 2010-104.

A recent case approved a fractional interest discount in artwork. See *Estate of Elkins v. Commissioner*, 140 TC 86 (March 11, 2013) reaffirmed by the 5th Circuit Court of Appeals (No. 60683, September 15, 2014). In this case, a discount of 10 percent was allowed by the Court, but the 5th Circuit ruled that this “nominal” amount was not enough and the appropriate discount was 44.75 percent.

### Portfolio Adjustment

The basis for a portfolio adjustment is an FLP with a non-diversified portfolio of marketable securities. In applying a willing buyer/willing seller test, the valuation analyst must decide if a willing buyer might not be interested in a portfolio with a specific asset mix, rather than a diversified portfolio. A portfolio containing one or two holdings might be considered riskier than one that was well-diversified. See *Estate of Piper v. Commissioner*, 72 TC 1062 (Sept. 13, 1979).

### Restricted Securities Adjustment

Restricted securities are those that are acquired from an issuer in a transaction exempt from registration requirements of federal and state securities laws (known as *private placements*). There are also restrictions imposed by the SEC on resales of these restricted securities. Several court cases have upheld additional discounts to account for restricted securities, but if the price of the security already reflects such a discount, it should not be taken twice.

### Blockage Adjustment

This adjustment accounts for the depressive effect of suddenly placing a large block of stock on the market. This adjustment is expressly recognized by Treasury Regulation Sections 20.2031-2(e) and 25.2512-2(e). Adjustments of this type are limited to blocks of publicly traded stock. It is helpful to fully document trading and volume activity in a stock for a period of time prior to the valuation date in order to justify such an adjustment.

### Market Absorption Adjustment

This is an expansion of the blockage adjustment to take into account other assets besides stock, such as real estate, works of art, sheet music, manuscripts, books, animal mounts, and animal trophies. The basis of this adjustment reflects the lack of time within which to make an orderly disposition of these types of assets. It is possible that the sale of all the property at once or within a short space of time might result in an abrupt increase in supply, which, with no change in demand, might reduce the price the properties might bring. The valuation analyst should consider the number and type of asset being considered and whether or not such an adjustment has been included in any professional valuation of these assets.

### Adjustment for Built-In Capital Gains Tax

Under the willing buyer/willing seller test, an adjustment may be made for the fact that the underlying assets may now have a market value greater than book value and there may be a built-in capital gain with respect to those assets. If so, a willing buyer might become responsible for capital gains tax when the assets are sold. A hypothetical willing buyer would take this into consideration when evaluating an FLP interest. This issue is also related to the IRC Section 754 election.

### The FLP Written Report

Now that there are issues to consider, how does the valuation analyst go about presenting these findings in the report? One useful way is to set up the report following the eight factors of Revenue Ruling 59-60. Remember, the ultimate user of the report is the IRS. By laying out the report in the order of the eight factors, the valuation analyst is showing the IRS that he or she is considering each of the factors that they have laid out in their ruling. In addition, the valuation analyst should include sections relating to capitalization and discount rates, if appropriate, as well as discounts and premiums.

The valuation analyst might also want to consider following the IRS’s adequate disclosure rules as laid out in Regulation Section 301.6501. These have been included as exhibit 21.1. Although these regulations specifically relate to gifts, including the same information in a report for estate tax purposes will aid the valuation analyst in preparing a well-supported report.

## EXHIBIT 21.1 IRS Adequate Disclosure Rules

### REG Section 301.6501(c)-1. Exceptions to general period of limitations on assessment and collection.

**Caution:** The Treasury has not yet amended Regulation Section 301.6501(c)-1 to reflect changes made by PL 105-34.

**301.6501(c)-1(a)** False return. In the case of a false or fraudulent return with intent to evade any tax, the tax may be assessed, or a proceeding in court for the collection of such tax may be begun without assessment, at any time after such false or fraudulent return is filed.

**301.6501(c)-1(b)** Willful attempt to evade tax. In the case of a willful attempt in any manner to defeat or evade any tax imposed by the Code (other than a tax imposed by subtitle A or B, relating to income, estate, or gift taxes), the tax may be assessed, or a proceeding in court for the collection of such tax may be begun without assessment, at any time.

**301.6501(c)-1(c)** No return. In the case of a failure to file a return, the tax may be assessed, or a proceeding in court for the collection of such tax may be begun without assessment, at any time after the date prescribed for filing the return. For special rules relating to filing a return for Chapter 42 and similar taxes, see §301.6501(n)-1, 301.6501(n)-2, and 301.6501(n)-3.

**301.6501(c)-1(d)** Extension by agreement. The time prescribed by section 6501 for the assessment of any tax (other than the estate tax imposed by Chapter 11 of the Code) may, prior to the expiration of such time, be extended for any period of time agreed upon in writing by the taxpayer and the district director or an assistant regional commissioner. The extension shall become effective when the agreement has been executed by both parties. The period agreed upon may be extended by subsequent agreements in writing made before the expiration of the period previously agreed upon.

**301.6501(c)-1(e)** Gifts subject to Chapter 14 of the Internal Revenue Code not adequately disclosed on the return.

**301.6501(c)-1(e)(1)** In general. If any transfer of property subject to the special valuation rules of section 2701 or section 2702, or if the occurrence of any taxable event described in section 25.2701-4 of this Chapter, is not adequately shown on a return of tax imposed by Chapter 12 of subtitle B of the Internal Revenue Code (without regard to section 2503(b)), any tax imposed by Chapter 12 of subtitle B of the Code on the transfer or resulting from the taxable event may be assessed, or a proceeding in court for the collection of the appropriate tax may be begun without assessment, at any time.

**301.6501(c)-1(e)(2)** Adequately shown. A transfer of property valued under the rules of section 2701 or section 2702 or any taxable event described in §25.2701-4 of this Chapter will be considered adequately shown on a return of tax imposed by Chapter 12 of subtitle B of the Internal Revenue Code only if, with respect to the entire transaction or series of transactions (including any transaction that affected the transferred interest) of which the transfer (or taxable event) was a part, the return provides:

**301.6501(c)-1(e)(2)(i)** A description of the transactions, including a description of transferred and retained interests and the method (or methods) used to value each;

**301.6501(c)-1(e)(2)(ii)** The identity of, and relationship between, the transferor, transferee, all other persons participating in the transactions, and all parties related to the transferor holding an equity interest in any entity involved in the transactions; and

**301.6501(c)-1(e)(2)(iii)** A detailed description (including all actuarial factors and discount rates used) of the method used to determine the amount of the gift arising from the transfer (or taxable event), including, in the case of an equity interest that is not actively traded, the financial and other data used in determining value. Financial data should generally include balance sheets and statements of net earnings, operating results, and dividends paid for each of the 5 years immediately before the valuation date.

**301.6501(c)-1(e)(3)** Effective date. The provisions of this paragraph (e) are effective as of January 28, 1992. In determining whether a transfer or taxable event is adequately shown on a gift tax return filed prior to that date, taxpayers may rely on any reasonable interpretation of the statutory provisions. For these purposes, the provisions of the proposed regulations and the final regulations are considered a reasonable interpretation of the statutory provisions.

**301.6501(c)-1(f)** Gifts made after December 31, 1996, not adequately disclosed on the return.

**301.6501(c)-1(f)(1)** In general. If a transfer of property, other than a transfer described in paragraph (e) of this section, is not adequately disclosed on a gift tax return (Form 709, "United States Gift (and Generation-Skipping Transfer) Tax Return"), or in a statement attached to the return, filed for the calendar period in which the transfer occurs, then any gift tax imposed by Chapter 12 of subtitle B of the Internal Revenue Code on the transfer may be assessed, or a proceeding in court for the collection of the appropriate tax may be begun without assessment, at any time.

## EXHIBIT 21.1 IRS Adequate Disclosure Rules

**301.6501(c)-1(f)(2)** Adequate disclosure of transfers of property reported as gifts. A transfer will be adequately disclosed on the return only if it is reported in a manner adequate to apprise the Internal Revenue Service of the nature of the gift and the basis for the value so reported. Transfers reported on the gift tax return as transfers of property by gift will be considered adequately disclosed under this paragraph (f)(2) if the return (or a statement attached to the return) provides the following information—

**301.6501(c)-1(f)(2)(i)** A description of the transferred property and any consideration received by the transferor;

**301.6501(c)-1(f)(2)(ii)** The identity of, and relationship between, the transferor and each transferee;

**301.6501(c)-1(f)(2)(iii)** If the property is transferred in trust, the trust's tax identification number and a brief description of the terms of the trust, or in lieu of a brief description of the trust terms, a copy of the trust instrument;

**301.6501(c)-1(f)(2)(iv)** Except as provided in §301.6501-1(f)(3), a detailed description of the method used to determine the fair market value of property transferred, including any financial data (for example, balance sheets, etc. with explanations of any adjustments) that were utilized in determining the value of the interest, any restrictions on the transferred property that were considered in determining the fair market value of the property, and a description of any discounts, such as discounts for blockage, minority or fractional interests, and lack of marketability, claimed in valuing the property. In the case of a transfer of an interest that is actively traded on an established exchange, such as the New York Stock Exchange, the American Stock Exchange, the NASDAQ National Market, or a regional exchange in which quotations are published on a daily basis, including recognized foreign exchanges, recitation of the exchange where the interest is listed, the CUSIP number of the security, and the mean between the highest and lowest quoted selling prices on the applicable valuation date will satisfy all of the requirements of this paragraph (f)(2)(iv). In the case of the transfer of an interest in an entity (for example, a corporation or partnership) that is not actively traded, a description must be provided of any discount claimed in valuing the interests in the entity or any assets owned by such entity. In addition, if the value of the entity or of the interests in the entity is properly determined based on the net value of the assets held by the entity, a statement must be provided regarding the fair market value of 100 percent of the entity (determined without regard to any discounts in valuing the entity or any assets owned by the entity), the pro rata portion of the entity subject to the transfer, and the fair market value of the transferred interest as reported on the return. If 100 percent of the value of the entity is not disclosed, the taxpayer bears the burden of demonstrating that the fair market value of the entity is properly determined by a method other than a method based on the net value of the assets held by the entity. If the entity that is the subject of the transfer owns an interest in another non-actively traded entity (either directly or through ownership of an entity), the information required in this paragraph (f)(2)(iv) must be provided for each entity if the information is relevant and material in determining the value of the interest; and

**301.6501(c)-1(f)(2)(v)** A statement describing any position taken that is contrary to any proposed, temporary or final Treasury regulations or revenue rulings published at the time of the transfer (see §601.601(d)(2) of this Chapter).

**301.6501(c)-1(f)(3)** Submission of appraisals in lieu of the information required under paragraph (f)(2)(iv) of this section. The requirements of paragraph (f)(2)(iv) of this section will be satisfied if the donor submits an appraisal of the transferred property that meets the following requirements—

**301.6501(c)-1(f)(3)(i)** The appraisal is prepared by an appraiser who satisfies all of the following requirements:

**301.6501(c)-1(f)(3)(i)(A)** The appraiser is an individual who holds himself or herself out to the public as an appraiser or performs appraisals on a regular basis.

**301.6501(c)-1(f)(3)(i)(B)** Because of the appraiser's qualifications, as described in the appraisal that details the appraiser's background, experience, education, and membership, if any, in professional appraisal associations, the appraiser is qualified to make appraisals of the type of property being valued.

**301.6501(c)-1(f)(3)(i)(C)** The appraiser is not the donor or the donee of the property or a member of the family of the donor or donee, as defined in section 2032A(e)(2), or any person employed by the donor, the donee, or a member of the family of either; and

**301.6501(c)-1(f)(3)(ii)** The appraisal contains all of the following:

**301.6501(c)-1(f)(3)(ii)(A)** The date of the transfer, the date on which the transferred property was appraised, and the purpose of the appraisal.

(continued)

**EXHIBIT 21.1 IRS Adequate Disclosure Rules** *(continued)*

**301.6501(c)-1(f)(3)(ii)(B)** A description of the property.

**301.6501(c)-1(f)(3)(ii)(C)** A description of the appraisal process employed.

**301.6501(c)-1(f)(3)(ii)(D)** A description of the assumptions, hypothetical conditions, and any limiting conditions and restrictions on the transferred property that affect the analyses, opinions, and conclusions.

**301.6501(c)-1(f)(3)(ii)(E)** The information considered in determining the appraised value, including in the case of an ownership interest in a business, all financial data that was used in determining the value of the interest that is sufficiently detailed so that another person can replicate the process and arrive at the appraised value.

**301.6501(c)-1(f)(3)(ii)(F)** The appraisal procedures followed, and the reasoning that supports the analyses, opinions, and conclusions.

**301.6501(c)-1(f)(3)(ii)(G)** The valuation method utilized, the rationale for the valuation method, and the procedure used in determining the fair market value of the asset transferred.

**301.6501(c)-1(f)(3)(ii)(H)** The specific basis for the valuation, such as specific comparable sales or transactions, sales of similar interests, asset-based approaches, merger-acquisition transactions, etc.

**301.6501(c)-1(f)(4)** Adequate disclosure of non-gift completed transfers or transactions. Completed transfers to members of the transferor's family, as defined in section 2032A(e)(2), that are made in the ordinary course of operating a business are deemed to be adequately disclosed under paragraph (f)(2) of this section, even if the transfer is not reported on a gift tax return, provided the transfer is properly reported by all parties for income tax purposes.

For example, in the case of salary paid to a family member employed in a family owned business, the transfer will be treated as adequately disclosed for gift tax purposes if the item is properly reported by the business and the family member on their income tax returns. For purposes of this paragraph (f)(4), any other completed transfer that is reported, in its entirety, as not constituting a transfer by gift will be considered adequately disclosed under paragraph (f)(2) of this section only if the following information is provided on, or attached to, the return B 301.6501(c)-1(f)(4)(i) The information required for adequate disclosure under paragraphs (f)(2)(i), (ii), (iii) and (v) of this section; and

**301.6501(c)-1(f)(4)(ii)** An explanation as to why the transfer is not a transfer by gift under Chapter 12 of the Internal Revenue Code.

**301.6501(c)-1(f)(5)** Adequate disclosure of incomplete transfers. Adequate disclosure of a transfer that is reported as a completed gift on the gift tax return will commence the running of the period of limitations for assessment of gift tax on the transfer, even if the transfer is ultimately determined to be an incomplete gift for purposes of §25.2511-2 of this Chapter. For example, if an incomplete gift is reported as a completed gift on the gift tax return and is adequately disclosed, the period for assessment of the gift tax will begin to run when the return is filed, as determined under section 6501(b). Further, once the period of assessment for gift tax expires, the transfer will be subject to inclusion in the donor's gross estate for estate tax purposes only to the extent that a completed gift would be so included. On the other hand, if the transfer is reported as an incomplete gift whether or not adequately disclosed, the period for assessing a gift tax with respect to the transfer will not commence to run even if the transfer is ultimately determined to be a completed gift. In that situation, the gift tax with respect to the transfer may be assessed at any time, up until three years after the donor files a return reporting the transfer as a completed gift with adequate disclosure.

**301.6501(c)-1(f)(6)** Treatment of split gifts. If a husband and wife elect under section 2513 to treat a gift made to a third party as made one-half by each spouse, the requirements of this paragraph (f) will be satisfied with respect to the gift deemed made by the consenting spouse if the return filed by the donor spouse (the spouse that transferred the property) satisfies the requirements of this paragraph (f) with respect to that gift.

**301.6501(c)-1(f)(7)** Examples. The following examples illustrate the rules of this paragraph (f):

Example (1). (i) Facts. In 2001, A transfers 100 shares of common stock of XYZ Corporation to A's child. The common stock of XYZ Corporation is actively traded on a major stock exchange. For gift tax purposes, the fair market value of one share of XYZ common stock on the date of the transfer, determined in accordance with §25.2512-2(b) of this Chapter (based on the mean between the highest and lowest quoted selling prices), is \$150.00. On A's Federal gift tax return, Form 709, for the 2001 calendar year, A reports the gift to A's child of 100 shares of common stock of XYZ Corporation with a value for gift tax purposes of \$15,000. A specifies the date of the transfer, recites that the stock is publicly traded, identifies the stock exchange on which the stock is traded, lists the stock's CUSIP number, and lists the mean between the highest and lowest quoted selling prices for the date of transfer.

**EXHIBIT 21.1 IRS Adequate Disclosure Rules**

(ii) Application of the adequate disclosure standard. A has adequately disclosed the transfer. Therefore, the period of assessment for the transfer under section 6501 will run from the time the return is filed (as determined under section 6501(b)).

Example (2). (i) Facts. On December 30, 2001, A transfers closely-held stock to B, A's child. A determined that the value of the transferred stock, on December 30, 2001, was \$9,000. A made no other transfers to B, or any other donee, during 2001. On A's Federal gift tax return, Form 709, for the 2001 calendar year, A provides the information required under paragraph (f)(2) of this section such that the transfer is adequately disclosed. A claims an annual exclusion under section 2503(b) for the transfer.

(ii) Application of the adequate disclosure standard. Because the transfer is adequately disclosed under paragraph (f)(2) of this section, the period of assessment for the transfer will expire as prescribed by section 6501(b), notwithstanding that if A's valuation of the closely-held stock was correct, A was not required to file a gift tax return reporting the transfer under section 6019. After the period of assessment has expired on the transfer, the Internal Revenue Service is precluded from redetermining the amount of the gift for purposes of assessing gift tax or for purposes of determining the estate tax liability. Therefore, the amount of the gift as reported on A's 2001 Federal gift tax return may not be redetermined for purposes of determining A's prior taxable gifts (for gift tax purposes) or A's adjusted taxable gifts (for estate tax purposes).

Example (3). (i) Facts. A owns 100 percent of the common stock of X, a closely-held corporation. X does not hold an interest in any other entity that is not actively traded. In 2001, A transfers 20 percent of the X stock to B and C, A's children, in a transfer that is not subject to the special valuation rules of section 2701. The transfer is made outright with no restrictions on ownership rights, including voting rights and the right to transfer the stock. Based on generally applicable valuation principles, the value of X would be determined based on the net value of the assets owned by X. The reported value of the transferred stock incorporates the use of minority discounts and lack of marketability discounts. No other discounts were used in arriving at the fair market value of the transferred stock or any assets owned by X. On A's Federal gift tax return, Form 709, for the 2001 calendar year, A provides the information required under paragraph (f)(2) of this section including a statement reporting the fair market value of 100 percent of X (before taking into account any discounts), the pro rata portion of X subject to the transfer, and the reported value of the transfer. A also attaches a statement regarding the determination of value that includes a discussion of the discounts claimed and how the discounts were determined.

(ii) Application of the adequate disclosure standard. A has provided sufficient information such that the transfer will be considered adequately disclosed and the period of assessment for the transfer under section 6501 will run from the time the return is filed (as determined under section 6501(b)).

Example (4). (i) Facts. A owns a 70 percent limited partnership interest in PS. PS owns 40 percent of the stock in X, a closely-held corporation. The assets of X include a 50 percent general partnership interest in PB. PB owns an interest in commercial real property. None of the entities (PS, X, or PB) is actively traded and, based on generally applicable valuation principles, the value of each entity would be determined based on the net value of the assets owned by each entity. In 2001, A transfers a 25 percent limited partnership interest in PS to B, A's child. On the Federal gift tax return, Form 709, for the 2001 calendar year, A reports the transfer of the 25 percent limited partnership interest in PS and that the fair market value of 100 percent of PS is \$y and that the value of 25 percent of PS is \$z, reflecting marketability and minority discounts with respect to the 25 percent interest. However, A does not disclose that PS owns 40 percent of X, and that X owns 50 percent of PB and that, in arriving at the \$y fair market value of 100 percent of PS, discounts were claimed in valuing PS's interest in X, X's interest in PB, and PB's interest in the commercial real property.

(ii) Application of the adequate disclosure standard. The information on the lower tiered entities is relevant and material in determining the value of the transferred interest in PS. Accordingly, because A has failed to comply with requirements of paragraph (f)(2)(iv) of this section regarding PS's interest in X, X's interest in PB, and PB's interest in the commercial real property, the transfer will not be considered adequately disclosed and the period of assessment for the transfer under section 6501 will remain open indefinitely.

Example (5). The facts are the same as in Example 4 except that A submits, with the Federal tax return, an appraisal of the 25 percent limited partnership interest in PS that satisfies the requirements of paragraph (f)(3) of this section in lieu of the information required in paragraph (f)(2)(iv) of this section. Assuming the other requirements of paragraph (f)(2) of this section are satisfied, the transfer is considered adequately disclosed and the period for assessment for the transfer under section 6501 will run from the time the return is filed (as determined under section 6501(b) of this Chapter).

*(continued)*

### EXHIBIT 21.1 IRS Adequate Disclosure Rules *(continued)*

Example (6). A owns 100 percent of the stock of X Corporation, a company actively engaged in a manufacturing business. B, A's child, is an employee of X and receives an annual salary paid in the ordinary course of operating X Corporation. B reports the annual salary as income on B's income tax returns. In 2001, A transfers property to family members and files a Federal gift tax return reporting the transfers. However, A does not disclose the 2001 salary payments made to B. Because the salary payments were reported as income on B's income tax return, the salary payments are deemed to be adequately disclosed. The transfer of property to family members, other than the salary payments to B, reported on the gift tax return must satisfy the adequate disclosure requirements under paragraph (f)(2) of this section in order for the period of assessment under section 6501 to commence to run with respect to those transfers.

**301.6501(c)-1(f)(8)** Effective date. This paragraph (f) is applicable to gifts made after December 31, 1996, for which the gift tax return for such calendar year is filed after December 3, 1999.

Essentially, the IRS is telling the valuation analyst that to “pass muster,” we must present a fully supported and documented report. This is not substantially different from all the standards discussed earlier in this book: Do the work and report it properly.

The valuation analyst should not have the reader of the report have to guess about his or her methodology, discounts, or conclusions. For example, the valuation analyst does not want to state: “the studies indicate 25 to 45 percent; therefore, we selected 35 percent.” This is not supported. There are numerous court cases that disallow discounts strictly because the valuation analyst did something similar to this. The valuation analyst should select a benchmark discount and then adjust it (up or down) based on specific items that he or she discussed in detail in the report and, if necessary, use quantitative methods along with the other studies. A sample FLP report is located in cyberspace for download with all of the other goodies that come with this book.

## As Valuation Analysts, Do We Go for the Big Discounts?

You should now have a better idea about our role as valuation analysts. It is important that the valuation analyst not cross the line from being an independent, objective valuation analyst to being an advocate of bigger and bigger discounts. This can happen, especially if a client requests that we review a partnership document with an eye to adding restrictions and provisions that might increase the discounts. This is not our role as valuation analysts because we must be unbiased and not lose our objectivity. In addition, by acquiescing in such requests, we move beyond the realm of our own expertise. This does not excuse valuation analysts from being aware of the law, especially state laws regarding limited partnerships and LLCs. Key questions to review with the partnership's attorney might include the following:

- What restrictions in the partnership documents are more restrictive than state law?
- What is the state law? Get a copy of the state's Limited Partnership Act and read it thoroughly.
- Does a limited partner have a right of withdrawal from the partnership and on what basis?

As we have seen, these issues can affect the valuation conclusion. It is important for the valuation analyst to remember that his or her assignment is the determination of fair market value. This means the consideration of both a hypothetical willing buyer as well as a hypothetical willing seller. The valuation analyst's final conclusion of value must be reasonable. Remember, the buyer might buy for that low a price, but an independent analyst must also ask the question, if I were the seller, would I sell that low?

## Conclusion

In addition to the valuation of interests in FLPs for estate and gift tax purposes, the valuation analyst will also value operating entities. The issues that were discussed in earlier chapters in this book regarding valuation are applicable for estate and gift tax valuations as well. The IRS also looks at issues such as built in gains (chapter 14), pass-through entity tax affecting (chapter 18), quantification and support of normalization adjustments (chapter 6), and quantification and support of discounts and premiums (chapters 14 and 15). This is in addition to the proper application of the various valuation approaches and methods, as well as the quantification and support of discount and capitalization rates (chapter 13). This book is definitely worth it.

If I have done my job, there should now be a much better understanding of estate and gift tax valuations and recognition that the valuation analyst deals with many of the same issues in these valuations as he or she does in all other valuations.

# Chapter 22

## Divorce Valuations

### Learning Objectives

In this chapter, I will attempt to explain the following:

- The role of the valuation analyst
- Standards of value and their unique aspects in divorce assignments
- Different valuation dates used in these assignments
- How the normalization process differs in divorce assignments
- Valuing professional practices for divorce assignments
- Personal versus enterprise goodwill
- How non-compete agreements affect values in the distribution of marital property

### Introduction

Many valuation assignments are performed for divorce purposes. Regardless of whether the jurisdiction falls under the equitable distribution rules or the community property rules, a marital business will usually have to be valued so the parties can allocate the value along with the other marital property. Business valuation assignments related to divorce proceedings have become a growing part of the valuation analyst's business. Because closely held businesses are considered to be marital assets subject to distribution, there is a need to value these assets as part of the marital estate. For the purpose of this chapter, I am going to include professional practices within the discussion of closely held businesses. However, the unique aspects of valuing professional practices are covered in chapter 23.

Performing a business valuation for divorce purposes is unlike any other type of business valuation assignment that the valuation analyst may get involved in. Because the proceeding takes place in a court of equity, the rules of the game may be different than what we are trained to do as valuation analysts. The trier of fact is charged with being fair to both parties in the overall divorce; therefore, he or she will attempt to make the end result come out in a manner that makes the distribution of the marital estate fair to both parties, even if it means that the valuation of the business or business interest is changed from what the valuation analyst thought was the correct value. There have been times that I have seen a judge listen to expert testimony, take a little of this and a little of that, and mysteriously come up with a value that permitted one spouse to keep the marital business and the other spouse to keep the marital home. And we thought that we were good with numbers! Some of these judges, who were history majors in college, move the numbers around better than I ever could.

In addition to understanding the many nuances of business valuation, case law in the jurisdiction of the divorce must be considered. The valuation analyst must be aware of the local case law in order to avoid fatal errors in the valuation. For example, in certain jurisdictions, the valuation analyst cannot consider any income that extends beyond the valuation date. Using a discounted cash flow methodology, which requires a forecast to be used to estimate value, may be a futile exercise because the court may not allow the subsequent figures to be used. This makes the divorce valuation even more challenging because we are sometimes being asked to value a company without considering the future (who buys history?).

I cannot emphasize strongly enough the need to be aware of the pertinent case law in the jurisdiction of the divorce. The valuation analyst must speak with the client's attorney and get the cases that will be relied upon. I have seen valuation analysts come into a jurisdiction where he or she is unfamiliar with the case law, and the

end result ends up being pretty ugly for the analyst. In several instances, the judge not only put no weight on the expert's testimony, but he or she was criticized in the judge's legal opinion. That never bodes well for the expert.

## The Role of the Valuation Analyst

The valuation analyst may be engaged to perform business valuation services for a variety of clients. These clients may be any of the following:

- The husband
- The wife
- Both spouses
- An attorney
- The Court

Frequently, the valuation analyst will be engaged by one of the parties to the divorce, although, not always. We usually set up our engagement letter so that the attorney is our client and the attorney's client is the responsible party for our fees. We do this so that there is attorney-client privilege, meaning that until the attorney approves of my opinion and formally names me as the expert, I can be fired without my work becoming discoverable in the litigation. This is a strategy that the valuation analyst should discuss with the client's attorney. Sometimes, we cannot come up with the value that the client or the attorney is looking for and we get fired. I am okay with that because I would rather be fired than have the attorney try to put pressure on me to breach my ethical responsibilities of not becoming an advocate. Keep in mind that the client's emotions run very high in this type of assignment. In fact, I have often said that this would not be a bad business if it were not for the client!

More and more, litigants are finding that the cost of the divorce has become so prohibitively expensive that they are seeking to retain only one valuation analyst. However, when the valuation analyst is hired by only one party, the other party may also engage a valuation analyst. Sometimes, each party may pick a valuation analyst, and the two valuation analysts may choose a third valuation analyst to act as a neutral valuation analyst for both parties.

The valuation analyst may also be court-appointed. Certain jurisdictions will appoint a valuation analyst in order to avoid a battle of the experts. This will not always work, however, because each party will continue to have the right to hire his or her own expert to challenge the court-appointed valuation analyst. The court-appointed valuation analyst will generally be looked upon by The Court as the only neutral party in the entire process, besides The Court itself. In my experience, unless one party can show that the court-appointed valuation analyst really messed up, it is very difficult to convince The Court that a different valuation should be accepted.

## Definition of Value

Early in the valuation process, a valuation analyst must determine what the definition of value will be for the assignment at hand. As a review, reread the portion of chapter 4 where the different standards (definitions) of value were defined. In the divorce arena, these definitions are frequently twisted, mangled, commingled, and redefined (and that is the easy part of the assignment).

Valuation analysts are accustomed to the concept of fair market value because of their experience in working with the income tax laws and regulations. However, in divorce-related valuations, the definition of value is usually dictated by The Court that has jurisdiction over the matter. The problem is that even the same standard of value is applied inconsistently by the courts. Another problem is that frequently the standard of value must

### Author's Note

Let me provide you with a practice pointer here. If you are mutually retained as an expert in a litigation assignment, be very careful. Frequently, valuation analysts, particularly in divorce assignments, are also asked to perform forensic procedures with respect to either unreported income or personal expenses that are buried in the financial statements. When the valuation analyst does this type of work, he or she is actually working against one of the parties that is his or her client. Unless the engagement letter provides for some form of a waiver, it might be considered to be a conflict of interest. Please be careful!

be interpreted from the case law because it is not clearly stated. The valuation analyst can assist the client's attorney in the interpretation of the case law, but it is advisable not to be the party making the judgment call concerning the standard of value. This is a legal determination and, therefore, should be left to the attorney to make. I already explained this when I discussed engagement letters in chapter 3.

In *Standards of Value: Theory and Applications*, the authors provide a really good breakdown of their analysis of all the jurisdictions where this matter comes into play. They explain that “when it comes to divorce, only two states, Arkansas and Louisiana, provide any statutory guidance as to the standard of value.”<sup>1</sup>

We found that only Arkansas and Louisiana provide direction in their statutes. We then moved to the case law in each jurisdiction, and through this review, we found clearer guidance in 24 additional states. Including Arkansas and Louisiana, 25 states direct the use of fair market value in their case law, and one state, Alabama, uses the term *fair value*.<sup>2</sup>

They continue by stating “most states do not recommend or require any particular standard with which to value assets upon the dissolution of marriage.”<sup>3</sup> In other words, good luck. It is for this reason that valuation analysts must work closely with the attorneys so that the correct standard of value is used by the valuation analyst to further the legal argument that will be raised by the attorney. We do not make case law but, rather, we perform the number-crunching under the direction from legal counsel about the standard of value, and then, they make the case law.

The standard of value in the other jurisdictions is not as easily determined. The case law must be reviewed in order to properly categorize the standard into what the valuation profession has called *value in exchange* or *value to the holder*. This is the difference between valuing an asset as if it was being sold in the open market versus valuing it as if it is kept by the owner (fair market value versus investment value—sound familiar?). What this really means is that the valuation analyst must use the principles that are used in the valuation profession to make them fit into the jurisdiction's mandate (through case law) concerning what should happen. For example, Florida is a fair market value state. Not only does *Christians v. Christians*<sup>4</sup> refer to fair market value, but *Thompson v. Thompson*<sup>5</sup> specifically states that

[t]he clearest method would be the fair market value approach, which is best described as what would a willing buyer pay, and what would a willing seller accept, neither acting under duress for a sale of the business.<sup>6</sup>

This application of fair market value, which also requires the exclusion of personal goodwill (which will be discussed later in this chapter), interprets this standard of value to be fair market value in exchange, as opposed to value to the holder.

The two most common definitions of value used by the courts seem to be fair market value and intrinsic (investment) value.<sup>7</sup> However, fair value has also shown up.

1 Jay E. Fishman, Shannon P. Pratt, and William J. Morrison, *Standards of Value: Theory and Applications*, 2nd ed. (Hoboken, NJ: John Wiley & Sons Inc, 2013); 259.

2 *Ibid*, 265.

3 *Ibid*, 259.

4 *Christians v Christians*, 732 So. 2d 47; 1999 Fla. App. LEXIS 6687; 24 Fla. L Weekly D 1218.

5 *Thompson v. Thompson*, 576 So. 2nd. 267, 1991 Fla. LEXIS 69.

6 *Ibid*.

7 Intrinsic value and investment value, in a divorce context, are frequently described as the value to the owner of the business. Conventional valuation definitions treat these differently.

## Fair Market Value

Fair market value is, by far, the most commonly used definition of value in the business valuation arena. However, fair market value seems to vary by jurisdiction. Frequently, the definition of fair market value is quoted from Revenue Ruling 59-60 as

the amount at which the property would change hands between a willing buyer and a willing seller when the former is not under compulsion to buy and the latter is not under any compulsion to sell, both parties having reasonable knowledge of the relevant facts.

This definition assumes a hypothetical arm's length sale without regard to a specific buyer or seller.

## Intrinsic Value

"Beauty is in the eye of the beholder." This is probably the easiest way to describe intrinsic value. Although certain jurisdictions use this concept, and momentum is actually building in many others to use this concept, the term is ambiguous. Intrinsic value is frequently referred to as *investment value* to the owner of the business.

Intrinsic value recognizes that the business owner who is going through a divorce will not be selling the business; therefore, there will be no hypothetical transaction, as in a fair market value assignment. Instead, the owner will continue to receive the benefits of ownership into the future. In this instance, the value of the business may be worth more or less to the owner than the market as a whole.

## Fair Value

The first fair value case seen in the matrimonial arena came out of New Jersey in *Brown v. Brown*.<sup>8</sup> Following the thought process in the principles employed by the New Jersey Supreme Court in shareholder litigation, the family court judge determined that when a business that was being run harmoniously by three brothers was the subject of a marital estate, discounts for lack of control and marketability would be inappropriate because the nonbusiness owner spouse would receive less than an equitable share of the business because, if the business was to be sold, each of the brothers would receive a pro rata share of the whole. Although this may not be the *true* fair value of the one-third interest, it was the first time that the New Jersey courts moved away from fair market value.

According to *Standards of Value*, the Virginia case of *Howell v. Howell*<sup>9</sup> and the Alabama case of *Grelier v. Grelier*<sup>10</sup> join Brown in the fair value arena. Many valuation analysts think of *Howell* as a "value to the holder" case. Again, if the valuation analyst is going to participate in this arena, he or she needs to read these cases before doing the work.

## What Do the Definitions Really Mean in a Divorce Context?

If there was a written definition of what the different value concepts mean in a divorce engagement, many of us would have considerably less work to do. Much of the litigation that takes place arises because of the various interpretations of the value concepts. Although fair market value, intrinsic value, and fair value are not strangers to the experienced business valuation professional, case law and state statutes govern the division of property between the parties in a divorce. Unfortunately, most of the state statutes use the term *value* without any precise definition.

The valuation analyst using the fair market value concept generally assumes a hypothetical transaction. This also means that the valuation of a minority interest should probably include a discount for lack of control. However, this may not work in every jurisdiction. The valuation analyst must be familiar with the local case law. He or she should look for assistance from the client's attorney. Don't be surprised, however, if the attorney asks the valuation analyst for his or her opinion. The valuation analyst must be careful not to practice law without a license!

<sup>8</sup> *Ellen Brown, v. James Brown, A-985-00T5* (2002 N.J. Super. LEXIS 105).

<sup>9</sup> 523 S.E.2d 514 (Va. App. 2000).

<sup>10</sup> 2009 WL 5149267 (Ala Civ. App.) (Dec. 30, 2009).

Intrinsic value, rather than fair market value, is sometimes used in the valuation of professional practices for divorce purposes. Shannon Pratt discussed the California case of *Lopez v. Lopez*<sup>11</sup> in an early edition of *Valuing a Business*. In valuing professional goodwill, the court indicated that the following factors should be considered:

- The age and health of the professional
- The professional's demonstrated past earning power
- The professional's reputation in the community for judgment, skill, and knowledge
- The professional's comparative business success
- The nature and duration of the professional's practice, either as a sole proprietor or as a contributing member of a partnership or professional corporation

Some authors feel that a professional's age, health, judgment, skill, and other factors mentioned by the court are indications of intrinsic value. However, many of these factors may also be considered in a fair market value assignment. The intrinsic value argument takes the position that because the professional will be staying with the practice, it is important to consider the personal attributes of the individual. Because fair market value assumes a hypothetical willing buyer, rather than a specific buyer or the owner, consideration of personal attributes violates the spirit of fair market value. The fair market value argument states that the willing buyer must be able to carry on the practice in a similar manner as the willing seller, and as such, must have a similar level of ability (judgment and skill, or in the case of a surgeon, the hands) to maintain the practice in a manner that has value. Clearly, this can be argued both ways.

Intrinsic value may also be applied to other types of closely held businesses. In a Wyoming case, *Neuman v. Neuman*,<sup>12</sup> one of the highly contested issues involved whether a discount for lack of marketability should be applied to the business value because the owner would not be selling the business. Fair market value assumes a sale; therefore, a discount would have to be taken, if appropriate. The trial court, and later the Supreme Court of Wyoming, found in favor of not applying a discount, creating a difference between the value of a business to a willing buyer and the value of a business to the owner for purposes of divorce.

Another major issue arises as a result of each jurisdiction's determination of how these concepts should be applied. One of the controversial issues that should be considered by the valuation analyst is whether a covenant not to compete is to be included as part of a valuation using the fair market value standard of value. Although many valuation analysts have interpreted fair market value to have an implied covenant, not all do. Logically, a willing buyer would not buy a practice, particularly the goodwill, if the seller has the right to open up across the street. However, in the *Thelien*<sup>13</sup> case in Missouri, the court assigned no value to the intangibles because there was no evidence presented that indicated that Dr. Thelien could sell his share of the dental practice without a covenant not to compete and receive an amount greater than his share of the tangible assets.

Carrying some of these value concepts to an extreme, court cases have expanded accepted standards of value, for example, New Jersey case law used to refer to fair market value, and more recently, fair value. However, in an attempt to bring fairness to the litigation, a judge followed the intrinsic standard of value and ruled that celebrity goodwill was a marital asset.<sup>14</sup> In *Piscopo*, entertainer Joe Piscopo was found to have celebrity goodwill. When was the last time that anyone saw Joe Piscopo? So much for his celebrity goodwill.

## Valuation Dates

Valuation dates in business valuations for divorce purposes should be provided to the valuation analyst by the clients and their attorneys, preferably the attorneys. The correct valuation date may depend on numerous factors, and as a result, the client's attorney will usually be in the best position to provide the date or dates that should be used. Business interests and business assets may be valued at numerous dates. This will frequently

11 *In Re: Marriage of Lopez* 113 California Reporter 58 (38 Cal App. 3rd 1044 [1974]).

12 *Neuman v. Neuman*, 842 P2d580 (Wyo. 1992).

13 *Thelien v. Thelien*, 847 SW2d116 (MO App WD 1992).

14 *Piscopo v. Piscopo*, 231 NJ Super 576.

depend on the jurisdiction, whether the asset is considered active or passive, particular case sensitive factors, or the like. Therefore, the valuation date in a divorce engagement may be one or more of the following dates:

- Date of the marriage
- Date of a gift or inheritance
- Date of the separation
- Date of the divorce complaint (petition)
- Date agreed to by the parties
- Date of the trial

## Date of the Marriage

---

The date of the marriage will generally not be used for valuing the marital business unless there is a claim that part or all of the business is premarital and, therefore, separate property. Business assets that are acquired or commingled during the marriage become marital property in most, if not all, jurisdictions. This may require the business to be valued at the date of the marriage, as well as a subsequent date, to measure any incremental appreciation that is considered to be subject to distribution.

## Date of a Gift or Inheritance

---

Property acquired by gift or inheritance frequently is considered to be separate property. When this is the case, valuation may not be necessary because it is to be excluded from distribution. However, many arguments have been raised that the separate property becomes commingled into marital property. Sometimes, only some of the business ownership was inherited or gifted, making the balance subject to distribution. Also, the value of the gift or inheritance is often understated for tax purposes. When this occurs, the valuation analyst may wish to examine estate or gift tax returns to determine the manner in which the values were derived. This assumes, of course, that estate or gift tax returns were filed. It also assumes that the adequate disclosure rules (discussed in chapter 21) were followed so that you can figure out what was done to determine value. Guidance may be required from the attorney concerning the extent of the valuation services to be provided in these cases.

## Date of the Separation

---

In certain jurisdictions, the date of the separation of the parties is considered to be the presumptive date that the marriage is considered to be over. Other jurisdictions consider the date of separation as the start of the time period that each party no longer contributes to the marital estate, but not necessarily the date to be used for the valuation. In other jurisdictions, everything is includible until a divorce complaint is filed. If the date of separation is the applicable date, a business valuation may be necessary as of that date.

## Date of the Divorce Complaint (or Petition)

---

For those jurisdictions that consider the filing date of the divorce to be the applicable date, a business will generally be valued at that date. Many jurisdictions start off with this date, but provide the judge with the latitude to change the date if the facts and circumstances warrant it. Sometimes, the parties separate and no formal complaint is filed with the court for many years. Some attorneys may argue that the marriage really ended when the parties separated. In certain jurisdictions, this could require two valuations to be performed, one at separation and one at the complaint date. The valuation analyst should speak to the client's attorney for proper direction.

## Date Agreed to by the Parties

---

On occasion, the parties, with the help of their attorneys, may agree to a date to be used for the business valuation. Circumstances surrounding the particular divorce may encourage agreeing to the date. For example, a fairly well-known individual is going to be divorced. As soon as a divorce complaint is filed, it becomes public record subject to media attention. The attorneys and the clients may agree to value all the assets, come to a written settlement, and take care of all aspects of the divorce before filing the actual complaint. After everything is taken care of, a complaint is filed, but the parties are immediately divorced in an uncontested

action. This saves the media harassment during the months or years that it takes to get divorced under normal circumstances.

## Date of the Trial

This is always tricky for the business valuation analyst. Because we all know that it takes quite a bit of time to accumulate the information and analyze it in order to properly value a business, valuing the asset at the time of trial becomes difficult, particularly because trial dates are frequently postponed, and we won't always know the actual date until the last minute. However, many courts are specifying that assets in a marital dissolution be valued as of the date of the divorce trial. This not only makes it difficult for the valuation analyst to value the asset, but it makes an early settlement of the case even more difficult for the parties. This requires valuing a potentially moving target. Frequently, a date may be agreed upon by the parties so that the process does not have to be held up until trial. The good part of using this date is that the valuation analyst may have to go through numerous iterations of the valuation as it gets closer to trial. If there are many postponements, this could be like the full employment act for valuation analysts.

## Valuation Methods

In most business valuation assignments, multiple valuation methods will be used. Valuation standards tell us to consider whichever methods may be applicable to a particular assignment. The number of methods, as well as which methods, depends on the purpose of the assignment, the standard of value to be used, the type of business, and the availability of information. The valuation analyst should apply similar criteria in divorce assignments as in other types of assignments unless the local jurisdiction provides otherwise (in the statute or case law). You also should be aware of any methods that the judge likes or dislikes. If the judge likes the excess earnings method, you really should do everything possible to include it in your valuation. Oh, by the way, there is one method that I have seen used by the courts that has not been mentioned in the book as of yet. It is the HFB method. This is the valuation method in which the judge hears how much the marital house is worth, and because the nonbusiness owner spouse will get the house, the value of the business ends up coming in around the same amount. HFB stands for *house for business*. Only kidding! (Well, maybe not.)

## Valuation as of a Specific Date

A business valuation is similar to a balance sheet: It is “as of” a specific date in time. Values change as factors around the business change. This is especially evidenced in the public stock market. As such, the information used in performing a business valuation should be only that information that was known or knowable as of the valuation date. This can best be illustrated by a real situation that I encountered many years ago. A valuation of a bicycle shop was to be performed as of June 10, 1992, the date of the divorce complaint. The business burned down on March 14, 1993. In this instance, the value as of June 10, 1992 was the real issue. A valuation analyst cannot forecast a fire nine months after the valuation date. Two other issues, however, may come to light with this example:

- If the business was over-insured, and the owner collected a large settlement, which increased the worth of the business, should the court take this into consideration in awarding distribution of the marital estate?
- If the business was under-insured, or co-insured, and the owner collected less than the inventory and business was worth, should the court take this into consideration in awarding distribution of the marital estate?

Because most divorce proceedings take place in a court of equity, the concept of fairness will often be the driving factor for the court. The valuation analyst will have to get guidance from the client's attorney concerning the valuation date, as well as what information can be considered based on the litigation position that will be taken in court. This type of situation may call for the valuation analyst to provide the court with the value as of a particular date but also an updated value so that the court can consider the equities of the situation. Before doing this, however, the valuation analyst should check with the client's attorney. In my real example, it turned out that the business owner was over-insured, and the owner received an unbelievable insurance settlement that allowed him to rebuild a mega-store that was worth far more than the previous store. However,

the court required the valuation to be as of the earlier date, ignoring the insurance settlement—because the nonowner spouse was convicted of arson. You have to love this business!

## Data Gathering and Analysis

The data gathering and analysis phase of a business valuation assignment is very important in providing the valuation analyst with the information needed to render a meaningful and well informed conclusion of value for a business. The procedures and information will be the same regardless of the purpose of the assignment. However, a divorce valuation frequently requires additional documentation to be gathered and analyzed. Also, there may be other procedures that will be applied for divorce assignments.

Depending on the methods being used, the valuation analyst should gather sufficient information about the company being valued, including, but not limited to, financial data, economic data, industry data, market data, as well as information about the history and nature of the company, its legal status, and its management.

Some practitioners send out massive document requests asking for the sun, the moon, and the stars. Although we would like to obtain as much of this information as possible, some of this data may not exist. If missing data is important to the assignment, the valuation analyst may need to use alternative procedures to obtain this information. For example, if an accounts payable listing is requested as of March 4, 2016, and the business does not maintain one, the valuation analyst can discuss the payment terms for vendor invoices with management and perform a review of the checkbook to create such a listing based on the checks that were written after that date. This is one instance when being an accountant as well as a valuation analyst really pays off. The valuation analyst must be aware of the difference between information that is not available versus information that is intentionally not provided by the business owner. The latter happens frequently in litigation assignments, divorce or otherwise. If information is being intentionally withheld, the valuation analyst or a forensic accountant can try to perform forensic procedures to work around the missing data, but often, the client's attorney will have to get involved by petitioning the court to compel cooperation. This situation happens all too often and makes it very difficult for the valuation analyst to complete the assignment on a timely basis, if at all.

Because data gathering is such an important part of the valuation process and because the nature of a litigation assignment is such that the valuation analyst may not get everything that is requested, the valuation analyst must keep good records regarding the documents that have been requested. The initial document request is frequently accomplished by having the client's attorney send the valuation analyst's document request to the other attorney. The valuation analyst will generally send written communications to the client's attorney regarding missing information. If the attorney decides to take appropriate legal action, it can be accomplished by attaching the letters received from the valuation analyst.

## Gathering Financial Data

Most valuation analysts ask for about five years of financial information when performing a business valuation. However, there is no magic to the five-year period. Sometimes more information is needed, sometimes less. Rarely will the valuation date for most divorce valuations be on the year-end of the company being valued. Accordingly, the valuation analyst should request interim financial statements. Other financial information such as tax returns, forecasts, or budgets maintained by the company should also be requested. Analyses of the underlying assets, liabilities, and income and expense accounts may also be needed. These items should not be anything unusual for the valuation analyst who performs other types of business valuations.

## The Valuation Process

The balance of the valuation process is the same as it would be for other types of valuation assignments. However, the nature of divorce litigation makes it more difficult to follow all the normal steps that would be performed in a typical assignment. For example, if the nonclient spouse is actively involved in managing the business, he or she may be reluctant to allow the valuation analyst to visit the company's facilities. This individual may be trying to hide information from the valuation analyst that could be discovered during a site inspection

(like expensive artwork on the walls). Alternatively, confidentiality may be the concern; that individual may not want the employees to know that a divorce is in progress. Sometimes, the business owner is just afraid that the employees will think that the business is going to be sold and they may leave unnecessarily. The valuation analyst should always request a site visit. If a site visit cannot be arranged, the valuation analyst should assess the impact of this on the valuation engagement. A qualification should also be put in the report, such as the following:

We requested the opportunity to perform a physical inspection of the business premises but were denied access. Information gathered during such an inspection may have had an impact on the outcome of our analysis. Had we been allowed to inspect the premises, our conclusions may have been different.

If possible, the valuation analyst should conduct management interviews during the site inspection. The valuation analyst should ask all the questions that are necessary to supplement the written documentation received, as well as to obtain a further understanding of the company's history, customer base, product mix, and financial results. If the valuation analyst has also been hired to perform a forensic examination of the company's records, any additional questions that are important to that examination should also be asked during these interviews.

## Normalizing the Financial Statements

The normalization process is intended to restate the reported earnings of the business to an economic basis that a prospective purchaser would receive. In divorce valuations, the restating of the reported income is also considered in the business owner's ability to pay support (or amount of support needed). These adjustments become even more important for that reason. Adjustments are generally made pertaining to generally accepted accounting principles (GAAP), nonrecurring items, non-operating items, or discretionary items that are under the control of management. Frequently, the discretionary items become part of the business owner's ability to pay support or reduce the need to receive support. In Connecticut, for example, the amount of reasonable compensation used by the valuation analyst in the valuation of the marital business is often used as the amount that will be considered in the support part of the litigation. This eliminates the situation in which the business owner gets double-dipped from the value and support. Double-dipping is what happens when the valuation analyst adds back excess compensation, creating a higher valuation, and support is based on the actual level of compensation. The double-dipping occurs due to the higher valuation and the higher amount of income available to pay support. Another way to say this is the poor person gets whacked twice, once during the valuation and the other in the support payments.

Normalization adjustments are generally made to the income statement to present the results of the company's operations as they might be in the hands of the prospective buyer of the company. Discretionary income statement adjustments are normally made only if a controlling interest is being valued. This is because a minority stockholder is generally unable to influence operations and, therefore, would not receive the adjusted income as dividends. However, in most divorce valuations, a minority interest in a family-owned business may be treated as if the minority stockholder has control. The normalization adjustments are the same ones that were discussed previously.

## Unreported Revenues

In an attempt to hide income from the government and the business owner's spouse, the issue of unreported income frequently arises in divorce valuations. This is especially true when support is an issue. Valuation analysts with proper training can perform these types of forensic procedures. This book, however, is not intended to teach you how to play hide and seek.

When unreported revenues are located, the valuation analyst should advise the client's attorney immediately. The attorney may want to use this information to help negotiate a settlement before a report is written and a trial becomes necessary. In many states, the judge has a responsibility to turn over income tax fraud to the IRS or the local prosecutor, if evidence is presented in the courtroom that supports the allegation. If a

settlement is not reached, and it becomes necessary to complete the valuation, most valuation analysts agree that the unreported revenue should be treated as a normalization or GAAP adjustment. The valuation analyst does not do his or her client a true service if the analyst kills the goose that lays the golden egg. If the spouse goes to jail, where do you think the support will come from? However, as a valuation analyst, we cannot merely “turn the other cheek.”

Sometimes, no matter how the valuation analyst tries to help his or her client(s), the client(s) may not be rational when going through a divorce. I was court-appointed a number of years ago to value a jewelry store. The husband owned the business and the wife, an accountant, provided me with the real set of books. I tried like crazy to get these people to settle the valuation issue. I dragged my feet in issuing a report, but finally, the judge told me I needed to issue a report. He knew the allegations from the wife about unreported income and also knew that I was trying to help these people. To make a long story short, I testified to the unreported income and in the gallery of the courtroom were two invited guests of the judge, the IRS and the Division of Taxation of New Jersey.

## Stockholder Loans

A common balance sheet normalization adjustment involves the treatment of stockholder loans. Very often, an asset may appear on the books representing monies taken by the owner in lieu of compensation. The treatment of this asset will depend on the collectibility of the loan. Because most businesses will be valued based on cash flow or earnings capacity, the valuation analyst should treat this balance sheet item as a non-operating asset. If this item is going to be considered as part of the individual's current earnings for support purposes, it may be unfair to also treat it as an asset of the business. Chances are that it will not be repaid in the future. If the balance has been accumulated over many years, only the current increment may end up being treated as income available for support purposes. Therefore, part of this asset *may* be considered as a non-operating asset of the business.

When stockholder loans are recorded as liabilities of the company, the valuation analyst should assess whether the loan is for legitimate business purposes. For example, if the business owner has sufficient capital to act as a bank for the business and adequate capitalization of the business is demonstrated, the stockholder loan should be treated as a true business liability. This is especially true when the business could have borrowed from a bank and repayment terms, notes, and other indications of an obligation are present.

Stockholder loans that do not meet the previously mentioned conditions should be treated as capital of the business. Undercapitalized businesses are set up frequently. The owner treats the infusion of monies as loans so that the money can be repaid, with or without interest, at the discretion of the owner. In most instances, these loans are paid in capital and should be treated as such. For cash-type businesses, the valuation analyst should investigate the source of these loans because they may come from unreported revenues.

## Income Taxes

Income taxes are probably one of the most confusing adjustments that arise in divorce, and all valuation assignments. Some valuation analysts prefer to value a company on a pretax basis, whereas others prefer an after-tax basis. Regardless of which is used, the answer should be the same. Whether the valuation analyst uses a pretax basis or an after-tax basis, the discount or capitalization rates will change accordingly. At this point, this is likely obvious.

When valuation analysts are engaged to value sole proprietorships, partnerships, S corporations, or limited liability companies (pass-through entities), a pretax or an after-tax earnings stream can be used. There is no definitive rule about these entities. Many valuation analysts will use corporate tax rates, others will use individual rates. Individual rates get a little bit cloudy because of itemized deductions, personal exemptions, and self-employment taxes. The valuation analyst can use either set of rates but should be prepared to discuss the merits of the rates used.

Pass-through entities have given many state court judges a serious headache. The argument of “to tax or not to tax” keeps coming up in their courtrooms. In the Massachusetts case *Bernier*,<sup>15</sup> the court followed the guidance from *Delaware Open MRI v. Kessler*.

## Explaining the Valuation

Unless prohibited by local statute or case law, the methods used in a divorce engagement are the same methods used in other types of valuation assignments. Since the nature of divorce valuations is adversarial, the valuation report will often become a source of controversy and come under attack by the opposition. An experienced valuation analyst will always assume that expert testimony will become necessary. For that reason, it is imperative that the judge understands the valuation process and how the estimate of value was determined.

Frequently, the opposing attorney will attempt to destroy an expert’s credibility by attacking the contents of the valuation report. It is not uncommon to have an attorney ask an expert an abundance of questions in an attempt to confuse the judge and jury. Because most judges do not have a background in business valuation, it sometimes becomes easy to confuse them. Another favorite tactic used by attorneys is to attack forecasts by sticking a copy of a subsequent financial statement in front of the expert and saying “isn’t it true that your forecast was wrong?” Of course, the forecast is different than the actual results. All that an expert can say to this type of question is that “at the time the forecast was prepared, we used all of the information that was available to us. This is the same information that a willing buyer would have known about, as well. I really cannot say why the actual results were different. I would have to perform an extensive analysis to figure it out. This would take far more time than we have available right now.”

## Reaching a Conclusion of Value

After applying various methods of valuation to the subject company, the valuation analyst will have to determine the appropriate estimate of value. This is accomplished in the same fashion as every other type of valuation. However, different jurisdictions vary greatly when it comes to applying valuation premiums and discounts. The valuation analyst should speak with the client’s attorney about local case law.

## Divorce Valuations of Professional Practices

Professional practices are generally valued in the same manner as other types of businesses. However, there are definite distinctions between other types of businesses and professional practices. Some of the unique characteristics of the professional practice make them subject to special considerations in valuations, particularly for divorce.

### Professional Practices Differ From Regular Business Enterprises

Professional practices are generally service businesses. Most of the value in a professional practice will be intangible in nature. The composition of the typical professional practice is that it does not have a significant investment in tangible assets as compared to its investment in people. However, some professional practices may have a sizeable investment in equipment. For example, a radiology practice may own MRI and X-ray equipment. Professional practices generally provide specialized services, which require the owners, and frequently their employees, to possess special levels of knowledge.

Professionals, such as doctors, lawyers, accountants, and in some cases, valuation analysts and others, are generally licensed by a state licensing body. Therefore, in most circumstances, professional practices can only be sold to similarly licensed professionals. Professional licenses are not transferable between individuals. Therefore, the market value of a license is nonexistent, if consideration is given to the true definition of that

15 *Bernier v. Bernier* 449 Mass. 774 – (2007) Also see 82 Mass. App. Ct. 81 and 147 US 242 - 1893. This case was appealed and also when to the Massachusetts Supreme Court.

concept. Logic states that it cannot have value if it cannot be sold. However, a license provides the professional with the ability to make a living; therefore, it has intrinsic value to the individual licensee. In New York, the value of a license is a marital asset. I'm surprised that they don't value "green cards" because they provide the opportunity for a non-USA resident to earn a living! New York is a funny place—they will value almost anything.

Because of the nature of a professional practice, the value of the practice is highly dependent on the skills, reputation, and efforts of individual professionals. Therefore, some of the value of the practice is attributable to the personal reputation or skill of the owner and may not be transferable to a buyer. For example, a skilled heart surgeon cannot transfer his or her skilled hands to a willing buyer. This is known as *professional goodwill*. In some instances, *professional goodwill* has no value to a prospective purchaser. *Practice goodwill*, or the commercial goodwill of the practice, is generally a component of most professional practice valuation estimates.

Because professional practices are built on specialized services, the nature of the particular practice being valued needs to be considered. This means that one type of medical practice will be valued differently than another type of practice. For example, the nature of a general practice would be that referrals come from numerous sources, including existing patients. The patients also tend to be repetitive. A brain surgeon, however, probably gets most of his or her referrals from other doctors. Hopefully, for the sake of the patient, this type of practice does not have many recurring patients.

## Divorce Valuations and the Market Can Be Very Different

The divorce courts have created many precedents regarding the valuation of professional practices. The precedents, however, vary from jurisdiction to jurisdiction, and they do not always make sense from a valuation point of view. The valuation analyst must become familiar with the case law in this area. For example, in New Jersey, attorneys were prohibited from selling their law practices. However, in *Dugan v. Dugan*,<sup>16</sup> the court found that the attorney's goodwill was a marital asset subject to equitable distribution. This case is cited in many other states. Therefore, for divorce purposes in some states, we need to value that which cannot be sold. Now, let's look at how a law practice could be sold.

What if Joe Lawyer brought in an associate who worked with him for two or three years? Joe retired and the associate takes over the practice and pays Joe a "retirement pension." This type of sale can, and does, take place in other professions pretty regularly. From a valuation standpoint, the valuation analyst should consider a discounted cash flow analysis to include the additional expense of having the associate work (an added expense) for the period of time that it may take to transition the practice over to him or her. An income stream expected to be generated by the associate should also be considered, but the point is that the transition may take a number of years.

Sometimes, government regulation affects professional practices. For example, through Medicare and Medicaid, health care services become subject to price schedules. When valuing a medical practice, the valuation analyst should be familiar with the government's regulatory role in the practice's specialty.

## Financial Information

Most professional practices maintain their books and records using the cash basis of accounting. Therefore, the valuation analyst should investigate whether an accrual basis of accounting would affect the valuation. For accountants who perform valuations, this may be easier than for other categories of valuation analysts. For a mature practice that is consistent from year to year, the method of accounting may not make that much difference. However, some practices can be greatly affected by growth, decline, or timing of receipts. This can be true for a personal injury law practice.

.....  
<sup>16</sup> *Dugan v. Dugan*, 92 N.J. 423 (1983).

## Adjustments to Financial Information

Financial statements of professional practices must usually be adjusted for all the GAAP and normalization items of other types of businesses. In addition, the following items are often important when valuing professional practices:

- Cash versus accrual accounting
- Work in process
- Contingent work in process
- Deferred revenues
- Contingencies

## Professional Versus Practice Goodwill

The distinction between *professional goodwill* (sometimes called *personal goodwill*) and *practice goodwill* (sometimes called *business or enterprise goodwill*) is that professional goodwill is the goodwill that is associated primarily with the individual, versus practice goodwill, which is the goodwill associated primarily with the entity. This can be demonstrated by assuming John Smith, CPA, is a partner at Deloitte. If a new client calls the firm specifically requesting John Smith, then there may be personal goodwill associated with the individual. However, if the client wants a “big four” name on the financial statements and contacts Deloitte and ends up with John Smith, there is probably practice goodwill. Sometimes, the two types of goodwill will overlap.

The existence of professional goodwill is based on the fact that clients come to the individual, as opposed to the firm. This may be based on the individual’s skills, knowledge, reputation, personality, and other factors. The implied assumption is that if this individual moved to another firm, the clients would go with him or her. Professional goodwill is more difficult to transfer to a new owner, but not impossible. Generally, the professional will assist in a smooth transition to a new owner in order to obtain the maximum price for the practice.

## Goodwill in a Professional Practice

The issue of personal versus professional goodwill arises most often during a divorce valuation of a professional practice. In most instances, there is little reason to separate the two concepts. However, some courts have determined that sole practitioners in any profession can only have personal goodwill because he or she is the practice. However, a sole practitioner’s practice can easily have both forms of goodwill, not to mention other forms of intangible assets.

To illustrate this point, let’s assume that Sarah Jackson, attorney at law, is a personal injury specialist. Her trial skills have allowed her clients to get jury verdicts that begin at \$1,000,000. Her law practice has a book value of \$85,000 and contingent work in progress of \$700,000. Gross revenues for the firm are \$8,000,000. Ms. Jackson draws a salary of \$3,000,000 annually (she’s my hero!). The question becomes whether Ms. Jackson’s goodwill—her reputation and trial skills—can be transferred to another lawyer. If so, we might have many lawyers earning a lot of money. This illustrates personal goodwill.

Let’s illustrate practice goodwill. Now assume that Mary Brown, attorney at law, belongs to a prepaid legal services plan, from which she gets client referrals. Because the law firm is signed up with the legal services plan, referrals come to the practice regardless of her reputation and skills. This is practice goodwill. However, assuming that Ms. Brown does a good job for these clients, referrals may come to her in the future, which would be an element of personal goodwill.

The standard of value to be applied and the case law regarding goodwill will vary depending on the jurisdiction of the trial. The valuation analyst should ask the client’s attorney early in the process about the proper standard of value to be used. In fact, it is a good practice to have the standard of value spelled out in the engagement letter with the client. The valuation analyst should also make certain that the case law regarding goodwill in the jurisdiction of the divorce is understood.

Many courts have found that goodwill is an asset to be included in the marital estate of a professional for divorce purposes. In some states, professional goodwill is considered to be marital property even though it is

not transferable. In such cases, the standard of value is not fair market value but, rather, intrinsic value to the owner. Since the last edition of this book was published, many more states have joined the band wagon and have taken the position that professional goodwill is not a marital asset subject to division. However, practice goodwill is a marital asset subject to division.<sup>17</sup>

As I pointed out before, one of the most widely cited cases detailing the factors to consider when valuing professional goodwill in a divorce is the California case *Lopez v. Lopez*.<sup>18</sup> The factors listed in that case that are worth repeating include the following:

- The age and health of the professional
- The professional's demonstrated past earning power
- The professional's reputation in the community for judgment, skill, and knowledge
- The professional's comparative professional success
- The nature and duration of the professional's practice, either as a sole proprietor or as a contributing member of a partnership or professional corporation

As illustrated previously, it is frequently difficult to distinguish between professional goodwill and practice goodwill. In the Florida case, *Williams v. Williams*,<sup>19</sup> the trial court ruled that the value of Mr. Williams' accounting practice included \$43,200 in practice goodwill. On appeal, the trial court's finding was reversed. In its opinion, the appellate court stated that

the goodwill of [a] professional practice can be a marital asset subject to division in a dissolution proceeding, if it exists and if it was developed during the marriage . . . . However, for goodwill to be a marital asset, it must exist separate and apart from the reputation or continued presence of the marital litigant . . . . When attempting to determine whether goodwill exists in a practice such as this, the evidence should show recent actual sales of a similarly situated practice, or expert testimony as to the existence of goodwill in a similar practice in the relevant market. . . . Moreover, the husband's expert, who testified the practice had no goodwill, stated that no one would buy the practice without a noncompete clause. This is telling evidence of a lack of goodwill.

Clearly, the non-compete clause was the issue in the court's strict interpretation of fair market value. The inconsistency of the various cases throughout the country makes this a challenging field. In a little while, you can read an exhibit that deals with the valuation of a non-compete clause.

Probably because of the number of divorces each year, it should be little surprise that California has more reported cases dealing with the valuation of professional practices than any other state. State courts will frequently look to other courts when they do not have a precedent of their own. The valuation analyst can be helpful to the attorney by being familiar with the cases, but it is the attorney's job to determine what case law should be followed.

The ongoing problem of the different court rulings can be further demonstrated in *Beasley v. Beasley*<sup>20</sup> and *Dugan v. Dugan*.<sup>21</sup> In *Beasley*, the court ruled that the sole proprietorship law practice cannot have goodwill because goodwill constitutes the present value of future earnings, which stem from the future post-marital efforts of the attorney spouse. In this situation, the court basically felt that the cut-off date for the valuation is the date of the divorce. By using the future earnings of the attorney to calculate goodwill, the same dollars would be used to calculate both value and support. This would be double-dipping.

17 Some of the cases dealing with personal goodwill around the country include *Nail v. Nail*, 486 S.W. 2d 761 (Texas Supreme Court 1972); *Geesbreght v. Geesbreght*, 570 S.W. 2d 427 (Texas Civil Appeals Court 1978); *Prahinsky v. Prahinsky*, 540 A.2d 833 (Md. App. 1988) and 582 A.2d 784 (Md. 1990); *Thompson v. Thompson*, 546 So.2d 99 (Fla. App. 4 Dist. 1989); *Hollbrook v. Hollbrook*, 103 Wis. 2d 327, 309 N.W. 2d 343; *Zells v. Zells*, 157 Ill. Dec. 480, 572 N.E. 2d 944 (111.1991); and *DeMasi v. DeMasi*, 366 Pa. Super. 19, 530 A. 2d 871,883.

18 In *Re: Marriage of Lopez*, 113 California Reporter 58 (38 Cal. App. 3d 1044 [1974]).

19 *Williams v. Williams*, No. 95-00577, 1996 WL 47675 (Fla.App.2 Dist. Feb. 7, 1996).

20 *Beasley v. Beasley*, 518 A.2d 545 (Pa. Super. 1986).

21 *Dugan v. Dugan*, 92 N.J. 423 (1983).

In *Dugan*, it was decided that an individual's law practice, even though it was a professional corporation, could have goodwill that is transferable. The court stated that

[g]oodwill is to be differentiated from earnings capacity. It reflects not simply a possibility of future earnings, but a probability based on existing circumstances. . . . Moreover, unlike the license and the degree, goodwill is transferable and marketable. . . . An individual practitioner's inability to sell a law practice does not eliminate the existence of goodwill and its value as an asset to be considered in equitable distribution. Obviously, equitable distribution does not require conveyance or transfer of any particular asset.

The irony of the *Dugan* case is that the same Supreme Court in New Jersey found that earnings capacity is not a marital asset in *Stern v. Stern*.<sup>22</sup> Earnings capacity was not a marital asset subject to distribution, but now, probable future earnings is a factor in determining whether there is goodwill that is subject to distribution. The words are so subtle that it would be easy for the untrained individual to misinterpret these cases. This is just one more reason for the valuation analyst to rely on the client's attorney for guidance with these matters. By the way, have you noticed that many of the really contested divorce cases involve attorneys as one of the litigants? They are the only ones who are crazy enough to take these issues all the way to the top court in the state. This is a very expensive process.

## Non-Compete Agreements

Many valuation analysts believe that implicit in the definition of *fair market value* is a covenant not to compete. If the seller has a right to open up next door, why would a willing buyer ever purchase a business or professional practice? Separating the value of the intangible assets (goodwill) from the value of the non-compete agreement is frequently a difficult task. In *Monaghan v. Monaghan*,<sup>23</sup> the business under scrutiny was a dental practice. The court determined that if the practice was sold, the nonbusiness owner spouse would receive 50 percent of the gross proceeds received in excess of \$80,000.

The practice was subsequently sold for \$160,000. The sales contract allocated the purchase price as follows:

Inventory and supplies	\$ 20,000
Patient list	15,000
Goodwill	16,000
Covenant not to compete	109,000
<b>Total</b>	<b>\$160,000</b>

A claim was made in this case that the practice actually sold for less than \$80,000 and the nonbusiness owner was not entitled to a share in the proceeds. The claim was based on the premise that the non-compete covenant was a personal asset and not part of the practice. Obviously, the opposite position was that the covenant was part of the goodwill of the practice.

The Washington appellate court did not have case law of its own to use regarding the treatment of a non-compete covenant in a divorce case. Relying on other jurisdictions, the appellate court cited cases from other western states. In these jurisdictions, the covenant not to compete was considered personal property belonging to the professional. These other courts reviewed the relationship of the non-compete as compared to the other assets to rule whether or not it seemed fair (like \$109,000 out of \$160,000). If the allocation was unreasonable in relation to the other assets, then a more fair and objective allocation would be required.

22 *Stern v. Stern*, 66 NJ Super. 1975.

23 *In Re: Delores A. Monaghan and Robert D. Monaghan*, 78 Wash. App. 918, 899 P.2d 841 (Aug. 9, 1995).

The appellate court remanded the case to the trial court to separate the value of the practice from the value of the covenant not to compete based on all the evidence. Different jurisdictions treat non-compete agreements differently. Before the valuation analyst can address issues involving a non-compete agreement, advice should be obtained from the client's attorney concerning how the courts in that particular jurisdiction treat this issue. An illustration of the valuation issues dealing with a covenant not to compete can be found in exhibit 22.1. This is a really long exhibit, but be patient. It is intended to cover a lot of points about valuing covenants, personal goodwill, intangible assets, and how to document all of this stuff in a litigation report. Also, do not worry about the dates. I would have liked to use a more recent example, but examples this good do not come along regularly.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

**Description of the Assignment.** Trugman Valuation Associates, Inc. was retained by Joan Carnes to determine the equitable distribution value of Carnes Respiratory Services, Inc. (CRS or the company) as of March 9, 1995, as well as to determine the value of the covenant not to compete that was part of an actual transaction involving certain assets of the company. We have also been requested to opine on whether the value ascribed to the covenant not to compete is corporate, personal, or a combination of both.

In order to accomplish the assignment at hand, the following steps were taken by the valuation analyst:

1. Determine the fair market value of CRS.
2. Determine the fair market value of the tangible assets of CRS.
3. Determine the fair market value of the identifiable intangible assets of CRS.
4. Subtract the fair market value of the tangible and identifiable intangible assets of CRS from the fair market value of the total enterprise.

The result of this process will be to determine the residual, or unidentifiable, intangible value that makes up the balance of the fair market value of the enterprise.

**Definition of Equitable Distribution Value.** For this matter, equitable distribution value of the equity of CRS has been determined as a result of an actual transaction involving certain assets of the company. Other assets were kept by the sole shareholder. The equitable distribution value has been determined and is referenced in the "Order on Motion to Vacate Final Judgment of Dissolution of Marriage" signed by the Honorable John L. Brown on July 24, 1996. The value established in paragraph (8) of this order is \$16,900,000.

#### Author's Note

By the way, I forgot to explain what happened here. Mr. Carnes went to his wife during the divorce process and said "Sweetheart, let's not fight. My business is worth \$5 million and I am prepared to give you half of the value along with the other assets that you are entitled to. I just don't want to fight with you." Nice guy, right? Wrong!!! Two weeks after the divorce was put through by the court, Mrs. Carnes found out that Mr. Carnes had sold his company for \$15+ million. When she called him with not so nice things to say, he said "tough luck." The court found that fraud was committed and reopened up the issue of equitable distribution. Mr. Carnes hired a valuation analyst who determined that out of the almost \$17 million (sales price plus assets not part of the deal), \$5 million was a personal covenant not to compete and should not be considered as a marital asset for equitable distribution purposes. In comes Trugman Valuation Associates to the rescue!!!

**Nature and History of the Company.** Carnes Respiratory Services, Inc. was incorporated on June 10, 1981. The company began operations in City A, State, providing durable medical equipment and respiratory therapy products to patients referred to the company by their doctors. Products were sold primarily to elderly patients through Medicare, Medicaid, or private insurance.

As time went on, CRS opened three additional locations, in City B, City C, and City D, State. Each of these locations was opened after Mr. Carnes and his marketing team determined that the location was viable, based on its demographics. Each of the CRS facilities was owned by Mr. Carnes personally and leased to the company.

At the valuation date, CRS was operating in various counties, selling items such as beds, wheelchairs, walkers, and respiratory therapy products. Sixty percent of CRS' sales came from respiratory therapy products, 30 percent from durable medical equipment, and 10 percent from miscellaneous products. Management estimated that 70 percent of its revenues resulted from rentals and 30 percent from sales.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

CRS developed a reputation for delivering high quality service to its patients. Services included guaranteed 1-hour delivery, 24 hours a day service, and educating patients in the use of their equipment. This was very important in differentiating CRS from the rest of the market. Other companies in the durable medical equipment market competed with CRS. In City A, competitors included Respitch, Inc. and Lincare. In City B, CRS' competition included MediHealth, Inc., Lincare, Americare, Inc., and State Oxygen, Inc. Competition in City C consisted of Coast, Inc., and Lincare. In City D, Lincare, Sunshine, Inc., Medicaid, Inc., and Homedco, Inc. competed with CRS. As will be discussed later in this report, although these companies participated in the same markets as CRS, Mr. Carnes did not believe that any of these companies offered a significant, competitive threat to CRS.

As of the valuation date, the company had approximately 50 employees. Responsibility for overall management was shared between Mr. Carnes and Ms. Lori Rodgers. Their duties included day-to-day operations, training, marketing, and ensuring that whatever needed to be done was accomplished. They also shared the responsibilities for managing the City A facility, which was both a retail and billing operation. Each of the other three stores had a manager responsible for the store's operations. The company had four marketing representatives whose primary responsibilities were to maintain existing referral sources and establish new ones. CRS also had a delivery manager, who was responsible for coordinating drivers and the delivery of products to patients. Additional employees included customer service representatives, drivers, accounts receivable clerks, office staff, warehouse staff, and a dispatcher.

**Excess Assets.** From our analysis of CRS' financial statements, it appears that CRS has excess assets. Excess assets, sometimes referred to as non-operating assets, are assets that a business owns, that are not necessary for the operations of the business.

CRS had two categories of assets that are considered to be excess, current assets, and fixed assets. At the valuation date, CRS' balance sheet indicates that the company had \$1,136,933 of current assets and \$9,977 of current liabilities. This does not include the \$550,000 of accounts receivable sold to Public Company Purchaser. The reason for this is that CRS' financial statements are prepared on a cash basis, which does not include accounts receivable. Taking this into consideration, CRS had current assets of \$1,686,933. Subtracting CRS' current liabilities from this figure results in the calculation of CRS' working capital of \$1,676,956 (\$1,686,933 – \$9,977 = \$1,676,956).

To check the reasonableness of this position, we reviewed Integra's Business Profiler for working capital industry norms for durable medical equipment providers. For 1995, Integra reported that median working capital, as a percentage of sales, was 7 percent. Applying this to CRS' revenues for the 12 months ended February 28, 1995 results in the following calculation of working capital:

Revenues	\$ 5,930,480
Integra Working Capital as a Percent of Revenues	× 7%
Required Working Capital	\$ 415,134

This indicates that CRS had excess current assets of \$1,261,822.

Public Company Purchaser and CRS allocated \$550,000 of the purchase price to accounts receivable. Public Company Purchaser assumed no other current assets, and \$35,000 of accrued current liabilities were not recorded as of February 28, 1995. This results in working capital of \$515,000. This represents 8.68 percent of CRS' revenues in the latest 12 months. Although slightly above the median, this figure is still within industry norms. As a result, we have determined that CRS has excess current assets of \$1,136,933. This figure represents all of CRS' current assets other than the accounts receivable.

CRS owned certain vehicles that we believe were non-operating assets. These vehicles were as follows:

1992 Mercedes	\$125,603
1992 Mercedes	61,158
1989 Jaguar	58,332
1993 Jeep	17,176
	\$262,269

(continued)

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

In our opinion, these vehicles were not necessary for the operation of CRS. They are luxury automobiles that represented perquisites to Mr. Carnes. In addition, Mr. Carnes retained these vehicles after the asset sale to Public Company Purchaser. As a result, we have determined these vehicles are non-operating assets. Their value has been estimated to be approximately \$200,000.

**Valuation of Carnes Respiratory Services, Inc.** As indicated previously, the valuation of a closely held company can be accomplished using the three approaches to value. One might ask why the transaction that transpired could not be used as the best indication of fair market value? Our analysis indicates that the price that was paid by Public Company Purchaser, Inc. represents a value that was greater than the fair market value of CRS.

In the actual transaction that took place, Public Company Purchaser purchased certain net assets of CRS at a price of \$15,035,000. According to the allocation included in the Asset Purchase Agreement dated March 9, 1995, the following was purchased:

Accounts receivable	\$ 550,000
Inventory	40,000
Fixed assets	712,000
Covenants	100,000
Goodwill/customer list	13,633,000
<b>Total</b>	<b>\$15,035,000</b>

The price paid is greater than the fair market value of the assets purchased. Since the definition of fair market value is based on the most probable price, a review of other factors brought to our attention in this matter, make us believe that the most probable price is lower than this amount. In addition, we believe that Public Company Purchaser had special motivations in consummating this deal that would cause the definition of fair market value to be violated.

In the deposition transcript of Steve Rice, a principal of Richard Associates, the business broker engaged by Mr. Carnes to assist in the sale of CRS, several statements are made that assist us in substantiating our position. Mr. Rice's responses are relevant in that they reflect the knowledge and expectations of the seller. In the course of Mr. Rice's deposition, he asserts that Public Company Purchaser overpaid for CRS, supporting his opinion with several pieces of information. Other than Public Company Purchaser, Mr. Rice indicated there were four offers made to purchase CRS. The companies and their offers are as follows:

Home Medical	\$11 million
Abey Home Healthcare	12 million
Homedco	11 million
Continuem Care	Undisclosed

Mr. Rice was then asked about the first Public Company Purchaser offer of \$13.5 million for CRS. This was an all cash offer, and Mr. Rice thought after presenting the offer to Mr. Carnes “. . . our deal was done.” Mr. Rice's opinion is explained in the ensuing dialogue:

“I felt that no one would turn that down and we just felt it was—at the time we believed it to be the highest price Public Company Purchaser had ever paid for a company. In fact, we could almost assure that it was the highest price they ever paid for a company.” Mr. Rice was then asked, “the highest price in dollar amount or the highest price compared to profits?” To this, Mr. Rice responded,

It's the highest price compared to gross revenues. Public Company Purchaser's never—they pay between 1.75 and 1.2 times gross revenue and that's just—we thought that was outstanding.

That offer we took to Mr. Carnes, to John, and it never hit his desk before he threw it back at us and I'm telling you the truth. This thing never hit his desk. He wouldn't even look at it. He wouldn't talk to us.

Q. Did he say why he was turning it down?

A. Yes.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

Q. Why?

A. Two provisions that we told him about, that most of his employees would be fired and he had no tenant for two of his properties. So, after that point we let Public Company Purchaser sit out on a fence and I took that offer to all the other players and they all said let Public Company Purchaser buy it. That went on for about a month and we never had—we probably had some contact, but most of the contact with Public Company Purchaser was coming in the front door. They were calling us, what's going on?

Finally, the last player who hadn't given up was Continuum Care. Continuum Care kept fooling around, fooling around. Public Company Purchaser was getting nervous. They thought they were going to lose the deal. And we went back to them and said, make—give it one best shot. Go ahead. You're still way off the mark. We never told them what the other offers were. We just said, you're way off the mark. With the suggestion that they keep all the employees in the billing center and take all the leases on the property and it did. I mean, I had really nothing to—well, I guess it had a lot to do with me. I pushed it.

Q. You persuaded Public Company Purchaser?

A. I held their hand to the fire because they thought they were going to lose this deal in their own backyard and it would look very, very bad for a public company to do that.

It is clear Mr. Carnes's advisors thought this was a tremendous deal, and it exceeded their expectations. The offer was not rejected by Mr. Carnes because of the price. According to Mr. Rice, the offer was rejected by Mr. Carnes because most of CRS' employees would be fired, and he would not have a tenant for two of his properties. It was Mr. Rice who obtained the higher offer from Public Company Purchaser, along with the accommodation of Mr. Carnes' concerns. He did this by letting Public Company Purchaser "sit out on a fence" and by telling Public Company Purchaser that they were "way off the mark," even though it was by far the best offer he had received for CRS. What allowed Mr. Rice to do this was a nonfinancial concern on the part of Public Company Purchaser, namely that the deal was in Public Company Purchaser's "own backyard" and losing it would be embarrassing to Public Company Purchaser. From Mr. Rice's statements, it appears that Mr. Carnes would have accepted the \$13.5 million dollar offer if his two conditions regarding his employees and tenancy had been met.

In fact, the dialogue comes back to this issue:

Q. All right. Did Mr. Carnes ever tell you what changed his mind regarding deciding to sell his business? He kept turning you down and later he—

A. The key issue was that as soon as we locked the employees in place and no one was to be terminated is when he said that's worth all the money in the world to me and that's exactly what he said, it's worth all the money in the world, these people having a job.

Again, according to Mr. Rice, Mr. Carnes's issues were not related to price, but other nonprice factors. Mr. Rice further explains the actions of Public Company Purchaser by stating:

A. They're buying earnings. Earnings drive the price of their stock. John had a lot of earnings for the size of business that he had. And whether they paid 15 million dollars or 12 million dollars or 13 million dollars, at that time it didn't matter. They got rid of a competitor and they got the best—and they got people there that they don't—that are better than any people that they have, so they took everything into—I'd like to say we had a lot to do with getting 15 million dollars for this company.

This further highlights his beliefs that Public Company Purchaser's motivation was beyond financial, and that Mr. Carnes' reasons for rejecting the first Public Company Purchaser offer were unrelated to the purchase price. Mr. Rice's comments raise the issue of whether Public Company Purchaser paid fair market value for CRS, or paid above fair market value for synergistic and public image reasons. As discussed earlier in this report, fair market value is established between a willing buyer and willing seller, neither party being under compulsion and both having reasonable knowledge of the relevant facts. It appears from the comments of Mr. Rice that he believed that Public Company Purchaser was under compulsion, and that he could exploit that compulsion to the advantage of John Carnes.

This brings about the possibility of a buyer's premium. A buyer's premium is concerned with elements of investment value. According to Pratt, investment value is defined "as value to a particular investor based on individual investment requirements, as distinguished from the concept of market value, which is impersonal and detached."

(continued)

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

As Pratt states, investment value is different for different buyers. There are many factors that can influence investment value such as estimates of earning capacity, perceptions of risk, tax statutes, and synergies. Stated differently, the investment value of a closely held company is the value to a particular buyer, as compared to the population of willing buyers, as is the case in fair market value. This value definition would be applicable when an investor might have specific investment criteria that must be fulfilled in an acquisition.

A valuation analyst will frequently use this standard of value when he or she represents a buyer who wants to know, "How much is the business worth to me?" The fact that the buyer is specific about the business value to him or her changes the standard of value to investment value, as opposed to fair market value, which may be the value to everyone else.

Under such a definition of investment value, certain elements can be quantified numerically in an income stream, and differences between fair market value and investment value can be calculated. Others, like Public Company Purchaser's desire not to let other major competitors into its "backyard," cannot be calculated from an income stream. Typical market data does not allow us to calculate such a premium.

However, one study has provided us with an insight into this type of a premium by comparing the multiples of earnings before interest and tax (EBIT) paid by financial buyers and strategic buyers. The study consisted of a poll of 35 professional investment bankers, lenders, and the managing partners of buy-out firms, and covered the manufacturing, retail, communications, services, and health care industries, in particular.

As discussed previously, hard data is difficult to obtain for such a survey. Accordingly, the study is based on the respondents "feel for the industry based on their experiences in both proprietary deals and auction settings. At times, their answers were categorized as a broad interpretation of the diversity within a sector." The multiples obtained by the survey for 1989, 1993, and 1995 and that calculate the premium that strategic buyers are paying over financial buyers are presented in table 1.

**TABLE 1 Trends in Acquisition Multiples**

	1989	1993	1995
Strategic Buyers	7.76	6.11	7.24
Financial Buyers	7.41	5.40	6.50
Premium	4.72%	13.15%	11.38%

(Source: Jennifer Lea Reed, "Purchase Multiple Press to Rarefield Heights," Buyouts, February 20, 1995, p.1.)

As can be seen in the data in table 2, the premium for 1995 was 11.38 percent. To apply a buyer's premium to the sale of CRS, the premium is applied to Public Company Purchaser's initial offer of \$13.5 million. The justification for this is two-fold. First, Public Company Purchaser's offer appears to already have included some elements of investment value because it was significantly greater than the other offers for CRS. Second, Mr. Carnes's reasons for not accepting the offer were unrelated to the purchase price but, rather, were related to the nonfinancial terms of the agreement.

We have applied this premium to Public Company Purchaser's \$13.5 million offer to test to our hypothesis. The results are presented in table 2.

**TABLE 2 Application of a Buyer's Premium**

Initial Offer From Public Company Purchaser	\$ 13,500,000
Times One Plus Strategic Premium	× 1.1138
Price With Buyer's Premium	\$ 15,036,300
Final Purchase Price	\$ 15,035,000
Difference	\$ 1,300

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

This strongly supports the assertion that Public Company Purchaser was a strategic buyer in its acquisition of CRS, and the assertions made by Mr. Rice in his deposition. To verify this against other known data, we relied on the deposition of Mr. Davidson, Public Company Purchaser's national acquisition program manager. Mr. Davidson indicated that Public Company Purchaser's acquisitions typically occur at 3.5 to 4.0 times free cash flow for the trailing 12 months. Based on Public Company Purchaser's estimate of free cash flow for the trailing 12 months of \$3.5 million, the price –to-free-cash-flow multiple paid for CRS using a value of \$13,500,000 was 3.86 ( $\$13,500,000 \div \$3,500,000 = 3.8571$  or 3.86 rounded). Based on this data and the information presented in Mr. Rice's deposition, we conclude that the fair market value of the operating business of Carnes Respiratory Services was \$13,500,000 at March 9, 1995, based on the actual market transaction that was consummated.

In order to test the conclusion reached in the market approach, we then applied an income approach methodology in our analysis. To implement the income approach, we have selected the discounted future benefits method. The discounted future benefits method is one of the most theoretically correct methods of appraisal. It is premised on the concept that value is based on the present value of all future benefits that flow to an owner of a property. These future benefits can consist of current income distributions, appreciation in the property, or a combination of both.

In order to apply this methodology, we began the analysis with a forecast of expected future operating cash flows for CRS. The forecasted income statement for CRS for the years ended March 9, 1996 through 2000 is presented in table 3.

**TABLE 3 Forecasted Income Statement and Cash Flow for the Years Ended March 9**

	1996	1997	1998	1999	2000
Net Sales <sup>1</sup>	\$ 6,500,000	\$ 7,345,000	\$ 8,299,850	\$ 9,378,830	\$ 10,504,290
Less: Cost of Sales <sup>2</sup>	916,500	1,035,645	1,170,279	1,322,415	1,481,105
Equals: Gross Profit	\$ 5,583,500	\$ 6,309,355	\$ 7,129,571	\$ 8,056,415	\$ 9,023,185
Less: Operating Expenses <sup>3</sup>	2,723,500	3,077,555	3,477,637	3,929,730	4,401,297
Equals: Net Operating Income	\$ 2,860,000	\$ 3,231,800	\$ 3,651,934	\$ 4,126,685	\$ 4,621,888
Less: Taxes <sup>4</sup>	1,144,000	1,292,720	1,460,774	1,650,674	1,848,755
<b>Net income</b>	<b>\$ 1,716,000</b>	<b>\$ 1,939,080</b>	<b>\$ 2,191,160</b>	<b>\$ 2,476,011</b>	<b>\$ 2,773,133</b>

1 Revenues for the trailing 12 months in 1995 are based on the Public Company Purchaser pro forma included in this report as exhibit 2. Revenues are grown thereafter to generate a compound annual growth rate for the entire forecast period of 12.7 percent. This is the approximate rate of growth projected for the industry, as previously discussed.

2 Cost of sales is forecasted as 14.1 percent of sales for each year in the forecast period. This is based on the historical average for the period analyzed.

3 The historic average operating expenses for the period ended May 30, 1991 through May 30, 1994 and the latest 12 months ended December 31, 1994 were 45.1 percent of sales. For fiscal 1994, operating expenses were 41.9 percent of sales, which we used in each year of the forecast period. The most recent fiscal year's figure was selected over the average, based on the downward trend in operating expenses as a percentage of sales during the historic period analyzed.

4 We have assumed a combined federal and state tax rate of 40 percent.

(continued)

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

Using the forecasted income statements presented in table 3, combined with an analysis of the balance sheet of CRS, we have prepared a forecast of the net cash flow for the years ended March 9, 1996 through 2000. This appears in table 4.

**TABLE 4 Forecasted Net Cash Flow for the Years Ended March 9**

	1996	1997	1998	1999	2000
Net Income (Table 14)	\$1,716,000	\$1,939,080	\$2,191,160	\$2,476,011	\$2,773,133
Add: Depreciation <sup>1</sup>	548,422	743,589	964,128	1,213,337	1,492,451
Gross Cash Flow	\$2,264,422	\$2,682,669	\$3,155,288	\$3,689,348	\$4,265,584
Less: Capital Expenditures <sup>2</sup>	1,209,000	1,366,170	1,543,772	1,744,462	1,953,798
Less: Increase in Net Working Capital <sup>3</sup>	43,506	59,150	66,839	75,529	78,782
Net cash flow	\$1,011,916	\$1,257,349	\$1,544,677	\$1,869,357	\$2,233,004

1 Depreciation is based on two factors: First, depreciating the existing fixed assets as of February 28, 1995 of \$1,878,538 over a remaining useful life of five years, and second, depreciating future fixed asset additions over a useful life of seven years.

2 Capital expenditures are calculated as 18.6 percent of sales. This is based on capital expenditures as a percentage of sales in fiscal 1994. The calculation is as follows:

Net Fixed Assets at May 31, 1995	\$1,771,669
Less: Net Fixed Assets at May 31, 1994	(1,214,949)
Plus: 1994 Depreciation Expense	375,715
1994 Fixed Asset Additions	\$ 932,435
Divided by 1994 Sales	\$5,018,896
1994 Fixed Assets as a Percent of Sales	18.6%

Our review of prior years' capital expenditures revealed 15.9 percent and 19.3 percent, for 1992 and 1993, respectively. We felt that the 1994 capital expenditures were reasonable under the circumstances.

3 The increase in working capital is based on the median for medical equipment rental and leasing companies with three to five million dollars in sales, which was seven percent. Therefore, we have used this figure multiplied by the increase in sales to estimate increases in working capital for each year in the projection period.

Once the cash flow has been forecast, the selection of a proper discount rate becomes necessary. Because the benefit stream being estimated will not occur until sometime in the future, the future benefits must be discounted to their present value. In this instance, a discount rate of 19.2 percent has been deemed applicable. This results in the value estimate of CRS being calculated as follows:

Year	Forecasted Cash Flow	×	19.2% Present Value Factors	=	Present Value Future Cash Flow
1996	\$1,011,916		0.8389		\$ 848,896
1997	1,257,349		0.7038		884,922
1998	1,544,677		0.5904		911,977
1999	1,869,357		0.4953		925,893
2000	2,233,004		0.4155		927,813
TV	21,636,450		0.4155		8,989,945
<b>Total</b>					<b>\$13,489,446</b>

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

In this instance, the terminal value is determined by growing the last year's forecasted net income by a stabilized growth rate. Net income is then converted to cash flow as follows:

Terminal Value Net Income	\$2,939,521
Plus: Depreciation <sup>1</sup>	2,000,000
Less: Capital Expenditures <sup>1</sup>	(2,000,000)
Less: Increase in Working Capital <sup>2</sup>	(83,509)
<b>Terminal value cash flow</b>	<b>\$2,856,011</b>

1 Depreciation and capital expenditures are set equal in the terminal year.

2 The increase in working capital is calculated as the increase in 2000, multiplied by one plus the long-term growth rate of 6 percent.

Adding the terminal value to the present value of the anticipated interim benefit stream results in the present value of the future benefits of CRS to be \$13,496,690, or \$13,500,000 rounded.

Another reasonableness check was performed based on the deposition transcript of Howard Davidson, Executive Vice President and General Counsel of Public Company Purchaser. As he states in his deposition, Mr. Davidson managed "the acquisition function for the company nationwide." The following excerpt from his deposition gives an overview of how Public Company Purchaser analyzes potential acquisitions, including CRS.

Q. Okay. Could you tell me what criteria was used by Public Company Purchaser for the purpose of establishing this \$13,500,000 value?

A. When we value businesses, we typically look at a number of elements, some financial related, others not specifically financial related. We look at the sales revenue. We look at the earnings on a historical basis of the business. We look at the earnings of what we believe to be a pro forma basis after acquisition. We look at the geographic area that the business serves. We look at the product mix that business has in terms of its respiratory and nonrespiratory components. We look at the scope of their business in terms of geography and referral sources. Those would be the principal criteria that we look at.

Q. Well, is there a rule of thumb that you apply to earnings for the purpose of getting some preliminary feeling as to what a company would be worth to Public Company Purchaser in connection with an acquisition?

A. It's flexible. And those criteria determine whether or not our interest level is higher or lower and our valuation level is higher or lower with respect to a particular business. If it's got a better geographic situation for us, if there are more synergies, if it's a higher respiratory mix, those would be conditions which would put the value at the higher end of the spectrum. If those situations either singularly or in combination are less desirable compared to what we're looking for, then the business (then a particular business is at the lower end of the spectrum).

Mr. Davidson further describes the process and the interest Public Company Purchaser had in CRS:

A. Well, as I said earlier, we look at the financial performance both historically and what it would be on a go-forward basis. And we then look at other elements to determine, you know, whether or not our interest level is at the higher end of the spectrum or the lower end of the spectrum. In this particular case, because of the locations because of the respiratory content, because of the reputation that the company had in the community it was at the higher end of the spectrum.

The key element of this statement is the reasons for Public Company Purchaser's interest in CRS: good locations, high respiratory therapy content, and good company reputation. Mr. Davidson indicates that Mr. Byrnes put together a pro forma income statement based on what he believed Public Company Purchaser would expect to occur at the CRS locations in the 12 months after acquisition by Public Company Purchaser. Mr. Davidson then used this pro forma to derive a value for CRS. Mr. Davidson describes the valuation:

(continued)

## EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

A. The only thing I can tell is that if you look across the broad range of acquisitions we've done, that based on a pro forma basis, the cash flow and reconciling that with historical performance, and looking at it at our operating center level, not at the corporate level on a consolidated basis, but at that center level, businesses typically tend to fall at about the three and a half to four times cash flow basis depending upon various and intangible factors, some higher and some lower.

Q. And some of them you've described here earlier today. And you've also indicated that because of the mix of product, the particular area where respiratory—Carnes Respiratory was operating, the reputation of the company, using the higher end of the spectrum to the extent that that rule of thumb has applicability at all would have been what was—would have been Public Company Purchaser's approach in this situation.

A. I don't have specific recall as to what the pro forma, if any, was done for this reflected. So I don't know what the multiple is in this particular case. But based on the quality of the business and its size and its location, I think it's a fair statement to say that this is at the very high end of the spectrum.

Although Mr. Davidson did not recall the exact pro forma in his deposition, we have been provided a copy of it and it is presented as exhibit 2 to this report. The pro forma indicated that Public Company Purchaser expected \$6.5 million in revenues, earnings before interest, tax, depreciation, and amortization (EBITDA) of \$3.75 million, and free cash flow of \$3.5 million. Free cash flow is defined as EBITDA less capital expenditures. Dividing the purchase price of \$15,035,000 by \$3,500,000 results in a multiple of price-to-free-cash-flow of 4.30. Following Mr. Davidson's testimony, if we divide \$13,500,000 by free cash flow of \$3,500,000, the result is a multiple of 3.86. This is very much in line with the range of 3.5 to 4.0 times cash flow testified to by Mr. Davidson.

This confirms the reasonableness of establishing the fair market value of the operating assets of CRS at \$13.5 million.

**Valuation of the Tangible Assets.** The next step in our analysis is to value the tangible assets of CRS to be used in the allocation of the purchase price. As previously discussed, Public Company Purchaser and CRS negotiated a transaction that included an allocation of the price to different classes of assets. In this instance, we are accepting the allocation of the tangible assets as being reasonable. This results in the tangible assets being valued as follows:

Accounts receivable	\$ 550,000
Inventory	40,000
Fixed assets	712,000
<b>Total</b>	<b>\$1,302,000</b>

**Valuation of the Identifiable Intangible Assets.** The approaches to the valuation of intangible assets are similar to the approaches used to value a business enterprise: market, asset-based, and income. Each of these approaches is discussed briefly below.

**The Market Approach.** The market approach, also referred to as the *sales comparison approach*, entails researching and identifying similar intangible assets to the subject intangibles that have been transacted in the marketplace. These transactions are then used as guidelines in developing the value of the subject intangible asset.

**The Asset-Based Approach.** The asset-based or cost approach attempts to ascertain the value of the asset by determining its cost. Cost typically can have several definitions. The most common definitions of cost are, reproduction cost, the cost to reproduce an exact copy of the asset; replacement cost, the cost to purchase an identical asset, or the cost to replace the functionality or utility of the asset; creation cost, the original cost to create the asset; and recreation cost, what it would cost to recreate, or duplicate an existing asset. In many circumstances, the definition of cost also includes the concept of obsolescence, or deterioration in value. Obsolescence can result from physical deterioration of the asset, functional obsolescence, technical obsolescence, or economic obsolescence. Although not all intangible assets suffer from obsolescence, the identification of obsolescence is important to the cost approach.

**The Income Approach.** As in the case of the valuation of the business enterprise, the income approach for intangible asset valuation determines the present value of the future benefits that will accrue to the owner of the asset. This is generally accomplished by either capitalizing a single period income stream or discounting a series of income streams, based on a multiperiod forecast.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

**Identifiable Intangible Assets.** In this appraisal, several intangible assets could be separately identified and valued. These assets include the following:

- Trademark
- Patient records
- Covenant not-to-compete

Although other intangible assets could be identified as existing in CRS, namely trained employee workforce, procedure manuals, and so on, they could not be separately valued. Therefore, these assets are valued under the residual method in the next section of this report.

**The Income Approach.** To value the identifiable intangible assets and the goodwill of CRS, we have used the income approach. To implement the income approach, we have used the residual cash flow methodology. The residual method allocates the cash flows of the business to its component assets. This includes both tangible and identifiable intangible assets. This is accomplished for assets whose values are known by calculating returns to those assets and subtracting the returns from the forecasted cash flows of the business. The cash flow of a business is the product of combining all of the assets of the business in their productive capacities to generate returns to the shareholders. The cash flow that remains after returns to all of the identified assets are subtracted is the cash flow attributable to the unidentified intangible assets.

We started by analyzing the returns being generated by the tangible assets of the business. Because we have previously determined that excess assets existed in CRS at the valuation date, returns to these assets have not been computed because this analysis focuses on the operating assets of the business. At the valuation date, the tangible operating assets have been valued in addendum 3.4 to the asset purchase and sale agreement between Public Company Purchaser and CRS. The addendum has been attached as exhibit 3 to this report. As per exhibit 3, the value of the tangible assets at the valuation date was as follows:

Accounts receivable	\$ 550,000
Inventory	40,000
Fixed assets	712,000
<b>Total</b>	<b>\$ 1,302,000</b>

To compute returns from these assets, we have developed rates of returns for each and applied them to the asset values. The starting point to estimate returns on these assets is the prime rate that banks charged at the valuation date. According to the Federal Reserve Board, the average prime rate for all U.S. commercial banks was 9 percent on March 9, 1995. The prime rate represents the rate of interest banks charge their best customers on the most secure types of loans.

For this analysis, we have added a premium to the prime rate for each of the different classes of assets to arrive at the following rates of return:

Asset Class	Return	After-Tax Return
Accounts Receivable	11%	6.6%
Inventory	12%	7.2%
Fixed Assets	14%	8.4%

(continued)

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

Accounts receivable are the most liquid of the three asset classes, making them less risky than the inventory or fixed assets. Yet banks would still charge CRS a premium to lend against the receivables because it still presents risk to the bank. The inventory is less liquid than the accounts receivable and thus presents more risk to the bank. Therefore, we have added an additional 1 percent premium to the inventory rate. The fixed assets of the business are even less liquid than the inventory and present a greater risk to a bank that is considering lending against the fixed assets of a business. As such, we have added an additional 2 percent over and above the return to inventory.

All of the returns calculated are pretax returns. Because our objective is to allocate after-tax cash flow to these assets, we need to tax effect the returns to put them on an after-tax basis. To accomplish this, we have assumed the tax rate to be 40 percent and multiplied the pretax returns by one minus the tax rate, or 60 percent ( $1 - 40\% = 60\%$ ). It should be noted that the returns calculated here are minimum returns. The premise used here is that companies would require a rate of return equal to the cost to finance the asset. In fact, companies want to make profits on their assets and would want to earn an incremental return over and above their financing cost.

To calculate the cash flow that is allocable to each asset, the value of the asset is multiplied by the after-tax return. The calculations are presented in table 5.

**TABLE 5 Calculation of Returns to Tangible Assets**

Asset	Value	After-Tax Rate of Return	Return
Accounts Receivable	\$550,000	6.6%	\$36,600
Inventory	40,000	7.2%	2,880
Fixed Assets	712,000	8.4%	59,808

Once the returns from the tangible assets have been determined, we can subtract these returns from the cash flow of the business to obtain the cash flow allocable to all of the intangible assets. This is shown in table 6.

**TABLE 6 Cash Flows from Intangible Assets**

	1996	1997	1998	1999	2000
Cash Flow (Table 15)	\$ 1,011,916	\$ 1,257,349	\$ 1,544,677	\$ 1,869,357	\$ 2,233,004
Less Returns On:					
Accounts Receivable (Table 16)	36,300	36,300	36,300	36,300	36,300
Inventory (Table 16)	2,880	2,880	2,880	2,880	2,880
Fixed Assets (Table 16)	59,808	59,808	59,808	59,808	59,808
Cash Flows From Intangible Assets	<u>\$ 912,928</u>	<u>\$ 1,158,361</u>	<u>\$ 1,445,689</u>	<u>\$ 1,770,369</u>	<u>\$ 2,134,016</u>

**Trademark.** A *trademark*, or *trade name* as it is sometimes referred to, is one of the most common types of intangible assets. The trademark is the name that the company is recognized by in the market place. This is the reason trademarks have value because they are recognized by customers and referral sources. Typically, in an acquisition, the use of the trademark by the seller is prohibited to protect the value of the assets purchased by the buyer.

The valuation of a trademark is based on the present value of a stream of royalties that would be paid for the use of the trademark. Royalty rates for such purposes are typically defined as a percentage of sales. To obtain the actual rates, one must observe similar transactions in the marketplace.

A few companies keep databases of royalty rate data. For the purposes of this assignment, we used the database of ASU Consulting and Trademark Licensing Associates. These databases were searched for companies in the medical equipment and respiratory therapy industries and related fields. The searches did not identify any transaction that would be appropriate to the valuation of CRS' trademark.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

Our research and discussions with individuals at ASU Consulting and Trademark Licensing Associates leads us to believe that royalty rates typically range between 1 percent and 10 percent across markets and industries. Considering the low level of technology involved in CRS, as well as the company's strength and reputation, we have selected a royalty rate of 4 percent.

Estimating that the trademark has a relatively long-term holding period, we have calculated the cash flow for a 25-year life. The strength of the CRS name becomes more and more apparent when the historic sales growth is examined. Our calculation is shown in table 7.

**TABLE 7 Cash Flow Allocable to Trademark**

Year	Sales	Rate	Cash Flow
1996	\$6,500,000	4.0%	\$260,000
1997	7,345,000	4.0%	293,800
1998	8,299,850	4.0%	331,994
1999	9,378,831	4.0%	375,153
2000	10,504,290	4.0%	420,172
2001	11,134,548	4.0%	445,382
2002	11,802,620	4.0%	472,105
2003	12,510,778	4.0%	500,431
2004	13,261,424	4.0%	530,457
2005	14,057,110	4.0%	562,284
2006	14,900,536	4.0%	596,021
2007	15,794,569	4.0%	631,783
2008	16,742,243	4.0%	669,690
2009	17,746,777	4.0%	709,871
2010	18,811,584	4.0%	752,463
2011	19,940,279	4.0%	797,611
2012	21,136,696	4.0%	845,468
2013	22,404,897	4.0%	896,196

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

Once the cash flow has been forecast, the selection of a proper discount rate becomes necessary. Because the cash flow stream being estimated will not occur until sometime in the future, the future cash flow must be discounted to its present value.

The CRS trademark is well-established in its local markets. The company had an excellent reputation for service and integrity. As Mr. Carnes has said, he did not spend money on advertising, but let CRS' reputation build by word of mouth, from satisfied patient to doctor, and from doctor to doctor. These events have gone a long way in strengthening the trademark of CRS in its marketplaces. CRS had the predominant market position in each of its markets and continually maintained and upgraded its position with diligent marketing efforts. These positive qualities provide value to a trademark and reduce the risk associated with it. As a result, we have selected a 20 percent discount rate.

This results in the value estimate of the trademark being calculated as follows:

Year	Forecasted Cash Flow	×	20% Present Value Factors	=	Present Value Future Cash Flow
1996	\$260,000		0.8333		\$ 216,658
1997	293,800		0.6944		204,015
1998	331,994		0.5787		192,125
1999	375,153		0.4823		180,936
2000	420,172		0.4019		168,867
2001	445,382		0.3349		149,158
2002	472,105		0.2791		131,764
2003	500,431		0.2326		116,400
2004	530,457		0.1938		102,803
2005	562,284		0.1615		90,809
2006	596,021		0.1346		80,224
2007	631,783		0.1122		70,886
2008	669,690		0.0935		62,616
2009	709,871		0.0779		55,299
2010	752,463		0.0649		8,835
2011	797,611		0.0541		43,151
2012	845,468		0.0451		38,131
2013	896,196		0.0376		3,697
2014	949,968		0.0313		29,734
2015	1,006,966		0.0261		26,282
2016	1,067,384		0.0217		23,162
2017	1,131,427		0.0181		20,479
2018	1,199,312		0.0151		18,110
2019	1,271,271		0.0126		16,018
2020	1,347,547		0.0105		14,149
<b>TOTAL</b>					<b>\$ 2,134,308</b>

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

The indicated fair market value of CRS' trademark is \$2,134,308, or \$2,134,000 rounded.

**Patient Records.** One of the important intangible assets of a business such as CRS, is the patient records or customer list. These records are important to a potential purchaser because it is this very patient base that generates immediate cash flow to the company. This type of asset is generally valued by reviewing the expected life of the patient relationship and applying some factor to the sales in order to estimate the cash flow that would be expected to be generated from this relationship. Before applying factors to the cash flow of the company, we must first determine the cash flow available from the patient records and the remaining assets. This is calculated in table 8.

**TABLE 8 Cash Flows Available to Patient Records**

Year	Cash Flow	Accts. Rec.	Inventory	Fixed Assets	Trademark	Cash Flow to Other Intangibles
1996	\$1,011,916	36,300	2,880	59,808	260,000	\$ 652,928
1997	1,257,349	36,300	2,880	59,808	293,800	864,561
1998	1,544,677	36,300	2,880	59,808	331,994	1,113,695
1999	1,869,357	36,300	2,880	59,808	375,153	1,395,216
2000	2,233,003	36,300	2,880	59,808	420,172	1,713,843
2001	2,366,983	36,300	2,880	59,808	445,382	1,822,613
2002	2,509,002	36,300	2,880	59,808	472,105	1,937,909

Using Iowa curves, we have calculated the following survivorship rates for the life of the patient relationships:

Year	Survivorship %
1	83.88
2	62.43
3	47.22
4	34.57
5	23.13
6	12.32
7	1.87

(continued)

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

Therefore, projected cash flows from the existing patient base are estimated in table 9.

**Table 9**

Year	Cash Flow to the Residual	×	Survivorship Rate	=	Cash Flow to Patient Records
1996	\$ 652,928		0.8388		\$547,676
1997	864,561		0.6243		539,745
1998	1,113,695		0.4722		525,887
1999	1,395,216		0.3457		482,326
2000	1,713,843		0.2313		396,412
2001	1,822,613		0.1232		224,546
2002	1,937,909		0.0187		36,236

After calculating the cash flow attributable to the patient records, the next step is to discount these amounts to their present values to determine an estimate of the value of the patient records. In our opinion, the least risky of the identified intangible assets are the patient records because they are actual physical documents. Possessing these documents allows a buyer to continue servicing the existing patients. The remaining life of these records can and has been estimated. In addition, buyers such as Public Company Purchaser and other large companies in the industry have their own experiences with how long a patient will remain with the company. Because these patients are currently availing themselves of CRS' services, they are generating cash flows and will generate a material and predictable portion of CRS' cash flows over the following months and years. This makes the risk of receiving these cash flows low. Therefore, we have applied a 14 percent discount rate to the patient records. This results in an estimate of value as calculated in table 10.

**TABLE 10 Cash Flows Allocable to Patient Records**

Year	Cash Flow to Patient Records	×	Present Value Factors	=	Present Value
1996	\$547,676		0.8782		\$ 480,421
1997	539,745		0.7695		415,334
1998	525,887		0.6750		354,973
1999	482,326		0.5921		285,585
2000	396,412		0.5194		205,896
2001	224,546		0.4556		102,303
2002	36,239		0.3996		14,481
<b>TOTAL</b>					<b>\$1,858,995</b>

Therefore, based on our analysis, the value of the patient records is estimated to be \$1,858,995, or \$1,859,000 rounded.

## EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

**Covenant Not-To-Compete.** A covenant not-to-compete (non-compete agreement) is an intangible asset-based on a contractual agreement. Typically, the seller of a business, the covenantor, agrees not-to-compete with the buyer of the business, the covenantee, in a defined industry or market for a specific period of time, in a geographically defined area. A non-compete agreement has value to the buyer to the degree that it protects the assets (tangible and intangible) from loss of value by restricting competitive actions of the seller. From an economic perspective, the value of a non-compete agreement is dependent on several factors, including the ability of the seller to compete, the derivation of the non-compete agreement, and the losses the company would suffer if the seller competed.

In the instance in which the seller has the ability to compete, the relevant question becomes, what impact would competition from the seller have on the business? The answer to this question depends on a myriad of factors. Chief among them are: (1) the seller being in possession of relationships that could redirect business from the company to a new company established or invested into by the seller, and (2) the seller having either sufficient knowledge or technology to allow him or her to bring competitive services to market.

The single most important source document in determining the value of a covenant not-to-compete is the agreement in which the covenant is made. For this reason, we have performed a detailed review of the asset purchase agreement between Public Company Purchaser, CRS, and John W. Carnes, dated March 9, 1995 (the agreement).

The following discussion highlights items in the agreement that affect the value of the covenant not-to-compete.

Article 1.1(b) defines business as it applies to the agreement:

*“Business”* shall mean the entire business of Company [CRS], including, but not limited to, the business of marketing, advertising, selling, leasing, renting, distributing or otherwise providing oxygen, oxygen equipment, aerosol inhalation therapy equipment and respiratory medications, nasal continuous positive airway pressure devices, infant monitoring equipment and services, home sleep studies and related therapy equipment, and other respiratory therapy and durable medical equipment, products, supplies and services to customers in their homes or other alternative site care facilities.

Article 1.1(f) defines territory as:

[T]he State of State and a radius of one hundred fifty (150) miles from any of Company’s current operating centers, regardless of which states such radius may include.

Section 3.4 of the agreement pertains to the allocation of the purchase price and states:

The parties agree to allocate the Purchase Price among the Assets as set forth in Addendum 3.4. The values assigned to the Assets as set forth Addendum 3.4 were separately established by the parties in good faith and each party agrees to report the transaction contemplated by this Agreement to the Internal Revenue Service as required by Section 1060 of the Internal Revenue Code in accordance with Addendum 3.4, subject to the approval of Public Company Purchaser’s and Company’s independent auditors.

An important statement in this section is the discussion of the values being “separately established by the parties in good faith.” This indicates that the parties discussed each of the values and negotiated them separately, including the covenant not-to-compete. Addendum 3.4 has been attached to this report as exhibit 3.

Article 8.2 contains a no solicitation clause which states:

- a. From and after the Closing, neither Company nor the Shareholder [John W. Carnes] shall:
  - iv. directly or indirectly, hire, offer to hire, or entice away, or in any other manner persuade or attempt to persuade, any officer, employee or agent of Public Company Purchaser (including, but not limited to, any former officer, employee or agent of Company), or in any manner persuade or attempt to persuade, any officer, employee or agent of Public Company Purchaser (including, but not limited to, any former officer, employee or agent of Company) to discontinue his or her relationship with Public Company Purchaser. It is understood and agreed that the prohibitions contained in this Section 8.2 (i) shall apply to all current and future officers, employees and agents of Public Company Purchaser (including, but not limited to, any former officer, employee or agent of Company), whether or not any such person is then currently an officer, employee or agent of Public Company Purchaser or whether any such prohibited activity is in connection with employment, an offer of employment or other action within or outside the Territory; or
  - v. directly or indirectly solicit, divert or take away, or attempt to solicit, divert or take away any business Company had enjoyed or solicited prior to the date hereof or which Public Company Purchaser may enjoy or solicit in the Territory after the date hereof.

(continued)

## EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

- b. It is expressly understood and agreed by the parties hereto that it shall be a breach hereof for Company or the Shareholder to assist in any way any member of his or her family, any business associate, or any other person, firm, corporation, partnership, joint venture, association, trust or other entity, to engage in any activity which is prohibited by this Section 8.2.

Notice that this article deals with the existing customers and employees being acquired at the time of the agreement. This article acts as protection for Public Company Purchaser with respect to the customers and human capital it is acquiring.

Article 9 is the covenant not-to-compete and is presented in its entirety.

### 9.1 *Covenant.*

- a) In consideration of the purchase by Public Company Purchaser of the Assets and the Business pursuant to the terms and conditions of this Agreement, and for other good and valuable consideration, the company and Shareholder, (each hereinafter referred to individually as a "Covenantor" and collectively as the "Covenantors") hereby represent, warrant, covenant and agree, jointly and severally, that commencing on the date hereof and continuing for a period of five (5) years thereafter, none of the Covenantors will, directly or indirectly, engage in the business of marketing, advertising, selling, leasing, renting, distributing, or otherwise providing oxygen, oxygen equipment, aerosol inhalation therapy equipment and respiratory medications, nasal continuous positive airway pressure devices, infant monitoring equipment and services, home sleep studies and related therapy equipment, or any other respiratory therapy or durable medical equipment, products, supplies and services to customers in their homes or other alternative site care facilities within the Territory.
- b) Without limiting the generality of the provisions of Section 9.1 (a) hereof, this Covenant Not-to-compete shall be construed so that Covenantors shall also be in breach hereof if any of them is an employee, officer, director, shareholder, investor, trustee, agent, principal or partner of, or a consultant or advisor to or for, or a subcontractor or manager for, a person, firm, corporation, partnership, joint venture, association, trust or other entity which is engaged in such business in the Territory, or if any of them receives any compensation or remuneration from or owns, directly or indirectly, any outstanding stock or shares or has a beneficial or other financial interest in the stock or assets of any such person, firm, corporation, partnership, joint venture, association, trust or other entity engaged in such business in the Territory. Notwithstanding anything to the contrary contained in this Section 9.1 (b), no Covenantor shall be deemed to be in breach of this Covenant Not-to-compete solely by reason of owning an interest of less than one percent (1%) of the shares of any company traded on a national securities exchange or in the over the counter market.
- c) It is expressly understood and agreed by Covenantors that it shall be a breach of this Covenant Not-to-compete for any Covenantor to assist in any way any family member, any business associate, or any other person, firm, corporation, partnership, joint venture, association, trust or other entity, to engage in any activity which a Covenantor is prohibited from engaging in by this Covenant Not-to-compete.

### 9.2 *Remedies.*

Covenantors agree that the remedy at law for any breach of obligation under this Covenant Not-to-compete will be inadequate and that in addition to any other rights and remedies to which it may be entitled hereunder, at law or in equity, Public Company Purchaser shall be entitled to injunctive relief, and reimbursement for all reasonable attorneys' fees and other expenses incurred in connection with the enforcement hereof. It is the intention of Covenantors and Public Company Purchaser that this Covenant Not-to-compete be fully enforceable in accordance with its terms and that the provisions hereof be interpreted so as to be enforceable to the maximum extent permitted by applicable law. To the extent that any obligation to refrain from competing within an area for a period of time as provided in this Covenant Not-to-compete is held invalid or unenforceable, it shall, to the extent that it is invalid or unenforceable, be deemed void ab initio. The remaining obligations imposed by the provisions of this Covenant Not-to-compete shall be fully enforceable as if such invalid or unenforceable provisions had not been included herein and shall be construed to the extent possible, such that the purpose of this Covenant Not-to-compete, as intended by Covenantors and Public Company Purchaser, can be achieved in a lawful manner.

The key elements of the covenant not-to-compete are as follows:

- The covenant is for a term of five years.
- The covenant covers what the Agreement defines as "business."
- The covenant relates to the geographic region defined in the Agreement as the "territory."
- Prohibits partaking in the "business" in the "territory" for the five-year period.
- The covenant defines remedies for Public Company Purchaser if the covenant is violated.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

The valuation of the covenant not-to-compete is highly dependent on the impact of the seller's ability to compete in the marketplace with the buyer. Therefore, in order to estimate the potential impact of CRS competing with Public Company Purchaser, after the sale, we have performed a lost sales analysis.

A lost sales analysis entails estimating the potential losses to the covenantee from competition from the covenantor. The analysis is used as part of a residual method valuation of a non-compete. As part of a residual method of valuation, the lost sales analysis determines the cash flow that is allocable to the covenant not-to-compete. The cash flow is then valued directly in the residual valuation analysis.

Lost sales analysis can be used to value the subject business' cash flow for the period of the covenant, first assuming the covenant is in place and then a second time without the covenant. The difference in the values in these two scenarios is the value of the non-compete agreement.

Regardless of how it is to be used, there are several steps involved in preparing a lost sales analysis. The first step is to prepare a forecast of the company's income statement and cash flow assuming the covenant is in place, and the covenantor is not in violation of the agreement. This has previously been done to value the entire operating enterprise.

The next step is to ascertain what level of sales would be lost if the covenant was not in place. The impact of the lost sales on the company's income statement and cash flow must then be analyzed and forecasted. Determining the likely level of lost sales is a highly intricate process that typically involves in-depth discussions with management of the acquiring company. The closest information we have to interviews in this case are the depositions of the Public Company Purchaser officials and of Mr. Carnes. Based on our review of the various deposition transcripts provided to us, we determined that the possible range of lost sales would be between 1 and 25 percent. Our analyses follow in tables 11 and 12.

A general rule that is applied to these scenarios is that we have not reduced sales in any one year by more than 10 percent. This has been done to reflect that transferring revenues to a new entity would take Mr. Carnes time to accomplish.

Each of these tables includes the same assumptions regarding to cost of sales, operating expenses, and income taxes. They are:

1. Cost of sales is forecasted at 14.1 percent of sales based on the historic cost of sales.
2. Operating expenses are forecasted as 41.9 percent of sales.
3. We have assumed a combined federal and state tax rate of 40 percent.

The forecasted income statements of CRS for the years ended March 9, 1996 through 2000 assuming a one percent loss of revenues due to competition from Mr. Carnes are presented in table 11.

	1996	1997	1998	1999	2000
Net Sales*	\$6,435,000	\$7,271,550	\$8,216,852	\$9,285,042	\$10,399,247
Less: Cost of Sales	907,335	1,025,289	1,158,576	1,309,191	1,466,294
Equals: Gross Profit	\$5,527,665	\$6,246,261	\$7,058,275	\$7,975,851	\$8,932,953
Less: Operating Expenses	2,696,265	3,046,779	3,442,861	3,890,433	4,357,285
Equals: Net Operating Income	\$2,831,400	\$3,199,482	\$3,615,415	\$4,085,419	\$4,575,669
Less: Taxes	1,132,560	1,279,793	1,446,166	1,634,167	1,830,268
<b>Net income</b>	<b>\$1,698,840</b>	<b>\$1,919,689</b>	<b>\$2,169,249</b>	<b>\$2,451,251</b>	<b>\$ 2,745,401</b>

Note: Figures may be off due to rounding.

\* Sales in 1996 have been multiplied by 99 percent of the \$6,500,000 figure used in the noncompetition forecast analysis (\$6,500,000 × .99 = \$6,435,000). Thereafter sales have been grown at the rates used in the non-competition forecast analysis.

## EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

### Author's Note

The next several tables have been omitted from this exhibit, but they were based on a 5-, 10-, 15-, 20-, and 25-year analysis similar to this one.

Having presented these analyses, the lost income calculated under each scenario is summarized in table 12.

**TABLE 12 Summary of Lost Income from Seller Competition**

Lost Revenue	1996	1997	1998	1999	2000
1 Percent	\$ 17,160	\$ 19,391	\$ 21,912	\$ 24,760	\$ 27,731
5 Percent	85,800	96,964	109,558	123,801	138,657
10 Percent	171,600	193,908	219,116	247,601	277,313
15 Percent	171,600	281,167	317,718	359,022	402,104
20 Percent	171,600	368,425	416,320	470,442	526,895
25 Percent	171,600	368,425	505,062	570,721	639,207

As can be seen in table 12, the greater the loss of sales, the greater the loss of income, and as a result, loss of cash flow. The question that needs to be answered after an analysis like this is, what is the most likely loss of revenue that would result from the competition of the seller? In order to answer this question, we reviewed numerous documents relating to this matter. We have highlighted that which we consider to be most relevant to our analysis.

The deposition of John Byrnes provided us with a significant amount of relevant information. Mr. Byrnes is, and was at the time of the CRS acquisition, Chief Operating Officer of Public Company Purchaser. From his deposition, it is clear that he is highly experienced in the respiratory therapy business as an industry insider.

On page 4 of his deposition, Mr. Byrnes explained his involvement in the acquisition of CRS by Public Company Purchaser. Mr. Byrnes indicated that he reviewed a book from Mr. Carnes' business brokers and then attended a meeting with the brokers, John Carnes and Lori Rodgers. Mr. Byrnes indicated the reason he went to the meeting was "to see if Lori was capable of running the business herself." This is significant because it demonstrates that Public Company Purchaser believed Ms. Rodgers to be a key individual in the operations of CRS.

When asked if he knew of CRS and Mr. Carnes prior to their meeting in December 1994, he said "we knew who they were and we knew that they're at four locations and were a good competitor." Later Mr. Byrnes was asked "Why were you concerned about whether or not Ms. Rodgers would be able to run the company after the acquisition?" His response was "Because the feeling I got was that Mr. Carnes wasn't coming in the acquisition." Mr. Byrnes was asked "Did Public Company Purchaser have an interest in having Mr. Carnes continue on with the business in some capacity, if you recall." Mr. Byrnes' reply was "No," "we did not have an interest." This is a very clear statement that Public Company Purchaser's interest was in Lori Rodgers and not in John Carnes.

Mr. Byrnes was asked what Ms. Rodgers's role has been from the acquisition forward. His response was "Her title is an area manager. She runs the four Carnes locations. We opened up a City E office. She also runs several other locations for us now. She has several locations that report to her." Clearly, Ms. Rodgers has shown the capabilities, not only to effectively run what was CRS, but also the ability to take on these new locations, as well.

When asked about the source of referrals that generate revenues for his company, Mr. Byrnes indicated that half come from doctors and half come from hospitals. Mr. Byrnes was asked how these referral relationships were maintained. He replied, "In Carnes' case, we continued to do exactly the same things that they were doing. They had four or five sales reps who called on hospitals, the doctors, the nursing agencies, who were willing to service their indigent patients who provided a high level of service." Mr. Byrnes was then asked, "Did you attempt to ascertain as part of the due diligence who had been responsible for generating the doctors, hospitals, and nurse referrals that Carnes Respiratory had?"

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

Mr. Byrnes responded that Public Company Purchaser had ascertained that information and “that it was the sales people who brought in the business.” Mr. Byrnes was then asked “Did you have any reason to believe that the relationships that existed with the doctors, nurses, and hospitals had been of long standing, namely initiated and started by Mr. Carnes himself?” Mr. Byrnes responded “There’s probably some in City A. But for the other locations outside of City A, I think it was the salespeople he hired.” Mr. Byrnes was then asked a series of questions regarding the percentage of business CRS derived from each of its locations. His response indicated the following:

City A	25%
City D	15%
City B	40%
Total	80%

In regard to the City B store, Mr. Byrnes was asked “did you attempt to ascertain or did you ascertain the role that Mr. Carnes individually had in initially establishing and having continuity in terms of the referral relationship?”

Mr. Byrnes answered “It was Judy Clark that got the business there.” Mr. Byrnes was asked how he was aware of this and he responded “because when he opened in City B, I was the center manager there [For Public Company Purchaser].” Mr. Byrnes further commented that he “knew who was out calling on the docs.”

From all of these questions and answers, it is clear that Mr. Byrnes is well versed in the local markets where CRS operated, and how the company was generating its referrals. Mr. Byrnes’ concerns were about the abilities of Lori Rodgers, as discussed above. Mr. Byrnes was later asked what his determination of Ms. Rodgers’s abilities to run the locations was. He responded “I thought she could.” When asked why, Mr. Byrnes said, “She knew what was going on. She knew where the business was coming from. She knew what was going on in all four markets. And I just felt confident that she was on top of the business.”

Another deposition that was helpful was that of Mr. Davidson, who was specifically asked about the non-compete agreement and how the value was derived. He responded as follows:

A As you know, we’ve been on a fairly active acquisition program for a number of years. From the beginning of 1991 through today, we’ve closed more than 70 acquisitions.

Working with our independent auditors, we have determined that during 1995, we were basically allocating \$50,000 per shareholder to the covenant. Because of the size of this transaction, which was the business was larger than the normal business in the industry and larger than our normal acquisition, we felt it appropriate to increase that from 50,000 to 100,000 in terms of allocation of the purchase price to the covenant. So it was a standard calculation adjusted for the size of the business that we arrived at working with our outside auditors.

Although one could construe this statement as indicating that Public Company Purchaser applies a blind rule of thumb to the allocation of purchase price for a non-compete, we do not believe that is the case. As Mr. Davidson indicated, his company is very experienced in acquiring other companies. Their method of allocating to a non-compete is based on this experience, and as he mentioned, from working with Public Company Purchaser’s independent auditors. At some point in this process, Public Company Purchaser, with its outside accountants’ assistance, determined this to be an appropriate measure. This should also be held up against Public Company Purchaser’s tax and accounting incentives. An allocation of purchase price to a non-compete agreement can be amortized over the life of the agreement. Goodwill on the other hand, is amortizable for financial statement purposes over 40 years. In prior years, goodwill was not at all deductible for income tax purposes. Now, it can be amortized over 15 years.

In addition, Public Company Purchaser is required by law to submit its financial statements to the SEC because of its status as a publicly traded company. These financial statements must fairly represent the financial condition of the company and have been audited by the company’s outside accountant. In recording the allocation of purchase price, the company has a duty to fairly report it to its shareholders and the independent accountant has opined to its fairness. Given these facts and circumstances, we do not believe that Public Company Purchaser’s methodology is without merit.

(continued)

## EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

The third Public Company Purchaser deponent was Robert G. Abbott, whose deposition pointed out two issues relevant to our analysis. The first issue is the importance of Lori Rodgers to Public Company Purchaser in the transaction.

Q. Now, in that regard, is that instrument or Ms. Rodgers's Employment Agreement with Public Company Purchaser pursuant to the terms of the agreement? Because I don't know why, but I was of the impression that Ms. Rodgers did not have a written Employment Agreement with Carnes Respiratory.

A. No. This is an Employment Agreement between Ms. Rodgers and Public Company Purchaser as a condition precedent to closing the acquisition.

The key is that her employment agreement with Public Company Purchaser was a precondition to the acquisition. Public Company Purchaser was concerned with locking her into the deal from the very beginning. The second issue is over the negotiation of the individual asset values.

Q. And did Mr. Gonzales or anyone on behalf of Mr. Carnes make any suggestion as to what the allocation should be or was the allocation something that was the product of Public Company Purchaser?

A. I do not believe anyone representing the seller or the seller himself made any suggestions as to what the allocation should be. I believe the process was we presented our good faith estimate of what the allocation should be and it was accepted by the seller after their review.

The importance of this response is that neither Mr. Carnes nor his representatives commented on the allocation of the asset values. This issue will be taken up again later in this report. The fourth and final Public Company Purchaser official deposed in this matter was Phillip Phillips. Mr. Phillips is Public Company Purchaser's controller. Mr. Phillips was deposed for the purposes of understanding more about Public Company Purchaser's acquisition process and how Public Company Purchaser values individual assets, particularly covenants not-to-compete.

Mr. Phillips established that Public Company Purchaser does have a written policy as to how it allocates purchase prices. In establishing this, he stated:

We have—using the term protocol or methodologies as to how we—how we come up with the end product of a purchase price allocation. That is, from the inception of the early—late 1990, '91 and '92 when we started acquiring businesses with our outside auditors, we developed that methodology.

And it's been applied over that entire span of our acquisition program with very minor adjustments, very few in form and very few in substance. It's primarily the same methodologies from the time I started with the company in 1993.

The important points in this statement are that the methodology has been developed with Public Company Purchaser's outside auditor and that it has been applied over time with very little modification. Mr. Phillips goes on further to discuss how covenants are valued, and what the trend has been over time.

A. And the covenant, which is the second item—ready to go to the next one?—if you're in an asset and stock purchase, in each of those transactions, there is normally—with an asset purchase, there is one or more persons that are the influential persons in that business.

In a stock purchase, certainly there are shareholders that are oftentimes participants in the business in our industry, and they are the significant influencing persons involved in the business.

We value covenant based on the same methodology, the number of persons that are involved times an amount. And the amount in the case of March 9th of 1995 was \$100,000 for the significant person involved in the Carnes Respiratory acquisition.

The methodology of using a number of persons involved times a dollar amount has been in place for 1994 through today. The only variation is that the dollar amount that we have assigned to each of those significant persons in the business has changed. It's continued to slide on a downward scale.

In 1994, we were valuing—when we were developing purchase price allocations, we were looking at businesses and saying—and we were buying from a different pool of sellers.

In this case, I don't think Mr. Carnes is a doctor. But in '94, we were buying many physician-owned practices. And you would often be buying for more than one person, and there's a—there's 12 shareholders. We were valuing those in that time frame from 50 to \$100,000 per person.

Through the middle of '95, then we started to change the valuation to more in the \$25,000 per person; in 1996, more in the 10,000, where today and for the last 12 to 18 months, we've been valuing each covenant based on the number of persons at \$5,000 per person.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

Q. Since that is truly the focus of our litigation, let me address that for a few moments.

A. Sure.

Q. The \$100,000 number or \$50,000 number, or whatever number may be used, where does that number come from?

A. It is purely an estimate based on management's ability to estimate what this covenant is valued to us internally.

There are two factors in this statement. First, that the dollar amount assigned to each shareholder has decreased through time. This indicates that Public Company Purchaser has seen what it believes to be trends in the value of non-compete agreements and has adjusted its valuations accordingly. This further supports the notion that Public Company Purchaser's allocation is not arbitrary. Second, the value of the covenant is Public Company Purchaser's perception. This indicates that as an active participant in this market Public Company Purchaser does not believe that the owning individual is highly valuable to the success of the business.

A review of the deposition transcript of John Carnes also provides us with important information regarding the covenant not-to-compete. From reviewing Mr. Carnes's deposition transcript, we feel Mr. Carnes was very knowledgeable about his business and his industry. It appears that Mr. Carnes has good marketing skills and is a very effective teacher. These are both important skills in developing and growing a successful business in this industry. In addition, Mr. Carnes describes the importance of his employees and the level of service provided to customers in the success of CRS. The deposition covers topics from opening new locations, competition, and key employees, to marketing and referral development.

Mr. Carnes was asked about and discussed how CRS decided to open new locations. Key factors appeared to be a geographic area with an elderly population and a sufficient potential referral base. In answering a question about how the actual decision process went, Mr. Carnes said:

We'd take all my marketing people and I would think I'd see an area I thought would be good. I would visit it myself or I would have some kind of contact. And I would send all those marketing reps into the area, and they would talk with doctors about who they were using or how they were doing or how they could be, you know, handled better by a company. If we saw there was potential, then we would go there and open a facility.

Mr. Carnes was asked why he opened the City D location. He responded:

A. Carnes Respiratory continued to expand yearly looking for places that we thought we had potential business. And I had looked at purchasing a company down there one time and didn't. And then I thought it would be a good opportunity for Carnes to expand.

So I expanded down there because I thought there would be some additional business, which, in that business, as always, you look for an older population of people that had some problems. That's why we moved there.

Mr. Carnes later discussed how City C differed in respect to why it was opened.

A. No sir. We did that a little bit different than that. We had some doctors in City A that also covered City C.

And so they were looking for some additional people. They wanted better coverage up there. So that helped make— There's more than just one reason you would decide to go there, but that was one of the major reasons to look at City C.

And, again, it's an older population of people, which is what we were. We were government, Medicare—you needed older people—older sick people.

Training is a very important part of CRS' business. Employees who typically are not highly skilled when they began their employment at CRS must be trained to deliver a high level of service to CRS' patients. CRS' employees were trained in how to educate patients in using oxygen and other equipment. Mr. Carnes discussed the training of these individuals in-depth.

A. It would be delivered to the patient's home, and they would educate the patient in how the doctor prescribed the oxygen for him, and how the equipment worked.

Q. Okay. Would this be someone that had been trained in your operation to do this?

A. Yes, sir.

Q. This wouldn't be someone out of the labor pool—

A. No.

(continued)

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

Q. —in City F or City B, would it?

A. No.

Q. This would be someone that you would recognize as having the degree of skill necessary to—

A. We had constant education programs at the company to educate everybody that came onboard. They all had to go through a training period or a training phase to do anything that was related to our company, whether it would be install a bedside commode or a walker. And we were governed by the joint commissions, which said that we were doing it in a proper safe manner for the patient.

Q. They were skilled people?

A. Well, you know, you don't hire them skilled. You hire them and then, you know, train them to do the job. So you weren't respiratory therapists or, you know, physical therapists or nurses, no, sir.

Q. Was there a difference between the truck driver and the person who actually took the tank to the patient?

A. No.

Q. Would that person that was trained by you—of course, he'd already know how to drive a truck, but, obviously, that person be trained by you, then, to take the tank inside and help the patient?

A. Yes, sir. Me or my staff trained them. Ninety percent of them I have trained myself.

Q. Was there some sort of formalized training you gave them? In other words, did you have some sort of brochure you followed or was it just based on your experience in the business?

A. Well, initially when we first did it, it was, you know, based around our experience the way—but when we became JCO certified or joint commissioned, then we had protocol that you had to follow, and it was a written procedure. We had a policy and procedure manual that we—Lori Rodgers, matter of fact, wrote our policy and procedure manual that joint commissions came in and inspected us and said, yes, we're following proper procedure with all the safety precautions and everything that should be done to maintain the health and safety for the patients with the equipment.

The quality of the services provided by CRS differentiated the company from its competition. In discussing the quality of the services provided compared to its competition, Mr. Carnes felt that CRS was superior in all respects.

A. Not a chance.

Q. Is this because of the better training you provided your people?

A. I think it was better training and just simply the way we maintained, you know, our equipment. And there was just never a question just from the physicians and the patients themselves and the referrals from social services workers at hospitals, nurses at hospitals. Your patients and word-of-mouth back to the physicians is what built Carnes Respiratory Services.

Q. And that's what I was going to ask you. Is it this quality of services that you—to which you attribute the obvious success of Carnes Respiratory Services in these areas?

A. I think we gave the best out there, yes, sir. Public Company Purchaser must think we gave pretty good, too, because they still carry our name in several of the locations. Even though they bought my company they still have my name on it.

Mr. Carnes answered a series of questions relating to competition from other companies in the oxygen business. Through his responses, he indicated that he did not believe any of the independent companies in his industry offered any significant competition to CRS. Mr. Carnes described CRS' competitive advantage as taking care of patients.

And so you got business based around what your ability—the physician, he wanted his patients taken care of. I mean, that's what he was looking for. So whoever gave the best care to his patients is, you know, who he's normally going to use. And so it was a combination of a lot of things, and it was years. We didn't do it overnight. It took us, you know, 13 years to build that business.

In addition to providing high quality service to patients, Mr. Carnes believed it was crucial to market these services to potential referral sources. When asked, Mr. Carnes discussed the importance of marketing and the marketing staff to CRS.

A. My marketing people met with me, not just—We had a meeting every week. There is no question about it. But it was daily that my marketing people would get on their radio or they had mobile phones in their car, that I talked to them constantly about, you know, this position, you need to do this. You need to do this. You need to do this hospital.

So my marketing people were in constant contact with me every day. My marketing people are the backbone and center of this whole thing. So did I spend the majority of my time with my marketing people? There is no question about that.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

Q. How many marketing people did you meet with when you would meet weekly?

A. Whatever number we had. So what was it? Five maybe.

Q. That's what I'm asking. I don't know.

A. Yes, sir.

Q. Would that include Lori Rodgers or was she in addition to the marketing people that you're referring to?

A. Lori was a business director. That was her title. But it was not unusual for me to send Lori. If I had a big luncheon somewhere, if I had a special deal going on with a doctor, would I send Lori into one of the doctor's offices with the marketing person? Yes. That wasn't unusual for her to do that. It wasn't unusual for me to go to one myself.

The key to referrals is developing relationships with doctors, nurses, social workers, and certain hospital personnel. Mr. Carnes was asked about how significant referral sources were developed. His response to that question was:

A. How you develop it was, it's a combination of a lot of things, but a lot of it depends on your reputation when you first did what you said you were going to do back in 1981, when Carnes Respiratory first started. You had to do what you said you were going to do.

And one of the things that helped us more than anything is, we went out and we said, "We will have equipment in a patient's home within the hour." And so it was a reputation that you built over years of doing exactly what you said you were going to do and taking care of patients better than anybody else could take care of it. And that reputation rested, honest to God, with John Carnes, because it was Carnes Respiratory.

Referral development was discussed further with Mr. Carnes.

Q. When you—your sales personnel would call on a physician or a hospital, did you regard them as engaging in referral development at that point?

A. That was their job. So anything that they did—They might do a talk for a nursing service. They might go to a nursing service and put on a demonstration. They would take a driver with them and they would do, you know, a demonstration of how oxygen equipment would work, or if a nursing service, you know, wasn't sure where the low air loss mattress how it worked, we would use our marketing people to go put on a demonstration for a nursing service.

Mr. Carnes clearly believed that marketing was the key to his business because he said "Everything that you do is a marketing tool. Anything that you do good is going to be considered a marketing tool. So everything that we did is geared around making sure that we get referrals."

The discussion moved on to the subject of key personnel. One of the key individuals at CRS was Lori Rodgers. When asked to describe her role at CRS, Mr. Carnes responded:

A. Lori Rodgers started to work for me in City B for \$5 an hour as a person to run the City B store. And from there she developed and was trained and aggressive about, and she ended up being the director for the business. She ran the businesses just like I would have done from years and years of training.

How good she is. She just was promoted this week to regional manager for Public Company Purchaser. She has the highest job, other than the CEO, here in State. She covers all of the State operations for them, which is their largest, by far, dollar volume dollar-wise in their company. So how good is she? That's how good she is.

Q. What were her duties with CRS, Carnes Respiratory Services?

A. Yes, sir. Well, she started out, like I said, as a customer service person, and then, you know, from there, for different jobs, in charge of billing. And just finally, her title—I let her call herself whatever she wanted to— was director of business.

Q. Was that her title as of December of 1994?

A. Yes, sir.

(continued)

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

Q. Okay. And what were her duties as of December 31st, 1994?

A. She had, you know, combination of everything, to make sure that—you know, same as I would do. The drivers did what they were supposed to, the marketing people did what they were supposed to, billing, that we collected our money.

She met with—Every time we had a marketing meeting, she was part of that. If I had a meeting with drivers, she was part of that. Many a times I would send her to—if I couldn't go to run one of the operations that I had problems, I would send her to City D or send her to City B or send her to City C to handle a situation that, you know, I didn't have time to get to.

So she did the same kind of things that I would have done if I couldn't get to them, or she was a part of what I wanted done. Like any CEO would do, that they would pass down to a president or someone under them to do things that, you know, needed to be done.

So did she—One of the biggest things she ever did for Carnes Respiratory, she wrote a manual—policies and procedures manual which was for joint commissions when we decided that we needed to be joint commissioned. Lori actually gathered the information and put this policy and procedure manual together that I would have had to spend \$25,000 to get done. She did it for me in addition to her job. She did it on the weekends and at night and other times. So what did she do? She did everything.

Q. Did she have any responsibilities concerning the referral development?

A. Absolutely.

Q. What were those?

A. Again, you know, if we had a marketing—if one of the marketing people needed her to help support them in some way, did Lori go from the office into physicians' offices and take care of whatever needed to be done? Yes.

Q. What was—

A. That wasn't her major—That was not her major job, no.

Q. What was her major job?

A. All of it. But the marketing part would have just been one of the 10 other things that she did. Her job was to make sure that everything there—that she was part of everything that went on. Somebody that you can count on if you're not there, that you know is going to do everything that you would do, and make sure that if you did go on vacation or you did go skiing or you did something, that you knew it was going to get done right.

Mr. Carnes felt that there were several key people at CRS in addition to Ms. Rodgers, as indicated in the following discussion.

Q. Who did you regard as the management personnel of Carnes Respiratory Services in December of '94, other than yourself, obviously?

A. The key people?

Q. Yeah.

A. Key people at that point was Lori Rodgers, all of my marketing people. Judy Clark was really important. No question. She had tremendous—

Q. She is one of those four or five marketing people?

A. Yes. And Janie Wey; tremendously important.

Q. Another one of the marketing people?

A. Caroline Hanken; tremendously important. My other marketing person, Kathy Elston, at that time was fairly new.

Wasn't near as effective because she didn't have the time under her belt. She had a really tough territory. God. Then, you know, my supervisor of my drivers was Johnie Goodson, my brother, a young lady by the name of Brenda Harrell, who ran my billing department for me, Cindy Jacobi.

From the deposition transcript, it is apparent that CRS' success is derived from the collaboration of several key individuals. As Mr. Carnes stated, the marketing representatives are the "backbone" of the company. It also appears that Ms. Rodgers was very important to the business because she worked in all facets of the business and was essentially interchangeable with Mr. Carnes. It appears that Mr. Carnes's skills lay in marketing and training. Mr. Carnes said that he performed over 90 percent of the training of all employees. This developed the employees' skills, making them proficient at their jobs.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

In addition to the Public Company Purchaser executives and John Carnes depositions, we also searched for other authoritative sources to assist in the valuation of the covenant not-to-compete. The value of non-compete agreements in the purchase and sale of a company has been the subject of numerous court cases involving the IRS and taxpayers. According to Neil C. Kelly, ASA, CFA, the IRS maintains a theory called the “mass asset” rule. Prior to tax reform, this theory held that certain intangible assets were “non-depreciable as a matter of law, because such intangible properties are part of a single mass asset, which, in the aggregate, has no determinable useful life and is either inextricably linked to goodwill or self-regenerating.” According to Mr. Kelly, for a non-compete agreement to not fall under the mass asset rule, it must have the following components:

1. A recital to the effect that it is the intent of the parties that the Covenant not-to-compete is separate and distinct from any goodwill the seller may be selling.
2. That the subject covenant is not merely for the purpose of protecting the purchase goodwill.
3. That the Covenant has an independent basis-value.
4. That the Covenant was expressly bargained for—separate and distinct from the goodwill of the seller.
5. That a specific monetary sum is being paid for the Covenant.
6. That the Covenant is for a specified period of time—which goes to the permissible amortized period.
7. That the Covenant to compete restrains a key individual from competing with the purchaser, and if same is not accomplished, that the purchaser will suffer an economic detriment because of the key person’s ability and competitive activities.
8. That even in the event of the death of the grantor of the Covenant, such will not entitle the purchaser to depreciate or recover the cost of such Covenant over a period shorter than the term of such a Covenant.
9. The amount the purchaser is paying for the Covenant not-to-compete is depreciable over the life of the Covenant regardless of whether the purchaser makes payments for such Covenant over a period shorter than the life of the Covenant.
10. A recital to the effect that the value allocated to the Covenant has economic reality or substance.

In addition, guidance can be found in the four tests that the courts have historically applied to non-compete agreements in determining whether it could be amortized for federal income taxes. The four tests were summarized in *Forward Communications Corp. v. U.S.*, 78-2 USTC Para. 9542, as follows:

1. Whether the compensation paid for the covenant is severable from the price paid for the acquired goodwill.
2. Whether either party to the contract is attempting to repudiate an amount knowingly fixed by both the buyer and seller as allocable to the covenant.
3. Whether there is proof that both parties actually intended, when they signed the sale agreement, that some portion of the price be assigned to the covenant.
4. Whether the covenant is economically real and meaningful.

The first test was effectively established in *Marsh & McLennan, Inc. v. Commissioner*, 51 T.C. 56 (1968). *aff’d* on other grounds, 420 F.2d 667 (3d Cir. 1969). In this case, the court looked at whether the compensation paid for the covenant is separable from the price for goodwill. Where goodwill and the covenant not-to-compete are closely related, the benefits of the elimination of competition may be permanent or of indefinite duration and, hence, the value of the covenant is not exhaustible or a wasting asset to be amortized over a limited period.

In *Commissioner v. Danielson*, 378 F.2d 771 (3d Cir.) cert. Denied 389 US 358 (1967), the courts looked at whether either party was attempting to repudiate an amount knowingly fixed by both as allocable to the covenant, the calculable tax benefit of which may fairly be assumed to have been a factor in determining the final price.

In *Annabelle Candy Co. v. Commissioner*, the courts looked at whether the covenant played a real part in the negotiations.

Although the valuation of a non-compete agreement is not concerned with whether or not the value is amortizable, these tests do provide meaningful guidance in the valuation process. In reviewing Mr. Kelly’s points, we have determined the following:

1. Based on the asset purchase agreement, the parties intended for the covenant not-to-compete to have value separate and distinct from the value of goodwill.
2. It appears that Mr. Carnes was skilled in his business and would have the ability to compete with Public Company Purchaser. This does not indicate what level of competition Mr. Carnes might provide.
3. Based on our review, the covenant does have independent basis value as presented in addendum 3.4 to the agreement.
4. The agreement clearly lays out the allocation of purchase price. A series of documents dated between March 1 and March 9, 1995, between Robert G. Abbott, a member of Public Company Purchaser’s acquisition group and Associate Corporate Counsel, and Mr. Carnes’ attorney, Larry Gonzales, indicates that the asset purchase agreement and lease had been negotiated, as well as the value of the accounts receivable. In fact, Mr. Carnes appears to have been personally involved in this negotiation. In a fax transmittal dated March 1, 1995, from Rick Stevens of Richards & Associates, Inc. to Mr. Abbott, regarding the accounts receivable, Mr. Stevens writes “John believes a fair resolution would be additional consideration of \$332,516. The excess over \$600,000 as of stopping billing on February 28, 1995.”

(continued)

## EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

Although there is no indication that Mr. Carnes or his representatives expressly bargained for the value of the covenant not-to-compete, they did negotiate the terms of the deal, as well as particular asset values. From this, we must conclude that Mr. Carnes and his advisors implicitly approved of the value of the covenant not-to-compete.

5. The agreement clearly states that \$100,000 is being paid for the covenant not-to-compete.
6. The covenant is for a period of five years after which it expires.
7. The covenant does constrain Mr. Carnes from competing and the same stated in 2 above holds here, as well.
8. We are unaware of the impact the death of Mr. Carnes would have on Public Company Purchaser's ability to recover the cost over a shorter period of time.
9. The value of the covenant is depreciable over the life of the covenant even though payments for the covenant were made over a shorter period.
10. No recital of the economic reality of the covenant was found.

In reviewing the four tests put forth in *Forward Communications Corp. v. U.S.*, we found the following in regard to the agreement.

1. The compensation paid is separable from goodwill because it was expressly laid out in the agreement.
2. We have found no evidence that Mr. Carnes repudiated or attempted to repudiate the allocation to the covenant offered by Public Company Purchaser.
3. Both parties clearly intended an allocation to be made to the covenant not-to-compete because it is expressly laid out in the agreement.
4. Based on Mr. Carnes's apparent skills and abilities, he appears to have an ability to compete. However, this is in no way an indication of the level of competition he could provide. Therefore, the covenant is economically real and meaningful.

Of particular importance is whether the covenant was at issue in the negotiation process. This relates to the economic reality of the covenant and its economic significance. According to Kelly, the following are factors which are important in determining the economic reality of a non-compete agreement.

- a. The presence of a grantor of the covenant not-to-compete having business expertise evidencing a formidable capability to compete.
- b. Grantor's ownership of technology and machinery necessary to compete.
- c. Grantor's possession of sufficient economic resources to compete.
- d. Legal enforceability of the covenant for the term of the particular covenant under state law.
- e. Grantor's legal capacity to compete.
- f. Covenant having sufficient scope to assure non-competition without overreaching.
- g. Not too advanced age of grantor.
- h. Good health of grantor.
- i. Payments for covenant that are not pro-rata to the grantor's stock ownership in the seller.
- j. Purchaser's policing of the covenant not-to-compete.
- k. Structuring payments under the covenant to occur over time and to cease upon breach of such covenant.
- l. Vigorous negotiations over the covenant and negotiations over its value should be recited in the agreement.
- m. Detailed, specific, and carefully drafted covenant not-to-compete.
- n. Independent appraisal of the value of the covenant not-to-compete.
- o. Some degree of reasonableness in the percentage of the considerations allocated to the covenant and other items.

The importance of the covenant not-to-compete having economic substance was further delineated by a Bureau of National Affairs' paper on the subject published in 1992. The paper stated:

The most important factor is whether the covenant is economically real, that is, whether the covenant is the product of bona fide bargaining rather than a sham. The economic reality theory is primarily concerned with business realities which would cause reasonable persons, genuinely concerned with their economic future, to bargain for the covenant not-to-compete.

Among the facts to be considered are whether the seller could actually compete with the purchaser—where the seller is, objectively, likely to be a competitor. The paper states that courts have also looked at the actual contract negotiations to determine if the parties' intentions were for the covenant not-to-compete to have value.

**EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)**

In addition, the amount allocated to the covenant not-to-compete may not reflect economic reality. The tax-payer has the burden of proving that he is entitled to the deduction. *Welch v. Helvering*, 290 U.S. 111 (1933). Courts have frequently found that covenants have no value or, at least, substantially less value than the purchaser attributes to them. The same factors as above have been considered for this purpose. Further, courts have looked at the actual contract negotiations to determine if the parties intended the covenant to have any value. For example, if the parties agreed to pay a certain amount for the assets of the seller and the purchase price is not altered when a covenant not-to-compete is later added, the covenant has no or minimal value.

Other guidance on determining the value of a covenant not-to-compete is given in Revenue Ruling 77-403. The ruling states that the relevant factors for determining the value of a non-compete agreement include:

- 1) Whether in the absence of the covenant the covenantor would desire to compete with the covenantee;
- 2) the ability of the covenantor to compete effectively with the covenantee in the activity in question; and 3) the feasibility, in view of the activity and market in question, of effective competition by the covenantor within the time and area specified in the covenant.

Based on the issues presented by Kelly in regard to the mass asset rule, the covenant is a distinguishable asset that can be valued separately from goodwill. Further, the covenant in the Public Company Purchaser-CRS deal appears to pass the four tests from *Forward Communication Corporation v. U.S.* Tests two and three are of particular importance here. The importance of test two is that after Public Company Purchaser proposed the allocation to the covenant, Mr. Carnes and his advisor did not attempt to repudiate or negotiate it, although they did negotiate several other items in the agreement. As a result, we believe the covenant is economically real. Test three is significant because the allocation to the covenant is clearly made in the agreement.

From the deposition of various Public Company Purchaser executives, we learned that Public Company Purchaser has developed a methodology for allocating a portion of the acquisition price to covenants with the assistance of its outside accountant. In addition, we know that Public Company Purchaser is a major player in the industry and has been undergoing a major acquisition program. Therefore, Public Company Purchaser's actions appear to be reflective of market conditions.

As Mr. Davidson states, "Public Company Purchaser's interest in CRS was due to its good locations, respiratory therapy control, and good reputation." According to Mr. Byrnes, he did not believe that Mr. Carnes held many of the referral relationships personally. In fact, Mr. Byrnes knew first hand that in City B, Judy Clarke was generating the referrals. Mr. Byrnes believed that Mr. Carnes may have originally held some of the relationships in City A. This puts Mr. Carnes's control of the referral base at less than 25 percent.

As we know from Mr. Carnes, additional relationships were developed by the marketing representative in that territory. It was also the marketing person's responsibility to maintain existing relationships. In addition, from Mr. Carnes's deposition, we understand that the marketing people are critical to the success of CRS.

We also learned from Mr. Carnes that he was responsible for over 90 percent of the training of these individuals, as well as the other employees of the company. Mr. Carnes has imparted a great deal of his knowledge and expertise to these individuals. It appears this has occurred to a large extent with Ms. Rodgers, who did everything Mr. Carnes did for the company.

Ms. Rodgers's talents were recognized by Public Company Purchaser, who ensured she was part of the acquisition, by making an employment agreement with her a prerequisite to the acquisition closing. According to Mr. Byrnes, Public Company Purchaser's interest was always in Ms. Rodgers, and Public Company Purchaser had no interest in retaining the services of Mr. Carnes. We believe Mr. Byrnes to be credible on this issue because Public Company Purchaser did not offer Mr. Carnes an employment contract prior to the closing of the acquisition.

If Public Company Purchaser felt that Mr. Carnes was essential to the business because he held many personal relationships, then it would be a prudent business decision to bring Mr. Carnes along with the acquisition and lock him into an employment contract for a period of time that allows for a transfer of these relationships. In this type of a situation, a buyer needs to ensure the transferability of what it is purchasing. Relationships take time to develop. They cannot be transferred overnight.

(continued)

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

An employment contract is typically used to retain the services of the seller as an employee of the acquirer for a specified period of time. Typical time periods range from six months to two years. During the term of the employment contract, the business seller assists the buyer in the transitioning of the business. Prudence dictates that such an agreement should be in place before closing, as was the agreement with Lori Rodgers. Yet Public Company Purchaser had no interest in such an arrangement with Mr. Carnes. From this position, one can reasonably infer that Public Company Purchaser did not believe that Mr. Carnes was important to the successful transition of the customers and referral sources to Public Company Purchaser.

Using all of this information, we have determined that Mr. Carnes would be able to provide a minimal loss of business to the CRS locations acquired by Public Company Purchaser. Mr. Carnes created a company of highly skilled individuals and significantly reduced CRS' reliance on himself. In addition, Lori Rodgers, the person who was most crucial to the deal taking place has been tied up in an employment contract by Public Company Purchaser. As a result, we believe that only a small portion of the sales could be diverted if CRS continued to compete with Public Company Purchaser. Therefore, we have selected 10 percent as the percentage of sales that CRS could divert from Public Company Purchaser.

Based on a lost sales analysis of 10 percent, we have determined that the lost income attributable to the covenant not-to-compete is as follows:

1996	1997	1998	1999	2000
\$171,600	\$193,908	\$219,116	\$247,601	\$277,313

The estimated cash flow attributable to the lost income, calculated in a manner similar to what we calculated previously, is as follows:

1996	1997	1998	1999	2000
\$22,471	\$88,164	\$116,897	\$149,365	\$185,730

The major difference between the lost net income and the cash flow is the level of capital expenditures, which far outpaces depreciation expense. These items were treated in a consistent manner when the valuation of CRS was previously performed. However, since management of the company can change the level of capital expenditures, we believe that it would be more prudent to discount the lost earnings, rather than cash flow, in valuing the covenant.

The value of the covenant not-to-compete is the present value of the lost income to the buyer. Using a discount rate of 24 percent, this equates to the value of the covenant being \$578,766, or \$579,000 rounded. The discount rate used is based on a discount rate applicable to cash flow of 18 percent, with a 6 percent premium due to the increased risk of earnings over cash flow.

The covenant not-to-compete is a less predictable asset and has several risk factors associated with it. In reviewing Kelly's factors pertaining to the economic reality of the covenant, we find the following:

1. Mr. Carnes has the expertise necessary to compete. Mr. Carnes has proven to be quite knowledgeable about his business, and by all accounts has been very successful.
2. Mr. Carnes has the financial resources necessary to compete. Given the low cost of doing business and Mr. Carnes's financial assets, Mr. Carnes reasonably has the economic capacity to compete.
3. Mr. Carnes is not advanced in age nor is he of diminished health that would keep him from competing.
4. Very little of the purchase price was structured over time. Only \$500,000 was not paid at closing and this was for accounts receivable. Several of Kelly's factors also serve to reduce the risk associated with the covenant.
5. The covenant has sufficient scope to insure non-competition. This reduces the risks associated with violation of the covenant.
6. There is no technology or machinery that Mr. Carnes owns that would enable him to compete. In addition, CRS is a marketing-based business, and individuals other than Mr. Carnes are in control of many of the relationships.

As a result of these factors, we have selected an 18 percent discount rate for the covenant not-to-compete. It was increased by 6 percent to reflect the earnings premium. It should be noted that this rate does not reflect the level of competition that could be put forth by Mr. Carnes, but only the risk associated with Mr. Carnes competing.

As a test for reasonableness of the amount allocated to the covenant not-to-compete, we examined information available in the public domain. As a result of the respiratory therapy industry's current consolidation mode, we have reviewed the SEC's filings of publicly-traded companies in the respiratory product and medical equipment sales and rental industry to gain some insight into their acquisition practices and how they allocate purchase price to intangible assets and non-compete agreements, in particular.

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

We reviewed the 1995 10-K filings for Apria Healthcare Group, American Home Patient, Inc., Complete Management, Inc., Interwest Home Medical, Inc., Public Company Purchaser, Pediatric Services of America, Inc., and Rotech Medical Corp. From these documents, we attempted to isolate information relating to how they allocated the purchase prices of their acquisitions. Although all of these companies discuss their acquisition in one form or another, only Public Company Purchaser and Pediatric Services of America (PSA) provided enough detail to be meaningful to our analysis. As a result, we analyzed Public Company Purchaser's 10-Ks for 1993–1995, and PSA's 1995 filings.

In the notes to its consolidated financial statements, Public Company Purchaser discloses the purchase price of its acquisitions for the year and the allocation of the total purchase. Public Company Purchaser divides the allocation between current assets, fixed assets, identified intangibles, and goodwill. This data for 1993–1995 is presented in table 13, and each item as a percentage of the year's total acquisition purchase price is presented in table 14.

**TABLE 13 Breakdown of Public Company Purchaser, Inc.'s Total Acquisitions by Year, 1993–1995**

	1993	1994	1995	Average
Current Assets	\$ 1,704	\$ 2,915	\$ 8,097	\$ 6,358
Property and Equipment	2,828	4,024	4,731	3,861
Intangible Assets	7,277	11,613	12,056	10,315
Goodwill	14,195	43,000	46,050	34,415
	<b>\$26,004</b>	<b>\$61,552</b>	<b>\$70,934</b>	<b>\$54,949</b>

**TABLE 14 Breakdown of Public Company Purchaser, Inc.'s Total Acquisitions by Year as a Percentage of Total Acquisitions, 1993–1995**

	1993	1994	1995	Average
Current Assets	6.6%	4.7%	11.4%	11.6%
Property and Equipment	10.9%	6.5%	6.7%	7.0%
Intangible Assets	28.0%	18.9%	17.0%	18.8%
Goodwill	54.6%	69.9%	64.9%	62.6%
	<b>100.0%</b>	<b>100.0%</b>	<b>100.0%</b>	<b>100.0%</b>

From table 13, it is clearly seen that the largest component of the acquisition costs for each year was goodwill, followed by identified intangibles. Of particular importance to this analysis is the allocation to identifiable intangible assets. Public Company Purchaser, as we will show later in this report, typically only identifies patient records and non-compete agreements. Therefore, we have made the assumption that the identified intangible assets line in table 14 contains only these two types of assets. As can be seen in the data, these assets represented 28, 18.9, and 17 percent of the total purchase prices in 1993, 1994, and 1995, respectively.

(continued)

## EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space) *(continued)*

As a major player in this industry, Public Company Purchaser's economic decisions are reflective of market conditions. Total acquisition purchase price for 1995 was \$70,934,000. This represented the accumulation of 20 separate and distinct transactions. Each of these was negotiated with an arm's-length (nonrelated) party. Most of these businesses were much smaller than CRS because total revenues for the acquired companies, excluding CRS, was \$38.4 million, or an average of approximately \$2 million. In 1993, Public Company Purchaser acquired 15 companies with revenues of \$18 million or \$1.2 million each. In 1994, Public Company Purchaser acquired 24 companies with \$35 million in revenues, or \$1.46 million each. As a result, the data taken from Public Company Purchaser's 10-Ks provide us with a guide from the marketplace for the combined values of a non-compete agreement and a customer list. This guide indicates that on a combined basis, these assets should constitute 17.0 to 18.8 percent of the purchase price, based on Public Company Purchaser's 1995 acquisitions and the 3-year weighted average, respectively.

On October 3, 1994, PSA bought Oxygen Specialties, Inc. (OSI) for \$4.9 million. OSI was a medical equipment company located in New Orleans. According to PSA's Form 10-K, \$200,000 of the purchase price was paid for the non-compete agreement. This represents approximately 4.1 percent of the purchase price.

In our valuation, we determined the value of the covenant not-to-compete and the patient records (customer list) to be \$2,450,000, and the covenant to be \$579,000. Based on a total value of \$13,500,000, the total of the covenant plus the patient records amounts to 18.06 percent of the total, and the covenant alone amounts to 4.3 percent of the total. This demonstrates the reasonableness of our calculations.

**Allocation of the Covenant Not-To-Compete Between CRS and John Carnes, Individually.** In addition to the issue of the economic reality of the covenant, the allocation of the covenant is significant in determining personal goodwill. A common practice in asset purchases is for the non-compete agreement to name the selling company, and its shareholders, as being subject to the non-compete. This is exactly the case in the sale of assets to Public Company Purchaser. The agreement was between Public Company Purchaser as the purchaser and CRS and John W. Carnes as the sellers. The issue becomes one of allocating the non-compete between the company, which results in corporate goodwill, and John Carnes, resulting in personal goodwill.

Carnes Respiratory Services developed an excellent reputation for the services it provided to clients. This reputation is, in large part, the corporation's, and not Mr. Carnes's. Mr. Carnes has done an excellent job over the years in training personnel, teaching his marketing people, and transferring his importance to other members of the company. Earlier in the business' formation, there can be no doubt that John Carnes was CRS. However, over the years there has been a clear transition to other members of the company. In fact, it was Lori Rodgers, and not John Carnes, who Public Company Purchaser insisted sign an employment contract with the firm as a prerequisite to a deal.

Recognizing the fact that Mr. Carnes is no longer required to provide a personal service to the patients, referral sources and others, we do not see there being any economic reason to allocate any of the covenant not-to-compete to Mr. Carnes personally. We further believe that the deposition transcripts reviewed and cited throughout our report justify our position.

**Summary.** The fair market value of Carnes Respiratory Services as of March 9, 1995 was \$13,500,000. The allocation of the purchase price of the company as of the same date is as follows:

Accounts Receivable	\$ 550,000
Inventory	40,000
Fixed Assets	712,000
Trademark	2,134,000
Patient Records	1,859,000
Covenant Not-to-compete—CRS	579,000
Covenant Not-to-compete—John W. Carnes	0
Goodwill	7,626,000
<b>Fair Market Value</b>	<b>\$13,500,000</b>
Buyer's Premium	1,535,000
<b>Price Paid by Public Company Purchaser</b>	<b>\$15,035,000</b>

### EXHIBIT 22.1 Valuing the Covenant Not to Compete (Many Sections of the Actual Report Omitted for Space)

The equitable distribution value of Carnes Respiratory Services Inc. as of March 9, 1995 was \$16,900,000, consisting of the following:

Price Paid by Public Company Purchaser	\$15,035,000
Retained Assets	1,900,000
<b>Total</b>	<b>\$16,935,000</b>
<b>Rounded</b>	<b>\$16,900,000</b>

I really like this last exhibit because not only does it address issues surrounding personal goodwill, but it also addresses the valuation of a covenant not to compete. If you really think about it, what is the covenant really protecting? More often than not, the covenant is protecting the intangible assets that the seller is transferring to the buyer. Therefore, probably the most valid methodology to determine the value of the personal goodwill is to perform an allocation of value similar to what would be done under an allocation of purchase price assignment. Allocate the tangibles, the identifiable intangibles, and then what is left is the unidentifiable intangibles that are to be allocated between personal and enterprise goodwill.

Before we get off this subject, let's look at another example involving personal goodwill. There are other ways to address personal goodwill, and a valuation analyst should be prepared to use them if the situation calls for it. A section from a divorce valuation of a dental practice is shown in exhibit 22.2. This report not only addressed personal goodwill, but it also had to address an incremental value for the marital estate because the dental practice was a premarital asset.

### EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space)

**Description of the Assignment.** Trugman Valuation Associates, Inc. was retained by Alan Jones, Esquire, on behalf of Jones & Holtz P.A. to value the common stock of Scott M. Smith DDS P.A., a Florida corporation, as of March 23, 2000 and November 28, 1987. In addition, Trugman Valuation Associates was requested to address the issue of how much of the value relates to the personal goodwill associated with Dr. Scott Smith.

The purpose of this valuation is to determine the fair market value of this common stock interest as the basis for equitable distribution in the matter of *Scott M. Smith v. Cynthia Smith*.

**History and Background of the Practice.** Scott M. Smith DDS, P.A., trading as The Dental Group (hereafter referred to as The Dental Group or the practice) was incorporated in the state of Florida on October 11, 1993. Prior to that time, the practice operated as a sole proprietorship, owned and operated by Dr. Scott Smith.

The practice was purchased in or about November 1983 and has operated at the same location since the time of purchase. The Dental Group is located at 1234 Main Street, Some City, Florida. As the practice grew, The Dental Group occupied more space in its location. Originally, it rented approximately 1,200 square feet, and in 1984, it added an additional 1,600 square feet. In 1986, it added an additional 1,600 square feet. In or about August 1994, Dr. Smith began a dental lab, which began to service the dental practice. This dental lab is not part of this appraisal. In addition to the Some City practice, Dr. Smith operated a second location as The Dental Group in Second City, Florida. On October 3, 1989, this practice was sold to Dr. Mark Brown. Dr. Smith informed us that he spent approximately one day every two weeks at this location and Mrs. Smith worked there one day per week, or less.

(continued)

## EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space) *(continued)*

The Dental Group is considered to be a general dentistry practice. However, since about 1987, Dr. Smith has added implants to the services that the practice offers. In addition to Dr. Smith performing implants, he also does endodonture, bone grafting, periodonture, and wisdom teeth surgery. He is the only one in the practice that provides these treatments. The patient base is considered to be average, and the only marketing activities that the firm carries is Yellow Page advertising. According to the County Areawide Telephone Directory, covering the time period August 1999–2000, there were slightly more than 200 dentists listed. In 1983, the practice consisted of Dr. Smith and four office personnel. At the current date of the valuation, there are approximately 20 people employed, including three dentists.

**Smith to Brown Transaction.** In July 1989, an Asset Purchase Agreement was entered into between Dr. Scott Smith and Dr. Mark Brown. As mentioned previously, the Second City location was sold at this time. According to the agreement, the following assets were sold: equipment, office furniture and fixtures, office and clinical supplies, leasehold improvements, miscellaneous assets (which included the present telephone numbers of the practice, a list of current suppliers of the practice, and the goodwill of the practice), and patient records. In addition, the purchase price included a restrictive covenant. The Asset Purchase Agreement indicates:

This covenant is conveyed by Dr. Smith individually, pursuant to the terms and conditions outlined in this agreement; the parties hereby acknowledge that a portion of the total purchase price, as hereinafter set forth, is compensation to Dr. Smith for this covenant.

The total purchase price was \$366,000. The purchase price was allocated as follows:

Equipment	\$ 73,200
Office Furniture and Fixtures	18,300
Office and Clinical Supplies	21,960
Leasehold Improvements	29,280
Miscellaneous Assets	10,980
Patient Records	131,760
Restrictive Covenant	80,520
<b>Total</b>	<b>\$366,000</b>

The restrictive covenant covered a three-mile radius from the business premises for a three-year period. The location of the current office is in the central city of Some City, which has a relatively stable population. Most of the patients come from a five-mile radius, primarily from the north of the existing location. It is our understanding that the more affluent section of Some City is to the south and east of the current location. This does not tend to be the area that this practice draws from. The demographics of the practice can best be described as retirees and working class people, nonunion laborers, but relatively stable. Many of the patients are older, but there is primarily a mix of patients within the practice.

**Referrals.** Referrals to the practice tend to come to a particular doctor. Dr. Smith described his practice as “almost like running three private practices.” Each dentist has his own responsibility regarding patients and the costs are reduced due to all of them operating under one roof. However, the other two dentists are, in fact, employees of the corporation, as is Dr. Smith. In many instances, Dr. Smith will perform the higher end services that the other dentists are unable to perform, and in many instances, Dr. Smith refers new patients to the other doctors.

Less than 10 percent of the practice relates to DMOs (Dental Maintenance Organizations); most of the services are fee-for-service. The current location has reached its capacity and there is no additional room to expand. Major competition exists within a two-block location from this practice. The Dental Group is one of the largest dental practices in the community. A physical examination of the practice's equipment indicates that much of the equipment is at least 15 years old or older. Although it is in good condition, much of it was bought in the late 1980s. A refurbishment had taken place at around the valuation date, therefore, other than normal maintenance, it is not anticipated that there should be any major repairs on the existing facilities.

### EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space)

**Employees and Office Setup.** The two main professional employees of the practice are Dr. Scott M. Smith and Dr. Paul Rogers. Dr. Smith is a graduate of Case Western Reserve University and his employment history includes The Dental Group at the current location and the Second City location. Dr. Rogers graduated from the University of Iowa, including the University of Iowa Dental School, and has been with the practice since December 1998. Turnover in the practice has been very low at 10 to 15 percent per year. Dr. Smith belongs to the American Society of Osseointegration and the International Congress of Oral Implantologists.

The office is normally staffed from 8:00 a.m. to 5:00 p.m. Monday through Friday, and 8:00 a.m. to 4:00 p.m. on Saturday. Doctors are generally available at the office during these hours as well. Nonowner professionals generally work a 40-hour week, and the other individuals employed by the firm work about the same hours. This includes 3½ hygienists, 7–8 dental assistants, 4 secretarial/office clerical individuals, and 1 office manager.

Fees charged tend to be relatively modest; a typical new patient fee is \$53, including an exam and a single x-ray. Recall fees for adults and children are \$50 and \$37, respectively. The practice has approximately 6,000 active patient files and sees approximately 125 new patients per month. Overall, this is a well-established, mature practice.

**Financial Analysis.** A valuation is a “prophecy of the future.” Although a willing buyer looks at the historical results of a business, he or she will be using these results to determine what the business prospects are in the future. In order to begin our analysis, we analyzed the historic financial statements presented as Schedules 1 and 2 at the back of this report. In addition, the practice provided the appraiser with a balance sheet as of March 23, 2000, one of the valuation dates.

In order to assist in comparing The Dental Group to its industry peer group, we used the database maintained by Integra Information Inc. for Standard Industrial Classification Code 8021, Services-Offices and Clinics of Dentists. In order to have our comparison be as relevant as possible, we only reviewed data for practices with a revenue range from \$1 million to \$2.5 million. Included in this data was 2,558 practices.

Before a proper comparison to industry data can be performed, certain adjustments are required related to the historic financial statements of the practice. These adjustments are intended to “normalize” the financial statements. The process of normalization involves restating the balance sheet or income statement to reflect the economic values included in these statements. The normalization of the balance sheet is reflected in table 7.

1 Cash was adjusted to reflect the overdraft in existence at March 23, 2000.

2 Several adjustments were made to accounts receivable. Because the practice reports on a cash basis, it normally does not reflect patients' accounts receivable on its balance sheet. The monies reflected were categorized as accounts receivable from Smith Sterling, an affiliated laboratory that is owned by Dr. Smith. In reality, these monies were a capital contribution made by Dr. Smith to this other venture and have nothing to do with the operations of The Dental Group. Therefore, we have removed these items as non-operating. It is our understanding that this item would not be subject to equitable distribution, so removing it from the balance sheet provides a cleaner analysis relating to the value of The Dental Group. The amount removed at March 23, 2000 was \$688,022.

At the valuation analyst's request we were provided with accounts receivable from the patients as of March 23, 2000. This amounted to \$519,565. Included in this amount were various accounts receivable turned over to the Coast Collection Bureau. According to a historic analysis dated January 10, 2003, the amount of accounts receivable turned over to the collection agency amounted to \$125,456. We performed an analysis of this report and determined that the amount of receivables turned over to the collection agency at March 2000 was \$45,792. Based on collection history, we estimated that only 10 percent of this amount would be collected and deducted 90 percent of the outstanding amount (\$41,213) from accounts receivable. The balance of collectable accounts receivable is \$478,352.

One additional adjustment is required in order to reflect accounts receivable at its net realizable value. Because the practice reports on a cash basis, it does not pay income taxes, nor would the shareholder pay income taxes on the receivables until these monies are collected. Therefore, in order to properly reflect the true value of these receivables, a provision for income taxes has been subtracted at 35 percent. Therefore, accounts receivable at March 23, 2000 is estimated to be \$310,929.

3 An adjustment was made to reflect supply inventory, which is typically expensed as these items are paid for. At the valuation analyst's request, an inventory was provided to us, which amounts to \$16,155 of supplies.

(Notes continued)

## EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space)

(Notes continued)

- 4 A loan receivable for a laboratory owned by Dr. Smith in Costa Rica has been removed from the balance sheet. This item is also considered to be a capital contribution and does not have any bearing on the value of The Dental Group. Therefore, it has been removed.
- 5 Fixed assets have been adjusted to reflect straight line depreciation based on the class life depreciable lives as permitted under the IRS regulations. This adjustment is consistent with the normalization adjustment that was made to the income statement for depreciation expense. The value of the fixed assets has been estimated at \$107,428.
- 6 Accumulated depreciation has been removed in its entirety since the fixed assets were estimated to reflect current value.
- 7 Similar to accounts receivable, accounts payable are normally not reflected on the balance sheet of the practice because it reports using the cash method of accounting. In this instance, there was a small balance being carried on the books in the amount of \$5,269. We were provided with an accounts payable aging detail schedule as of March 23, 2000, which reflected total accounts payable at the appraisal date of \$56,917. Once again, to be consistent with our treatment of accounts receivable, there would be a tax benefit received when these items are paid. Therefore, we have reduced the accounts payable by the same 35 percent tax rate as before. Therefore, accounts payable is reflected as being \$43,496 at the appraisal date.
- 8 Payroll taxes payable was adjusted to reflect the balance per the March 23, 2000 balance sheet.
- 9 Notes payable were adjusted to reflect the balance as of the March 23, 2000 balance sheet. These notes are all to various lending institutions.
- 10 Loans from stockholders have been removed from the balance sheet because we considered these items to be capital contributions.
- 11 There has been a note payable to "A. Smith" for a number of years. We have removed this item as not being applicable to the dental practice.
- 12 The net of the adjustments has been posted to retained earnings to reflect the market value of the net tangible assets of the practice.

As a result of our analysis, the adjusted book value of the net assets of the practice, excluding any intangible value, amounts to \$207,534. The next step in the valuation process is to normalize the income statement. This normalization is shown in table 8.

**TABLE 8 Income Statement Normalization**

	December 31,				
	1995	1996	1997	1998	1999
Historic Net Income (Schedule 2)	\$ 134,906	\$ 208,815	\$ 338,175	\$ 385,025	\$ 330,466
Adjustments					
Depreciation/Amortization Expense <sup>1</sup>	10,392	3,592	4,308	16,043	13,655
Officer's Compensation—Addback <sup>2</sup>	110,000	125,467	78,436	51,820	33,328
Officer's Compensation—Reasonable <sup>3</sup>	(177,059)	(182,535)	(188,180)	(194,000)	(200,000)
<b>Adjusted Pretax Net Income</b>	<b>\$ 78,239</b>	<b>\$ 155,339</b>	<b>\$ 232,739</b>	<b>\$ 258,888</b>	<b>\$ 177,449</b>
Income Taxes <sup>4</sup>	17,787	49,044	81,827	92,902	58,409
<b>Adjusted Historic Net Income</b>	<b>\$ 60,452</b>	<b>\$ 106,295</b>	<b>\$ 150,912</b>	<b>\$ 165,986</b>	<b>\$ 119,040</b>

- 1 Depreciation expense has been adjusted to reflect the same useful lives as were used to calculate the estimate of fair market value of the fixed assets. Therefore, an add back was in order as the depreciation allowed was considered to be greater than the economic depreciation necessary to reflect the value of these assets.
- 2 Officer's compensation has been added back in its entirety as Dr. Smith does not always take salary but, rather, sometimes takes distributions of profits, which are not considered in the determination of the net income of the practice. Reasonable compensation will be deducted in item number 3 below.

(Notes continued)

## EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space) *(continued)*

*(Notes continued)*

3 In order to estimate reasonable compensation, we consulted the 1999 Survey of Dental Practice, published by the American Dental Association. We analyzed the average net income from primary practice several different ways in order to estimate reasonable compensation. First, we looked at general practitioners with 20–24 years of experience. The mean compensation was \$159,760, whereas the median for this group was \$140,000. We also looked at specialists because Dr. Smith performs endodonture, periodonture, and some surgical and implant procedures. Therefore, we considered his compensation as possibly being comparable to specialists. Specialists with 20–24 years' experience had a mean compensation of \$262,470 and a median of \$256,530. We considered the fact that Dr. Smith spends part of his time performing general dentistry and other times performing services that might be considered to be a specialty. Therefore, we weighted the median 50 percent each in estimating compensation based on this factor, at \$198,265. This equates to the third quartile of general practitioners with 20–24 years of experience as the amount reflected in the survey is \$200,500.

We then considered data by region. Using the South Atlantic Region, we found that general practitioners had a mean net income of \$165,960 and a median of \$120,000, with the third quartile being \$180,000. Specialists in this area had a mean net income of \$244,470 and a median of \$206,000. Using the same weighting of the medians amounted to \$163,000.

As an additional source for officer's compensation, we reviewed the information in the Integra Database. Using the 2,558 practices included in this data, having an average revenue in 1999 of \$1,112,000, officer's compensation as a percent of revenue amounted to 20 percent. We considered using this amount, but as a practice gets larger, the percent of officer's compensation generally declines. Even if we reduced this amount to 15 percent of revenues, the 1999 compensation would equal an amount greater than \$286,000. We believe that this amount was too high for a practice of this type.

Therefore, we have estimated reasonable compensation to be approximately \$200,000, an amount similar to the average of the practitioners with Dr. Smith's experience. Prior years were deflated by a 3 percent cost-of-living factor.

4 Income taxes were estimated based on a graduated tax structure using C-corporation income tax rates. Although The Dental Group operates as an S corporation, taxes must be considered due to the economic impact of this item. Whether the taxes are paid by the corporation or the individual, enough profit must be passed through to the shareholder to allow personal income taxes to be paid. Therefore, these monies would not be available for reinvestment by the practice and can be considered to be the equivalent of a C corporation income tax.

As a result of our analysis, it appears that the adjusted historic net income rose from 1995–1998 and then declined in 1999.

**Valuation Calculations.** As indicated previously in this report, the three approaches of valuation to be considered in an appraisal are (1) the Market Approach, (2) the Asset-Based Approach, and (3) the Income Approach. The narrative that follows discusses the valuation methods employed within each approach.

### THE MARKET APPROACH

**Transaction Method.** In order to determine the value of The Dental Group using the market approach, an attempt was made by the valuation analyst to gather information regarding guideline practices bought and sold in the open market. In order to accomplish this, we researched several sources, including the IBA, BizComps®, Pratt's Stats, and Done Deals databases to obtain information regarding comparable transactions.

**IBA Database.** The information located is maintained in a market data file compiled by the Institute of Business Appraisers, Inc., a professional appraisal organization that maintains a proprietary database of actual transactions of closely held businesses and professional practices all over the United States. As a result of our search, 2,426 such transactions were located under Standard Industrial Classification Code 8021, Services-Offices and Clinics of Dentists. Of these 2,426 transactions, 2,014 were eliminated. A portion of these were eliminated based on the description of the practice because they appeared to be something other than a general practice of dentistry; for example, some were engaged in oral surgery and others in orthodontics. All transactions that took place prior to 1996 were also eliminated because financial, as well as technological changes, have affected the practice of dentistry. The remaining transactions more adequately reflect The Dental Group's practice. They are presented in table 10.

(continued)

## EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space) *(continued)*

A statistical analysis indicated an  $R^2$  of 0.48 and 0.30 for the price-to-revenues and price-to-earnings multiples, respectively. A linear regression with an  $R^2$  below 0.50 reflects poor correlation of the data. However, the standard deviation for the price-to-revenue multiple was only 0.13 with a coefficient of variation of 0.22. This means that some degree of confidence can be had in using this data, as long as it is not used alone. The earnings multiples have poor statistical representations and cannot be used.

**Pratt's Stats.** The next database used in our analysis was Pratt's Stats. This database recorded 97 transactions. From this amount, we eliminated 48 transactions for the same reasons as explained previously. The transactions considered are included in table 12.

**TABLE 12 Pratt's Stats Asset Transactions**

Business Name	Revenues	Sale Date	Selling Price	Deal Price	Discretionary Earnings	Equity Price to	
						Revenues	Discretionary Earnings

Peter E. Labadie, DDS	182,390	10/22/1999	169,600	169,600	102,355	0.93	1.66

A more detailed statistical analysis was performed on the data included in the results (including data not presented in table 12). It is shown in table 13.

Based on these results, only two multiples can be used with any degree of confidence: Equity Price to Revenues, Equity Price to Discretionary Earnings.<sup>1</sup>

**Other Databases.** Although we looked for transactions in the other databases, an insufficient amount of data was located.

**Value Estimates—Transaction Method.** Once the pricing multiples have been chosen, the next step is to choose the appropriate multiple to value The Dental Group. Using the available data, we further analyzed these transactions against the performance of The Dental Group.

First we looked at the geographic region. Of the 412 transactions in the IBA data, 27 transactions were specifically in Florida. Seventy-six transactions were in the Southeast. The medians of these transactions were 0.65 and 0.66, respectively.

<sup>1</sup> Deal price to revenues and equity price to revenues are the same; therefore, only equity price to revenues was utilized.

**EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space)**

## EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space) *(continued)*

Additionally, we performed a ratio analysis from the data included in the Pratt's Stats database, which is reflected in table 14.

**TABLE 14 Pratt's Stats Asset Transaction Ratio Analysis**

	Net Profit Margin	Operating Profit Margin
Count	29	33
Mean	24.04%	24.47%
Standard Deviation	13.96%	14.42%
Coefficient of Variation	58.06%	58.94%
90th Percentile	44.20%	45.20%
75th Percentile	37.99%	37.99%
Median	18.74%	21.08%
25th Percentile	13.41%	13.64%
10th Percentile	9.79%	7.52%
<b>The Dental Group</b>	<b>6.23%</b>	<b>10.61%</b>

The table indicates that The Dental Group underperformed compared to the lowest 10th percentile with respect to net profit and between the 10th and 25th percentile for operating profit. This means that The Dental Group would not sell as favorably as many of the practices included in the transaction data.

Therefore, for those multiples used, we have chosen the equivalent of the 10th percentile. Our value indications are as follows:

**TABLE 15 IBA Database Value Estimate**

Estimate of Value (Equity or Invested Capital)	\$ 1,001,587	\$ 657,955
Less: Interest-Bearing Debt	—	—
Indication of Value—Control, Non-Marketable	\$ 1,001,587	\$ 657,995
Rounded	\$ 1,000,000	\$ 658,000

One further explanation is required of the data included in tables 15 and 16. The data presented in the IBA database, as well as the data used from the Pratt's Stats database, are asset sales. This means only those assets that are typically sold as part of a transaction would be included in the estimate of value. Therefore, additional assets and liabilities must be taken into consideration. In this report, we call them *retained assets*. These would be the items that would typically be retained by the seller or paid for above and beyond the estimate of value that is calculated from the various transactions.

Based on the IBA database, the estimate of The Dental Group as of March 23, 2000 would be approximately \$960,000. Based on the data included in Pratt's Stats, the equity price to revenues results in an estimate of approximately \$1 million, whereas the equity price to discretionary earnings reflects only a value of \$658,000.

**INCOME APPROACH**

**Capitalization of Earnings Method.** The capitalization of earnings method is premised on the concept that value is based on a stabilized income stream that is capitalized by an appropriate capitalization rate to reflect the risk associated with the income stream. Mathematically, this is presented in the following formula.

$$V = \frac{I}{R}$$

V = Value  
I = Income Stream  
R = Capitalization Rate

(continued)

## EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space) *(continued)*

The use of this formula requires an estimate of income to be made for the subject practice. The next portion of the application of this method requires the determination of the appropriate capitalization rate to be used for this level of income.

The Dental Group is a mature practice that has reached its maximum capacity at its present location. Revenues have grown marginally from \$1.8 million to \$1.9 million from 1997–1999. A review of the adjusted profitability during this period reflects an up-and-down scenario. Therefore, we believe that a simple average of the past three years is most representative of the future earnings of the practice.

Applying an inflationary growth rate to the earnings and capitalizing the result by 24 percent (see discussion of discount and capitalization rates) yields the following estimate of value:

**TABLE 17 Capitalization of 3-Year Average Net Income**

	1997	1998	1999
Net Income	\$150,912	\$165,986	\$ 119,040
3-Year Average Net Income			\$ 145,313
One Plus the Long-Term Rate of Growth			× 1.03
Net Income for Capitalization			\$ 149,672
Capitalization Rate			÷ 24.00%
Indication of Value—Control, Marketable			\$ 623,633
Less: Discount for Lack of Marketability		10.00%	(62,363)
<b>Indication of value—Control, Non-marketable</b>			<b>\$ 561,270</b>
<b>Rounded</b>			<b>\$ 561,000</b>

In estimating the value of The Dental Group using the income approach, a 10 percent discount for lack of marketability has been subtracted. The discount, explained further later in this report, is intended to reflect the closely held nature of the practice after applying a capitalization rate that was derived from the public market. This method results in an estimate of value of \$561,000.

### ASSET APPROACH

**Excess Earning Method.** The adjusted book value of The Dental Group, without intangible value, was previously determined to be \$207,534 (see balance sheet normalization). In addition to the value of the tangible assets of The Dental Group, it is necessary to determine whether any goodwill exists and, if so, what value to place on that goodwill.

Revenue Ruling 59-60, the IRS training manual, and Revenue Ruling 68-609, which the IRS has been using in conjunction with Revenue Ruling 59-60 concerning earnings of an entity to be valued, all stress that potential future income is a major factor in valuing an entity. These sources further state that a review of prior earnings is necessary to predict the future. This is known as the “formula approach.”

This approach is described in Revenue Ruling 68-609 as follows:

The percentage return on the average annual value of the tangible assets used in the business is determined using a period of years (preferably not less than five) immediately prior to the valuation date. The amount of the percentage return on tangible assets thus determined is deducted from the average earnings of the business for such period and the remainder, if any, is considered to be the amount of the average annual earnings from the intangible assets of the business for the period. This amount (considered as the average annual earnings from intangibles) capitalized at a percentage of say fifteen percent to twenty percent is the value of the intangible assets of the business determined under the “formula approach.”

### EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space)

Revenue Ruling 59-60 also suggests that comparative income statements for a period of five or more years should be used in valuing a closely held business.

The average annual earnings of The Dental Group should be reduced by a reasonable return on the net tangible assets of the practice, which, if placed in the bank or in a different investment, would generate revenue. This return on investment should be subtracted from the average annual earnings of the practice.

The sources previously mentioned indicate that the formula approach should be used only if no other valuation approach for measuring intangibles can be determined. Caution must be exercised when this approach is utilized. It cannot be employed without taking into account outside influences, such as the general economic condition of the industry and whether earnings are increasing or decreasing.

The growth adjusted, normalized net income of the practice has previously been determined to be \$149,672. A weighted average return on tangible assets of 6.92 percent has been calculated based on the composition of the balance sheet yielding a return on tangible assets of \$14,358. Capitalizing the excess earnings by a capitalization rate of 33 percent (see discussion the “Discount and Capitalization Rates”) results in an estimate of value using this methodology as follows:

**TABLE 18 Excess Earning Method 3-Year Average Net Income**

Normalized Net Income	\$ 149,672
Less: Return on Tangible Assets	(14,358)
Excess Earnings	\$ 135,314
Capitalization Rate	÷ 33.0%
Value of Intangibles	\$ 410,042
Adjusted Tangible Book Value	207,534
Indication of Value—Control, Marketable	\$ 617,576
Less: Discount for Lack of Marketability (10%)	(61,758)
<b>Indication of Value—Control, Non-Marketable</b>	<b>\$ 555,818</b>
<b>Rounded</b>	<b>\$ 556,000</b>

Once again, a 10 percent discount for lack of marketability has been subtracted to take into consideration the fact that The Dental Group is a closely held dental practice. As a result of our computations, the value using this method is approximately \$556,000.

**Reconciliation of Values.** During the valuation, several methods were used to determine the value of the equity of The Dental Group. The values derived in this valuation are as follows:

(continued)

### EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space) *(continued)*

<b>Market Approach</b>	
Transaction Method	
IBA Database	
Price to Revenues	\$ 960,000
Pratt's Stats	
Equity Price to Revenues	1,000,000
Equity Price to Discretionary Earnings	658,000
<b>Income Approach</b>	
Capitalization of Income	561,000
<b>Asset Approach</b>	
Excess Earnings	556,000

The market approach is normally afforded the greatest amount of weight for a going concern because fair market value is determined by the market, and it is the valuation analyst's role to interpret the market. In this instance, the transaction method was used providing three indications of value. Those indications that utilized a multiple of revenue resulted in a considerably higher value than the method that utilized a multiple that relied on The Dental Group's earnings. The fact is that The Dental Group's earnings were inferior to the target practices based on our analysis of the data included in the Pratt's Stats database. Therefore, we put slightly more weight on the multiple involving earnings than those that involved revenues. Forty-five percent of the total weight in this valuation has been applied to the market approach.

The income approach utilizes the earnings of the company to arrive at a value. This value is based on the earnings of the practice and looks at the practice from an investment point of view for an owner or operator purchasing the entire operation. Once again, because of low earnings, the result is a lower indication than the market approach. In this instance, we assigned a 30 percent weight to the income approach because it truly values the practice and does not subject the valuation analyst to as many assumptions as those based on the limited data included in the transaction method.

The asset-based approach was utilized using the excess earnings method, which is a commonly used method for valuing professional practices. In this instance, the results are very similar to the income approach, and we have put 25 percent of the weight on this approach.

Revenue Ruling 59-60 suggests that a valuation analyst not arbitrarily weight different methodologies, but that the true intent of the revenue ruling is for the valuation analyst to consider the advantages and disadvantages of each of the methodologies and to develop an informed opinion using judgment, common sense, and the facts and circumstances available to determine how each method should be weighted in the process. As a result of the various weightings, an opinion of value for The Dental Group, which is predicated on Dr. Smith issuing a restrictive covenant to a purchaser of The Dental Group, is as follows:

**EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space)**

Approach	Value	Weight	Weighted Value
<b>Market Approach</b>			
Transaction Method			
IBA Price to Revenue	\$ 960,000	10%	\$ 96,000
Pratt's Stats Equity Price to Revenue	1,000,000	20%	200,000
Pratt's Stats Equity Price to Discretionary Earnings	658,000	15%	98,700
<b>Income Approach</b>			
Capitalization of Income	561,000	30%	168,300
<b>Asset Approach</b>			
Excess Earnings	556,000	25%	139,000
Estimated Value of The Dental Group		100%	\$702,000

**Justification for Purchase Test.** Valuation is not the process of developing capitalization rates or multiples. It is, however, the process of providing the user of the valuation with an estimate of value within a reasonable range. Recognizing that valuation is not an exact science, a test was performed to substantiate the amount of indebtedness that could be undertaken, using a four-year payback period, based on the normalized economic income that would be available to a willing buyer.

Assuming typical terms for a business transaction of this kind, a purchaser would use approximately 33.33 percent equity, with the balance being debt, to acquire a business of this type. This means that the pretax income would have to carry debt service and taxes. The valuation analyst used the average adjusted pretax income from 1997 to 1999 as indicative of future pretax income that would be available to service the debt incurred by the prospective buyer when purchasing the practice. This is the same income stream that was used to value the practice. The tax rate has been assumed at 35 percent. Using an 11.0 percent interest rate (prime rate as of the valuation date plus 2 percent), and a \$702,000 purchase price results in the following:

	Year 1	Year 2	Year 3	Year 4
Annual Payments	\$ 145,156	\$ 145,156	\$ 145,156	\$ 145,156
Interest	46,612	35,207	22,485	8,292
Principal	\$ 98,544	\$ 109,949	\$ 122,671	\$ 136,864
Cash Flow				
Pretax Income	\$ 229,716	\$ 236,607	\$ 243,706	\$ 251,017
Interest Expense	46,612	35,207	22,485	8,292
Taxable Income	\$ 183,104	\$ 201,400	\$ 221,221	\$ 242,725
Tax	64,086	70,490	77,427	84,954
Net Income	\$ 119,018	\$ 130,910	\$ 143,794	\$ 157,771
Principal Payments	98,544	109,949	122,671	136,864
<b>Cash Flow</b>	<b>\$ 20,474</b>	<b>\$ 20,961</b>	<b>\$ 21,123</b>	<b>\$ 20,907</b>
<b>Return on Down Payment</b>	<b>8.75%</b>	<b>8.96%</b>	<b>9.03%</b>	<b>8.94%</b>

(continued)

## EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space) *(continued)*

The preceding calculations indicate that a purchaser of this practice could pay \$702,000 and satisfy the debt obligations that would result from the acquisition.

**Personal Goodwill.** The majority of states have ruled that goodwill should be factored into determining a professional practice's value for the purposes of equitable distribution. The courts that choose to include goodwill do so because they consider it to be an asset, whereas the courts that choose not to include it state that it is because it is too speculative. Trugman Valuation Associates has been requested to address the issue of personal goodwill as it relates to The Dental Group. Before attempting to quantify the issue of personal goodwill, it is important to understand what this concept means.

**Professional Versus Practice Goodwill.** The distinction between professional goodwill (sometimes called *personal goodwill*) and practice goodwill (sometimes called *business* or *commercial goodwill*) is that professional goodwill is the goodwill that is associated primarily with the individual versus practice goodwill, which is the goodwill associated primarily with the entity. This can be demonstrated by assuming John Smith CPA is a partner at PricewaterhouseCoopers. If a new client calls the firm specifically requesting John Smith, then there may be personal goodwill associated with the individual. However, if the client wants a "big four" name on the financial statements and contacts PricewaterhouseCoopers and ends up with John Smith, there is probably practice goodwill. Sometimes, the two types of goodwill will overlap.

The existence of professional goodwill is based on the fact that clients come to the individual, as opposed to the firm. This may be based on the individual's skills, knowledge, reputation, personality, and other factors. The implied assumption is that if this individual moved to another firm, the clients would go with him or her. Professional goodwill is more difficult to transfer to a new owner, but not impossible. Generally, the professional will assist in a smooth transition to a new owner in order to obtain the maximum price for the practice.

**Goodwill in a Professional Practice.** The issue of personal versus practice goodwill arises most often during the divorce valuation of professional practices. In most instances, there is little reason to separate the two concepts. However, some courts have determined that sole practitioners in any profession can only have personal goodwill because he or she is the practice. A sole practitioner's practice can easily have both forms of goodwill.

To illustrate this point, let's assume that Sarah Jackson, attorney at law, is a personal injury specialist. Her trial skills have allowed her clients to get jury verdicts that begin at \$1,000,000. Her law practice has a book value of \$85,000 and contingent work in progress of \$700,000. Gross revenues for the firm are \$8,000,000. Ms. Jackson draws a salary of \$3,000,000 annually. The question becomes whether Ms. Jackson's goodwill—her reputation and trial skills—can be transferred to another lawyer. If so, we might have many lawyers earning a lot of money. This illustrates personal goodwill.

Let's illustrate practice goodwill. Now assume that Mary Brown, attorney at law, belongs to a prepaid legal services plan, from which she gets client referrals. The fact that the law firm is signed up with the legal services plan, referrals come to the practice regardless of her reputation and skills. This is practice goodwill. However, assuming that Ms. Brown does a good job for these clients, referrals may come to her in the future, which would be an element of personal goodwill.

Most courts have found that goodwill is an asset to be included in the marital estate of a professional for divorce purposes. In many states, professional goodwill is considered to be marital property even though it is not transferable. In such cases, the standard of value is not truly fair market value but, rather, intrinsic value to the owner. Several states have taken the position that professional goodwill is not a marital asset subject to division, but practice goodwill is.<sup>2</sup>

One of the most widely cited cases detailing the factors to consider when valuing professional goodwill in a divorce is a California case, *Lopez v. Lopez*.<sup>3</sup> The factors listed in that case include the following:

- The age and health of the professional
- The professional's demonstrated past earning power
- The professional's reputation in the community for judgment, skill, and knowledge
- The professional's comparative professional success
- The nature and duration of the professional's practice, either as a sole proprietor or as a contributing member of a partnership or professional corporation

As illustrated previously, it is frequently difficult to distinguish between professional goodwill and practice goodwill. In a Florida case, *Williams v. Williams*,<sup>4</sup> the trial court ruled that the value of Mr. Williams' accounting practice included \$43,200 in practice goodwill. On appeal, the trial court's finding was reversed. In its opinion, the appellate court stated:

<sup>2</sup> Some of the cases dealing with personal goodwill around the country include *Nail v. Nail*, 486 S.W. 2d 761 (Texas Supreme Court 1972); *Geesbreght v. Geesbreght*, 570 S.W. 2d 427 (Texas Civil Appeals Court 1978); *Prahinsky v. Prahinsky*, 540 A.2d 833 (Md. App. 1988) and 582 A.2d 784 (Md. 1990); *Thompson v. Thompson*, 546 So.2d 99 (Fla. App. 4 Dist. 1989); *Hollbrook v. Hollbrook*, 103 Wis. 2d 327, 309 N.W. 2d 343; *Zells v. Zells*, 157 Ill. Dec. 480, 572 N.E. 2d 944 (111.1991); and *DeMasi v. DeMasi*, 366 Pa. Super. 19, 530 A. 2d 871,883.

<sup>3</sup> In re: *Marriage of Lopez*, 113 Cal. Rptr. 58 (38 Cal. App. 3d 1044 (1974))

<sup>4</sup> *Williams v. Williams*, No. 95-00577, 1996 WL 47675 (Fla.App.2 Dist. Feb. 7, 1996)

## EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space)

the goodwill of [a] professional practice can be a marital asset subject to division in a dissolution proceeding, if it exists and if it was developed during the marriage .... However... for goodwill to be a marital asset, it must exist separate and apart from the reputation or continued presence of the marital litigant. . . . When attempting to determine whether goodwill exists in a practice such as this, the evidence should show recent actual sales of a similarly situated practice, or expert testimony as to the existence of goodwill in a similar practice in the relevant market .... Moreover, the husband's expert, who testified the practice had no goodwill, stated that no one would buy the practice without a noncompete clause. This is telling evidence of a lack of goodwill.

Clearly, the non-compete clause was the issue in the court's strict interpretation of fair market value. The fact that the expert testified that without a covenant not-to-compete, no one would buy the practice is an indication that the goodwill was associated with the grantor of the covenant.

**Non-compete Agreements.** (This is the same verbiage as in exhibit 17.1, so I am leaving it out here.)

In essence, a covenant not-to-compete is used to protect the goodwill that is associated with the practitioner that would allow that individual to compete with the purchaser of the practice. In the valuation performed in this matter, the indicated value of \$702,000 can be broken down between tangible and intangible value as follows:

Tangible Value	\$208,000
Intangible Value	494,000
Total Value	<u>\$702,000</u>

The normalized balance sheet was used to derive the value of the net tangible assets. Therefore, by subtraction, any remaining value would be attributable to intangible assets. This would be the maximum amount that a willing buyer would be looking to protect in an acquisition of The Dental Group. In order to estimate the amount of personal goodwill associated with The Dental Group, the appraiser looked for two separate factors that would provide market evidence as to the value of a non-compete agreement.

**Contract for Sale Between Dr. Scott Smith and Dr. Mark Brown (July 1989).** As indicated earlier in this report, the asset purchase agreement that involved Dr. Smith included a restrictive covenant. In fact, according to the allocation on page three of this agreement, the \$366,000 purchase price was allocated between tangible and intangible assets as follows:

Tangible Assets	\$153,720
Intangible Assets	212,280
Total	<u>\$366,000</u>

The intangible assets were broken down between patient records and restrictive covenant as follows:

Patient Records	\$131,760
Restrictive Covenant	80,520
Total	<u>\$212,280</u>

This indicates that approximately 22 percent of the purchase price was allocated to a restrictive covenant ( $\$80,520 \div \$366,000$ ).

**Market Evidence from the Pratt's Stats Database.** Included in the detail of the Pratt's Stats database is information relating to whether or not a covenant not-to-compete was granted, and if so, how much of the sale price was allocable to this covenant. An analysis was performed of the transactions resulting in the information provided in table 19.

(continued)

**EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space) (continued)**
**TABLE 19 Pratt's Stats Transactions with Non-Compete Information**

Business Description	Sale Date	Sell Price	Liabilities Assumed	Employ Agree Value	Price Liabilities & Employment Agreement	Non-compete Value	Non-compete to Selling Price
Dental Practice	1/22/1999	443,500			443,500	175,933	39.67%
Dental Practice	11/2/1999	20,000			20,000	5,000	25.00%

Dentist	10/24/1997	287,000			287,000	1,000	0.35%
Dentist, General	5/1/1997	482,000			482,000	33,000	6.85%
Dentist, General	4/1/1998	150,000			150,000	15,000	10.00%
Dentist, General	4/1/1998	120,000			120,000	20,000	16.67%
Dentist, General	1/1/1998	210,000			210,000	20,000	9.52%
Dentist, General	2/1/1998	210,000			210,000	40,000	19.05%
Dentist, General	4/1/1997	173,000			173,000	20,000	11.56%
Dentist, General	1/1/1998	137,000			137,000	10,000	7.30%
Dentist, General	10/1/1997	147,000			147,000	12,000	8.16%
Dentist, General	2/1/1998	60,000			60,000	20,000	33.33%
Dentist, General	10/1/1997	28,000			28,000	3,000	10.71%
Dentist: Orthodontist	10/15/1998	119,000			119,000	10,000	8.40%
Dentist: Orthodontist	6/15/1999	342,000			342,000	11,000	3.22%
Family Dentistry	5/28/1998	176,677			176,677	5,000	2.83%
Family Dentistry	9/15/1998	105,500			105,500	10,000	9.48%
<b>Many transactions have been omitted from this exhibit to save space</b>							
Orthodontia	7/15/1999	200,000			200,000	20,000	10.00%
Orthodontist	4/1/1998	400,000			400,000	25,000	6.25%
Orthodontist	2/1/1998	175,000			175,000	20,000	11.43%
Pediatric Dentistry	3/1/1998	375,000			375,000	40,000	10.67%
Periodontal Practice	1/5/1998	265,000			265,000	50,000	18.87%
<b>Average</b>							<b>14.29%</b>

### EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space)

The selling price of the practice minus any liabilities assumed and employment agreement values that were specifically allocated as part of the selling price in order to determine the price of the practice, net of the liabilities and of the employment agreement, are included in table 19. We then compared this amount to the result that was allocated to the value of the non-compete agreement. The average non-compete agreement value to the net selling price amounted to 14.29 percent. We further analyzed this data and removed all specialty practices to see what impact, if any, these had on the average. The average went up to 14.74 percent. Therefore, the market evidence indicates that of these transactions, between 14 and 15 percent is indicative of the non-compete values.

**Conclusion.** Clearly, the best indication of the value of a non-compete agreement would be using market data involving Dr. Smith himself. Although the transaction was from 1989, clearly, it is within the range of reasonableness (22 percent versus 14.74 percent) based on the other market evidence. Therefore, it appears that approximately 20 percent of the purchase price, or \$140,400 (\$702,000 × 20 percent) would be a reasonable indication of the value of the non-compete. Therefore, in our opinion the value of The Dental Group that should be subject to equitable distribution as of March 23, 2000 would be \$561,600.

#### VALUE—DATE OF MARRIAGE—NOVEMBER 28, 1987

Trugman Valuation Associates was also asked to estimate the value of the practice as of the date of the marriage, November 28, 1987. We requested financial statements or tax returns, or both, at around that date, including prior years, but the only information that still existed were financial statements for 1989 and 1990. Not anticipating that these records would ever be needed, they were discarded and are no longer available. Therefore, we are attempting to estimate the value based on the information that we have.

For the year ended December 31, 1989, net professional revenues were \$1,564,551 from the practice. Included in this amount is income from not only the Main Street location, but also from the Second City office. That practice was sold under contract dated July 1989 and was effective October 3, 1989. Our review of the 1990 financial statements reflects net professional fees in the amount of \$1,102,408. During this year, the Second City location was no longer in existence. Therefore, with the exception of any possible growth in the practice, the difference between these years could be attributable to the portion of the practice that was sold. The difference in revenue between 1989 and 1990 was \$462,143. Annualizing this amount, one could estimate that the annual difference (again excluding growth) would be \$616,191. Therefore, revenues for the entire 1989 year, including the equivalent full year for Second City, that would have existed in previous years can be calculated as follows:

1989 Reported Revenues	\$1,564,551
Less: Difference From 1989 to 1990	462,143
Sub Total	\$1,102,408
Add: Annualized Difference	616,191
Total Restated Annualized Revenues for 1989	\$1,718,599

In order to estimate the 1987 revenues, we applied a deflation factor of 5 percent consisting of 3 percent inflation and 2 percent real growth to the restated 1989 revenues. This would approximate 1987 revenues as \$1,551,036. This indicates that the entire practice was generating 81.13 percent of the annual revenues just prior to the divorce (\$1,551,036 ÷ \$1,911,743). Using the relationship of revenues as a proxy for the change in value, an estimate of the value of the practice in 1987 can be performed as follows:

Value—March 23, 2000	\$ 702,000
Revenue Relationship	× 81.13%
Value—1987	\$ 569,533
Rounded	\$ 570,000

(continued)

## EXHIBIT 22.2 Personal Goodwill—Dental Practice (Some Sections Have Been Omitted for Space) *(continued)*

Based on these figures, we estimated that the value of the practice at November 28, 1987 was approximately \$570,000. In order to be consistent with the treatment of personal goodwill from the latter date, we estimated that 20 percent of this amount, or \$114,000, should be considered nonmarital, personal goodwill. Therefore, the value that should be used as the base to calculate an incremental value would be \$456,000.

## Valuation of Other Marital Assets

Over the past several decades, new assets are being included in the cadre of items that are considered to be part of the marital estate. Once again, the courts are trying to be fair to the nonprofessional spouse. Rather than treating certain items as part of the ability to pay additional support, the courts have found these items to be marital assets. Some of the items included in this group are professional licenses and celebrity goodwill.

### Professional Licenses

The value of a professional license is frequently considered to be part of professional goodwill. In New York, the *O'Brien*<sup>24</sup> case provided that a professional license had value, even when there was no professional goodwill. In fact, the professional practice had not yet been started. In this case, Mrs. O'Brien worked so that Dr. O'Brien could attend medical school. About two months after Dr. O'Brien received his medical license and was serving a residency in general surgery, he filed for a divorce.

Clearly, there could be no professional goodwill in this case because Dr. O'Brien had not started his practice yet. However, Mrs. O'Brien's expert valued the professional license on the basis that it had value due to the enhanced earning capacity provided to Dr. O'Brien. A comparison was made between the average income of a college graduate to the average income of a general surgeon. This difference was capitalized over Dr. O'Brien's expected working life and adjusted for factors such as the time value of money and mortality.

Because New York started treating professional licenses as marital assets subject to distribution, additional issues have arisen. Arguments have now been raised that when the license holder has maintained a professional practice for a long period of time, the license has merged with the practice and no value should be assigned to the professional license. This concept was challenged in *McSparron v. McSparron*.<sup>25</sup>

In *McSparron*, the court stated the following:

Application of the merger doctrine is particularly inimical to the statutory purposes because it generally favors the non-licensed spouse in a shorter marriage over the non-licensed spouse who is faced with rebuilding his or her economic life after the break-up of a long-term marriage. . . . In view of these logical and practical difficulties, we conclude that the letter and spirit of our holding in *O'Brien* is best served by eliminating the concept of "merger" from the inquiry. The merger doctrine should be discarded in favor of a common-sense approach that recognizes the ongoing independent vitality that a professional license may have and focuses solely on the problem of valuing that asset in a way that avoids duplicative awards. . . . Care must be taken to ensure that the monetary value assigned to the license does not overlap with the value assigned to other marital assets that are derived from the license such as the licensed spouse's professional practice.

### Celebrity Goodwill

New Jersey was always famous for its turnpike. In fact, whenever I told someone that I lived in the Garden State, I was asked "near what exit on the turnpike?" New Jersey is also on the map as the home of *The Sopranos* and the infamous *Bridgeway* in which the governor's staff was accused of creating chaos at the

<sup>24</sup> *O'Brien v. O'Brien*, 66 NY 2d 576 (1985).

<sup>25</sup> *McSparron v. McSparron*, No. 260, 1995 WL 722880 (N.Y. App. Dec 7, 1995).

George Washington Bridge to get even with a political rival. But New Jersey also started a trend that may be nothing to be proud of. Joe Piscopo, comedian and entertainer, probably did not find it funny or entertaining when the New Jersey Superior Court found that he had a marital asset, with value, called *celebrity goodwill*.<sup>26</sup> The concept of celebrity goodwill is based on the premise that the enhanced earnings capacity of a celebrity is marital property. The determination of value in this case was made by applying a percentage to gross revenues for three of the last five years. New York, once again, not wanting to be too far behind, ended up with two cases of its own, *Golub v. Golub*<sup>27</sup> and *Elkus v. Elkus*.<sup>28</sup> This craziness is catching on like wild fire.

## Conclusion

If the valuation analyst plans to do divorce valuations, he or she needs to make sure that he or she becomes familiar with the law of the land. The valuation analyst should not get caught up in the craziness of the litigation or the clients will most likely make him or her nuts. Do the valuation with the integrity and objectivity that is expected in any professional engagement.

If I did my job right, this chapter should have provided some of the nuances of the divorce valuation process and a lesson on valuing a covenant not to compete. Remember that really long exhibit? It wasn't that long ago. Because we have had so much fun, let's move on.

# Chapter 23

# Professional Practice Valuations

## Learning Objectives

In this chapter, I will attempt to do the following:

- Discuss the reasons for valuing professional practices
- Discuss the characteristics of a professional practice
- Distinguish between professional practice valuations and other types of businesses
- Discuss engagement-specific matters

## Introduction

Valuations of professional practices frequently have unique aspects associated with them. Professional practices, by their very nature, are different than most businesses. As such, the valuation analyst must truly understand the attributes of each type of practice that may be valued. These professional practices, whether they are an accounting practice, a medical practice, an engineering practice, and so on, will all be similar, but different. Yes, it is contradictory.

Before the valuation analyst can value a professional practice, a good starting point is to understand what is meant by a profession. The term *profession* means

a vocation or occupation requiring special, usually advanced, education, knowledge, and skill—for example, law or medical professions. Also refers to whole body of such profession. The labor and skill involved in a profession predominantly mental or intellectual, rather than physical or manual. The term originally contemplated only theology, law, and medicine, but as applications of science and learning are extended to other departments or affairs, other vocations also receive the name, which implies professed attainments in special knowledge as distinguished from mere skill.<sup>1</sup>

The valuation of professional practices will have many common aspects to the valuation of professional service firms. For example, the valuation techniques used to value a medical practice may be similar to the valuation of a tax preparation business. Clearly, there will be differences between these two types of firms. Hopefully, by the end of this chapter, we'll be in agreement.

## Why Are Professional Practices Valued?

Remember a long time ago, back in chapter 1, I provided a box with a list of business valuation engagement considerations (box 1.1)? Well, guess what? Most of these same reasons apply here. The most common reasons for valuing professional practices are as follows:

- Mergers and acquisitions
- Estate and gift taxes
- Marital dissolution
- Buy-sell agreements
- Ownership disputes
- Damages litigation

<sup>1</sup> Henry C. Black, *Black's Law Dictionary* (St. Paul, MN: West Publishing Co., 1997): 1210.

Like all other valuations, the purpose and function of the valuation will affect the manner in which the valuation analyst will proceed.

## Characteristics of the Professional Practice

The professional practice differs from other types of businesses because of its unique characteristics. These include the following:

- It is a service business in which there are generally fewer tangible assets than intangible assets.
- There is a strong relationship between the professional and the client or patient, which is based on the professional's reputation.
- The professional practice, more often than not, depends on a strong referral system to get new clients or patients.
- The professional is frequently licensed, regulated, or certified by a governmental or regulatory agency or professional organization.
- In order to get licensed or accredited, most professionals are required to obtain an undergraduate degree, as well as maintain some level of continuing education to keep his or her license or certification.

Each of these aspects is pretty self-explanatory, so there is little need to expand on them.

## Professional Practice Versus Other Business Valuations

Valuing professional practices will require the valuation analyst to follow the same general guidelines as with other types of business enterprises. Obviously, with most of the value being in the intangible assets, the professional practice valuation will be much more oriented toward a market or income approach. An asset-based approach could be used, but the valuation analyst would have to find a suitable manner in which to value the intangible assets. There is the excess earnings method, but I said suitable! All kidding aside, the excess earnings method should result in the same value as with the income approach because the tangible assets are relatively small. Whether the analyst is capitalizing the entire earnings stream or the majority of the earnings stream (the excess earnings), using the proper capitalization rates will get you to the same place. An example appears in exhibit 23.1.

### EXHIBIT 23.1 Capitalization of Earnings Versus Excess Earnings

**ADJUSTED BOOK VALUE.** As of the valuation date, the adjusted book value of the tangible assets of Dental Associates was as follows:

Total Assets	\$309,703
Total Liabilities	51,118
<b>ADJUSTED BOOK VALUE</b>	<b>\$258,585</b>
<b>ROUNDED</b>	<b>\$259,000</b>

**GOODWILL—EXCESS EARNINGS METHOD.** In addition to the value of the physical assets of Dental Associates, it is necessary to determine whether any goodwill exists and, if so, what value to place on that goodwill.

Now that normalized earnings have been determined, a calculation must be performed to determine a reasonable return on the tangible net assets of the practice. This must be subtracted from the economic net income to determine the excess earnings to be capitalized.

### EXHIBIT 23.1 Capitalization of Earnings Versus Excess Earnings

The adjusted tangible net assets of the practice have previously been determined to be approximately \$259,000. If this amount was placed in an investment with similar risk as the components of these net assets, a certain amount of income would be generated, regardless of whether the business was operating. For this reason, the goodwill calculation requires the return on the net assets to be removed because the income that would be generated from an alternative investment would not be part of the intangible value of the practice.

According to our research at the valuation date, corporate bonds (Aaa) were paying 7.96 percent, on average. A reasonable rate of return on the net assets would be 12 percent, in light of the fact that the net assets are not highly risky, but are riskier than Aaa corporate bonds. This results in excess earnings being calculated as follows:

Normalized Economic Income	\$148,135
Return on Net Assets (\$259,000 × 12%)	31,080
<b>EXCESS EARNINGS</b>	<b>\$117,055</b>

Capitalizing excess earnings (pretax) at a rate of 30 percent results in an intangible value (goodwill) of \$390,183 for this practice.

Combining the tangible and intangible assets and liabilities yields the following result:

Assets Other Than Goodwill	\$309,703
Goodwill	390,183
<b>Total Assets</b>	<b>\$699,886</b>
Less: Liabilities	51,118
<b>ESTIMATE OF VALUE</b>	<b>\$648,768</b>
<b>ROUNDED</b>	<b>\$649,000</b>

**CAPITALIZATION OF HISTORIC EARNINGS.** Another method of valuation, which places an emphasis on the earnings stream of the practice, is the capitalization of historic earnings method. This method capitalizes the entire income stream based on the earnings power of the net assets. As such, an appropriate capitalization rate must be selected that would be appropriate for this income stream.

The normalized economic income for the practice was determined to be \$148,135. Capitalizing this amount by 23 percent results in the value of this practice being \$644,065, or \$644,000 rounded.

The example in exhibit 23.1 reflects the fact that there should not be a major difference between the conclusion of value that is derived when using the excess earnings method when compared with the capitalization of earnings method. You should already be familiar with that from previous chapters. However, because most professional practices do not have substantial amounts of assets, most of the income stream will be attributable to the intangible assets of the practice. In these situations, the excess earnings will be very similar to the earnings stream being capitalized in a single period capitalization model. This means that the capitalization rate for the income stream and the excess earnings should be relatively close. In fact, the capitalization rate must be high enough to reflect the risk associated with the income stream being predominantly derived from the intangible assets. They are clearly riskier than the tangible assets.

## Buy-Sell Agreements

Many professional practices have buy-sell agreements in place to avoid fighting over value in the event that a buyout must occur. Many of these agreements contain formulas that have nothing to do with the economic reality of the situation. This frequently causes fights among the owners. The valuation analyst should always read the agreement to determine if there is a mandatory provision regarding the determination of value. He or she must be careful, however, because many times these agreements specify provisions applicable to only certain types of departures by an owner, such as in case of death. In those circumstances, this will have to be the valuation methodology that the valuation analyst will follow. However, in other circumstances, that may not be the case. Also, in certain jurisdictions, these types of agreements will not be considered indicative of value, for example, in a marital dissolution case.

Sometimes, the buy-sell agreement may be the manner in which partners, members, or stockholders come and go on a regular basis from a firm, thereby creating internal transactions or a market for the interest. Revenue Ruling 59-60 tells us to consider (factor number 7) the “sales of the stock and the size of the block of stock to be valued.” Internal transactions may be the best indication of fair market value. However, the valuation analyst must be careful to properly understand the formula contained in these agreements. Many times, they are established to be punitive to owners who leave before retirement, disability, or death. The owners all agree that they do not want to finance each other if they choose to leave the practice and compete with the old firm.

A simple calculation pursuant to a buy-sell agreement is demonstrated in table 23.1. In this example, three owners signed a stockholders’ agreement that included a formula to calculate the value of the dental practice in the event one of the shareholders was bought out.

**TABLE 23.1 Buy-Sell Formula: Value of Dental Associates**

50% gross receipts	\$618,700
Plus:	
Fair market value of furniture and equipment	60,175
Inventory	3,500
95% of accounts receivable	186,909
Less:	
Liabilities	(51,118)
Value of Class A Common Stock	\$818,166
Plus:	
Class B Common Stock*	3,500
<b>VALUE OF PRACTICE</b>	<b>\$821,666</b>
<b>ROUNDED</b>	<b>\$822,000</b>

\* According to the agreement, the Class B stock is to be valued at the price of \$1,000 per share. At the date of the valuation, three and a half shares were outstanding.

## Internal Transactions

The nature of professional practices is such that there are many times when internal transactions can be used to determine the value of a fractional interest in the firm. Many firms have buy-sell agreements that outline how owners will come and go. In certain types of valuations (for instance, divorce), these may not be considered. The valuation analyst should check with the client's attorney about the case law in the jurisdiction where the case is pending. Sometimes, a review of prior transactions can also assist the valuation analyst in estimating the value of the firm, or at least, an interest in the firm. Let's look at an example in which there was a transaction. What happened is illustrated in exhibit 23.2.

### EXHIBIT 23.2 Internal Transaction

**PRIOR TRANSACTION.** As discussed in the "History of the Dental Practice," on January 1, 2016, Dr. Black signed an agreement with Drs. Brown and Green to purchase one third of the dental practice. The terms of the purchase were that Dr. Black would receive a reduced salary (\$85,000 in comparison to \$160,000) for a 7.5 year period. At the end of this period, Dr. Black would own 50 shares of the Class A common stock, or one third of the stock.

In order to determine the value of the dental practice at the time of the buy in, it is necessary to discount the payments (the \$75,000 salary differential) back to the date of the original transaction. At the time of the transaction, low grade corporate bonds (Baa) were paying 6.22%. This transaction is considerably riskier than corporate bonds, so the discount rate used was 10 percent.

The value of a one-third interest in Dental Associates at January 1, 2016 is calculated as follows:

Year	Amount	Discounted at 10 Percent
2016	\$75,000	\$ 71,510
2017	75,000	65,009
2018	75,000	59,099
2019	75,000	53,726
2020	75,000	48,842
2021	75,000	44,402
2022	75,000	40,365
2023	37,500	21,168
Value of one-third interest as of January 1, 2016		<u>\$404,121</u>

The previous exhibit contains a calculation of a one-third interest in the dental practice. The problem that the valuation analyst might face is when using this information to estimate the value of a controlling interest in the practice. In theory, the valuation analyst could add a control premium to the minority result determined, but practically speaking, where would he or she get empirical evidence to support the size of the premium? Years ago, we went to *Mergerstat Review*<sup>®</sup> as a basis of the premium. Today, I would not touch that with a 10-foot pole! Clearly, the public market strategic premiums cannot offer even a little assistance in determining the correct premium for a local dental practice. The valuation analyst has no choice but to be subjective and reasonable.

## External Transactions

Sometimes, instead of there being an internal transaction, the practice may have acquired another practice, or a portion of one, that can be used to determine some formula that can be applied to the entire practice. The valuation analyst should obtain as much information about the acquisition as possible. At a minimum, get the contract, closing documents, financial disclosures made by the seller, and any due diligence performed by the acquirer or the acquirer's accountant. This can assist the valuation analyst in using this data. An example of an acquisition in which there was only limited data supplied by the doctor (nonclient) in a divorce litigation is provided in exhibit 23.3.

### EXHIBIT 23.3 External Transaction

**PURCHASE OF JOHNSON PRACTICE.** In the history section of this report, we discussed Dr. Peters' purchase of Dr. Johnson's practice. Although Dr. Peters did not gain many new patients as a result of this transaction, the transaction itself can be used as a methodology for valuing Dr. Peters' practice.

Dr. Peters bought Dr. Johnson's patient list for \$80 per patient. This did not include any of the other assets of the practice.

Utilizing this methodology results in a calculation of value as follows:

Patient List (\$80 × 4,109)	\$328,720
Other Assets (Net)	41,000
<b>Value</b>	<b>\$369,720</b>
<b>Rounded</b>	<b>\$370,000</b>

## Subsequent Events

This section does not only pertain to professional practices. However, I put it here because I have an example of how it applied in the valuation of a professional practice. In reality, it could have been any kind of business. I have discussed subsequent events in several different places throughout this book. Although valuation, for the most part, is performed based on the events that were *known* or *knowable* by the willing buyer and willing seller, there are many times that subsequent events can act as either the valuation analyst's friend or foe. The Tax Court has been known to look at transactions after the valuation date to test the reasonableness of what the valuation analyst has done. Although I do not agree with the notion of playing Monday morning quarterback, sometimes it is necessary. For example, getting away from the pure standard of fair market value, sometimes the courts are concerned with doing what is *fair and equitable*. If a subsequent event will assist in that regard, the courts have taken advantage of the information. This does not mean that the valuation analyst can bend the rules to fit his or her valuation into the actual results. All I am saying is that in some circumstances, it may be appropriate to consider the subsequent event, and in other circumstances, although the valuation analyst may not choose to rely on it, he or she may want to present it to the court. The valuation analyst should be prepared to discuss the factors that might have caused the subsequent event, like a transaction, to be more or less because of other factors that may have affected the subsequent price that was reached between the parties. Sometimes, we just don't know!

Keep in mind that while there are some court cases that rely on subsequent events, the court has used this information in the spirit of determining whether the valuation analyst should have known that the subsequent event would have taken place. The court has tried to determine whether there was information that should have been *known* or *knowable* by the valuation analyst.

A section from a report where we were court-appointed in a divorce case is contained in exhibit 23.4.

### EXHIBIT 23.4 Subsequent Events

After the date of the filing of the divorce (the effective date of the valuation), Dr. Black decided to leave Dental Associates and open his own practice. The effective date of this dissolution was December 31, 2015.

Under the terms of the dissolution agreement, Dr. Black would open his own office by the end of June 2016. He was permitted to continue seeing his patients at Dental Associates' offices at no cost to him until May 15, 2016. When Dr. Black left, he took approximately 1,100 patient files with him, consisting of approximately \$331,000 of annual revenues. In addition, his assistant followed him to his new offices, and he can pay the periodontist as an independent contractor to come to his office to treat patients, if he wishes.

In return, Dr. Black tendered his stock back to the corporation. No monies exchanged hands as a result of this transaction. Clearly, losing approximately one third of the revenues will have an effect on the value of the practice. This is discussed in more detail below.

**ADJUSTED BOOK VALUE.** Per the terms of the dissolution agreement, Dr. Black will not take any of the assets of the practice with him. Therefore, the adjusted book value remains at \$258,585 or \$259,000 rounded.

**CAPITALIZATION OF HISTORIC EARNINGS.** An analysis was done showing the financial effect of Dr. Black leaving the practice. This new income level was then normalized in a manner consistent with what was done in the "Valuation Calculations" section of this report. This analysis is shown as follows:

2015 Taxable Income	\$ 3,031
Adjustments to 2015 Taxable Income	
Income generated by Dr. Black <sup>1</sup>	(330,810)
Dr. Black's salary	120,027
Assistant's salary	21,368
Supplies <sup>2</sup>	29,800
Lab fees <sup>2</sup>	43,453
Payroll taxes and benefits	14,140
Consulting services <sup>2</sup>	14,453
2015 Income without Dr. Black	\$ (84,538)
Normalization adjustments	
Interest and dividends	(718)
Insurance	8,675
Rent	7,520
Depreciation	8,294
Legal and accounting	10,624
Officers' compensation <sup>3</sup>	75,962
Contributions	263
Normalized Net Income	\$ 26,082

(1) Income as reported on Dental Associates' internal Procedure Analysis Report.

(2) The assumption was made that Dr. Black accounted for approximately one third of these expenses.

(3) Because Dr. Black's salary was added in above, only Dr. Brown's and Dr. Green's salaries were adjusted.

(continued)

**EXHIBIT 23.4 Subsequent Events** *(continued)*

Using the same methodology as used previously in this report, capitalizing normalized net income results in a value of \$113,400.

**VALUE OF THE 50 PERCENT INTEREST OWNED BY DR. GREEN.** After Dr. Black left, Dr. Green then owned 50 percent of the practice, rather than 44 percent. As a result, his interest in the practice is valued at \$129,500 (one-half of \$259,000).

**Author's Note**

The original report also contained a market approach, which was ultimately used in the reconciliation of the values. By removing a chunk of the gross receipts of the practice, an asset-based approach ended up being the highest value. Go figure!

## More About Professional Practice Versus Other Business Valuations

One of the key ingredients to a successful professional practice is the ability of the professional to service and keep the clients or patients happy. There tends to be much more dependence on the professional than in other types of businesses. In that regard, the professional is a *key* person. This does not necessarily mean that there should be a discount associated with that professional, but the importance of this individual to the practice must be considered. During the valuation process, the attributes of the professional must be identified, and there should be a determination about whether or not others in the practice could step in and fill his or her role. Unusual skills, long work hours, large referral base, and other similar factors will certainly affect the valuation, whether it ends up as part of reasonable compensation or built into the discount or capitalization rates.

Another factor that differentiates the professional practice from other types of businesses is the fact that the professional, and in some cases, the firm, must be licensed or accredited. In most instances, the professional practice is subject to standards and possibly ethics that an operating business may not be subject to. For example, as CPAs, we are subject to the rules promulgated by the board of accountancy, or its equivalent, in our state.

One other distinction between professional practices and other types of businesses immediately comes to mind—that is, the method of accounting used to keep the books and records. Most smaller professional practices use the cash method of accounting. This will require the valuation analyst to obtain additional information that may normally be available for other types of businesses directly in the financial statements, for example, accounts receivable or work in progress.

## The Valuation Process

In chapter 3, I gave a general checklist that can be used to assist the valuation analyst in gathering information about general types of businesses. The valuation analyst can adapt that checklist to request items that are more specific to the valuation of different types of professional practices. For example, a document request for a medical practice may request the following items:

- List of items comprising medical supplies inventory (quantity, description, and cost) as of the valuation date.
- Information relating to accounts receivable submitted to a collection agency or law firm.
- List of all personnel broken down by status with the firm and department, among others. For professionals, please indicate specialization, board certifications, and medical school where internship and residency were performed and fellowships were received.
- Appointment books for the past three years.
- List of all hospital affiliations.
- List of all specialties or subspecialties, or both.

For a law firm, the valuation analyst may want to add the following items to the checklist:

- List of all unbilled work-in-process as of the valuation date.
- Schedule of fees billed and collected, broken down by specialty (for example, criminal, municipal, real estate, and matrimonial) for the past three years.
- A schedule of all contingent fees received since the valuation date, for all matters started prior to that date.
- A list of all contingent matters that have not been finalized but that were started on or prior to the valuation date.
- A schedule of all contingent litigation matters for the past three years, indicating fees received, professional hours billed, and costs associated with each suit.
- A schedule of all attorney time written off over the past three years.
- List of all personnel, broken down by status within the firm and department, among others. For professionals, please indicate specialization and the year they were admitted to the bar.

The general checklist can be modified for accounting firms to include the following:

- Schedule of unbilled work-in-process as of December 31, 2011.
- Breakdown of fees billed and collected over the past three years between audit, tax, compilation and review, management advisory services, and all others.

In this chapter, I will demonstrate some of the unique aspects of professional practice reports by showing you sections of reports that contain different types of analyses. Before we get there, however, let's consider the questions that the valuation analyst probably wants to ask at a management interview. A checklist that we have adapted from *PPC's Guide to Business Valuations* is included in exhibit 23.5.

You can tell from the information in exhibit 23.5 that many questions asked in a professional practice valuation are similar, if not the same, as those that are asked in other types of business valuation assignments. However, there are some differences. The balance of this chapter is going to concentrate on those differences. Some of the issues that will be covered include the following:

- History of the practice
- Economy and industry analysis
- Cash versus accrual accounting
- Accounts receivable
- Work-in-process
- Prepaid insurance
- Supplies
- Library costs
- Reasonable compensation

### EXHIBIT 23.5 Professional Practice Questionnaire—Professional Practice Company and Industry Background Information

Practice Name: \_\_\_\_\_

Completed by: \_\_\_\_\_ Date: \_\_\_\_\_

**INSTRUCTIONS:** This form is designed to be used in place of TVA-4 when valuing a professional practice. It covers the data typically needed to obtain an understanding of the professional practice being valued. This information should be obtained through reviewing practice documents and interviewing practice personnel. Many of these questions are general in nature and will not necessarily apply to all professional practices. Answer only the questions that apply to the practice being valued. Some of these questions may be duplicative if a medical or dental profile was filled out (see form TVA-5a).

Document the requested information in the space provided. Attach additional sheets if necessary. If the information is not relevant, write N/A in that space.

7. Has the practice ever had any offers to merge with another practice?

---

---

---

---

**SERVICE MIX**

8. Description of the practice’s service mix (that is, types of engagements, or services performed):

---

---

---

---

9. Breakdown of revenue by service (major services).

Service	% of Revenue	% of Recurring Clients and Patients

10. How diversified is the service mix?

---

---

---

11. Do all revenues depend on the same factors?

---

---

12. Which service area is growing faster? \_\_\_\_\_

The slowest? \_\_\_\_\_

13. Has the practice developed any proprietary products?

---

---

---

---

**EXHIBIT 23.5 Professional Practice Questionnaire—Professional Practice Company and Industry Background Information**

14. Does the practice have patents, technology, or expertise that prevent others from copying the services offered?

---

---

---

---

15. Discuss the practice's research and development efforts, the importance of new products or services, and the annual cost of research and development activities.

---

---

---

16. Are revenues cyclical?

---

---

17. What economic factors (inflation, interest rates, and so on) affect revenue?

---

---

18. Are revenues seasonal?

---

---

19. Describe the practice's client base.

---

---

20. How many clients or patients are seen per week, on average?

---

---

---

21. What percentage are seen in the practice office?

---

---

22. Describe the geographic area that client and patients come from (that is, the approximate mile radius from the office).

---

---

(Adapted from PPC's Guide to Business Valuations, Copyright © 2017 Thomson Reuters. All Rights Reserved. For subscription information, call (800) 431-9025 or visit [tax.thomsonreuters.com](http://tax.thomsonreuters.com).)

(continued)

**EXHIBIT 23.5 Professional Practice Questionnaire—Professional Practice Company and Industry Background Information** *(continued)*

23. How would the geographic area be described (that is, urban or rural, growing or declining, affluent or blue collar, stable or transient)?

---

---

24. Are there any special demographic factors that should be considered such as the age of clients or patients?

---

---

25. How does the practice obtain clients or patients?

---

---

26. What percentage of total clients or patients are the result of referrals?

---

---

27. Of this percentage, how many referrals were from other professionals?

---

---

28. How many referrals were from other clients or patients?

---

---

29. Are referrals to a specific professional or doctor, or to the firm in general?

---

---

---

30. Does any one referral source account for 10 percent or more of the practice revenue? \_\_\_\_\_

---

---

31. Does any referral source account for 5 percent or more? \_\_\_\_\_

---

---

32. Are there any contractual relationships that provide the practice with access to facilities or client referrals?

---

---

---

33. Briefly describe the relationship and the percentage of revenues provided by the relationship.

---

---

---

(Adapted from PPC's Guide to Business Valuations, Copyright © 2017 Thomson Reuters. All Rights Reserved. For subscription information, call (800) 431-9025 or visit [tax.thomsonreuters.com](http://tax.thomsonreuters.com).)

**EXHIBIT 23.5 Professional Practice Questionnaire—Professional Practice Company and Industry Background Information**

34. Does the practice maintain records to track the source of client or patients?

---

---

---

35. Does the practice advertise? Describe marketing methods, if any.

---

---

36. What is the annual cost of marketing and practice development efforts, including travel and entertainment costs relating to entertaining referral sources or potential clients?

---

---

---

---

---

**COMPETITION**

37. Who are the practice's major competitors? Where are they located? How big are they? How diversified are they?

---

---

---

---

---

38. How does the practice compare in size to its competitors?

---

---

---

---

39. How easy is it to enter the profession? What are the barriers to entry?

---

---

---

40. What are the practice's competitive strengths and weaknesses?

---

**OPERATIONS**

41. Describe the practice's organization structure. (Attach organization chart, if available.)

---

---

---

---

42. As of the valuation date, what are the weekly business hours for the practice?

---

43. How often does the practice bill? Describe the basis for fees, that is, hourly charge, fixed fee, cost plus, fee schedule, and so on. Provide a copy of the fee schedule, if available.

---

---

---

44. What is the balance of unbilled work in process? How much of this balance is collectible?

---

---

---

45. Does any of the work in process represent contingent fees? If so, what percentage?

---

---

46. Complete the following if the information is available:

Service	Gross Fees	Write Down	Net Fee	Paid by Insurance	Paid by Client or Patient	Write Down
<b>TOTAL</b>						

47. What is the practice's percentage of collectibility for accounts receivable?

## History of the Practice

A well-written, comprehensive valuation report will generally contain a lot of information in it. I discussed the features that should be in a report in chapter 17. In a professional practice valuation assignment, there is frequently information about the type of profession that is not only important to demonstrate an understanding about the firm but can also substantially affect the value conclusion. Let's highlight some history sections that would be different depending upon the type of practice being valued. The purpose of the following exhibits is to demonstrate some of the important information that the valuation analyst needs to be concerned with for various professional groups.

Let's start with an accounting practice. In addition to obtaining the normal stuff for inclusion in the history of the company section, accounting practices need to be distinguished from other types of businesses based on the types of services that they provide to their clients. A firm with traditional accounting services will more often be sold at a higher rate than a firm that does more management consulting, or one-shot engagements. Several excerpts from the history sections of various reports are included in exhibit 23.6.

### EXHIBIT 23.6 History Section—Accounting Practice

#### Excerpt 1

All the clients of the firm came from relationships developed by the principals of John Smith & Company. Many times, the relationship was established long before any services were provided. Although the senior Mr. Smith was responsible for many of these personal relationships, both Mr. Jones and Mr. Smith Jr. (Bob) had taken over client development and relationship building over the several years prior to the valuation date. Much of this relationship building has been through community affairs in which the firm's principals are involved.

By 2016, the firm's revenues were broken down as follows:

Audit	\$450,971	44.2%
Tax	303,915	29.8%
Compilation and Review	147,055	14.4%
Other Services	117,539	11.6%
	<b>\$1,019,480</b>	<b>100.0%</b>

A detailed analysis was conducted by the valuation analyst, on a client-by-client basis, indicating that approximately 70 percent of the firm's revenues came from 30 clients in 2016. Many of these clients have been, and continue to be, served primarily by Bob Smith and Michael Jones. These relationships are key to the generation of revenues.

#### Author's Note

Not only did we address the breakdown of the services, but we also addressed who services the clients and how the relationships were built. We also looked at the risk of concentration of the client base. In another valuation, the same information looked like this:

#### Excerpt 2

The practice is a conventional accounting firm whose net revenues over the last three years have been derived from the following services:

	2014	%	2015	%	2016	%
Audit	\$ 37,385	10.9	\$ 27,956	8.0	\$ 39,737	11.2
Review	4,866	1.4	5,129	1.5	4,982	1.4
Compilation	52,391	15.3	56,890	16.3	55,628	15.7
Tax	244,492	71.4	254,794	73.1	251,603	70.8
Other	3,372	1.0	3,732	1.1	3,268	0.9
<b>TOTAL</b>	<b>\$342,506</b>	<b>100.0</b>	<b>\$348,501</b>	<b>100.0</b>	<b>\$355,218</b>	<b>100.0</b>

The importance of the information contained in exhibit 23.6 should be self-explanatory to the accountants reading this book who have bought or sold an accounting practice. The type of services offered to clients makes a big difference. Not only are different amounts paid for different types of clients, but the risk profile regarding the transferability of the clients also needs to be considered.

Just as the various types of services are important to an accounting practice, a medical practice has certain attributes that are important, as well. Some examples of these are included in exhibit 23.7.

### EXHIBIT 23.7 History Section—Medical Practice

#### Excerpt 1

One of the services historically offered by the practice has been x-rays. However, in 2015, two events occurred that will eliminate this revenue stream. First, many of the insurance companies have stated that specialists other than approved radiologists will not be reimbursed for these services.\* Second, the x-ray machine is located in a medical office down the hall from the practice. This other medical practice has notified Dr. Smith that as of May 2015, they will no longer have space available for the x-ray equipment. Dr. Smith has determined that it does not make financial sense to attempt to relocate the x-ray machine in light of the lack of future reimbursements from the insurance companies; therefore, it is discontinuing this service. Collections from x-ray services were \$74,145 and \$67,593 in 2013 and 2014, respectively.

\* This was confirmed by the valuation analyst by making phone calls to various health maintenance organizations.

#### Author's Note

Another item of importance in a medical practice is the hours that the office is open, the hours that the doctor works, and the hours that the doctor sees patients. This information will allow the valuation analyst to compare this practice to other practices based on the studies published by the American Medical Association (AMA).

#### Excerpt 2

Dr. Smith typically sees patients during the following hours:

Monday	8:00 a.m.–5:00 p.m.
Tuesday	8:00 a.m.–7:00 p.m.
Wednesday	8:00 a.m.–5:00 p.m.
Thursday	8:00 a.m.–5:00 p.m.
Friday	8:00 a.m.–5:00 p.m.
Saturday	8:00 a.m.–12:00 p.m.
	(every third Saturday)

(continued)

**EXHIBIT 23.7 History Section—Medical Practice** *(continued)*

Dr. Smith's hours often start earlier than his patient hours for paperwork and other administrative activities. On average, Dr. Smith sees approximately 20 patients per day. However, the number of patients seen per day varies with respect to the type of patient (new versus return). Appointments with new patients, on average, last approximately 45–60 minutes, whereas appointments with return patients last approximately 15 minutes. The fees for new patients range from approximately \$100–\$150. According to an estimate by Dr. Smith, the practice currently has between 750 and 800 active individual patient files.

 **Author's Note**

No medical practice valuation would be considered complete without a discussion about health maintenance organizations (HMOs). Managed care is an important part of a medical practice valuation because it can severely affect the future cash flows. The valuation analyst should find out about the different types of contracts in place at the valuation date. Are they capitation plans (the doctor is paid so much per month per patient, regardless of whether they come in for an appointment) or are they fee-for-service (pay as you go type practice)? Let's look at what we found out.

*Excerpt 3*

According to Dr. Smith, the practice maintains approximately 10 health maintenance organization (HMO) contracts. Dr. Smith's practice primarily consists of Medicare patients, many in HMOs, with the balance consisting mostly of patients who are enrolled in HMOs. Given the nature of the practice, Medicare and HMO reimbursement rates are a critical factor in its financial performance. According to Dr. Smith, these contracts can be canceled with 30 days' notice, and most of the practice's new patients are as a result of Dr. Smith being listed as a specialist in the HMO provider books. This can be problematic though because many internists also provide rheumatology services, and they are generally listed as primary care providers in the HMO books. This makes the practice reliant on referrals from these primary care physicians who can often treat these patients, as well.

 **Author's Note**

In another medical practice valuation, we were able to get more information about managed care. This is how it was presented.

*Excerpt 4*

We requested a list of the managed care companies that Dr. Peters had contracts with as of the valuation date, but this information was not available. Instead, we were provided with an assortment of lists and contracts for various times during 2016. We were informed that this information is not substantially different than what existed as of the valuation date. A summary of this data appears in table 1.

**EXHIBIT 23.7 History Section—Medical Practice****TABLE 1 Managed Care Contracts**

Company	Date	Type of Contract	Number of Patients	Capitation Amount
Blue Cross/Blue Shield of NJ	Oct. 2015	Fee for Service	495	N/A
Mercy Health Plan	Nov. 2015	Capitation	57	\$ 942.96
The Prudential	Oct. 2015	Capitation	233	3,122.45
Aetna U.S. Healthcare	Nov. 2015	Capitation	326	Not Provided
NY/Care	Oct. 2015	Capitation	48	412.02
Keystone	Nov. 2015	Capitation	15	261.95

In addition, Dr. Peters has submitted applications to the following companies over the last few years:

- First Option Health Plan of New Jersey
- Seton Health Network Inc./Quality Pediatric Network
- Medicochoice Network Inc.
- First Option Health Plan/Medicaid
- Better Health Advantage
- Consumer Health Network
- Sanus Health Plan/New York Life
- Liberty Health Plan
- Metrahealth
- International Union of Operating Engineers
- QualCare
- Harmony Health Plan

The applications and contracts we reviewed for these companies do not provide enough detail to determine the type of contract it is, the reimbursement rates, the number of patients, or if Dr. Peters was participating in the plan as of the valuation date. What it shows is that the list provided in table 1 is probably not complete.

Unfortunately, because of the litigation process, we do not always get all the information that we ask for. The last excerpt in exhibit 23.7 demonstrates that. In situations like this, the valuation analyst has to make a judgment call concerning whether the missing information will have a material effect on the outcome of the valuation. If it does, DO NOT ISSUE A REPORT! Have I made my point? If the valuation analyst does not have enough information to provide a reasonable indication of value and he or she does not care about his or her reputation, the valuation analyst can issue a report. If the information is not material, the valuation analyst can use his or her judgment by adjusting the risk associated with the practice. In the example presented, we lowered the discount rate slightly to reflect the fact that the practice probably had contracts that we were not told about. This would have the impact of reducing the risk and raising the value (slightly).

Before we change topics, let's also discuss a situation that valuation analysts face on a regular basis if they are preparing a valuation report for a divorce. This could have gone in the divorce chapter, but because my example relates to a medical practice, it's here. Imagine valuing a pain management practice in which the doctor claims that his income has gone way down because of Medicare cuts that have eaten away at his ability to make a living (poor, poor doctor!). We call this *RAIDS* (Recently Acquired Income Deficiency Syndrome). A portion of the report of this poor doctor's practice is shown in exhibit 23.8.

### EXHIBIT 23.8 The Poor Doctor Who Was Hurt By Medicare

Historical revenues for the practice have been as follows:

Year	Revenue	Growth
2009	\$2,013,836	
2010	2,437,418	+21.0%
2011	2,767,860	+13.6%
2012	2,998,560	+8.3%
2013	3,508,022	+17.0%
2014	4,759,452	+35.7%
2015	6,723,193	+41.3%
2016	7,891,141	+17.4%
<b>Simple Average</b>		<b>22.0%</b>
<b>Compound Annual Growth Rate</b>		<b>21.5%</b>

The practice has experienced dramatic growth over this seven-year period. After analyzing the annual growth, it does not appear that growth came solely from adding doctors. Even before Dr. Jackson joined the practice in mid-2013, the growth in revenues was still in the double digits. After all four doctors were in place in 2014, the practice experienced a staggering 41 percent increase in 2015. Historical revenues are depicted graphically in figure 1.

**EXHIBIT 23.8 The Poor Doctor Who Was Hurt By Medicare** *(continued)***Figure 1 Revenues**

In Dr. Brown's deposition, the topic of Medicare reimbursement was discussed numerous times.<sup>1</sup> In every instance, Medicare reimbursements were described as going down. In fact, Dr. Brown stated that "we've seen a drop everywhere from Medicare" for "every code we do" and "there's been cuts every year." As for health insurance reimbursements, Dr. Brown states "every time Medicare drops, they drop."

The practice provided us with the list of CPT codes that it uses. In order to analyze the impact on the practice of the reimbursement rates, we reviewed the reimbursement rates for these codes since 2011.

This analysis is reflected in table 5 on the following page.

<sup>1</sup> Deposition of Dr. Brown January 3, 2017, pgs. 7, 37, 41,42, 51; February 14, 2017, pgs. 202, 203, 204.

**EXHIBIT 23.8 The Poor Doctor Who Was Hurt By Medicare** *(continued)*

The data in table 5 reflects the year-to-year volatility of the reimbursement rates from Medicare.

During Dr. Brown's deposition (January 3, 2017), he indicated that there are a number of CPT codes that are the most commonly used by the practice. We had requested a breakdown of the number of procedures broken down by CPT code, but we were told that the practice's computer systems could not generate the requested report. This is fairly unusual because we generally get this report from almost every practice we value. Despite not having the report, we used the CPT codes that Dr. Brown testified about to test the reimbursement rates for those items. This appears in table 6.

**TABLE 6 Commonly Used CPT Codes Per Dr. Brown**

CPT Code	2011	2012	2013	2014	2015	2016	2017	2012 Change	2013 Change	2014 Change	2015 Change	2016 Change	2017 Change
20552	—	67.43	55.69	59.82	59.55	59.59	55.53		-17.41%	7.42%	-0.45%	0.07%	-6.81%

<b>AVERAGE</b>								<b>-3.14%</b>	<b>4.27%</b>	<b>1.87%</b>	<b>12.96%</b>	<b>0.32%</b>	<b>-10.51%</b>

*(continued)*

**EXHIBIT 23.8 The Poor Doctor Who Was Hurt By Medicare** *(continued)*

The volatility reflected in these CPT codes is even greater than what was shown in the previous table. However, despite the changes in the reimbursement rates, the practice has experienced extraordinary revenue growth over the past five years. The comparison is shown in table 7.

**TABLE 7 Year-To-Year Change**

Year	CPT Code Reimbursement	Most Used CPT Code Reimbursement	Actual Revenues
2012	-4.0%	-3.1%	+8.3%
2013	+6.9%	+4.3%	+17.0%
2014	+7.2%	+1.9%	+35.7%
2015	+6.5%	+13.0%	+41.3%
2016	+1.1%	+0.3%	+17.4%

The year-to-year percentage change for both revenues and reimbursements are depicted graphically in figure 2.

**Figure 2: Year-To-Year Change****Economy and Industry Information**

Besides the normal economy and industry stuff, sometimes there may be provisions in state laws that are unique to a professional practice. Sometimes it may be regulatory issues that the valuation analyst would not even think about in the normal course of his or her research. One of those cases is illustrated in box 23.1.

**BOX 23.1** Economy and Industry Section—Accounting Practice

In the state of Arkansas, there are two major acts that affect an accounting practice. The Arkansas Professional Corporation Act, which was passed in 1963, provides regulations that are designed for those who provide *professional services*, which includes CPAs. This act states that the officers, directors and shareholders of a corporation must be licensed in their profession. In addition, the act includes regulations for the purchase of stock in a corporation. The act states:

If the articles of incorporation or bylaws of a corporation subject to this subchapter fail to state a price or method of determining a fixed price at which the corporation or its shareholders may purchase the shares of a deceased shareholder or a shareholder no longer qualified to own shares in the corporation, then the price for the shares shall be the book value as of the end of the month immediately preceding the death or disqualification of the shareholder. Book value shall be determined from the books and records of the corporation in accordance with the regular method of accounting used by the corporation.

In addition, the Arkansas Public Accountancy Act of 1975 presents other regulations for the accounting industry. The purpose of this act was to “promote the dependability of information...” that is provided by the financial and accounting sectors regarding the financial condition of business enterprises. In other words, this act is intended to set standards for those providing accounting and financial services to the public, and to ensure the public that the information is fair, reliable, and that the service was performed by a competent individual. This act also states:

Each shareholder of the corporation must be a certified public accountant or a public accountant of this state in good standing and must be principally employed by the corporation or actively engaged in its business.

 **Author's Note**

The importance of these provisions was that the law required individuals to be licensed and actively engaged in the business. It also provided a formula to determine value under certain conditions. These are the types of provisions that a valuation analyst should locate or the valuation may be performed in contradiction to the law.

## Cash Versus Accrual Accounting

As an accountant, I would like to have all financial statements presented to me in accordance with generally accepted accounting principles. I would like to have these statements prepared on an accrual basis of accounting. I would also like to see Santa Claus come down my chimney! Life is not always that simple, and I frequently do not get what I want. Most professional practices report their financial results on a cash basis. If you are reading this book, I hope it is because you consider yourself to be a valuation analyst (or at least a wannabe). Having financial statements prepared on a cash basis, in many circumstances, should not be too upsetting. Be practical, and unless it is really called for, do not try to restate all the prior years on an accrual basis. There is a good chance that the information does not exist to allow this to be done easily and in a cost-effective manner. Think about the effect on these statements.

Not that I want to give a lesson in accounting, but I think I better explain where I am going with this stuff. First of all, as I hope the valuation analyst already knows, the concept behind the accrual method of accounting is to provide an appropriate matching of revenues and expenses to the time period in which they belong. For example, under the accrual method of accounting I would record revenues in the period that I provide the service (and bill my client), rather than when I collect the fees. This is just simply a method to make sure that the revenues are recorded when earned, rather than when collected, and expenses are recorded when incurred, rather than when paid.

Now, with that said, many professional practices do not use the accrual method of accounting because they do not want to pay income taxes on revenues that they have yet to collect. Therefore, the financial statements will exclude uncollected revenues. The expenses are frequently not as much of a problem, particularly at the end of a fiscal year, because most professional practices will accelerate the payment of every expense that can be found so that it can take advantage of the tax deduction for those expenses. There may be some

unpaid bills during an interim valuation date, but generally, they are not material (materiality is another accounting concept—I love speaking accounting speak!). If the revenues (and expenses) are omitted from the financial statements of the professional practice, there could be a misstatement of the *true* net income for the period. Many valuation analysts, particularly accountants, try to restate all the financial statements on an accrual basis to gain better accuracy. What I am really saying is that it just may not matter. If the valuation subject is a relatively mature practice, the impact of the change between the beginning and ending accounts receivable and accounts payable may be so insignificant that adjusting these items may result in higher fees being charged to the client than the impact on the valuation.

Clearly, the balance sheet should be restated to an accrual basis as of the valuation date in order to capture all the assets and liabilities of the practice. You can use the same techniques that I discussed in chapter 11 to adjust the balances to fair market value. The income statement may or may not be adjusted. If there is a consistent trend in the practice, cash basis probably is a good reflection of the cash-generating capabilities of the practice. This is the basis on which these practices are frequently sold. The accrual assets and liabilities are not usually part of the selling price of the practice. The seller keeps the accounts receivable and the liabilities are also his or her responsibility. Therefore, the buyers are really buying the cash flow stream based on collections. Let's face it—this is all we really care about anyway: How much do I expect to collect? An alternative to converting the financial statements to an accrual basis is to treat the accrual assets and liabilities as non-operating assets and liabilities (not in the traditional definition of non-operating but, rather, as *excess or omitted* assets and liabilities), and add or subtract the values from the income or market approach determination of value based on the cash basis figures.

Because the valuation analyst wants to ensure that his or her valuation is reasonably accurate, he or she can make sure to review the billing records of the practice to ensure that the future cash flows will not suddenly change dramatically. The most current time period before the valuation date is most important. Let's say the valuation analyst is valuing an accounting practice. Look at billings and work-in-process to determine the future. In a mature practice with a steady number of staff, these figures should not change materially from year to year. A staff person can only work so many hours each year. Therefore, the billing should be consistent, other than a possible change in billing rates.

Looking at a medical practice, however, is a totally different thing. Billings may be great, but it is really collections that are important. It is not uncommon to see certain types of medical practices collecting only a small fraction of what they bill. Insurance companies, Medicare, and Medicaid love to beat up doctors. The valuation analyst must be aware of any potential changes to the reimbursement policy that will have a large impact on future cash flows.

Because the balance sheet is probably more important than the income statement for these additional assets and liabilities, let's discuss what to do with several types of assets and liabilities for different types of professional practices.

## Accounts Receivable

The nature of most professional practices is that accounts receivable can be fairly high. The valuation analyst must spend an appropriate amount of time in this area because of its magnitude. In most smaller practices, the record keeping may require the valuation analyst to use some accounting skills to figure out how much is outstanding. How we dealt with accounts receivable in the valuation of a psychology practice is shown in exhibit 23.9.

### EXHIBIT 23.9 Accounts Receivable—Psychology Practice

Dr. Lewis submits insurance claims to insurance companies once each calendar quarter. By the time he submits these claims, it is not uncommon for an additional three to four weeks to go by, resulting in accounts receivable and unbilled work-in-process equaling four months of revenue.

In order to estimate the value of this asset as of October 29, 2016, a review of patient charts and appointment books indicated that billing for the period July 1, 2016 through September 30, 2016 was submitted to insurance companies in October 2016 and billing was not done for the period October 1, 2016 through October 29, 2016 until January 2017.

Accounts receivable and unbilled work-in-process has been estimated by the valuation analyst as follows:

Number of Patient	Visits
July	177
August	194
September	182
October 1–29	191
<b>Total Visits</b>	<b>744</b>
<b>Average Fee</b>	<b>× 85</b>
<b>Accounts Receivable and Unbilled Work in Process</b>	<b>\$ 63,240</b>

Most patients are billed at \$100 per hour, but Dr. Lewis's practice has generally accepted insurance assignment without pursuing the balance. A review of the patient files indicates some patients are billed as low as \$45 per hour and others at \$80 to \$90 per hour. Most patients who have insurance (which is the majority of the patients) are covered after their deductible at 50 percent, 80 percent, or 100 percent with the majority being covered at 80 percent.

Therefore, in order to compensate for the monies that will not be received by Dr. Lewis, the normal hourly rate of \$100 was reduced by 15 percent.

The information in exhibit 23.9 shows the manner in which the records were used to estimate the accounts receivable. Under normal circumstances, this balance sheet item would have been tax affected to recognize that upon receipt, the value will be less because taxes would have to be paid.

The example in exhibit 23.10 illustrates accounts receivable with tax affecting for a law firm valuation.

### EXHIBIT 23.10 Accounts Receivable With Tax Affecting For A Law Firm

As of the valuation date, total accounts receivable is reflected in XYZ's records as follows:

0–30 days	\$ 637,577	39.31%
31–60 days	184,070	11.35%
61–90 days	152,984	9.43%
91–120 days	70,074	4.32%
121 + days	577,184	35.59%
<b>Total</b>	<b>\$1,621,890</b>	<b>100.00%</b>

(continued)

### EXHIBIT 23.10 Accounts Receivable With Tax Affecting For a Law Firm *(continued)*

As with any professional practice, accounts receivable is rarely 100 percent collectible. In fact, over 35 percent of XYZ's accounts receivable have been due for more than 120 days. Because fairness is the desired result of this valuation, we requested that an analysis be performed to determine how much of the total amount has not been collected. To date, this amount is \$321,438. Therefore, collectable accounts receivable is deemed to be \$1,300,452.

Once the accounts receivable are collected, the partners will have to pay income taxes because these accounts represent future revenues of the firm. Therefore, a reduction by an estimated federal and New Jersey tax of 40 percent is deemed appropriate. Therefore, accounts receivable, at net realizable value, amounts to \$780,271.

### Work-in-Process

Probably one of the most difficult assets to value on the balance sheet of a professional practice is work-in-process. Unless the firm keeps really good records, this can be pretty tricky. The worst type of practice for valuing work-in-process is a contingent fee law firm. Many law firms that perform personal injury services or other services where they are paid a percentage of what they collect for the client do not keep time records to support the number of hours worked. After all, they feel that because their fee is based on a percentage of collection, instead of hourly billings, they do not have to account to the client for the hours spent on the client's matter.

If the law firm does not keep adequate records, the valuation analyst can estimate the work in process by using comparative data published by such companies as Altman Weil Pensa, which publishes the *Survey of Law Firm Economics* on an annual basis. The best that the valuation analyst can do in these circumstances is to use an industry average as a percent of revenues or billings. However, when records do exist, the valuation analyst may be able to perform some detailed analysis. Sometimes, 20-20 hindsight may have to be used even though the valuation analyst is not supposed to use subsequent information. Sometimes the parties to a litigation will agree, for the sake of accuracy, to allow both sides to use data after the valuation date. The alternative would be to hire an experienced attorney to review all open cases and estimate the value of these files. This is impractical for a firm that has more than just a few cases, not to mention The Court might consider this approach to be speculative and disregard it.

Part of the valuation of a contingency fee law firm is contained in exhibit 23.11.

### EXHIBIT 23.11 Work-in-Process—Contingent Fee Law Firm

One component that is normally part of the balance sheet of a law practice is work-in-process. Work-in-process is an estimate of the future profit (revenues less direct expenses) anticipated to be earned on cases that are pending, but not completed, as of the balance sheet date.

In order to value work-in-process, the services of an experienced personal injury attorney would normally be required so that each file could be reviewed to answer at least the following questions:

1. How much will the case be worth?
2. What stage of completion is the case in?
3. What expenses will be incurred to complete the case (direct and indirect)?
4. How long will the case take to go to trial?
5. If it is a large case, what is the probability of the judgment being appealed?

Fair market value generally requires the valuation analyst to only consider information that would be available to the willing buyer at the valuation date. This date is the assumed date of a transaction; therefore, subsequent knowledge would not be available.

**EXHIBIT 23.11 Work-in-Process—Contingent Fee Law Firm**

However, this valuation is being performed for a marital dissolution. As such, the notion of fairness must enter into the valuation analyst's analysis so that The Court can be assisted in effectuating equitable distribution. Because we have the benefit of 20-20 hindsight in this matter, the valuation analyst has reviewed subsequent information to get a more accurate value of the work-in-process. This procedure is not only more equitable, but it is also more cost effective than bringing in a personal injury attorney to go through hundreds of files.

In order to determine the value of work-in-process, we were provided with records pertaining to the practice's clients, including case logs, case files, client ledger cards, closing statements and records of trust account cash receipts, and cash disbursements. The starting point was to review the case logs maintained by the practice. The law firm maintains a list of cases retained by the practice, which includes, among other information, the client's name and case number. We obtained the case logs for all cases retained from 2003 through May 10, 2008. Because this case log includes all cases opened by the practice during this time period, it was necessary to determine which cases were closed as of May 10, 2008, and which cases remained open as of this date, which need to be included as part of work-in-process. In order to determine the closing date of each individual case, we traced the client's name and case number to client ledger cards and case files. All cases remaining open as of May 10, 2008 were included in our schedule of work-in-process.

The next step was to trace all the open cases to the corresponding closing statements. As cases are settled, a closing statement is prepared by the practice that indicates the date the gross settlement was received, the total costs to be reimbursed out of the settlement, and the attorney's fees to be deducted from the settlement, resulting in the net amount payable to the plaintiff. Closing statements are prepared for every case settled by the practice, with the exception of workman's compensation and personal injury protection cases. As of the date of our field work, which was completed on February 29, 2011, many of the cases that were open as of May 10, 2008 had been closed. For all the cases that were closed and that had closing statements prepared, we traced the gross fee earned by the practice, the total costs reimbursed out of the gross settlement on the case, the date the gross settlement was received and the case closed, and the type of case. Recording the type of case enabled us to segregate work-in-process by major case types.

In several of the cases included in work-in-process, the law firm was required to split the gross fee earned with co-counsel. Because the actual fee earned by the law firm only represents a portion of the gross fee earned on a case, these co-counsel fees must be deducted in determining the fee that the law firm will ultimately collect. In addition, certain costs reimbursed to the practice were required to be split with co-counsel. A summary of the co-counsel fees and costs that were deducted from the gross fees and costs in the calculation of gross fees and reimbursed costs of the practice is provided in table 5.

**TABLE 5 Co-Counsel Fees and Costs Deducted from Work-in-Process**

Case #	Party Name	Co-Counsel Fees and Costs
200568	Singer, Z	\$ 12,422
200585	Jones-Gilmore, L.	1,727
200538	Carr, M.	693
200540	Iannou, P.	99,247
<b>TOTAL</b>		<b>\$114,089</b>

(continued)

**EXHIBIT 23.11 Work-in-Process—Contingent Fee Law Firm** *(continued)*

The total fees earned by the law firm and costs reimbursed to the practice on cases open as of May 10, 2008, and closed as of February 29, 2011, are summarized in table 6.

**TABLE 6 Cases Closed as of February 29, 2011**

Case Type	# of Cases	Actual		Average	
		Fees	Costs	Fees	Costs
Auto	160	\$1,492,745	\$112,827	\$ 9,330	\$ 705
PIP	36	33,080	5,592	919	155
Premises	52	479,910	87,206	9,229	1,677
Worker's Comp.	32	24,939	668	779	21
Environmental	2	290,055	100,500	145,028	50,250
Other	15	72,618	5,438	4,841	363
<b>TOTALS</b>		<b>\$2,393,347</b>	<b>\$312,231</b>		

The data in table 6 indicates that the majority of the fees earned by the practice are from automobile liability cases. We have calculated the average fees and costs per case for each of the major categories of cases conducted by the practice. It can be seen that both automobile and premises cases\* make up approximately two-thirds of the total cases in work-in-process and average approximately \$9,000 per case in fees earned.

The next largest portion of cases handled by the practice are personal injury protection and worker's compensation cases. These cases are much less profitable, averaging under \$1,000 per case. Environmental cases, by far, earn the largest fees, however, these cases generally take a much longer amount of time to complete.

This data in table 6 provides a starting point for valuing the work-in-process for cases that have been closed subsequent to May 10, 2008. However, there are additional factors that must be considered before the fair market value can be determined.

The more difficult part of the assignment is to value the cases that remain open as of the end of our field work on February 29, 2011. This was accomplished based on our analysis of the cases which have been closed, reviewing open case files, and discussions with management. A summary of the cases still open as of February 29, 2011 is provided in table 7.

\*These cases are also referred to as "slip and fall" cases.

**EXHIBIT 23.11 Work-in-Process—Contingent Fee Law Firm****TABLE 7 Cases Still Open as of February 29, 2011**

Case #	Party Name	Type	Estimated	
			Fees	Costs
200637	Brooks, J.	A	\$ 9,330 <sup>5</sup>	\$ 705
200360	Rencevicz, D.	MISC	12,500 <sup>1</sup>	—

E-999	Flood	ENV	— <sup>6</sup>	—
E-343	Gormley	ENV	— <sup>7</sup>	—
<b>TOTALS</b>			<b>\$61,647</b>	<b>\$6,910</b>

- The average fee earned on a worker's compensation case is only \$779. According to Mr. Gravitz, this case is likely to settle for an amount substantially more than the average. Mr. Gravitz has estimated that the fee earned on this case could be as high as \$14,000. Of this amount, \$1,500 is expected to be paid to co-counsel.
- According to Mr. Gravitz, both of these cases are likely to be limited by the lawsuit threshold. Because these cases are below the lawsuit threshold, it is highly unlikely that a fee will be earned.
- These cases have been settled as of February 29, 2011, however, closing statements were unavailable. Based on our discussions with Mr. Gravitz and a review of correspondence pertaining to the cases, we believe that these fees will be earned by the law firm.
- According to Mr. Gravitz, a tentative settlement has been reached in this case for \$15,000, of which the law firm will get 25 percent.
- For each of these cases, this valuation analyst has used the average fees earned per case type in order to determine an approximate fee that will be earned by the practice. Mr. Gravitz provided us with his estimate of the fees that could be earned on each of these cases. For each case, the expected fee was in line with the average fees indicated in table 6.
- This environmental case was substantially complete as of May 10, 2008, however, remained open, pending further litigation. Per discussions with Michael Gravitz and a review of case documents, it appears unlikely that any additional fees will be earned. All other fees earned in this case were collected prior to May 10, 2008.
- An inquiry was made to Michael Gravitz about this case in the beginning of 2008. It was eventually sent to another law firm. Per discussions with Michael Gravitz and a review of the case files, it appears likely that there may not be a fee earned on this case. It would be highly speculative to estimate a fee at this point in time.

The costs associated with each of the cases in table 7 were estimated based on the average cost per case type provided in our analysis in table 6.

In order to determine the completeness of work-in-process, we performed several additional procedures. The first procedure was to review the cash receipts and cash disbursements records from the practice's trust accounts to determine if any cases appeared on those records that were not included in the case logs.

(continued)

**EXHIBIT 23.11 Work-in-Process—Contingent Fee Law Firm** *(continued)*

All cases appearing on the cash receipts and cash disbursements ledgers were found in the case logs.

We also reviewed all the 2008–2010 closing statements, looking for cases that were closed after May 10, 2008 that may have been left off of work-in-process. Several cases were identified, which were not included on our schedule; however, upon further review of case records, it was determined that all of these cases were not started until after May 10, 2008. Therefore, they were properly excluded from our schedule of work-in-process.

As a final test, we reviewed subsequent cash receipts records for the practice's trust account. On a test basis, we selected cash receipts subsequent to May 10, 2008 and traced the receipt amounts, case number, and client name to our work-in-process list in order to ensure that no receipts came into the practice for cases that were not included in our schedule. For all receipts that could not be traced into our schedule of work-in-process, we reviewed the corresponding closing statements in order to verify that the cases were not started until after May 10, 2008, and were properly excluded from our schedule of work-in-process.

Once the preliminary work-in-process figures were derived, three additional steps were necessary to reach the fair market value. These steps were as follows:

1. Apply an overhead factor. Because ongoing overhead would be required after the appraisal date to allow the firm to generate the ultimate fees collected, consideration should be given to the costs associated with the collection process. This included direct out-of-pocket expenses for experts, salaries for lawyers to bring the case to trial, and other overhead costs associated with keeping the practice running.
2. Tax affect the work-in-process. Because the work in process will ultimately turn into profit for the firm, taxes should be calculated because they will ultimately be paid (either by the firm or by the individuals in the form of extra compensation).
3. Calculate the present value of the net profit after taxes. Because the work-in-process will not be collected for a period of time after the valuation date, the time value of money should be considered.

In order to apply the preceding three steps to this assignment, we started with the determination of an appropriate overhead rate to apply to the work-in-process. Previously, we calculated the normalized net income before taxes for the practice. These figures were \$52,187 and \$103,216, for 2006 and 2007, respectively. To determine the value of work-in-process, we have to determine the total overhead that is attributable to work-in-process. Our review of Schedule 2, in the back of the report, indicates that only two items require further adjustment for this purpose. Eliminating advertising expense, which is a prospective type of expense, and meals and entertainment, which may or may not relate to the work-in-process, results in a revised normalized net income attributable to work-in-process of \$106,320 and \$147,577 for these two years.

Applying a weighted average to the most recent year indicates that the law firm's normalized overhead rate is approximately 88.7 percent. This means that for every \$1 of revenue, it costs the firm 88.7 cents. Historically, the law firm has been considerably less profitable than other law firms. However, the reality is that the firm does not generate extraordinary profits.

The next consideration is the manner in which to apply the overhead factor. We have performed an analysis based on the amount of time that each file was open. Based on our discussions with not only Mr. Gravitz, but also our past experiences with other attorneys regarding similar matters, we have applied the overhead based on the allocation that 50 percent of the expenses are incurred in the last six months of the case; 25 percent of the expenses are incurred during the period between six months and one year of the end of the case; and the balance of the expenses are spread evenly during the remainder of the time that the case stayed open.

In order to perform the necessary calculations, we set up a computer model based on the parameters discussed previously. The results appear as schedule 3 at the back of the report. Using a burden rate of 88.7 percent results in an estimate of the expenses incurred after the valuation date to be \$1,298,994. This results in the profit portion of work-in-process attributable after the business valuation date to be \$975,301.

Applying a 35 percent tax rate and taking the present value of the net income from the date the file was closed to the valuation date results in the value of this portion of the work-in-process to be \$592,993.

Another portion of the work-in-process is the reimbursed costs that the law firm received after the valuation date. These expenses had previously been considered in the overhead factor applied against the other work-in-process, so there is no need to apply another factor to it. However, because these expenses are deducted when paid by the practice, taxes will be paid when the reimbursements are received. These reimbursements must also be discounted back to the valuation date. Applying similar treatment to these expenses results in an addition to work-in-process of \$285,328.

**EXHIBIT 23.11 Work-in-Process—Contingent Fee Law Firm**

The final portion of work-in-process that needs to be added is the portion attributable to the open files. The gross estimates to be received by the law firm are \$61,647 and \$6,910 for fees and costs, respectively. With the exception of cases numbered 200360, 200335, and 200428, all the other files were opened up in the beginning of 2008. In order to estimate the value of these cases, we followed similar procedures as was done for the cases that we knew were closed. In this instance, we assumed that these cases would remain open, on average, for four years. The value was estimated as follows:

Total Fees	\$ 61,647
Overhead Factor (88.7%)	54,681
Profit	\$ 6,966
Taxes (35%)	2,438
Net Profit	\$ 4,528
Present Value	\$ 3,328

The costs were estimated as follows:

Total	\$6,910
Taxes (35%)	2,419
Net Profit	\$4,491
Total	6,910
Present Value	\$3,301

As a result of our analysis, work-in-process is estimated to be as follows:

Cases closed to date	\$592,993
Reimbursed costs for cases closed to date	285,328
Cases still open	3,328
Reimbursed costs for cases still open	3,301
<b>TOTAL WORK-IN-PROCESS</b>	<b>\$884,950</b>

The illustration in exhibit 23.11 shows an analysis that took a lot of hours to perform. This is anything but easy. Sometimes, calculating the contingent work-in-progress makes no sense. Instead, the valuation analyst may be of assistance to the parties by making a recommendation of how to divide this asset, particularly in a matrimonial valuation. How we handled a major contingent fee in a matrimonial case is shown in exhibit 23.12.

### EXHIBIT 23.12 Major Contingent Fee

Work-in-process has been calculated from contingent fee schedules in client service agreements, settlement letters, and client ledgers from each case. Where applicable, we have used the actual settlement numbers to derive the actual work-in-process completed as of the valuation date. At present, the only cases that have been settled are the Rubin and Cohen matters. Due to the complexity of the work in process calculations, we have listed the calculations as follows:

<b>Rubin</b>	
<u>Jones Law Firm Fees Calculation*</u>	
Value of Settlement as of May 2015	\$ 350,000.00
Less: Disbursements	(25,551.11)
Subtotal to Calculate Contingent Legal Fees	\$ 324,448.89
<u>Legal Fee</u>	
1/3 of up to \$250,000 in Settlement Value	\$ 83,333.33
25% of Subtotal Amount Over \$250,000	18,612.22
Total Legal Fees as of Settlement	\$ 101,945.56
Less: 1/3 Referral Fee Paid by Jones	(32,430.73)
Total Legal Fees Attributable to Jones	\$ 69,514.83
<u>Work-in-Process Calculation</u>	
Unbilled Hours as of 2/28/14	352.3
Total Unbilled Hours	÷ 730.5
Percentage of 2/28/14 Fees to Total Unbilled Fees	× 48%
Subtotal	\$ 33,525.08
Plus: Pre 2/28/14 Disbursements	0.00
Work-in-Process as of 3/1/14	\$ 33,525.08
Less: 40% to Tax Affect	13,410.03
Tax Affected Work-in-Process	\$ 20,115.05

\*Note: Figures in these tables may not calculate exactly due to rounding.

We have calculated work-in-process based on a percentage of hours worked on each case. In the Rubin matter, approximately 48 percent of the total work completed in settling this case was performed before the valuation date. Multiplying the total monies attributable to the Jones Law Firm by 48 percent results in an untaxed work-in-process amount of \$33,525. Assuming that these monies are collected, we have tax-affected them at a rate of 40 percent, for a tax-affected work in process amount of \$20,115. A similar calculation has been performed for the Cohen matter.

**EXHIBIT 23.12 Major Contingent Fee**

<b>Cohen*</b>	
<u>Jones Fees Calculation</u>	
Value of Settlement	\$250,000.00
Less: Disbursements	(6,624.06)
<b>Subtotal to Calculate Legal Fees</b>	<b>\$243,375.94</b>
<u>Legal Fee</u>	
Equals 1/3 of up to \$500,000 in Settlement Value	\$ 81,125.31
Less: 1/3 Referral Fee Paid by Jones	(27,041.77)
<b>Total Legal Fees Attributable to Jones</b>	<b>\$ 54,083.54</b>
<u>Work-in-Process Calculation</u>	
Unbilled Hours as of 2/28/14	17.2
<b>Total Unbilled Hours</b>	<b>÷ 138.4</b>
Percentage of 2/28/14 Fees to Total Unbilled Fees	× 12%
<b>Legal Fee Estimate as of 2/28/14</b>	<b>\$ 6,721.37</b>
Plus: Disbursements as of 2/28/14	35
<b>Work-in-Process as of 3/1/14</b>	<b>\$ 6,756.37</b>
Less: Tax Affect—40%	2,702.55
<b>Tax Affected Work in Process</b>	<b>\$ 4,053.82</b>

\*Note: Figures in these tables may not calculate exactly due to rounding.

During an interview with Mr. Jones, he provided us with his estimates of the time necessary to complete each of the cases that were open as of the valuation date, including the Arney, Warner, Lamant, Port Rooster, and Angel matters, and their prospective settlements. Because of the highly speculative nature of these contingent fees, we have not included these in the work-in-process figure. These open cases add value to the practice, but because of the highly speculative nature of these cash flows, we could not estimate them with any certainty. Instead, we believe that these monies should be distributed on an “if and when collected” basis. At the bottom of this letter, we have provided you with a worksheet that you can use each time one of these matters is finalized.

As of the valuation date, two inputs into the worksheet are known, namely unbilled hours as of February 28, 2014, and disbursements through the same date. The following data reflects the inputs into the worksheet when you use it.

**TABLE 2 Worksheet Inputs**

	Unbilled Hours	Disbursements
Arney	186.50	\$ 8.95
Warner	126.95	441.15

(continued)

**EXHIBIT 23.12 Major Contingent Fee** *(continued)*

An important note on the Lamant matter is that the client had left the practice as of the valuation date but had already accrued \$3,486 in legal fees contingent upon settlement. The client has since returned to the practice, but a willing buyer would not know this as of the valuation date; therefore, the most that could be reasonably expected is their unbilled legal fees.

We have not addressed the Port, Rooster and Angel matters. The amounts are contingent on the successful litigation of these matters and are extremely large. In respect to equitable distribution regarding *Jones v. Jones*, the only way that these monies can be divided is on an “if and when collected” basis. At this point in time, it is beyond speculation to place dollar values on these matters due to the size and riskiness of these cash flows.

**Prepaid Insurance**

Certain types of professional practices, particularly medical practices, may be paying a significant amount in malpractice premiums. Typically, these items are expensed as they are paid. The valuation analyst needs to be aware of the policy period because this could turn out to be a large prepaid asset on the balance sheet at the valuation date. Imagine a medical practice that pays \$120,000 in malpractice premiums on February 1 and undergoes a valuation on March 1. Because 11 months of the premium are prepaid, the practice value just increased (on the basis of its assets) by \$110,000. Do not double count this by adjusting the income statement. The entire premium should be included if you are performing an income or market approach. Because a prepaid insurance policy that is cancelled may have a right to a return of some portion of the premium upon

the sale of the business, this asset may be considered as an additional item of value in a fair market value assignment and might need to have that value added at the end of the valuation as an excess asset. But, because nothing in life is easy, the valuation analyst must also consider whether the practice would most likely have to purchase what is called a *tail policy* to protect against any malpractice claims that arise during the future period for prior acts. This could turn out to be a liability, rather than an asset. Medical surgical practices and possibly audit firms may need this type of coverage. Who said this stuff is a walk in the park?

## Supplies

Certain types of professional practices maintain a supply inventory that could be material. For example, certain medical practices maintain an inventory of drugs that may have a very substantial value. The valuation analyst should inquire about supplies. Sometime we find out how often supplies are ordered and prorate the supplies expense. We generally only do this when supplies are considered material to the value of the practice.

## Library Costs

Law firms, accounting firms, valuation firms (like ours), and other professional practices used to spend a considerable amount of money each year to keep their libraries current. Sometimes the library may have significant value. Other times, the volumes and volumes of books sitting on shelves in the library have been replaced by the Internet. In these instances, the value may not be substantial. In fact, it may be worth only pennies. Other than the library really looking impressive, these days, the old books do not have nearly the value that they once had. The valuation analyst can make a few telephone calls to find out how much the major publications are worth in the used market.

## Reasonable Compensation

Probably the most important adjustment the valuation analyst makes during the valuation of a professional practice is reasonable compensation. This adjustment can literally make or break the valuation conclusion. The valuation analyst needs to be extremely careful to ensure that all factors that affect reasonable compensation for the professional are properly analyzed. Frequently, the valuation analyst needs to consider the market rate of compensation to replace the owner-employee with an employee with similar employment skills and attributes as the person being replaced. Many factors should be considered. Among them are the following:

- Job description
- Hours worked
- Education
- Age
- Special skills
- Rainmaking ability
- Size of the practice
- Profitability of the practice

Various sections of different types of professional practice compensation considerations are illustrated in exhibit 23.13. Although the dates are older, these are good examples, so why change them?

### EXHIBIT 23.13 Reasonable Compensation

#### DENTAL PRACTICE

In order to determine reasonable compensation for Drs. Brown, Green, and Black, several sources of information were used. There is much controversy over the issue of reasonable compensation and, generally, it is determined based on numerous factors. Appraisal theory has taught the valuation analyst to calculate reasonable compensation based on the norm within the industry. The hypothetical willing buyer will have the same qualifications and experience as the hypothetical willing seller, work the same number of hours as the hypothetical seller, and be in the same cost-of-living area of the country as the hypothetical seller.

(continued)

**EXHIBIT 23.13 Reasonable Compensation** *(continued)*

In “Professional Practice Goodwill: An Abused Concept,” published by the *Journal of the American Academy of Matrimonial Lawyers*, 1986, James T. Friedman found that most lawyers and judges wrongfully equate high earnings and divisible goodwill, and that most highly salaried professionals do not enjoy any more compensation than highly salaried nonprofessionals do.

Friedman attacks the excess earnings method and is highly critical of the methods used to determine reasonable compensation. He states the following:

In calculating excess compensation you must first deduct fair compensation for the individual whose practice you are valuing. The more valuable that individual’s contribution, the higher will be, the compensation entitlement, or replacement costs.

Friedman goes further and states that “the hard working, highly skilled specialist probably earns his or her total compensation and derives little excess from the enterprise.”

In *Valuing Small Businesses and Professional Practices*, published by Dow Jones-Irwin, Shannon P. Pratt, DBA., CFA., CFP., FASA., CRA., a renowned expert in the valuation field, states the following:

The smaller the business or practice, the more important looms the role of the owner/manager. How much of the success of the operation is due to the talent and efforts of the owner/manager(s)? How much of that success can be transferred to new ownership?

Pratt continues:

There is no point in paying a sizable sum for a business or practice from which the customers will disappear as soon as the new owner takes over, or which is dependent on a seller’s talent that will not be available to the new owner.

Pratt, in his discussion of goodwill, indicates that “several factors are dominant in determining the existence and value of practice and personal goodwill for professional practices:

1. Earnings levels that can be expected in the future.
2. The level of competition.
3. The referral base.
4. The types of patients or clients the practice serves.
5. Work habits of the practitioner.
6. The fees charged (compared to others in the same specialty).
7. Where the practice is located.
8. The practice’s employees.
9. The general marketability of the type of practice being sold.”

According to *Financial Studies of the Small Business*, published by Financial Research Associates, officers’ salaries in dental practices are approximately 29.71 percent of net sales. Using this information results in officers’ compensation as follows:

	2002	2001	2000	1999
Sales	\$1,237,400	\$1,278,449	\$1,257,051	\$1,203,644
Refunds and Allowances	(46,612)	(53,700)	(21,134)	(18,425)
Net Sales	\$1,190,788	\$1,224,749	\$1,235,917	\$1,185,219
Salary Percentage	× 29.71%	× 29.71%	× 29.71%	× 29.71%
Officers’ Compensation	\$ 353,783	\$ 363,873	\$ 367,191	\$ 352,129

Another source, *RMA Annual Statement Studies*, published by Risk Management Association, indicates that based on historical data, dentists in the upper quartile earn 32.9 percent of salaries on average. The upper quartile was chosen to reflect the fact that salaries in the Mid-Atlantic/Northeast area tend to be higher than the national average.

**EXHIBIT 23.13 Reasonable Compensation**

Based on the Robert Morris Associates' statistics, reasonable compensation for the officers of Dental Associates would be calculated as follows:

	2002	2001	2000	1999
Net Sales	\$ 1,190,788	\$ 1,224,749	\$ 1,235,917	\$ 1,185,219
Salary Percentage	× 32.9%	× 32.9%	× 32.9%	× 32.9%
Officers' Compensation	\$ 391,769	\$ 402,942	\$ 406,617	\$ 389,937

In The Survey of Dental Practice, the American Dental Association breaks down dentists' incomes by other criteria. Table 5, includes the net income of general practitioners who earn their money from the primary practice of dentistry.

**TABLE 5 Net Income of Independent General Practitioners by Age and Source of Dental Income**

Source of Net Income	Mean	1st Q	Median	3rd Q	S.D.	n
<b>Primary Private Practice</b>						
<i>Age Group</i>						
Under 30*	\$ —	\$ —	\$ —	\$ —	\$ —	18
30–34	82,000	45,000	69,500	100,000	53,120	166

Dental Associates is a professional corporation, so the dentists are considered to be incorporated partners. The median earnings level for an incorporated partner is \$95,000, whereas the income in the 3rd quartile is \$125,000.

The ADA survey then broke its statistics down by regions. The data in tables 9, 10, and 11 highlight some of the regional differences in income, age, and hours worked.

### EXHIBIT 23.13 Reasonable Compensation

The tables shown on the previous pages indicate that general dentists in the Middle Atlantic region earn a median salary of \$82,000, are age 46, and work 1,800 hours per year.

Based on the various statistics shown, the valuation analyst has determined the following reasonable compensation amounts for 2002:

Dr. Brown	\$115,000
Dr. Green	136,500
Dr. Black	106,670

The amounts are based on the salaries shown for years since graduation because it approximately reflects the number of years each dentist has been practicing. In addition, the third quartile was chosen to reflect a fairly stable practice in the Middle Atlantic area, which has been in existence for almost 30 years.

The salaries chosen approximately reflect the percentages of gross income earned by each doctor in 2002. Dental Associates maintains a Procedure Analysis Report, which is used to track each doctor's productivity. In 2002, the report showed the following breakdown of revenues:

Dr. Brown	\$322,527
Dr. Green	410,381
Dr. Black	330,810

Although Dr. Black's revenues were higher than Dr. Brown's, Dr. Brown is responsible for most of the administrative work of the dental practice and, therefore, should be compensated for those additional duties and responsibilities.

The total compensation determined represents 30.1 percent of 2002 net sales. This percentage was used to determine reasonable compensation for the other years, and the adjustment in table 4 is calculated as follows:

	2002	2001	2000	1999
Net Sales	\$ 1,190,788	\$ 1,224,729	\$ 1,235,917	\$ 1,185,219
Salary Percentage	× 30.1%	× 30.1%	× 0.1%	× 30.1%
Reasonable Compensation	\$ 358,427	\$ 368,643	\$ 372,011	\$ 356,751
Per Tax Return	468,873	594,376	538,742	515,825
Adjustment	\$ 110,446	\$ 225,733	\$ 166,731	\$ 159,074

#### LAW FIRM

One of the difficult components of a business valuation for a law practice is the determination of reasonable compensation for the owner of the practice. The purpose of reflecting reasonable compensation is so that a willing buyer, if purely an investor, would see what he or she would have to pay someone to perform the services that are done by the current owner.

Appraisal theory teaches the valuation analyst to calculate reasonable compensation based on the norm within the industry. The hypothetical willing buyer will have the same qualifications and experience as a hypothetical willing seller, work the same number of hours as the hypothetical seller, and be in the same cost of living area of the country as the hypothetical seller. In fact, case law has suggested that the valuation analyst examine the value of goodwill very carefully "for the individual practitioner will be forced to pay the ex-spouse 'tangible' dollars for an intangible asset at a value concededly arrived at on the basis of some uncertain elements."<sup>1</sup> Case law also suggests that the age, health, and professional reputation of the practitioner, the nature of the practice, the length of time the practice has been in existence, its past profits, its comparative professional success, and the value of its other assets should also be taken into consideration in the determination of goodwill.<sup>2</sup>

<sup>1</sup> *Dugan v. Dugan*, 92 NJ Super 435, 457 A.2d at 7.

<sup>2</sup> *In re-marriage of Lopez*, 38 Cal. App. 3d 93, 113 Cal. Rptr. 58 (3d Dist. 1974).

(continued)

**EXHIBIT 23.13 Reasonable Compensation** *(continued)*

However, goodwill cannot be measured without properly considering the effort expended by the practitioner. A reasonable level of compensation cannot be determined by merely consulting a salary survey without considering the work habits of the professional. Shannon Pratt states the following:

It's almost a cliché that professionals work long hours. However, some are willing to work longer hours than others. A practice that requires 80 hours a week of a practitioner's time will not be worth as much per dollar of income to a purchaser as one that requires only 50 hours per week.<sup>3</sup>

A review of the time and billing records of Donald Neal & Associates revealed the following billable hours per individual attorney over the past several years:

	2005	2004	2003	2002	2001
DAN	3486.25	3299.25	3284.00	3208.00	3576.00
KLJ	808.50	—	—	—	—
MFS	—	—	—	—	1422.80
REG	973.40	2096.45	2135.50	629.00	—
LJG	—	—	—	—	627.50
KEN	—	1191.00	2245.75	2105.75	738.75
AMC	317.75	2359.50	1690.25	1734.00	996.00
SCS	888.75	—	—	—	—
BCS	2815.50	2753.50	2097.50	—	—
DRR	2427.50	712.25	—	—	—
LEC	—	—	—	1309.25	650.50

The billable hours worked by Mr. Neal far exceed all the other attorneys in the firm. The nature of this practice requires exceptionally long hours. Turnover in associates has been a problem for this reason. However, as the owner, Mr. Neal does whatever it takes to get the job done. This is typical for a small professional practice.

What makes this practice somewhat unique is the “emergency room law” type of practice. If a client calls with a problem, it is not uncommon for the firm to dispatch at least one attorney immediately to investigate a situation. For example, if a call comes in about an alleged child molestation, a team of attorneys may be sent hours away to interview students, teachers, and the school administration. This can result in very long hours worked on a particular assignment. Also, school board meetings tend to be at night, and these types of jobs can also make for an exceptionally long day.

In order to determine a reasonable level of compensation for Mr. Neal, this valuation analyst consulted the *Survey of Law Firm Economics*, published by Altman Weil Pensa (AWP). This survey provides the valuation analyst with a benchmark of compensation levels. Various factors, besides the region in which the law practice operates, affect the amount of compensation earned by a practice's owners. These factors include the size of the practice, the type of law performed, and the year the owners were admitted to the Bar. AWP provides a breakdown of the salaries for lawyers broken down by each of these categories.

In order to use the survey, the valuation analyst considered several specialties within the legal profession in which to compare Donald Neal & Associates. There are no statistics for education law, but there are enough similarities between insurance defense firms and labor/employment specialties that a meaningful comparison could still be made.

<sup>3</sup> Shannon P. Pratt, *Valuing Small Businesses and Professional Practices*, 2nd edition (Business One Irwin: 1993), 414.

**EXHIBIT 23.13 Reasonable Compensation**

Some of the more meaningful data about the owners of the firms includes the following:

4 Owners with significant management responsibilities.

5 Owners with significant management responsibilities.

6 South only.

7 Firms with under 9 lawyers.

(continued)

**EXHIBIT 23.13 Reasonable Compensation** *(continued)*

A review of the preceding data indicates that the hours Mr. Neal worked far exceed his peers. In fact, using 2006 as a comparison to the AWP data reflects the following:

	Median AWP	Ninth Decile	Billable Hours	Percentage Over	
				Median	Ninth Decile
All Firms	1,707.00	2,216.00	3,486.25	+ 104.2%	+ 57.3%
South	1,747.00	2,245.00	3,486.25	+ 99.6%	+ 55.3%
Under 9 Lawyers	1,664.00	2,247.00	3,486.25	+ 109.5%	+ 55.2%
Insurance Defense	1,916.00	2,540.00	3,486.25	+ 81.9%	+ 37.3%
Labor/Employment	1,758.00	2,183.00	3,486.25	+ 98.3%	+ 59.7%
Admitted Bar (1978)	1,691.00	2,246.00	3,486.25	+ 106.2%	+ 55.2%

Mr. Neal worked almost twice the number of hours of any of the attorneys, based on median hours worked. He also worked, on average, 53 percent more hours than the attorneys who made up the ninth decile of the survey. Clearly, the profitability of the firm is attributable, in large part, to the work habits of the owner.

A review of the total compensation for owners of firms reflects various levels, depending on the categorization within the survey. The median total compensation for firms in the south, where the owners have significant management responsibilities was \$265,360, whereas the ninth decile for this category was \$458,437. It can only be assumed by this valuation analyst, that there are larger firms reflected in these figures.

Firms with under nine lawyers for this same group had a median and ninth decile total compensation of \$143,265 and \$328,410, respectively. Total compensation for owners without significant management responsibilities ranged from a median of \$134,294 to \$183,893 and a ninth decile from \$280,210 to \$336,329.

Whether the median or the ninth decile compensation is used as a base compensation for Mr. Neal, these figures must be adjusted for the significant number of hours that he works. Based on the preceding data, a base amount, before this adjustment, appears to be approximately \$175,000 for the median and \$315,000 for the ninth decile. These figures can then be adjusted as follows:

	Median	Ninth Decile
Base Amount	\$ 175,000	\$ 315,000
Excess Billable Hours Percentage	× 100%	× 53%
Extra Compensation	\$ 175,000	\$ 166,950
Total Compensation	\$ 350,000	\$ 481,950

The next part of this analysis is the determination of which group of owners is considered to be applicable to Mr. Neal. Mr. Neal is the firm's "rainmaker." He is the reason that clients come back for more. Although repeat patronage is an element of goodwill, the personal component of the goodwill will generally be reflected in the level of compensation that an individual can command. Being a rainmaker adds significant value to the firm. Part of that value is reflected in the salary.

The upper quartile of the survey is a more conservative level of compensation than the ninth decile. We feel that the median does not compensate Mr. Neal for his rainmaking or administrative responsibilities. The average billable hours for the upper quartile was about 2,000 hours, or about 74 percent less than Mr. Neal's billable hours. The survey compensation is about \$230,000. After adjusting for hours worked, compensation is estimated as \$400,200.

### EXHIBIT 23.13 Reasonable Compensation

In our opinion, reasonable compensation appears to be about \$400,000. This represents 26.8 percent of 2005 revenues. In order to check this amount for reasonableness, we consulted *RMA Annual Statement Studies*, published by Risk Management Association, a banking organization that compiles financial information by Standard Industrial Classification Codes. According to this publication, the percentage of officers', directors', or owners' compensation to sales was 28.7 percent for firms with \$1 million to 3 million in revenues.

Prior years' compensation has been calculated as 26.8 percent of revenues to be consistent with our calculation for 2005.

#### ACCOUNTING PRACTICE

In order to determine reasonable salaries for Mr. Thomas and Mr. Lux, we reviewed several sources of information. The first source was the survey from the Texas Society of CPAs, which indicates that owners of firms with revenues between \$401,000 and \$1 million receive 52 percent of revenues as earnings. For firms with revenues over \$1 million, this drops significantly to 38.2 percent of revenues. The second source we reviewed was Risk Management Association's Annual Statement Studies. This data indicated salaries for partners of approximately 27.2 to 27.5 percent of revenues.

The third source of information we reviewed was the *Accounting Finance and Information Technology Salary Guide*, published by Robert Half. Although this survey does not discuss salaries at partner levels, it does report data for the manager level. According to the survey, managers' salaries could range as high as \$76,000 in accounting firms with revenues under \$15 million. This is based on Robert Half's placement experience. The fourth and final source of information we used was from the firm itself. Brian Edwards, CPA, is the firm's manager, who, at the valuation date, was making \$86,000 per year. Combined with the Robert Half data, this sets an absolute floor on the compensation of the firm's partners. Because the partners are the ones generating the business, they should naturally be more highly compensated than the individuals strictly servicing the clients.

Because the Texas Society of CPAs survey deals with firms in New Jersey, it is more relevant than the RMA data. As discussed, the partners of firms with over \$1 million in revenues earn 38.2 percent of revenues. This is consistent with the RMA data when pre-tax profits are factored in; combining salaries and profits results in a 36.4 percent salary level for partners of firms with revenues between \$1 million and \$3 million. Based on this data, we have determined reasonable salaries for Mr. Thomas and Mr. Lux to be approximately 27 percent of revenues for 2007, or \$285,000. We have assumed this to be the appropriate percentage for all years in our analysis to reflect their salaries based on fees generated. These figures are calculated as follows:

Year	Revenues	%	Officers' Compensation
2007	\$1,055,627	27%	\$285,019
2006	901,226	27%	243,331
2005	789,052	27%	213,044
2004	775,066	27%	209,268
2003	861,495	27%	232,604

Given the industry data and the number of hours worked by the two partners, the data appears reasonable.

#### ANOTHER ACCOUNTING PRACTICE

According to the firm's financial statements, none of the firm's partners take an annual salary. Therefore, the income statement must be normalized to account for the number of partners needed to maintain daily operations of the firm and for an appropriate level of compensation required to replace them. Based on information provided regarding partners' billable hours in the first nine months of 2003, on average, each partner's total hours worked consisted of 42 percent billable hours and 58 percent nonbillable hours. In the first nine months of 2002, approximately 47 percent of partners' total hours were billable.

(continued)

**EXHIBIT 23.13 Reasonable Compensation** *(continued)*

According to the Texas Society's Practice Management Survey, 53 percent of total hours of active owners of large accounting practices are billable. Assuming that the 2002 and 2003 time analysis of the Jackson Greer partners' work is comparable to their billable hours worked as of October 2005, Jackson Greer's partner productivity is below the industry average. As of October 2005, the firm has eight partners. We estimate that six partners would be the number of partners necessary to run the practice at an efficient level compared to its peer group.

Jackson Greer establishes hourly billing rates based on a 0.00225 multiple of the employee's annual salary. For partners of the firm, the hourly billable rate is \$250. Divided by the multiple, this results in an annual salary of approximately \$110,000 per partner.

In order to verify the reasonableness of the level of salary, we performed research regarding salaries paid to partners of accounting firms in order to compare the Jackson Greer partner salary to industry statistics. Our findings are as follows:

Source	Criteria	Salary
<i>CPA Newsletters</i>	CPA Salaries—Partner Mid-Atlantic Region	\$113,000
<i>CPA Newsletters</i>	CPA Salaries—Partner Firm Revenue over \$1,700,000	120,000
<i>Executive Compensation Survey Analysis</i> <sup>8</sup>	CEO President—Median Sales Volume: \$2.5—9.99 Mil.	110,815
<i>Source Finance's Accounting &amp; Finance Salary Survey</i>	Public Accounting Partner-Median	90,000

Utilizing these surveys, the average partner salary is approximately \$108,000. Based on this research, we feel that \$110,000 is a reasonable estimate for a partner's salary at Jackson Greer.

For 2005, a reasonable officers' compensation expense of \$660,000 was added to Jackson Greer's operating expenses. This amount comprises a \$110,000 salary per partner, multiplied by six partners. In order to account for this expense in previous years, this amount was deflated at an annual rate of 6 percent based on the average of 6.5 percent and 5.4 percent reflected in CPA Newsletters' Annual Compensation Survey for the past two years, respectively. Before calculation of reasonable owner's compensation for 2000, two partners' salaries were removed (based on 2001 salary estimates) to accommodate the fact that two partners joined Jackson Greer in the November 2000 to January 2001 period.

**MEDICAL PRACTICE**

Because Dr. Peters operates as a sole proprietorship, he does not take a salary from the practice. Rather, he pays taxes on the net income from the practice.

A willing buyer might not operate the practice as a sole proprietorship, so in order to determine what a reasonable level of earnings will be from the practice, a reasonable level of salary must be factored in.

MGMA produces a second survey entitled "Physician Compensation and Production Survey: Current Year Report Based on Last Year Data." According to this survey, some median compensation figures are as follows:

Pediatricians: single specialties	\$137,994
Pediatricians: Eastern United States	128,177
Pediatricians: 51%–100% Managed Care	130,998
Primary Care: Eastern United States	129,238
Primary Care: 51%–100% Managed Care	135,598

<sup>8</sup> Published by the National Institute of Business Management.

### EXHIBIT 23.13 Reasonable Compensation

According to the AMA's publication, *Physician Marketplace Statistics*, some median compensation figures are as follows:

Pediatricians: Self-Employed (United States)	\$149,000
Pediatricians: Self-Employed (Mid-Atlantic)	129,000

Some additional information provided in the AMA publication is as follows:

Median Office Hours:	
Pediatricians	35
New Jersey	30
Self-Employed	30

In addition, median hours spent in hospital rounds for all three categories are 5 hours.

The preceding salary range indicates that median salaries for pediatricians range from \$129,000 to \$149,000. Therefore, a salary of \$135,000 appears to be reasonable.

According to the MGMA survey, median compensation rose 2.29 percent from last year to this year, and 2.12 percent from the previous two-year period. Therefore, these figures have been used to deflate the current-year salaries for the prior years.

## Valuation Calculations—Unique Aspects of the Calculations

Sometimes, professional practice valuations involve more than the typical calculations. All the normal methodologies will be employed in the valuation process. However, many professional practices have a greater emphasis placed on the gross revenues of the practice. Obviously, you cannot ignore earnings, but the willing buyer will frequently be purchasing the revenue stream and may often be a strategic or synergistic buyer. This may be the highest value for the practice. For control valuations, this may be the correct value even though it is higher than the other indications of value. Although not a professional practice valuation, the Tax Court case *Estate of Samuel I. Newhouse v. Commissioner*, 94 TC 193(RIA) (1990) is a great case to read regarding different types of potential willing buyers. I have included the case in the downloadable materials. In the meantime, here is a synopsis of the case.

### Issue: Different Classes of Willing Buyers Result in Different Values

The theme that I am highlighting is a small, but important part, of the case. Valuations that are performed for estate tax purposes must use the fair market value standard of value. Valuation theory tells us that fair market value assumes a hypothetical transaction between a hypothetical willing buyer and a hypothetical willing seller. This case addresses the issue of fair market value “to whom.”

Fair market value deals with the hypothetical willing buyer and willing seller. This case addressed the issue of which class of willing buyer should be considered in the determination of fair market value. Valuation analysts frequently use terms such as strategic or synergistic buyer. Based on information acquired earlier in this book, the notion would be that if there is a *strategic* or *synergistic buyer* involved, the value determined would represent investment value and not fair market value. This is not always correct.

Part of the determination of fair market value requires the valuation analyst to determine the likely market for the property. Clearly, the willing seller, if prudent, will look to sell the property in the market that would bring him or her the greatest price.

The *Newhouse* case examined four classes of potential investors:

- The passive investor
- The active investor
- The control investor
- The public investor

Goldman Sachs analyzed these four categories of investors as all being valid willing buyers in the definition of fair market value. The court's opinion discusses the different types of investors. The subject company of the valuation is referred to as "Advance." Important descriptions from the opinion are excerpted in box 23.1.

**BOX 23.1****Classes of Potential Investors**

- A passive investor would not be interested in managing Advance and would not attempt to wrest control from management. Expecting to realize value from dividends and private resale, the passive investor would not expect to extract value from Advance through liquidation, merger, or public offering. The passive investor would consider that Advance's stock was not publicly traded, which would depress expectations of resale value. Due to this illiquidity, lack of control, and the uncertainties and constraints affecting the purchase, Goldman Sachs concluded that the passive investor would have offered 30 percent less than the public trading market value of the common stock and, thus, only \$141 million for the common stock.
- The active investor would be inclined to pursue action, short of seeking control, that would quickly maximize the return on his or her investment. One course of action would be to declare a dividend of Advance's excess cash and any funds that could be obtained through borrowing. Because of the high prevailing interest rate and planned capital expenditures, the common shareholder could extract no more than \$74 million of excess cash plus loan proceeds. Advance also had \$145 million of excess cash, which could be distributed with the loan proceeds. Because of the time and uncertainty involved in this plan of action, the active investor would pay no more than 85 percent of the amount he or she hoped to extract. This figure would be far less than the \$141 million the passive investor would be willing to pay.

Alternatively, the active investor might cause the excess cash to be distributed immediately and then cause Advance to pay dividends at the highest possible level. Assuming that the active investor would insist on an after-tax yield on his or her investment of about 13 percent or 14 percent, Goldman Sachs concluded that the active investor would be willing to pay \$150 million for the Advance common stock.

- A control investor would have purchased the Advance common stock with the goal of acquiring 100 percent of the equity ownership and control of the company. A control investor would hope to realize value from his or her purchase by dividend distributions, by liquidation, or by merger, but Advance's unusual capital structure would prevent the latter two courses of action without eliminating the preferred stock or securing their consent. The preferred had the right to block liquidation. Because the common's power to effect a merger adverse to the preferred's interests was so uncertain, Goldman Sachs concluded that any willing buyer, as a matter of sound business judgment, would analyze the value of the common as if that option were foreclosed. Goldman Sachs' analysis is persuasive.

Goldman Sachs concluded that only another media company would be interested in acquiring Advance and that none of the major media companies would have considered buying the common stock without first eliminating the claims of the preferred shareholders. Because the control investor would assume that he could not receive anything except 22 percent of the highest level of dividends declared, he or she would be in the same position as the active investor and would pay no more than what the active investor would pay, that is, \$150 million.

- Goldman Sachs concluded that an underwritten public offering would be the best way to sell the Advance common stock, requiring the three different types of stock to be recapitalized into a single class. Goldman Sachs' research indicated that in approximately half of the transactions in which voting control was transferred, the buyers paid a premium for control. Goldman Sachs concluded that no control premium was warranted. Goldman Sachs then determined that after exchanging the class A common stock 1 for 3, and the class B common and the preferred stock 1 for 1, the offering price would be \$25 per share subject to a 7 percent discount. The price for all the shares would be \$778 million, and for petitioner's shares it would be \$176 million.

Because the benchmark value for a public offering, \$176 million, was the highest value, Goldman Sachs concluded that the value of petitioner's Advance common stock was \$176 million on February 29, 1980.

In a previous AICPA self-study program, *Business Valuation Methods*, Alan Zipp discussed the categories of investor. He stated the following:

### ***The Passive Investor***

A passive investor would not be interested in managing the business. He would expect to realize value from dividends and resale and not from liquidation, merger, or public offering. Although the passive investor neither controls management, business operations, nor cash flow, he would expect to have some influence on management to increase dividends in the future. The passive investor would consider a depressed resale value because a closely held company is not publicly traded. Due to this illiquidity, lack of control, the uncertainties of future dividends, and constraints affecting a resale, a passive investor would be willing to purchase the business only at a substantial discount, of perhaps 30% or more.

### ***The Active Investor***

The active investor would be inclined to pursue action, short of seeking control, that would quickly maximize the return on his investment. One course of action would be to pressure the control interest to declare a dividend. Continuous pressure on management to promote business growth and to distribute dividends would be the role of the active investor. Because of the time and uncertainty involved in this plan of action, the active investor would pay no more than 85% of the amount he hoped to extract as dividend distributions.

### ***The Control Investor***

The control investor would purchase an interest in a business with the goal of acquiring 100% of the equity ownership and control of the company. A control investor would hope to realize value from his purchase through excess salary and fringe benefits, dividend distributions, liquidation, merger, or perhaps a public offering. A control investor, being in a position to determine the timing and amount of dividend distributions, salary and fringe benefits, and liquidation or sale prospects, would be willing to pay about 90% of the amount he expects to receive.

### ***The Public Investor***

The public investor would purchase a business interest with the full acceptance of being a minority stockholder and having no influence over business operations. The public investor would hope to realize value from his purchase in the appreciation in value of the investment, along with dividends received. The public investor would only consider historical dividends, even though the company had the ability to pay higher dividends, because the public investor is not inclined to seek larger distributions. The public investor, unlike the passive investor, would make the investment only if the company planned to make a public or private offering creating a market for the shares. Therefore, in addition to a substantial discount for the lack of control and influence, illiquidity, uncertainty of future dividends, and risk of liquidation, the public investor would want a discount for the costs associated with the underwriting of a public or private offering, from 5% to 20%. Hence, the public investor in a closely held business would expect a discount from 35% to 55% or more.

The importance of this case is that it explicitly contends that the willing buyer of a company can be any number of possible buyers with varying intentions and return on investment requirements. The result of such a conclusion is the creation of an awareness that one type of buyer, based on his or her intentions, will pay a much different price than that of another buyer. As discussed previously, there are many different traits and factors that must be considered. The review of such issues is not relegated only to those mentioned within this case summary. The motivations for investment for the different classes of willing buyers can vary greatly. The difficult part of this exercise is to identify as many of the different classes of buyers as possible. Identifying the numerous reasons why one investor differs from another will support the existence of a difference in value even for the same company.

Although this portion of the willing buyer analysis is rational and sound, it is frequently overlooked. The process of valuation must consider all factors, regardless of whether they are used in the final conclusions of the report. Ensuring that all variables have been analyzed will justify conclusions better than by ignoring them.

The valuation analyst is faced with the challenge of defining the market for the subject interest being valued. Just keep in mind that the market should represent a rational, knowledgeable buyer and not the most gullible who will pay the most for the property. Gullible buyers don't count!

## Rules of Thumb

A very popular, but often abused, method of valuation for professional practices is the multiple of revenue method. This method is also referred to as the *industry rule of thumb* method. There are many disadvantages to this method. The major disadvantage is the number of different multiples that are used for the same type of practice. A classic example of the danger in applying this method is one of the historical rules of thumb for an accounting practice. Over the years, accounting practices have been sold for a range between 50 percent and 150 percent of gross billings. This means that an accounting practice with gross billings of \$1 million could be valued anywhere from \$500,000 to \$1,500,000. This is clearly too wide a spread to be meaningful. Disparities such as this take place all the time and must be considered before applying unsupported rules of thumb.

Sometimes, we will put a rule-of-thumb section into a report to act as a sanity check on the other methods of valuation. When we do this, we usually start off our reports with the discussion that started off this section of the book. This is illustrated in exhibit 23.14.

### EXHIBIT 23.14 Rules of Thumb

There were several "rules of thumb" located for accounting practices. In *Handbook of Small Business Valuation Formulas and Rules of Thumb*, published by Valuation Press, Glenn M. Desmond, ASA., MAI., suggests two methods:

- (1) A monthly net revenue multiplier of 9 to 15.

As a result of this multiplier, the value of the practice, without considering the retained assets, would be as follows:

	Low	High
Annual Forecasted Revenues	\$ 602,238	\$ 602,238
	÷ 12	÷ 12
Monthly Revenues	\$ 50,187	\$ 50,187
	× 9	× 15
Indicated Value	\$ 451,683	\$ 752,805
Retained Assets	(418,417)	(418,417)
Enterprise Value	\$ 33,266	\$ 334,388
Rounded	\$ 33,000	\$ 334,000

**EXHIBIT 23.14 Rules of Thumb**

(2) Annual owner's cash flow multiplier, with a multiplier between 2 and 5.  
The value range under this method is calculated as follows:

Normalized Owner's Cash Flow	\$ 420,289	\$ 420,289
Multiplier	× 2.0	× 5.0
Indicated Value	\$ 840,578	\$2,101,445
Add Retained Assets	(418,417)	(418,417)
Enterprise Value	\$ 422,161	\$1,683,028
Rounded	\$ 422,000	\$1,683,000

The problems with using rules of thumb are apparent when reviewing the wide divergence of values that are calculated, with little data supporting the conclusions. Although rules of thumb can sometimes be used as a sanity check on other methodologies employed by a valuation analyst, they should never be used as a stand-alone, viable, valuation method. In the example in exhibit 23.14, the rules of thumb created values ranging from \$33,000 to \$1,683,000, a 5,000 percent swing in values. Very meaningful, isn't it?

**Statutory Rule Value**

Once in a while, the valuation analyst will find a provision that is built into a professional licensing law that may require a particular methodology to be used in certain circumstances. If there is a statutory valuation method required, use it. Even if it is not required, it may give you one more indication to consider. A section of a report dealing with a statutory methodology is shown in box 23.2.

**BOX 23.2 Statutory Valuation Method**

The state of Arkansas has passed laws governing business formation and conduct within Arkansas. The Arkansas Professional Corporation Act, in particular, governs the formation; corporate names; limitations on officers; directors and shareholders; employees; certification; and price of shares of deceased or disqualified shareholders.

Although this valuation does not deal with a deceased or disqualified shareholder, the statute does provide guidance in determining value. The statute states the following:

**4-29-213. Shares of deceased or disqualified shareholder—Price.**

If the articles of incorporation or bylaws of a corporation subject to this subchapter fail to state a price or method of determining a fixed price at which the corporation or its shareholders may purchase the shares of a deceased shareholder or a shareholder no longer qualified to own shares in the corporation, then the price for the shares shall be the book value as of the end of the month immediately preceding the death or disqualification of the shareholder. Book value shall be determined from the books and records of the corporation in accordance with the regular method of accounting used by the corporation.

In accordance with this statute, the value of John Smith & Company is determined as \$125,186, as stated in the balance sheet dated December 31, 1991, located in Schedule 1 at the end of this report.

Although the statutory method discussed in box 23.2 did not provide us with anything that was even remotely close to the values that we derived using other methods (other than the low end of the rule of thumb), it turned out to be pretty useful. In this valuation, the IRS was challenging the buyout of the senior partner from this accounting practice. In fact, the IRS agent claimed that the practice was worth a fortune. Unfortunately, he used the high end of a rule of thumb. Even the statutory method showed that it was not worth anywhere near what the agent came up with.

### Asset-Based Approach

More often than not, an adjusted balance sheet may be created for the purpose of figuring out what the value of the assets and liabilities are that may be retained by the owners if a market approach (transaction method) valuation is performed. Other times, it will be done to allow an excess earnings methodology to be used in the valuation. Using the asset-based approach will really depend on the composition of the asset base of the practice. Because so many practices get the majority of their value from the intangible assets, going through the tedious exercise of reviewing each balance sheet item and valuing them separately may make little sense. However, some of the assets that we discussed earlier may need to be valued even if a full balance sheet valuation is not performed. The valuation analyst needs to use his or her head. I hope that valuation analysts don't need this next exhibit, but in case they do, exhibit 23.15 demonstrates the result of an adjusted book value methodology being applied to a professional practice (tangible assets only) without the explanations of each adjustment because analysts have seen many of them before. This book is already thick enough without repeating this stuff again.

#### EXHIBIT 23.15 Adjusted Book Value Presentation Tangible Assets Only

**ADJUSTED BOOK VALUE.** The firm's balance sheet was prepared as of December 31, 2016, a couple of days prior to the valuation date. Book value rarely reflects the fair market value of the company's balance sheet; therefore, certain adjustments were deemed necessary by the valuation analyst. This analysis is shown in table 2.

**TABLE 2 Balance Sheet**

	Book Value	Adjustments	Adjusted Book Value
Current Assets			
Cash	\$ 74,365	—	\$ 74,365
Accounts Receivable	—	97,464	97,464
Advances	(14,719)	—	(14,719)
Work-in-Progress	—	51,305	51,305
Prepaid Insurance	—	8,481	8,481
Other Investments	6,875	—	6,875
<b>Total Current Assets</b>	<b>\$ 66,521</b>	<b>\$ 157,250</b>	<b>\$ 223,771</b>

*(Table continued)*

**EXHIBIT 23.15 Adjusted Book Value Presentation Tangible Assets Only****TABLE 2 Balance Sheet** *(continued)*

	Book Value	Adjustments	Adjusted Book Value
Gross Fixed Assets	\$ 47,969	\$ (7,739)	\$ 30,230
Accumulated Depreciation	(42,966)	42,966	—
Net Fixed Assets	\$ 5,003	\$ 25,227	\$ 30,230
Other Assets			
Cash Surrender Value of Officer's Life Insurance	75,000	—	75,000
<b>TOTAL ASSETS</b>	<b>\$ 146,524</b>	<b>\$ 182,477</b>	<b>\$ 329,001</b>
Current Liabilities			
Mortgages and Notes Payable (Current)	\$ 6,519	\$ —	\$ 6,519
Unfunded Deferred Compensation Payable	—	39,059	39,059
Funded Compensation Payable	—	75,000	75,000
Taxes Payable	6,968	—	6,968
Total Current Liabilities	\$ 13,487	\$ 114,059	\$ 127,546
Long-Term Liabilities			
Unfunded Deferred Compensation Payable	\$ —	\$ 530,486	\$ 30,486
Loans from Stockholders	7,851	—	7,851
Total Long-Term Liabilities	\$ 7,851	\$ 530,486	\$ 538,337
Total Liabilities	\$ 21,338	\$ 644,545	\$ 665,883
Stockholders' Equity			
Common Stock	\$ 200	\$ —	\$ 200
Paid-In Capital	8,910	—	8,910
Retained Earnings	116,076	(462,068)	(345,992)
Total Stockholders' Equity	\$ 125,186	\$ (462,068)	\$ (336,882)
<b>TOTAL LIABILITIES AND STOCKHOLDERS' EQUITY</b>	<b>\$ 146,524</b>	<b>\$ 182,477</b>	<b>\$ 329,001</b>

## Conclusion

Valuing a professional practice is not too terribly different than valuing other types of businesses. However, the valuation analyst must understand the unique aspects of each type of practice if a reasonable value is to be determined. I hope that this chapter provided some things to think about the next time (or the first time) a valuation analyst either values or reviews a professional practice.

# Chapter 24

# Ownership Disputes

## Learning Objectives

In this chapter, I will attempt to explain the following:

- What causes ownership disputes
- The difference between dissenting and oppression cases
- The impact of case law on the standard of value and valuation adjustments
- Valuation methodologies accepted by the courts
- Anything else that comes to me (by now, you should be used to me)

## Introduction

Before I begin, let me start off with some attribution for the materials that are included in this chapter. In addition to my own stuff, valuable information came from my reading and, in some instances, from adapting portions of materials from *Valuing a Business*<sup>1</sup> and *The Handbook of Advanced Business Valuation*.<sup>2</sup> Like I said earlier: If it ain't broke, don't fix it. There is another resource that you should have in your library if you do this type of work: *BVR's Guide to Fair Value in Shareholder Dissent, Oppression and Marital Dissolution*, published by Business Valuation Resources, and updated annually. These books, in addition to so much other material, have allowed me to organize this chapter.

In this chapter, I am referring to ownership disputes, rather than shareholder disputes, because not all disputes are only among corporate owners. They can be among members of limited liability companies, partners, or any types of owners or beneficial owners that may have legal rights under state statutes. If the valuation analyst has been involved with shareholder disputes, he or she cannot assume that the laws are the same for limited liability companies or partnerships. The various jurisdictions have different statutes for these different types of entities. Guidance should always be obtained from the client's legal counsel before embarking on the journey of ownership disputes.

I probably should not have to state this upfront, but I want to play it safe. Ownership disputes typically result from a minority owner who feels that he or she (or they) have not been treated fairly by those who have control over the company. A controlling owner would probably not have to file a lawsuit against himself or herself. Therefore, individuals who own minority interests in closely held entities are subject to an additional element of risk solely because they have a minority position in the entity. The major risk factor is that they cannot exercise the prerogatives of control that were discussed in chapter 14. As such, this significant lack of control causes them to have a lack of liquidity because who in their right mind wants to buy minority shares in a closely held company? As a result, they are prisoners in the company. The information in box 24.1 shows what a minority shareholder typically cannot do because he or she does not have exercisable control. However, if the valuation analyst was valuing a partnership interest instead of a corporate interest, the items in box 24.1 on the following page, would have to be modified because a partner can cause a liquidation under the *Uniform Partnership Act* if there is no agreement to the contrary.

1 *Valuing a Business*, 5th edition, by Pratt and Niculita, has some excellent materials throughout.

2 *The Handbook of Advanced Business Valuation*, edited by Robert Reilly and Robert Schweihs. See in particular chapter 15, authored by Anne C. Singer and Jay E. Fishman.

**BOX 24.1****Common Exercisable Majority Ownership Rights**

- Appoint or change operational management
- Appoint or change members of the board of directors
- Determine management compensation and perquisites
- Set operational and strategic policy and change the course of the business
- Acquire, lease, or liquidate business assets, including plant, property, and equipment
- Select suppliers, vendors, and subcontractors with whom to do business and award contracts
- Negotiate and consummate mergers and acquisitions
- Liquidate, dissolve, sell out, or recapitalize the company
- Sell or acquire treasury shares
- Register the company's debt or equity securities for an initial or secondary public offering
- Declare and pay cash or stock dividends, or both
- Change the articles of incorporation or bylaws
- Select joint ventures and enter into joint venture and partnership agreements

For the balance of this chapter, I am going to refer to shareholders and corporations, but understand that this could apply to other types of ownership and entities. Because this is a valuation book and not a legal treatise, I am going to keep it simple. These items are the prerogatives of control that were previously discussed. These are also the reasons for many shareholder lawsuits. When the minority shareholder feels that the controlling shareholder is taking advantage or mismanaging the company, a lawsuit frequently takes place. There are also times that the shareholder may be squeezed out of the company, triggering a lawsuit. In some jurisdictions, the lawsuit may occur because the corporation is in a deadlock situation. I will attempt to explain this stuff soon.

Many times, in a closely held company, the minority shareholder is an officer or employee of the company, rather than purely an investor. Disputes arise when the controlling shareholder decides to

- terminate the minority shareholder as an employee, director, or officer of the corporation.
- change his or her salary.
- completely freeze out the minority shareholder.
- otherwise abuse him or her (this abuse is called *oppression*).

In order to avoid allowing the controlling shareholders to take advantage of the minority shareholders, most jurisdictions have passed laws to protect the noncontrolling owners. These laws provide minority shareholders with remedies for actions regarding fraud, abusive behavior, and mismanagement by the controlling shareholder. These laws are frequently referred to as *oppressed shareholders' statutes* or *dissolution statutes*. In

some cases, they are not the same. Make sure that you work with an attorney so that you are following the correct rules. Let me give you a quick example. We represented a shareholder who was effectively thrown out of the company that he founded, and he subsequently filed a lawsuit. The jurisdiction did not have an oppression statute. We were engaged to value his interest using a fair value standard based on the following description in a state statute:

FL §607.1301(4) defines fair value as follows:

'Fair Value' means the value of the corporation's shares determined:

- (a) Immediately before the effectuation of the corporate action to which the shareholder objects.
- (b) Using customary and current valuation concepts and techniques generally employed for similar businesses in the context of the transaction requiring appraisal, excluding any appreciation or depreciation in anticipation of the corporate action unless exclusion would be inequitable to the corporation and its remaining shareholders.
- (c) For a corporation with 10 or fewer shareholders, without discounting for lack of marketability or minority status.

So, what is the problem? If you reread the Florida statute that was quoted in the preceding paragraph, you would discover that this statute is part of the dissenting shareholder statute. A battle ensued between the attorneys about whether or not to accept our report because the case before the court was not a dissenting shareholder matter. It turns out there are no other definitions of *fair value* in the Florida statutes, so we were instructed to use this one as an indication of what would be necessary to do the correct thing (compensating the shareholder for what was being taken away from him), which is normally the concept in many fair value litigations. I cannot say what would have happened because The Court dismissed the action based on some other technical issues that had nothing to do with our valuation.

This is where we learn from the possible mistakes of others. Two weeks later, I was reviewing a report with an attorney regarding a deadlocked corporation matter in which I had used the preceding definition, once again, because of the lack of definition elsewhere in the Florida statute. He had me remove the statutory definition and insert the following instead:

According to Florida Statute §607.1436

Election to purchase instead of dissolution.—

(1) In a proceeding under s. 607.1430(2) or (3) to dissolve a corporation, the corporation may elect or, if it fails to elect, one or more shareholders may elect to purchase all shares owned by the petitioning shareholder at the fair value of the shares.

In *Cox Enterprises Inc. v. News Journal Corporation*, 510 F.3d 1350,1357 (11th Cir. 2007), the Court addressed the issue of fair value in the context of the above statute. It stated:

Fla Stat. § 607.1436 gives the court charged with valuing shares in a corporation discretion to determine the most appropriate valuation method by which to arrive at “fair value.” See *G&G Fashion Design, Inc. v. Garcia*, 870 So.2d 870, 873 (Fla. Dist. Ct. App. 2004) (‘A trial court’s selection of one valuation method over another does not require reversal.’) (also citing *In re Walt’s Submarine Sandwiches, Inc.*, 569 N.Y.S.2d 492, 493, 173 A.D.2d 980, 980 (N.Y.App.Div.1991) (‘The valuation process is fact specific with an emphasis on the particular circumstances of the case.’)); see also *In re Blake v. Blake Agency*, 486 N.Y.S.2d 341, 347, 107 A.D.2d 139, 146 (N.Y.App.Div.1985) (‘The factors to be considered [in determining ‘fair value’] are, inter alia, market value, investment value, and net asset value, [and t]he weight to be accorded each factor depends upon the circumstances of the particular case.’) (citations omitted). When trial judges are given such discretion, ‘we review only for an abuse of that discretion.’ *FDIC v. Morley*, 915 F.2d 1517, 1523 (11th Cir.1990). In reviewing for abuse of discretion, we recognize the existence of a ‘range of possible conclusions the trial judge may reach,’ and ‘we must affirm unless we find that the district court has made a clear error of judgment, or has applied the wrong legal standard.’ *Amlong & Amlong, P.A. v. Denny’s, Inc.*, 500 F.3d 1230, 1238 (11th Cir.2007).

The Court went on by stating:

#### A. Consideration of Fair Market Value

Florida courts have explained that determination of ‘fair value’ for the purposes of the election statute ‘rests on determining what a willing purchaser in an arm’s length transaction would offer for an interest in the subject business.’ *G&G Fashion Design*, 870 So.2d at 871; see also *Friedman v. Beway Realty Corp.*, 87 N.Y.2d 161, 638 N.Y.S.2d 399, 661 N.E.2d 972, 976 (1995) (applying New York statute similar to Florida’s statute). This is not to say that ‘fair value’ is synonymous with ‘fair market value.’ Most courts have rejected the notion of such synonymy. See *Boettcher v. IMC Mortg. Co.*, 871 So.2d 1047, 1052 (Fla. Dist. Ct.App.2004). However, the terms are not mutually exclusive. On one hand, as Florida courts have explained, where ‘fair market value’ would take into account appreciation or depreciation in anticipation of corporate action such as a merger or acquisition, the valuation process under § 607.1436 must exclude both positive and negative effects of any such impending transaction. *Id.* On the other hand, a court may use fair market value as an estimate of ‘fair value’ when such potentially distorting corporate actions are not at issue. See, e.g., *G&G Fashion Design*, 870 So.2d at 872-73 (affirming trial court’s reliance on market value approach and evidence of good faith, bona fide, arm’s length offer for minority shareholder’s shares in determination of ‘fair value’).

This just goes to highlight the vast differences between the definitions that a valuation analyst might see in the same jurisdiction. This is why the valuation analyst needs to get this information from an attorney and not take it upon himself or herself to determine the correct definition or statute to follow. Back to theory!

Every jurisdiction has enacted dissenters' rights statutes. These statutes provide an appraisal remedy for the minority shareholder who does not agree with certain types of transactions approved by the controlling shareholders that have a financial impact on the value of the minority shares. In these instances, the statutes generally provide the remedy of allowing the shares to be sold.

Despite the different reasons for dissenting and oppressed shareholder suits, the standard of value in most of these cases is fair value. For dissenting shareholders, the purchase of their stock for fair value is usually the only remedy. For minority shareholders seeking a remedy for oppression, fraud, mismanagement, or similar problems, the courts frequently have more latitude for the remedy. In most instances, the minority shareholder will be allowed to sell his or her shares back to the corporation at fair value. In some instances, the shareholder may be entitled to compensation as a measure of damages, but for the mismanagement of the company, the shares would have been worth this much. In a very rare situation, The Court<sup>3</sup> allowed the minority shareholder to buy out the controlling shareholders. Our firm was actually involved in that case! Justice was truly served when our client was allowed to purchase the shares of the controlling shareholders at their low-balled valuation figure and keep the company that he had worked so hard to build. Once in a while, there really is justice in our legal system.

Because oppressed and dissenting shareholders rarely, if ever, have a ready market for their stock on the open market, as do stockholders in publicly traded companies, fair value is an important standard of value to ensure that the minority shareholders receive adequate consideration for their investment.

As discussed in chapter 4, fair value is not clearly defined, but it is used in the vast majority of dissenters' rights<sup>4</sup> and oppressed shareholders' statutes. Whereas the term fair market value has a definition, *fair value* is rarely, if ever, defined in a statute. When it is, it is often in a particular statute that may not apply to the particular case (as was the situation I described in the preceding section). Therefore, the definition has been left to judicial interpretation. The valuation analyst must check with the client's attorney for the interpretation in the jurisdiction in which the litigation takes place. This stuff can get very tricky when it comes to control versus minority issues, as well as marketable versus nonmarketable issues.

## Dissenting Shareholder Matters

Minority shareholders who believe that the value of their shares in a company that is undergoing, for example, some form of transaction, recapitalization, or merger, is greater than the proposed consideration to be received by them are entitled, by statute, to dissent from the transaction, recapitalization, or merger. This generally means that they have to file a lawsuit. The lawsuit usually states something like, "I'm not getting what I believe to be the fair value of my shares, and I want more." Most of the time, these matters come about because of a merger; however, dissenting shareholders' rights may also come into play when a corporation sells substantially all of its corporate assets or makes certain changes in its basic organizational structure that results in its shareholders being compelled to sell their shares for what is perceived to be an unfair price. Notice the use of the word *compelled*. They usually do not have a choice. Remember the definition of *fair market value*: Neither party is compelled. Here, the seller is compelled. Even the buyer may be compelled. In most cases, the dissenting shareholder's only remedy is to seek an independent valuation as the basis for an alternative cash settlement. A book that nicely summarizes the case law as it pertains to different definitions of types of value is *Standards of Value*, which I mentioned previously in this book.

In dissenting shareholder actions, the appropriate standard or premise of value is fair value. In states that have adopted the Uniform Business Corporation Act, the definition of *fair value* is "the value of the shares immediately before the effectuation of the corporate action to which the dissenter objects, excluding any appreciation or depreciation in anticipation of the corporate action unless exclusion would be inequitable." However, even in those states that have accepted this definition, there is little guidance about what this truly means. What is

<sup>3</sup> *Muellerberg v. Bikon Corp.*, 143 N.J. 167, 182, 669 A.2d 1382, 1389 (1996).

<sup>4</sup> Not all states have adopted the fair value standard in dissenters' cases.

somewhat clear, and actually seems to be agreed upon by most courts, is that fair value is not synonymous with fair market value.

Before we go any farther, let me comment about the quote from the Uniform Business Corporation Act. Notice that it states “immediately before the effectuation...” The key here is that the valuation analyst is trying to value the interest before the corporate action takes place. This means that the dissenting shareholder should not gain, nor be penalized, as a result of the action that is causing the dissension. If a merger will make the company stronger, that should not be taken into consideration. Also, if the corporate action actually hurts the value of the entity, the shareholder should not have to suffer due to the actions of the corporation. But notice the part of the quote that states “excluding any appreciation or depreciation in anticipation of the corporate action unless exclusion would be inequitable.” This section, which many states have omitted from their local statutes, is designed to provide flexibility for the court to do the “equitable” thing. Because fairness is the goal of this type of litigation, which usually takes place in a court of equity, the law is designed to allow factors to be considered by the court even if the value is affected by the corporate action. Now, with that being said, the question becomes whose job is it to determine whether a valuation analyst should exclude or include this information? Certainly, it is not ours to decide. This is a judgment call that must be left to the client’s attorney because it will most likely require a legal argument to be made. I frequently like to say that the attorney is the quarterback who calls the play, and I am the wide receiver who runs the pass pattern for the quarterback (if you are not familiar with football, just ignore my last statement).

Sometimes, equitable adjustments may be required separate and apart from the value that the valuation analyst determines. Here, too, it is not the job of the valuation analyst to determine these adjustments. We may quantify them, but we should be told which ones need quantification. I will discuss this point further in a short while.

Because the definition of *fair market value* involves the hypothetical willing buyer and the hypothetical willing seller (in other words, neither party is under any compulsion to buy or sell), there should be little doubt that a minority stockholder of a company involved in a statutory merger is a specific seller (not hypothetical) and is compelled to sell for a unilaterally determined price. In the absence of the right to refuse the “offer,” a dissenting shareholder has no choice but to seek fair value with the court’s help.

Under the principle of alternatives (discussed in chapter 4), the hypothetical willing seller, in a free and open market, has the option of rejecting a tender offer. As a result, the hypothetical buyers are typically motivated to pay a (control) premium in order to entice sellers to forego future participation or ownership. Distinctions between fair market value and fair value notwithstanding, guidance concerning the interpretation and application of fair value as evidenced by case law varies considerably between the jurisdictions.

One of the most important determinations affecting the calculation of fair value is the appropriate level of value—minority or controlling interest, marketable or nonmarketable basis. The case law is literally all over the place. In *Standards of Value*, the authors discuss various interpretations of the courts. I am not going to repeat them here. For the most part, my interpretation of the case law is that typically, in dissenting shareholder suits, the shares are valued as a pro rata share of the whole company. However, the question that the valuation analyst will have to address is based on value to whom? Certain case law discusses valuing the shares based on what the shareholder is giving up. That can make the income approach more important than the market approach. I will address this point soon.

Logically, if the entire company was sold, the minority shareholder would get a proportionate share of the transaction. Minority discounts are a concept applicable to fair market value. Because each shareholder should have the same value per share, minority discounts in fair value cases do not make sense. In fact, at least in the state of Florida, the legislation made sure that this would not be an issue. It specifically states “For a corporation with 10 or fewer shareholders, without discounting for lack of marketability or minority status.”<sup>5</sup>

.....  
5 The 2007 Florida Statutes, Title XXXVI, Chapter 607, Sec. 607.1301 Appraisal Rights; Definitions.

Case law for dissenting shareholder actions also seems to discourage the use of marketability discounts in the calculation of fair value. This is primarily due to the fact that there is some sort of transaction being proposed. This makes a market for the shares. Accordingly, the use of a marketability discount in calculating the fair value of the subject shares is not warranted. However, considering the complexity and contradictory nature of the case law in this arena, the valuation analyst should always rely on the advice of counsel on this issue. Have I said that enough times in this book? There will be a few more before we are through.

Minority shareholders who believe that certain fundamental or extraordinary corporate changes voted by the controlling shareholders will adversely affect the values of their interests in the company have statutory rights available as dissenters. Currently, the statutes of all states permit such shareholders to dissent from the controlling shareholders' action, compelling the corporation to purchase their stock.

In Delaware, the jurisdiction where an awful lot of this type of litigation takes place, only a merger or consolidation triggers dissenters' rights. However, under the statutes of most states, dissenters' rights are triggered by a variety of actions, such as a merger, sale, lease, exchange, or other disposition of all or substantially all the corporate stock.

Under normal circumstances, shareholders who wish to exercise their rights must give notice to the corporation that they intend to demand payment for their shares if the proposed action is approved in advance of the vote. The stockholder must then make a written demand for payment within some time period of the mailing of notice, advising that the corporate action was approved. In some jurisdictions, once the demand for payment is made, the dissenting shareholder no longer continues "to have any rights of a shareholder, except the right to be paid the fair value of his shares..."<sup>6</sup>

For example, in New Jersey, the applicable statute provides that the corporation must mail to each dissenting shareholder the financial statements of the corporation as of the latest available date and profit and loss statements for a 12-month period ending on the date of the balance sheet. The corporation may, at the time of this mailing, make a written offer to purchase the dissenting shareholder's shares at a specified price deemed to be the fair value. If no agreement about fair value is reached within the statutory time period, the dissenting shareholder may serve a demand on the corporation that it commenced an action to determine fair value. Once the action is initiated, the court may appoint a valuation analyst to estimate the fair value of the dissenter's shares.

## Oppressed Shareholder Matters

An oppressed shareholder case is, in effect, a corporate divorce between shareholders instead of husband and wife. These types of cases provide relief to a noncontrolling shareholder in a closely held business who seeks such relief because the controlling shareholder's fraud, oppression, or mismanagement. Courts have recognized that relief is frequently necessary for shareholders in closely held corporations because of the unique nature of a closely held entity. In a closely held company,

- shareholders who are employed by the company often expect to be active participants in management.
- when disagreements occur, the controlling shareholder usually has the ability to use his or her power to unfairly take advantage of the minority shareholder, preventing the minority shareholder from obtaining a fair return on his or her investment.
- the illiquidity associated with the minority shareholder's stock means that he or she may not be able to get out of the investment that he or she no longer wants.

Although courts usually have a number of equitable remedies available, including corporate dissolution, the most common remedy afforded minority shareholders is an award of fair value for their stock.

The buy-out remedy provides the minority shareholder with the ability to liquidate an otherwise relatively illiquid investment. If the system works properly, it provides the minority shareholder with a fair return on his or her investment, and it divorces people who do not want to stay married in business.

<sup>6</sup> This is the language that appears in N.J.S.A. (14A:11-3(2)).

Under most of the state statutes, the minority shareholder cannot just waltz into court and get the fair value for his or her stock. The shareholder usually has to prove oppression, fraud, or mismanagement before the court will order a buyout at fair value. In certain jurisdictions, once a minority shareholder files a lawsuit requesting dissolution of the corporation on the basis of oppression or related grounds, the controlling shareholder can automatically elect to purchase the shares of the minority shareholder for fair value. This turns the case into nothing more than a simple stock purchase, eliminating the allegations of oppression or wrongdoing. In some jurisdictions, the alternative of purchasing a minority shareholder's stock is irrevocable, absent court approval. In other states, the corporation may elect not to proceed with the purchase if it is dissatisfied with the value eventually set by the court for the stock. Once again, inconsistent laws make our job difficult. But that is why we get paid the big bucks!

The payment of fair value to an oppressed shareholder has been recognized as a complete and just remedy for oppression. The Delaware Supreme Court has said that fair value "measures that which has been taken from [the shareholder], viz., his proportionate interest in a going concern."<sup>7</sup>

## Fair Value

A proper understanding and definition of the applicable standard of value is a key to achieving a proper conclusion of value. The failure to stick to the correct standard of value can cause otherwise qualified business valuation analysts to greatly differ in their conclusions.

As mentioned previously, fair value is rarely legislatively defined. For business valuers, this often leads to confusion about the meaning of fair value in the context of these assignments. Moreover, even when the courts have addressed this issue, legal precedents can be vague or contradictory and, therefore, offer inadequate guidance about the application of the fair value standard. The dissenters' rights section of the Model Act<sup>8</sup> does not provide any direction as to how fair value is to be determined, although it contains a definition. This definition states

"Fair value," with respect to a dissenter's shares, means the value of the shares immediately before the effectuation of the corporate action to which the dissenter objects, excluding any appreciation or depreciation in anticipation of the corporate action unless exclusion would be inequitable.<sup>9</sup>

The definition contained in the Model Act has varied at the state level. Although some states have adopted that identical definition, other states use the definition without the final phrase "unless exclusion would be inequitable."<sup>10</sup> Some states use terms such as *fair cash value*,<sup>11</sup> *value*,<sup>12</sup> or even *fair market value*.<sup>13</sup> This is why you must know the rules of the jurisdiction.

The American Law Institute's concept of *fair value* as explained in *Principles of Corporate Governance* defines *fair value* as

... the value of the eligible holder's proportionate interest in the corporation, without any discount for minority status or, absent extraordinary circumstances, lack of marketability. Fair value should be determined using the customary valuation concepts and techniques generally employed in the relevant securities and financial markets for similar businesses in the context of the transaction giving rise to appraisal.<sup>14</sup>

7 Matter of Shell Oil Co., 607 A.2d 1213, 1218 (Del. 1992) (citations omitted), quoting *Tri-Continental Corp. v. Battye*, 74 A. 2d 71, 72 (Del. 1950); see also *Beerly v. Dept. of Treasury*, 768 F. 2d 942 (7th Cir. 1985).

8 The Model Business Corporation Act (MBCA) is a model set of law prepared by the Committee on Corporate Laws of the Section of Business Law of the American Bar Association and is followed by twenty-four states.

9 Model Act, '13.01(3).

10 The statutes of approximately 27 states contain the same definition of *fair value*. Approximately 14 other states, including New Jersey (N.J.S.A.'14A:11-3), use the same general concept of *fair value* without the final phrase "unless exclusion would be inequitable."

11 Ohio Rev. Code Ann. '1701.85(C) (Page's 1997 Supp.) (defined in the same way as *fair market value*); La. Rev. Stat. Ann. '12:131C(2) (West 1998 Supp.).

12 Kas. Stat. Ann. '17-6712 (1997 Supp.).

13 Cal. Corp. Code '1300(a) (West 1998 Supp.).

14 *Principles of Corporate Governance: Analysis and Recommendations*, Volumes 1 and 2, The American Law Institute, Section 7.22: 315.

Notice in this definition the phrase “absent extraordinary circumstances.” For those jurisdictions that follow this concept, a discount for lack of marketability will generally not be applied unless there are extraordinary circumstances. For example, a discount may be applied in a situation in which a minority shareholder interferes with business relationships to spite the controlling owner. Even though oppression may be demonstrated, the court may choose to punish the minority shareholder for his or her poor behavior in trying to hurt the business. This too, however, is a legal call and should be discussed with the client’s attorney.

#### Author's Note

The definition of fair value should never be taken from a valuation textbook because it is only through statutes and case law, which vary by jurisdiction, that the proper definition can be determined. I see valuation analysts quote books and make a determination that fair value is fair market value without discounts. Although this is sometimes the result, many times it is not. Please do not take the chance that you may get lucky. If you feel that lucky, buy a lottery ticket!

Fair value will usually be different than fair market value. Because *fair market value* refers to the price at which stock would be bought and sold in the marketplace, the estimation of the value of a minority shareholder’s stock under this standard may include a discount for lack of marketability and a discount for minority ownership interest. The methodology used in a fair value assignment may also be different than in a fair market value assignment. This could be the case in which the *market* price of stocks is not reflective of the *true* value of the guideline companies, resulting in a market value, but not a fair value, of the subject interest. If you do not think that this matters, think again. There can be times that the *true* value of what a shareholder is giving up may be miles apart from the fair market value of that interest. A portion of a fair value report where we attempted to reconcile the differences between the market approach and the income approach is shown in exhibit 24.1.

### EXHIBIT 24.1 Measuring the True Worth of What is Being Given Up Reconciliation of Values

In this valuation, various approaches to value were considered. The asset approach was eliminated because it did not consider the earnings potential of the Smith Entities. The remaining approaches resulted in the following:

Income approach	
Discounted cash flow	\$194.0 Million
Market approach	
MVIC to EBIT	148.0 Million
MVIC to debt-free net income	159.0 Million

We believe that the income approach results in the closest indication to fair value. The market approach is more indicative of fair market value. The pricing multiples are considerably lower than the intrinsic value of the guideline companies when considering the outlook for the future.

We further researched information in the public domain from the valuation date back, to attempt to resolve the issues of the market price of the stocks in the trucking industry. The following information summarizes our findings:

- *Fortune*—September 18, 2000

These are dark days for the trucking sector. Gas prices are soaring, the economy is slowing down, and interest rates are still one big question mark. Maybe that’s why shares of trucking companies linger at about book value. But at least one fund manager—PBHG Small Cap Value’s Jerome Heppelmann—thinks it’s time to buy.

### EXHIBIT 24.1 Measuring the True Worth of What is Being Given Up Reconciliation of Values *(continued)*

He's boosting his funds' weighting in trucking stocks from 2.5% to 4%, namely, with four companies: Swift Transportation, JB Hunt Transport Services, Covenant Transport, and US Xpress.

- *Morgan Keegan*—November 28, 2000

For regional, less-than-truck-load (LTL) carriers, rate increases have been gained more consistently. The LTL carriers, in general, pushed through a 4% to 6% rate increase this fall, which typically covers one-half of their revenue base. The other half of the revenue base is typically contractual in nature, and rate increases are sought as contracts expire. Truckers report that the pricing environment for LTL service is as good as it has been in recent memory. An estimated \$1.0 to \$1.5 billion in annual revenue/capacity has been taken out of the industry in the past two years as three major regional LTL carriers have ceased operations. This removal of capacity has been good for the remaining players. We believe regional LTL carriers are also benefiting from secular changes in shipping trends. As more and more distributors, manufacturers, and retailers practice just in-time inventory management, the need for high service freight delivery increases. Just-in-time also means smaller, more frequent shipments. Both of these dynamics favor the service-sensitive product offering of the LTL carriers.

A quick review of the data in table 5 shows us that our list of trucking companies, without exception, are all trading at a discount to their respective average P/E calculated over the past three years. Most are trading within earshot of their low P/E over that three-year time period, well below the high P/Es achieved.

**TABLE 5 Comparison of P/E Ratios**

	Historical P/E Hi-Low Avg	P/E on MK 2001 Estimate	P/E on MK EPS w/ (10%) Rev. Shortfall	P/E on MK EPS w/2% OR Increase	P/E on MK EPS w/Both Events
CVTI	24.5–5.3 / 13.2	8.1	9.5	15.2	18.5
HTLD	31.8–11 / 17.3	15.4	16.9	16.9	18.5
KNGT	34.8–11.1 / 21.6	11.8	13.3	13.6	15.3
MSCA	22.8–6.6 / 14	11.6	13.7	21.6	27.4
CRGO	11–4.8 / 8.1	5.4	6.0	7.0	7.8
SWFT	27.9–11.5 / 19.8	16.5	18.6	21.4	24.3
XPRSA	38.6–5 / 16.5	10.0	12.5	NM	NM
USFC	18.4–4.8 / 12.1	7.3	8.1	10.1	11.5
WERN	22.4–8.9 / 15	13.0	14.5	18.0	20.2

In our opinion, current valuations placed on our recommended truckers have assumed a recessionary environment in the year ahead. As industry conditions toughen, whether due to a slowing level of freight activity, higher fuel prices, or other reasons, we believe that consolidation will favor many of the carriers in our list of coverage. Though it is difficult to pound the table with doubt hanging over the growth prospects for 2001, we strongly encourage investors to have some exposure to the truckers on our coverage list.

Therefore, in our opinion, the fair value of the Smith Entities as an operating concern is estimated to be \$194.0 million.

#### Author's Note

We found that the investment bankers who followed most of the guideline companies had strong buy recommendations for these stocks. This added further proof that the market was undervaluing the companies. The Smith Entities were financially strong, postured for solid growth, and had a proven track record. Our client had also received very substantial dividends over the past 10 years. We believed that just because the stock market was depressed for the guideline companies, it was no reason to undervalue the subject company. This is why we concluded that the income approach better reflected the true or intrinsic value of what was being given up.

Shareholder disputes often include a battle about which discounts, if any, should be applied. Although it is the intention of the court to be equitable, these discounts are the cause of extremely contentious litigation.

The New Jersey Supreme Court decided two separate cases on the same day: one dealing with a dissenting shareholder issue and the other dealing with an oppressed shareholder issue. The contrasting issue of which discounts, if any, should be considered by the court was addressed in these two rulings, which were explained in our firm's newsletter and are reproduced here in box 24.2. Although this seems like it is old, the case law today seems to be similar in most jurisdictions. Everyone is struggling with these same issues.

**BOX 24.2****Trugman Valuation Associates, Inc. Newsletter, Valuation Trends, Winter 2000 Edition**

In July 1999, the Supreme Court of New Jersey ruled on two fair value cases. One of these cases was filed as a dissenting shareholder action, while the other was filed under the New Jersey Oppressed Shareholder Statute. Although there were several issues on appeal in each case, the commonality between them was the issue of a discount for lack of marketability (DLOM). While we recognize that all of our readers are not from New Jersey, we felt that these two cases are a good follow up to the last issue's article. These cases highlight the differences that can arise under the same standard of value.

The *Lawson Mardon Wheaton, Inc. v. Smith* (A-63/64-98) case deals with a family-owned business. After a number of shares of this family-owned business were sold or conditionally sold to a British company, the board of directors approved a plan to restructure the corporation. The reason for this restructuring was to keep the stock in the family by restricting future public sales of the company's stock. When the plan was approved in 1991, those stockholders who did not approve were notified of their right to demand payment of the fair value of their shares under N.J.S.A. 14A:11-1 to -11, also known as the Appraisal Statute. Twenty-six shareholders owning approximately 15 percent of the shares dissented and demanded payment for their shares. The corporation offered \$41.50 per share, which included the deduction of a 25 percent DLOM. This discount was based on the belief that there was a limited market of potential buyers for this stock. When the dissenters rejected this offer, this action was instituted.

Both the trial court and the appellate court determined the price of the stock after considering a DLOM finding that there were "extraordinary circumstances" in this situation giving applicability to this discount. The Supreme Court disagreed.

The Supreme Court's opinion stresses the nature of the term *fair value* and states "courts must take fairness and equity into account in deciding to apply a discount to the value of the dissenting shareholders' stock in an appraisal action." The court goes on to say

Indeed, equitable considerations have led the majority of states and commentators to conclude that marketability and minority discounts should not be applied when determining fair value of dissenting shareholders' stock in an appraisal action. Although there is no clear consensus, the use of a fair value standard, combined with application of equitable principles, has resulted in a majority of jurisdictions holding that a dissenting shareholder is entitled to her proportional share of the fair market value of the corporation. The value of the shares will not be discounted on the ground that the shares are a minority interest or on the related grounds of a lack of liquidity or marketability.

In addressing the issue of extraordinary circumstances, the Supreme Court disagreed with the lower courts. According to the decision, extraordinary circumstances exist when a dissenting shareholder holds out in order to benefit him or herself by doing so. In this case, The Court felt that disagreeing (dissenting) to a corporate change was not extraordinary, but rather an ordinary business matter.

In light of the issue of fairness, and the fact that extraordinary circumstances did not appear to exist, the Supreme Court overturned the lower court on these issues and held that a discount for lack of marketability was not applicable in this case.

On the same date, The Court ruled in the opposite direction in *Emanuel Balsamides, Sr., et. al. v. Protameen Chemicals, Inc., et. al.* (A-27-1998), which was an action brought under the New Jersey Oppressed Shareholder Statute (N.J.S.A. 14A:12-7).

In this case, Mr. Balsamides and Mr. Perle were equal partners in a manufacturing business. After many years of jointly running the business, the partners began having trouble working together, and over a number of years, this relationship deteriorated. Mr. Balsamides sought relief as an oppressed shareholder. Under this statute, if The Court finds the plaintiff to be oppressed, The Court "may appoint a custodian, appoint a provisional director, order a sale of the corporation's stock [as provided below], or enter a judgment dissolving the corporation.. ." After a 19-day trial, The Court found that Mr. Balsamides was oppressed, that Mr. Perle had conducted himself in such a way as to harm the business, and concluded that Mr. Balsamides should purchase Mr. Perle's share of the business. The trial court determined the purchase price of these shares of stock after the deduction of a 35 percent DLOM.

**BOX 24.2****Trugman Valuation Associates, Inc. Newsletter, Valuation Trends, Winter 2000 Edition**

The case was appealed to the appellate division, which overturned the trial court's decision relating to this discount. The appellate court "concluded that such a discount was not appropriate in this case because there was no sale of Mr. Perle's stock to the public, nor was Mr. Balsamides buying an interest that might result in the later sale of that interest to the public."

The case was then appealed to the Supreme Court, which overturned the appellate division on the issue of the discount for lack of marketability. The decision stated

The position of the Appellate Division ignores the reality that Balsamides is buying a company that will remain illiquid because it is not publicly traded and public information about it is not widely disseminated. Protameen will continue to have a small base of available purchasers. If it is resold in the future, Balsamides will receive a lower purchase price because of the company's closely held nature.

If Perle and Balsamides sold Protameen together, the price they received would reflect Protameen's illiquidity. They would split the price and also share that detriment. Similarly, if Balsamides pays Perle a discounted price, Perle suffers half the lack-of-marketability now; Balsamides suffers the other half when he eventually sells his closely-held business. Conversely, if Perle is not required to sell his shares at a price that reflects Protameen's lack of marketability, Balsamides will suffer the full effect of Protameen's lack of marketability at the time he sells.

In the Balsamides decision, the Supreme Court distinguishes the two cases. In summary, the cases are distinct based on the facts and the different statutes under which these cases arise. Regarding Wheaton, the court states, "it would be unfair and inequitable to apply a marketability discount. To allow the major shareholders to buy out the minority dissenters at a discount would penalize the minority for exercising their statutory rights. Moreover, it would create the wrong incentives for shareholders." Regarding the *Balsamides* decision, the court states, "In cases where the oppressing shareholder instigates the problems, as in this case, fairness dictates that the oppressing shareholder should not benefit at the expense of the oppressed. The statute does not allow the oppressor to harm his partner and the company and be rewarded with the right to buy out that partner at a discount. We do not want to afford a shareholder any incentive to oppress other shareholders."

Despite the differences that appear to exist in the cases, the bottom line appears to be that The Court is looking for all shareholders to be treated fairly, regardless of the circumstances.

## The Valuation Date

A valuation is an estimate of value at a given point in time. The date of the valuation, whether statutorily mandated or otherwise, is of great importance (and by now, you know that). Most state statutes provide that when a dissenting shareholder's stock is to be purchased, fair value is determined as of the day prior to the meeting of the shareholders at which the action dissented from was opposed. The valuation analyst must get a copy of the statute and read it. For example, the New Jersey statute provides: "In all cases, fair value shall exclude any appreciation or depreciation resulting from the proposed action."<sup>15</sup> This means that the dissenting shareholder does not get credit for any gain, nor is he or she penalized for any loss that results from the action from which he or she dissented. This actually makes sense when you think about it.

Under the fair market value concept, the valuation analyst only uses information known or knowable as of the date of the valuation. Under the fair value concept, some courts have allowed subsequent information to be used, as well. I discussed subsequent events previously, so I am not going to repeat that discussion here. However, if that discussion has already been forgotten, go back and start reading this book all over again. The Delaware Supreme Court has ruled that the language limiting consideration of some post-merger changes in value eliminates the consideration of the speculative elements of value created by the merger. It does not rule out consideration of elements of future value, including the nature of the enterprise, "that are known or susceptible of proof as of the date of the merger and not the product of speculation..."<sup>16</sup>

In reading the statutes, the valuation analyst should pay close attention to the wording. For example, under the New Jersey statute applicable to oppressed shareholders, the purchase price of any shares sold "shall be their fair value as of the date of the commencement of the action plus or minus any adjustments deemed

<sup>15</sup> N.J.S.A. '14A: 11-3(3)(c).

<sup>16</sup> *Weinberger v. UOP, Inc.*, 457 A.2d 701 (Del. 1983); see also *Cede & Co. v. Technicolor, Inc.*, 684 A.2d 289 (Del. 1996).

equitable by the court.”<sup>17</sup> Notice the phrase “plus or minus any adjustments deemed equitable by the court.” This gives the court latitude to do the fair thing. Many times, equitable adjustments will be made by the court. In some instances, it will be the role of the valuation analyst to provide these adjustments to the judge or jury. A section of a valuation report in a fair value litigation is contained in exhibit 24.2.

This section was included at the end of the valuation report. Our client was going to be bought out. The valuation date was determined by the court to be January 31, 1996. Again, some of these older cases are great teaching tools.

## EXHIBIT 24.2 Equitable Adjustment Analysis

At the request of Tom Sawyer, Esq., we have performed an analysis that is intended to assist the court regarding the issues raised in *William C. Musto v. Vincent G. Vidas, John S. Degnan, and Semcor, Inc.* (333 N.J. Super. 52 (App. Div. 2000)), particularly regarding the issues of interest and double recovery. Interest is considered under N. J. S. A. 14A:12-7(8)(d).

**Interest.** N.J.S.A. 14A:12-7 (8)(d) provides that:

Interest may be allowed at the rate and from the date determined by the court to be equitable, and if the court finds that the refusal of the shareholder to accept any offer of payment was arbitrary, vexatious, or otherwise not in good faith, no interest shall be allowed.

The court selected January 1996 as the valuation date, but the monies will not be paid to Susan Littleton until sometime in the future, many years after the valuation date. The statute compensates for the time lag through a consideration of interest. We must determine an appropriate interest rate.

In *Musto*, an argument was made regarding the use of an “equitable interest rate.”

The court determined that the interest rate to be used should be a rate that pertains to a creditor/lender as opposed to an equity owner. In fact, Judge Gottlieb used the prime lending rate, compounding the interest annually. He stated

Now interest. Defendants urge that it be not available but realistically as—a cutoff as of March 1992. This is when the several motions were made which memorialized a buy-out offer of the other. I’m not going to go on with that because then that overlooks the ultimate fact and that is that defendant had the use of plaintiff’s money...

What I have selected for the use of an interest rate payable here is the prime rate and why I have selected the prime rate is, it is most analogous to a corporate borrower and in light of Semcor’s solid financial position ...

I am not going to use the risk free rates, and by that I refer to the treasury notes, treasury bills, CDs, that sort of thing, since that would be intellectually inconsistent with my earlier determination of fair value where I said the cap rate which I have to apply ... to the income stream or reasonable income in order to arrive at the formulation of value, put a certain amount in there additional for Semcor not being, “risk free.”

I have thought about .... whether it should be compound or simple .... What I’ve done is try, since I’m using the prima [sic] rate.... to figure out if it were going to ABC Bank what it would be doing in borrowing X dollars for two years, four years, whatever it is, some period longer than one year.

In that marketplace, to my knowledge, it would be compounded on an annual basis at best, maybe compounded at a shorter period of time. That’s why I have chosen compounding as opposed to simple. I have chosen annual as opposed to quarterly compounding only because it seems to me that in the light of the events that occurred if it had been the equivalent circumstance the lending of money to Semcor would have been on probably not a quarterly compounding basis but on an annual.

In this instance, the fair value of Susan Littleton’s interest in the Littleton Entities was determined to be \$44,100,000 as of January 31, 1996. Interest should be added from that date.

In *Musto*, the court used the prime rate because “it is most analogous to a corporate borrower and in light of Semcor’s solid financial position...” According to the 1995 financial statements for the operating Littleton Entities, the interest rates being paid by these companies were as follows:

.....  
17 N.J.S.A. '14A: 12-7(8).

**EXHIBIT 24.2 Equitable Adjustment Analysis**

Notes payable to banks due in installments through December 2002 at interest rates of 8.75 percent to 9.48 percent.

Notes payable to financial institutions due in installments through August 2002 at interest rates of 7.5 percent to 13.2 percent.

On a weighted average basis, the Littleton Entities were paying about 10.35 percent.\* Since this is the rate of interest being paid by the Littleton Entities, we have applied this rate, with annual compounding through July 31, 2001. This calculation is included in table 55.

<b>TABLE 55 Pro Rata Valuation Plus Interest</b>	
Pro rata 1/3 ownership	\$44,100,000
Interest (10.35%)	
1/31/96–1/31/97	4,564,350
	\$48,664,350
1/31/97–1/31/98	5,036,760
	\$53,701,110
1/31/98–1/31/99	5,558,065
	\$59,259,175
1/31/99–1/31/00	6,133,325
	\$65,392,500
1/31/00–1/31/01	6,768,124
	\$72,160,623
1/31/01–7/31/01	3,734,312
<b>Total</b>	<b>\$75,894,936</b>

\* It is important to note that these rates represent collateralized loans that are secured. Any interest calculated for unsecured loans would normally be at a higher rate of interest to account for the additional risk to the lender.

**Double Recovery.** After considering interest, the next item to consider is whether any adjustment should be made for the monies received by Susan Littleton after the buy-out date to avoid a double recovery. The issue raised in *Musto* was whether the court should have permitted an equitable adjustment of account for the post-valuation growth until the stockholder's interest was actually redeemed. The facts in *Musto* are different than the litigation at hand.

In *Musto*, the plaintiff filed his complaint in December 1990. Shortly before the complaint was filed, the plaintiff was terminated from the company. The plaintiff received his year-end 1990 distribution, but received no other bimonthly distributions or paychecks from the company after that. He actually left in February 1991. In July 1991, he received a distribution from the company in the amount of \$200,000 and received an additional \$550,000 in deferred compensation. Value was determined in 1996, although *Musto* was out of the company for more than five years, earning his living elsewhere.

(continued)

**EXHIBIT 24.2 Equitable Adjustment Analysis** *(continued)*

In the most recent appellate decision, Judge Wallace stated

Defendants maintain the trial judge was correct in not deviating from the presumptive valuation date set forth in the statute (the date of the filing of the complaint) because an award of post-1990 profits under any rationale would constitute an illegal double recovery since the determination of fair value is actually based upon a company's future income stream. Defendants further assert that plaintiff would not have sought a post-1990 valuation date if Semcor's value had decreased after 1990. *Musto*, 333 N.J. Super. at 58-59.

The valuation date was set by the judge in this case as January 31, 1996. This is the date that has been used in our report. However, unlike *Musto*, Susan Littleton continued to work for the Littleton Entities after the valuation date. She continued to assist in creating value for the entities that she was being bought out of. The statute requires the court to consider whether any equitable adjustments should be made to reach a fair and just result for all of the parties to this litigation. N.J.S.A. 14A:12-7(8)(a) provides:

The purchase price of any shares so sold shall be their fair value as of the date of the commencement of the action or such earlier or later date deemed equitable by the court, plus or minus any adjustments deemed equitable by the court if the action was brought in whole or in part under paragraph 14A:12-7(1)(c).

In the *Musto* decision, Judge Gottlieb subsequently decided against an equitable adjustment for post-complaint corporate profits. Discussing the trial court's use of discretion, the appellate court stated

Thus, if the judge had allowed an equitable adjustment to account for a company's actual growth in the years following the valuation date, he might as well have accorded plaintiff a double recovery. Consequently, we find no abuse of discretion in the trial judge's denial of plaintiff's request for equitable adjustments to fair value. *Musto*, 333 N.J. Super. at 64.

To prevent any such double recovery, after applying interest, we must examine the money that Susan Littleton received after the valuation date to see what portion represents compensation for the work that she continued to perform as an employee of the company and what portion represents payment for her equity interest.

In order to respond to this issue, we reviewed the various entities' tax returns and financial information after 1995 (although January 1996 should be excluded from this analysis, we did not have the detail that would allow us to exclude it). Susan Littleton received the following monies from the Littleton Entities:

	Salaries	Commissions	Distributions
1996	\$ 498,429	\$1,425,000	\$ 38,400
1997	898,429	3,510,000	1,000,000
1998	1,172,927	3,380,000	2,638,477
1999	488,726	3,182,500	3,019,607
2000	500,000	1,000,000	1,314,500

**EXHIBIT 24.2 Equitable Adjustment Analysis**

In addition to the preceding, Susan Littleton was allocated profits and losses from the Littleton Entities as follows:

	1996	1997	1998	1999	2000
Company A	\$ (8,333)	\$ (9,657)	\$ (150)	\$ 2,506	N
Company B	7,979	6,710	10,495	9,637	O
Company C	(320,522)	(568,217)	(133,044)	94,539	T
Company D	17,807	(920,139)	(818,995)	(483,770)	
Company E	221,592	322,836	358,188	372,000	A
Company F	159,756	189,150	177,225	176,206	V
Company G	77,251	54,321	40,676	72,657	A
Company H	22,813	46,068	12,733	50,844	I
Company I	1,225,024	474,501	2,585,351	1,289,664	L
Company J	(171)	—	(200)	15,728	A
Company K	22,370	5,138	(200)	94,643	B
Company L	673,539	(746,437)	110,909	242,849	L
Company M	—	—	1,299,385	1,687,856	E
<b>Total</b>	<b>\$2,099,105</b>	<b>\$(1,145,726)</b>	<b>\$3,642,373</b>	<b>\$3,625,359</b>	

Some of the monies received by Susan Littleton may create a similar problem to the one that had to be addressed in *Musto*, namely the court's treatment of the deferred compensation received after the valuation date.

In disallowing the adjustment sought by the defendants, Judge Gottlieb stated

[I]t was characterized by the defendants as deferred compensation. It has been argued to me that .... that characterization was just a fiction in order to be able to take out of the corporation monies that year and still meet the equal compensation requirements.

[I]t was called deferred compensation.... to avoid taxes which would otherwise have had to have been paid to the State of New Jersey as a then subchapter S corporation....

So, the first concern that I have is the defendants have selected to go that route .... in order to gain a tax advantage and now having obtained that tax advantage wish to disavow it. I will not permit that. I find that they are estopped from characterizing it as anything other than deferred compensation for efforts before January 1, 1991.

The second basis is .... that it was paid pursuant to the equal compensation agreement and not for reasons of distributing to plaintiff a share of the corporation.

The appellate court, once again, supported Judge Gottlieb's opinion in stating

As noted above, N.J.S.A. 14A:12-7 (8)(a) authorizes a trial judge to make adjustments to fair value, either plus or minus, which the trial Judge finds equitable. The fact that Semcor was not obligated to make a payment to plaintiff, but did so voluntarily, does not mean the trial judge was obligated to make an equitable adjustment to fair value to account for the payment, or that his failure to do so constitutes an abuse of discretion. *Musto*, 333 N.J. Super. at 76.

(continued)

**EXHIBIT 24.2 Equitable Adjustment Analysis** *(continued)*

In this litigation, Susan Littleton received current compensation (salaries and commissions), as opposed to deferred compensation. She also received some cash distributions. Here, also, allocated profits and losses were reflected on the partnership and S corporation tax returns filed by the various companies.

The difficulties in trying to create an equitable adjustment would be determining which of the monies paid to Susan Littleton (salary, commission, or distributions) should be considered as a double recovery, and how the offsetting credit will be applied against these monies for all of the income taxes that have been paid on these items, including the allocated profits and losses.

Using an estimated 45 percent combined personal income tax rate, the net result of all of these items is as follows:

	1996	1997	1998	1999
Salary	\$ 498,429	\$ 898,429	\$ 1,172,927	\$ 488,726
Commissions	1,425,000	3,510,000	3,380,000	3,182,500
Allocations	2,099,105	(1,145,726)	3,642,373	3,625,359
Subtotal	\$ 4,022,534	\$ 3,262,703	\$ 8,195,300	\$ 7,296,585
Tax cost (45%)	1,810,140	1,468,216	3,687,885	3,283,463
Subtotal	\$ 2,212,394	\$ 1,794,487	\$ 4,507,415	\$ 4,013,122
Distributions	38,400	1,000,000	2,638,477	3,019,607
Net after tax	\$ 2,250,794	\$ 2,794,487	\$ 7,145,892	\$ 7,032,729
Noncash allocation	(2,099,105)	1,145,726	(3,642,373)	(3,625,359)
Net cash benefit	\$ 151,689	\$ 3,940,213	\$ 3,503,519	\$ 3,407,370

In addition to the preceding, the year 2000 figures have been estimated as follows:

Salary	\$ 500,000
Commissions	1,000,000
Allocations*	3,625,359
Subtotal	\$5,125,359
Tax cost (45%)	2,306,412
Subtotal	\$2,818,947
Distributions	1,314,500
Net after tax	\$4,133,447
Noncash allocation	(3,625,359)
Net cash benefit	\$ 508,088

\* At the time of the preparation of this report, the year 2000 figures were unknown. Because 1998 and 1999 were similar, we have estimated the year 2000 to be the same as 1999.

### EXHIBIT 24.2 Equitable Adjustment Analysis

Assuming that The Court wants to offset a portion of Susan Littleton's entitlement to avoid a "double recovery," the most that should be offset is the net cash benefit that has been received by her. The problem with adding back the entire amount is that Susan Littleton would also be giving back her compensation as an employee. The net cash benefit received by Susan Littleton should be reduced by whatever amount The Court deems to be reasonable to compensate her for her efforts as an employee during these years. This salary amount should be reduced by 45 percent to be consistent with our calculations.

**Reconciliation of Interest and Equitable Adjustments.** In the valuation analysis previously presented, a reasonable allowance for officers' compensation was estimated to be 2 percent of sales. This was unallocated between the officers, but if we assume that it was to be split evenly between Joan and Susan Littleton, each would be entitled to the following amounts:

1996	\$1,207,932
1997	1,328,725
1998	1,461,598
1999	1,607,757

The most equitable way to adjust the award to Susan Littleton would be to use the same level of compensation that was used in the valuation. This would avoid a "double recovery," and both value and compensation would be determined in a consistent fashion.

We believe the following calculation to be consistent with the intent of *Musto*.

Pro rata 1/3 ownership	\$44,100,000
1996 Equitable adjustment	512,674
<b>Subtotal</b>	<b>\$44,612,674</b>
Interest 1/31/96–1/31/97	4,617,412
<b>Subtotal</b>	<b>\$49,230,085</b>
1997 Equitable adjustment	(3,209,414)
<b>Subtotal</b>	<b>\$46,020,671</b>
Interest 1/31/97–1/31/98	4,763,139
<b>Subtotal</b>	<b>\$50,783,811</b>
1998 Equitable adjustment	(2,699,640)
<b>Subtotal</b>	<b>\$48,084,170</b>
Interest 1/31/98–1/31/99	4,976,712
<b>Subtotal</b>	<b>\$53,060,882</b>

(Table continued)

**EXHIBIT 24.2 Equitable Adjustment Analysis** *(continued)**(Table continued)*

1999 Equitable adjustment	(2,523,104)
Subtotal	\$50,537,778
Interest 1/31/99–1/31/00	5,230,660
Subtotal	\$55,768,438
2000 Equitable adjustment	456,566
Subtotal	\$56,225,005
Interest 1/31/00–1/31/01	5,819,288
Subtotal	\$62,044,293
Interest 1/31/01–7/31/01	3,210,792
Total Due to Susan Littleton	\$65,255,085

However, our client continued to be active in the business as a shareholder and employee until December 31, 2000. Significant dividends and distributions were made to the client subsequent to the valuation date, and the issue of double counting came up. Because the valuation was based on the anticipated future income stream, and the shareholder received part of that income stream, The Court wanted each side to address the issue of double counting. We performed our analysis in accordance with the case law that the judge and our client's attorney referred us to.

The determination of a valuation date, whether in a dissenters' rights case or an oppressed shareholder case (or any valuation case), is of considerable importance. This is because only those facts known or knowable at the valuation date should generally be considered. Courts have bought into this principle. It has been said that "valuation of securities is 'in essence a prophecy as to the future,' but this prophecy must be based upon facts available at the critical [valuation] date."<sup>18</sup> The Seventh Circuit Court of Appeals has stated that investors would be entitled to the future value "when 'known or susceptible of proof as of the [valuation] date....'" The court continued:

Here the subsequent events...were no more than speculation as of the time of the merger. We, like the district court, therefore exclude from consideration the fact that Mobil paid in 1980 more than twice the value implied by the merger in 1979. Only facts known in 1979 count . . . . Any increment of value attributable to changes after August 1979 [the valuation date] in the market for oil and gas, or to Mobil's willingness to make changes or bear special risks, belongs to [the purchasing] shareholders rather than [the selling shareholders]. The investors in a firm are entitled only to what it is worth as it exists, not as it could become in other hands.<sup>19</sup>

Therefore, the choice of a valuation date is essential because it acts as a cut-off date for the information that the valuation analyst may consider in performing the business valuation.

## Fair Value Methodology

Although business valuation contains many methods for a valuation analyst to use in estimating the value of a business, the valuation methods employed to estimate fair value have been heavily influenced by judicial precedents emerging from the Delaware courts. Delaware is the state where many public companies incorporate, and, as such, this jurisdiction sees more litigation in this area than many other jurisdictions. As a result of the case law that has come from these courts, Delaware's decisions have been followed in other jurisdictions. Although Delaware case law suggests that "all factors and elements which reasonably might enter into the fixing of value"<sup>20</sup> are relevant, until 1983 Delaware courts relied heavily on a fairly mechanical method known as the "Delaware Block Method." This method was adopted by a number of other states.

The Delaware Block Method had the valuation analyst

- derive separate values using methods under the income (based on earnings or dividends), asset-based, and market approaches.
- apply weights to each of the methods, depending upon the type of business being valued.
- add the results to determine the final estimate of value.

In the application of this method, the valuation analyst used pricing multiples derived from publicly traded guideline companies for the earnings or dividend methods. For public companies, the market approach would be based on some measure of the market price of the company's stock. In 1983, the Delaware Supreme Court decided the case of *Weinberger v. UOP, Inc.*<sup>21</sup> In this case, a minority shareholder objected to a freeze out merger, and the shares had to be valued. A *freeze out merger* occurs when a minority shareholder's interest in a corporation is involuntarily eliminated when controlling shareholders create a dummy corporation, transfer their stock to that corporation, and then agree to merge the old corporation with the new one. The new corporation acquires the assets and liabilities of the original corporation, with the controlling shareholders of the old corporation owning the stock of the surviving corporation. The minority shareholders no longer have any equity interest in the new business and have the right to receive only cash for their shares in the original company.

Although freeze out mergers may be thought to create special valuation problems because minority shareholders subject to a freeze out merger do not have a choice about whether to sell their stock, this is not the case. The valuation does not take into account any increased value or synergies that may result from the merger, and an ousted shareholder bears no costs or risks of the future enterprise and so should not share in its possible rewards. However, in *Mills v. Electric Auto-Lite Co.*,<sup>22</sup> it was determined that an undervaluation can occur in a freeze out situation.<sup>23</sup>

*Weinberger v. UOP, Inc.* became an important case because the Delaware Supreme Court held that the Delaware Block Method was "clearly outmoded" because it "excludes other generally accepted techniques used in the financial community."<sup>24</sup> Although this case did not totally eliminate the use of this method, it seems to have relaxed its exclusivity as a valuation method. Other valuation methods are much more common today. Thus, in most states, courts tend to base their valuation determination on any method accepted in the financial community. The discounted cash flow (DCF) method has become considerably more prevalent in the recent past.

The general interpretation by most courts in both dissenters' cases and oppression cases have held that fair value means valuing the business as a going concern, rather than as if in liquidation. This recognizes the fact that the business should be valued based on its status in the hands of the shareholders whose shares have been taken away from them. According to the Delaware Supreme Court, "The basic concept for value under the appraisal statute is that the stockholder is entitled to what has been taken from him, viz.,

20 *Tri-Continental Corp. v. Battye*, 74A.2d 71, 72 (Del. 1980).

21 *Weinberger v. UOP, Inc.*, 457 A.2d 701 (Del. 1983).

22 *Mills v. Electric Auto-Lite Co.*, 552 F.2d 1239, 1248 (7th Cir. 1977).

23 *The Handbook of Advanced Business Valuation*, p. 306.

24 547 A.2d at 713. See also *Stringer v. Car Data Systems, Inc.*, 314 Or. 576, 841 P.2d 1183, 1189 (1992) (fair value includes "all relevant factors"); *Schechter v. Watkins*, 395 Pa. Super. 363, 577 A.2d 585, 592 (1990) (in a forced buyout, the jury is instructed to consider any factor deemed appropriate).

*his proportionate interest in a going concern.*<sup>25</sup> However, as I indicated previously, the valuation analyst must check with counsel for the local interpretation. Not all states follow Delaware in this regard.

The battles that the valuation analyst may find himself or herself involved in can be truly challenging. The valuation analyst really has to know the valuation theory if he or she is going to compete in this business. A critique of a very large firm's valuation report in a shareholder dispute is included in exhibit 24.3. It has been edited to demonstrate only those points that have been discussed in this chapter (with a few other educational items thrown in). This firm only used a guideline company method, whereas we used the guideline company method and the DCF method. In this instance, the value derived using the DCF method was substantially greater than the guideline company method value because the guideline companies had a lower market value than intrinsic value.

### EXHIBIT 24.3 Partial Critique of Fair Value Report

**Page 1.** In the first paragraph of the executive summary, ABC Appraisal Co. says "Judge Harris directed that the purchase price be determined based on the fair value of John's interest as of January 31, 1996, or the end of the preceding year December 31, 1995 (valuation date), provided that the value not be materially different." This statement is incorrect. According to the November 1, 2000 order, Judge Harris specifically determined that the value was to be as of January 31, 1996. There is nothing in that order to indicate a different valuation date. The month does not materially change the value, but it allowed ABC Appraisal Co. to heavily rely on XYZ Appraisal Co., because their report was as of December 31, 1995. Practically speaking, we used December 31, 1995 financial data; however, the multiples and prices from the public market, as well as any known information to be considered in this valuation, should have included through January 31, 1996.

In the last paragraph on this page, ABC Appraisal Co. mentions reading the XYZ Appraisal Co. report, and they concur with XYZ Appraisal Co. that the market approach is the most reliable methodology to determine "the fair value of the interest." XYZ Appraisal Co. did not determine fair value, nor did they ever say that they were determining fair value. XYZ Appraisal Co. very clearly in their report determined fair market value, and any reliance by ABC Appraisal Co. on the XYZ Appraisal Co. report for fair value is incorrect.

ABC Appraisal Co. also states "because the Littleton Entities did not prepare financial forecasts, we could not perform a discounted cash flow (DCF) analysis, a form of the income approach." This statement is nonsense because ABC Appraisal Co. knew that the value would be considerably greater using a DCF because this company was a very profitable company and postured for substantial growth. The fact that the Littleton Entities did not prepare financial forecasts is not a reason for the valuation analyst not to perform a discounted cash flow analysis. We run into this situation, 90 out of 100 times in valuation when the company does not prepare its own forecasts. Part of being a valuation analyst is working with management to prepare a forecast or preparing your own, or both, because valuation is a prophecy of the future. Reliance on history, which the market approach does, will frequently undervalue the company, unless the valuation analyst is lucky enough to guess at the growth rate of the subject company and have guideline companies that are so comparable that little subjectivity has to be applied in the valuation process. This is rarely the case.

ABC Appraisal Co. also says "our valuation was based on all information that was known or should have been known as of the valuation date." This is clearly not true because they should have been able to determine, based on the financial information, that there was a ramping up of fixed assets, that the customer base was growing, that Littleton was coming out of their refinancing mode, and growth was clearly going to happen. All of this was known at the valuation date. They chose to ignore it.

ABC Appraisal Co. also said, "if such company forecasts had existed as of the valuation date, the value derived from a DCF analysis would be consistent with our determination of value." This is not true if fair market value understates the true value of the company. Clearly, we are dealing with an industry where the market was undervaluing these companies. Even reading the Alex Brown report attached to ABC Appraisal Co.'s report (which I will discuss later), the intrinsic value of most of these companies was considerably higher than fair market value. Because market perception is undervaluing these companies, a DCF analysis would not be consistent; if anything, the DCF analysis would tend to be considerably higher than the market approach. The DCF analysis actually values Littleton, as opposed to trying to make believe that the various publicly traded companies are a "good fit" in an industry that went through tough times in 1995.

<sup>25</sup> *In re McLoon Oil Co.*, 565 A.2d at 997, 1003 (emphasis in original).

### EXHIBIT 24.3 Partial Critique of Fair Value Report

**Page 2.** ABC Appraisal Co. indicates “an analysis of the guideline companies as of the valuation date indicates the market did not forecast any material future earnings growth.” While their statement may be correct regarding investors, and the prices that they are willing to pay for trucking company stocks, clearly growth was being forecasted. Morgan Keegan was forecasting anywhere from 18–35 percent growth (see page 48 of our report) and the analyst expectations regarding growth of guideline companies were substantial (see page 165 of our report). Alex Brown was forecasting 15–30 percent growth. ABC Appraisal Co. should have read their own attachment.

ABC Appraisal Co. also discusses at the bottom of the page that they determined a 35 percent discount for lack of marketability in this valuation. The 35 percent, which will be discussed in more detail later, is appropriate for a minority interest in a fair market value analysis under certain circumstances. This discount is punitive if applied in a fair value context, if the determination of value is to provide a pro rata interest in the company to the shareholder whose shares are being forced to be sold.

**Page 3.** At the top of the page, ABC Appraisal Co. indicates “John was found by the Court to be the oppressor, and should not gain disproportionately from the forced buyout.” While this may be true, he should also not be punished. The November 1, 2000 order of Judge Harris (on page 2) clearly indicates this.

**Page 5.** ABC Appraisal Co. indicates “we consider fair value to be based on the price that is ‘fair and equitable’ to both parties that would effectuate a transaction in the interest in The Littleton Entities on the open market.” This definition is problematic for a number of reasons. First, by treating a partial interest as being sold on the open market, they are clearly indicating that their valuation will be on a minority basis. I do not believe that that is the intent of the New Jersey Statute, as it appears that case law tends to disfavor a minority discount in fair value oppression cases. Therefore, treating an interest in the Littleton Entities on the open market is very different from treating the Littleton Entities on the open market. For this reason, I believe the premise that ABC Appraisal Co. is operating under violates the intent of the New Jersey Statute.

According to Pratt (*Valuing a Business*, page 352) “certain precedents—including those pursuant to California Corporation Code, Section 2000—have suggested that fair value may be interpreted to mean fair market value without a non-controlling ownership interest discount (i.e., a proportionate share of the overall business enterprise value).”

In discussing the difference between fair value and fair market value, Pratt includes a discussion in his book (page 801) on dissenting stockholder and minority oppression court cases. He states, “in most states, the standard value for dissenting stockholder suits and for minority oppression suits is fair value.” Several state statutes indicate that either “fair cash value” or simply “value” is the appropriate standard. While the various states interpret fair value quite differently from one another, and sometimes differently under differing facts and circumstances, they do not strictly equate fair value with fair market value.

This point is illustrated well by a New York court’s rejection of an expert’s valuation report based on fair market value in a dissenting stockholder case. The court stated

Because the petitioner’s expert ... in its valuation report (on title page) and on 15 occasions refers to its valuation to be based on Fair Market Value, and the Business Corporation Law only uses the term Fair Value... The Court considers it a threshold question as to whether fair value and fair market value are synonymous.

The standard upon which (the company’s experts) valuation was based, was market value... the statutory standard is much broader. . . The Court may give no weight (emphasis supplied) to market value if the facts of the case are required.<sup>1</sup>

Pratt indicates that the court ultimately rejected the fair market value of \$52 per share and awarded the dissenting shareholders \$99 per share. This illustrates the potential range of difference between fair market value and fair value. Another case cited by Pratt is *LeBeau v. N.G. Bancorporation, Inc.* (NO.CIV.A. 13414, 1998 WL 44993 (DEL.CH. Jan. 29, 1998)) In this case, when fair market value is used rather than fair value, the Delaware Court of Chancery stated that this was “legally flawed” as evidence regarding fair value.

ABC Appraisal Co. also says “pursuant to Judge Harris’s Order, we have used December 31, 1995 as the valuation date.” What order are they talking about? The November 1, 2000 order clearly indicates January 31, 1996 to be the valuation date. At the bottom of that same paragraph, ABC Appraisal Co., in discussing using only items that were foreseeable as of the valuation date, feels that this is consistent with *Musto*, which stated “equitable adjustments to fair value to reflect corporations’ growth in the years following the valuation date would have been improper.” However, equitable adjustments are very different from excluding anticipated growth. If something happens after the valuation date that caused the company to change, I would agree that this should be excluded if the foundation had not been set prior to the valuation date. In this instance, the economic, industry, and company data all point to the company being positioned for growth, including a substantial investment in rolling stock in the most recent year. This rolling stock was added for new business, as opposed to replacement of existing assets.

<sup>1</sup> *Matter of Slant/Fin. Corp. v. The Chicago Corp.*, (NYSUP. CT Oct. 5, 1995), aff’d 236 A.D. 2d 547, 654 N.Y.S.2d 627 (N.Y. APP. DIV. Feb. 18, 1997).

(continued)

### EXHIBIT 24.3 Partial Critique of Fair Value Report *(continued)*

Footnote 5 at the bottom of the page refers to the “Zukin book,” however, ABC Appraisal Co. does not discuss the context in which this quote is probably made. I have subsequent editions of this book as opposed to the 1990 book, but Zukin discusses dissenters’ rights cases and not oppression cases. Their underlying quote in the footnote would be true, except the New Jersey Statute also provides the court with the ability to make any equitable adjustments deemed necessary.

Rather than guessing at certain instances, actual information can be used as a sanity check on what might have been known or was knowable at that time. Based on our analysis of the actual 1996–1999 results, as compared to our forecasts for that same time period, it was reasonably predictable that this company should have been able to accomplish what it actually did. In fact, I believe it could have done better had management not been distracted by this litigation.

As a side note, getting back to the concept of being “fair and equitable,” what ABC Appraisal Co. wants the court to accept is that John gives up the income that he has received historically out of this business for \$8 million. Joe and Jane get to split what John gives up. If we discuss what would have actually been given up during 1996 to 2000, John received salaries, commissions, and distributions totaling \$24,066,995 (see page 191 of our report).

Even if we were to buy into the concept that ABC Appraisal Co.’s reasonable compensation for John of \$250,000 per year is appropriate, five years of compensation, or \$1,250,000 being subtracted from the \$24 million+ would result in John receiving excess distributions of \$22,816,995. On average, this is \$4.56 million per year. ABC Appraisal Co. wants the court to believe that someone receiving \$4.56 million per year should give this up for \$8 million. This defies common sense and logic.

What it also excludes is any rights in the future to receive this level of income. If we assume a simple capitalization of the \$4.56 million at 20 percent, this would result in a \$22.8 million value for the terminal period beyond the year 2000. Adding \$22.8 million to the other \$22.8 million that I have come up with would indicate a value of about \$45.6 million without any discounting being taken into consideration. This, in itself, indicates the serious flaw in the \$8 million value that ABC Appraisal Co. derives. It is anything but “fair and equitable” to give up a stream of income averaging \$4.56 million per year for only \$8 million.

**Page 9.** Once again, ABC Appraisal Co. indicates that they read pages 21–23 of the XYZ Appraisal Co. report, and that they believe that the XYZ Appraisal Co. discussion depicts an accurate portrayal of the general economic environment as of the valuation date. They also indicate that they agree with XYZ Appraisal Co.’s findings. First, did they do any independent analysis, or did they purely read XYZ Appraisal Co.’s report?

Second, despite the quote appearing at the top of this page, they ignore the fact that on page 23 of the XYZ Appraisal Co. report, it discusses stock market increases, particularly the Dow being up 33.5 percent, and the Nasdaq being almost 40 percent up in that year. What they also ignore is on page 23 of the XYZ Appraisal Co. report, where XYZ Appraisal Co. discusses the Federal Reserve Board lowering interest rates in December 1995 “to recharge the stalled economy.” This would have a positive effect on the value of the Littleton Entities.

ABC Appraisal Co. also states “the slowing economy led to a slowing within the trucking sector as retail sales and manufacturing production had been declining. These economic factors led to a decline in the demand for trucking services and a resulting over-capacity of trucks and service.” While this statement is true for 1995, they totally ignore the fact that it is expected to turn around in 1996 and forward. In fact, according to the Alex Brown report attached to the ABC Appraisal Co. report (on page 6), revenue growth is expected to be anywhere from 15–30 percent for this industry. The growth prospects for the industry look pretty good. ABC Appraisal Co., however, decides to only pick and choose that which serves their purpose in low-balling this valuation.

**Page 10.** According to ABC Appraisal Co., “market multiples in the trucking industry in 1995 were reflective of the economic outlook and other factors specific to the trucking industry.” This statement appears to be absolutely false when reading the Alex Brown report attached to the ABC Appraisal Co. report. In fact, Alex Brown is talking about many trucking stocks looking attractively valued to them, and they even indicate “stock valuations reflect diminished expectations and are at cyclically low levels.” They also indicate “we are 12-month bulls on trucking stocks, as we believe multiples are likely to expand on the prospect of yr/yr earnings growth in 2H 1996.”

Ironically, ABC Appraisal Co. also quotes from the Alex Brown report stating, “(Trucking) stocks with market capitalizations of less than \$100 million were penalized for their illiquidity and are trading at what we consider to be private company valuations (3–5x EBITDA, vs. 6–10x for larger stock).” First of all, we used a multiple of six in our report. What is also interesting is that ABC Appraisal Co. uses this to help try to support their lower earnings before interest, taxes, depreciation, and amortization (EBITDA) multiple, but they ignore the fact that Alex Brown is also talking about the public companies being penalized for their illiquidity, and that they are also trading at what looked like “private company valuations.” Despite all of this, ABC Appraisal Co. still wants to apply a 35 percent discount for lack of marketability (illiquidity). This is a clear case of double counting.

**EXHIBIT 24.3 Partial Critique of Fair Value Report**

**Page 11.** Once again, ABC Appraisal Co. refers to the XYZ Appraisal Co. report as the basis for the business description. They also acknowledge the breakdown of the company revenues being one-third for each of the following categories: less-than-truckload, truckload, and fleet management. This point becomes important in the search for guideline (comparable) companies because as XYZ Appraisal Co. pointed out in their report, comparability is frequently difficult to achieve.

XYZ Appraisal Co. valued the Littleton Entities separately and used different guideline companies for each because these companies did different types of trucking services. Now, we are comparing a broader category of company to a combined Littleton Entity, which actually makes them a bit less comparable. If anything, because of Littleton's diversification and the mix of business, they are probably less risky regarding any one aspect of the business, compared to the guideline companies. However, it makes comparability that much more of a problem. This is one more reason for questioning the validity of the outcome of the market approach.

**Page 12.** In discussing all of the nonconsolidated entities that were made part of this report, ABC Appraisal Co. lists Company A as being one of the companies included. One of the major differences between their report and our report is that we treated this valuation of Company A as a nonoperating asset, which added \$12.5 million to the value of the operating entity. It is my understanding from the real estate valuation analyst that this property was not legally zoned for the use, nor would it be necessary to use a \$12.5 million piece of property as a parking lot for trailers.

All of the other entities were combined in our report, as well, but here, also, there is a significant difference in value because of the treatment of these entities. At the bottom of the page, ABC Appraisal Co. indicates "... we conducted a functional review and benchmarking analysis of the non-consolidating entities contribution to the consolidating entities. This review indicated they were all functional components of the primary business." ABC Appraisal Co. should be questioned regarding the functional use of Company A.

**Page 13.** ABC Appraisal Co. also presents net fixed assets to sales and intangible assets to sales to indicate that the guideline companies have much greater levels of assets to sales than the Littleton Entities. Once again, this is not necessarily a deficiency on the part of the Littleton Entities. In reality, closely held companies have a lower ratio because they utilize their assets for a longer period of time because they do not necessarily have the asset replacement policy of the public companies. Once again, this is not necessarily a weakness. If the assets are in good working order, and if the assets do not require extraordinary repairs, what the private company effectively is doing is becoming more profitable by utilizing their assets for a longer period of time. ABC Appraisal Co. wants to turn this into a negative.

ABC Appraisal Co. also indicates "this analysis further confirms Judge Harris's conclusions that The Littleton Entities represented a single, unified entity." This analysis did not confirm that at all. Quite frankly, the judge is absolutely correct, but it is common sense that dictates that these entities have been operated as a single unified entity. The ABC Appraisal Co. analysis in no way confirms the unification of these companies.

Getting back to ABC Appraisal Co.'s assessment that the Littleton Entities was undercapitalized, nowhere does ABC Appraisal Co. recognize the fact that the officers of the company have been withdrawing extraordinary amounts of money, clearly indicating, as with most closely held companies, that they can operate the company as they wish to. Now,

ABC Appraisal Co. wants to penalize the value of the Littleton Entities for this reason. In reality, this company is not undercapitalized; it has had an extraordinary dividend paying capacity that the shareholders have taken advantage of.

It is important for the judge to understand that there is a very big difference between the operation of a public company and the operation of a closely held business. A public company has a board of directors that is charged with maximizing shareholder value. That is typically not the manner in which a private company is operated. A private company operates to not only minimize income taxes, but also to maximize the benefits to the current shareholders.

In this instance, while ABC Appraisal Co. talks about the Littleton Entities needing a capital infusion of \$19 million, they fail to recognize the fact that the excess compensation from 1993–1995 alone amounts to almost \$10 million. This is not taking into consideration any other cash distributions that were made to the shareholders during this period of time that were not considered to be compensation.

Clearly, the Littleton family, as a unified group, has elected to operate this company as a cash cow to the owners, rather than reinvesting these monies into the company. This does not necessarily mean that the company is weak. It shows that the company has the ability to operate in this fashion. In 1995, the company purchased or leased, or both, a significant amount of rolling stock to get ready for the next influx of business that was foreseeable in the upcoming year(s).

*(continued)*

### EXHIBIT 24.3 Partial Critique of Fair Value Report *(continued)*

Overall, the analysis included on this page is extremely misleading, and in my opinion, is intended to deceive the court rather than provide an independent analysis.

**Page 15.** In the discussion of valuation methods, ABC Appraisal Co. provides a brief description of the three basic approaches to valuation. I agree with them regarding not using a net asset approach. However, I clearly disagree with them regarding their lack of using the income approach. In the middle of the page, they state “we agree with XYZ Appraisal Co. that the market approach is the most appropriate methodology to determine the fair value of the interest. The income approach was considered, but not used, due to the lack of any contemporaneous projections prepared by The Littleton Entities during the general time frame of, or any time prior to the valuation date.”

There are several problems with this statement. First, while they agree with XYZ Appraisal Co., XYZ Appraisal Co. nowhere in their report refers to the standard of value as fair value. XYZ Appraisal Co. strictly performed a fair market value analysis. Fair market value is very different than fair value. Also, ABC Appraisal Co.’s rejection of the income approach because the Littleton Entities did not have contemporaneous projections is utter nonsense. As valuation analysts, we prepare projections in valuation reports on a regular basis. I find it hard to believe that ABC Appraisal Co. does not do the same. In fact, it would be interesting to get information from some of their old valuation reports, particularly the smaller, privately held companies, because more often than not, only the large companies have the internal staff to make projections. Valuation, in itself, is a prophecy of the future, and I find it hard to believe that ABC Appraisal Co. never uses the income approach.

ABC Appraisal Co. indicates, “inherent in the market approach are assumptions related to the future growth in cash flows and the associated risks in obtaining that growth.” However, they fail to further indicate that the growth inherent in the market approach is typically considered to be short-term growth, as opposed to long-term growth, which is considered in the income approach.

The public market is extremely short-term oriented, and more often than not, the multiples will reflect short-term growth. In fact, if a company has experienced substantial growth over the past several years, there is a good possibility that their multiples will be even lower than you would expect because the marketplace will have perceived that a lot of the growth has taken place, and that future growth will slow down. This is one of the misleading factors in comparing public companies to privately held companies, particularly where the public company has a track record of growing through acquisition.

Pratt discusses the various approaches to value in the context of dissenting rights and oppression suits. He indicates “most Courts embrace all three broad approaches to value (income, market, and asset-based approaches) in dissenting stockholder and judicial dissolution cases. The Chancery Court of Delaware has repeatedly expressed a preference for the discounted cash flow method (citations will be provided in sections to follow on the income approach). However, reliance on the DCF method is dependent on reasonable projections, which are not always available.” In discussing a Supreme Court of Utah case, *Oakridge Energy v. Clifton*, No. 960049, 1997 WL 191487 (Utah April 18, 1997), Pratt indicates

The Court noted that the consensus of the cases cited, is that the component elements to be relied on in estimating fair value are market value, net asset value, and investment value, and the Courts have traditionally favored investment value, rather than asset value, as the most important of the three elements. (footnote omitted).

In this instance, Pratt quotes the case which stated “we conclude that the trial court erred in using the stock market price... as the sole criterion for determining the fair value... .”

**Market Approach.** There are a number of cases, however, where the market approach was accepted. For example, Pratt states in *Borruso v. Communications Telesystems International*,<sup>2</sup> “both experts used only the guideline publicly traded company method, both relying primarily on multiples of revenue, because the financial history was insufficient to provide a basis for a DCF analysis, or even multiples of economic income variables, such as EBITDA.” Once again, although the market approach was accepted in this instance, a DCF analysis could not be performed due to insufficient history. That is certainly not the case regarding the Littleton valuation. All of the cases cited by Pratt relate to dissenting shareholder cases as opposed to oppression cases. This creates a distinction between the court’s considering a minority value versus a pro rata share of the entire company.

**Discounted Cash Flow Method.** In discussing the DCF method, Pratt indicates that in *Grimes v. Vitalink*,<sup>3</sup> the Delaware Court of Chancery characterized the DCF method as “increasingly the model of choice for valuations in this Court.” Another case where the court favored a DCF method over the guideline company method is *Gilbert v. M.P.M. Enterprises*.<sup>4</sup>

<sup>2</sup> *Karl Borruso and William Lee v. Communications Telesystems International*, C.A.NO.16316-NC, 999LEXIS 197(DELCH. September 24, 1999).

<sup>3</sup> *Charles M. Grimes v. Vitalink Communications Corporation*, NO.C.A.12334,1997 WL538676 (DEL.CH.Aug28,1997), aff’d no.425,1997 (DEL. April 1, 1998).

<sup>4</sup> *Gilbert v. M.P. Enterprises Inc.*, NO. C.A.14416-NC,1998Lexus60 (DEL.CH.April 24, 1998), aff’d *M.P. Enterprises Inc. v. Jeffrey D. Gilbert*,731A.2d 790 (DEL.June 24, 1999).

### EXHIBIT 24.3 Partial Critique of Fair Value Report

**Excess Earnings Method.** Although neither of us used the excess earnings method in the Littleton valuation, Pratt discusses *Balsamides* in the context of this method being accepted because the expert could not obtain all of the information needed to perform better valuation methods, but it should be noted that the excess earnings method is considered to be a control valuation. This means that the entire enterprise is valued without consideration to any minority discounts. You may wish to advance this argument as another reason why the use of the guideline company method in the ABC Appraisal Co. report without a control premium effectively penalizes John by valuing his interest on a minority basis as opposed to a pro rata share of the whole.

ABC Appraisal Co. is relying on the XYZ Appraisal Co. report to support the sole use of the market approach. Not only does the XYZ Appraisal Co. report not discuss their lack of use of the income approach, but XYZ Appraisal Co. on page 27 of their report states:

As a practical matter, it became obvious early in our search that it would be impossible to find an adequate number of publicly held businesses corresponding precisely to these definitions. (These definitions relate to the description of the type of business that Company B, Company C, and Company D are engaged in). It thus became necessary for us to broaden our criteria enough to select a group large enough for valuation purposes, but not so much as to impair valuation results by inclusion of companies only little or remotely analogous to Company B, Company C, and Company D. (Parenthetical remark added for explanation).

Even XYZ Appraisal Co. recognizes that they had to reach in order to meet a good definition of comparability. Now, ABC Appraisal Co. wants to solely rely on this method, despite the fact that there are potential problems with its application due to the subjectivity of comparability. Clearly, we ran into the same issue when we applied our market approach, but that is more of a reason to not just stop at a market approach. In fact, ABC Appraisal Co. talks about the market approach taking into consideration future growth and the associated risks in getting to the growth, but they once again fail to discuss the impact, if the market undervalues stocks in the public marketplace.

Substantial support exists for our position on this issue in Pratt's *Valuing a Business*, 4th Edition. In a discussion involving standards of value, Pratt discusses the different definitions of *intrinsic* or *fundamental value*. On page 31, he indicates the following:

#### **Intrinsic or Fundamental Value**

Intrinsic value (sometimes called fundamental value) differs from investment value in that it represents an analytical judgment of value based on the perceived characteristics inherent in the investment, not tempered by characteristics peculiar to any one investor, but rather tempered by how these perceived characteristics are interpreted by one analyst versus another.

In the analysis of stocks, intrinsic value is generally considered the appropriate price for a stock according to a security analyst who has completed a fundamental analysis of the company's assets, earning power, and other factors.

**Intrinsic Value.** The amount that an investor considers, on the basis of an evaluation of available fact, to be the "true" or "real" worth of an item, usually an equity security. The value that will become the market value when other investors reach the same conclusions. The various approaches to determining intrinsic value in the finance literature are based on expectations and discounted cash flows. See expected value; fundamental analysis; discounted cash flow method.<sup>5</sup>

**Fundamental Analysis.** An approach in security analysis which assumes that a security has an "intrinsic value" that can be determined through a rigorous evaluation of relevant variables. Expected earnings is usually the most important variable in this analysis, but many other variables, such as dividends, capital structure, management quality, and so on, may also be studied. An analyst estimates the "intrinsic value" of a security on the basis of those fundamental variables and compares this value with the current market price of this security to arrive at an investment decision.<sup>6</sup>

The purpose of security analysis is to detect differences between the value of a security as determined by the market and a security's "intrinsic value"—that is, the value that the security ought to have and will have when other investors have the same insight and knowledge as the analyst.<sup>7</sup>

If the market value is below what the analyst concludes is the intrinsic value, the analyst considers the stock a "buy". If the market value is above the assumed intrinsic value, the analyst suggests selling the stock. (Some analysts also factor market expectations into their fundamental analysis.)

**EXHIBIT 24.3 Partial Critique of Fair Value Report** *(continued)*

It is important to note that the concept of intrinsic value cannot be entirely divorced from the concept of fair market value because the actions of buyers and sellers based on their specific perceptions of intrinsic value eventually lead to the general consensus market value and to the constant and dynamic changes in market value over time.

Case law often refers to the term intrinsic value. However, almost universally, such references do not define the term other than by reference to the language in the context in which it appears. Such references to intrinsic value can be found both in cases where there is no statutory standard of value and in cases where the statutory standard of value is specified as fair value or even fair market value. When references to intrinsic value appear in the relevant case law, the analyst should heed the notions ascribed to that term as discussed in this section.

As you can see from the above definition, Pratt indicates that “the various approaches to determining intrinsic value in the finance literature are based on expectations and discounted cash flows.” Clearly, expected earnings are of critical importance, but other variables such as dividends, capital structure, management quality, and so on, are also considered in a fundamental analysis. What is striking is that Pratt indicates “if the market value is below what the analyst concludes is the intrinsic value, the analyst considers the stock a ‘buy.’” This is exactly what is taking place in the Alex Brown report attached to the ABC Appraisal Co. report. In fact, not only does Alex Brown consider certain stocks to be a ‘buy,’ they, in fact, suggest that certain of these stocks are considered to be a “strong buy.”

On the front page of the December 1995 Transportation Report, Alex Brown lists a number of truckload and less-than-truckload public companies that are considered to be strong buys. In fact, eight of these companies were used by us as guideline companies, while three of the seven of ABC Appraisal Co.’s guideline companies are also listed in this category.

ABC Appraisal Co. says “. . . hence the market approach is a fair proxy for the income approach.” Besides the fact that this assumes that the market comparable companies are properly priced, it is also not the case in this situation. We point out at the top of page 166 of our report, that our correlation analysis indicates that there is no direct correlation between earnings growth and the pricing multiples. We say “it appears that the companies with the lowest three-year compound growth rate in earnings have the highest earnings estimates, but this is not translating directly into high multiples.” Clearly, there are many factors that affect the prices of stocks in the public market, and, in this instance, we have an industry that does not necessarily behave as analysts would expect. Therefore, the results can be extremely misleading and caution must be exercised by a valuation analyst in using this information, particularly as the sole source of deriving a valuation conclusion for a closely held company. This is one of the reasons why it is suggested that valuation analysts use as many approaches and methods as may be applicable in any given situation: not only to serve as checks and balances upon ourselves, but also because there is a subjective element to the valuation process. Using a single approach can bias the result, and that is not necessarily the intention of the valuation process.

**Page 16.** At the bottom of this page, ABC Appraisal Co. discusses excess compensation. Their analysis refers to a Court Trial Exhibit Number 1707, indicating the total salary and commissions for Joe and John to be approximately \$2.75 million each. We have no problem with the use of this figure because it is the same amount that we reflect on page 74 in table 18 of our report. However, at the very bottom of the page, carrying over to the next page, is a discussion about Judge Harris’s perception of Joe being the dominant person in the business.

ABC Appraisal Co. uses the court’s findings as a basis of determining reasonable compensation for Joe to be what he was actually paid and substantially reducing John’s salary. There is no empirical basis to support the level of replacement compensation based upon the court’s statement. Regardless of who the dominant person is, the issue becomes what would be the cost of replacing this person with someone of equal ability to run this company, if the company was to be sold? In order to support their conclusion, ABC Appraisal Co. refers to a return on equity analysis that they performed showing that an investor would be content paying Joe this huge amount of money because they would continue to get their return. However, what ABC Appraisal Co. has done is an extremely misleading and incorrect analysis.

The return on equity analysis is used as one of the factors to consider in the reasonableness for the deductibility of compensation paid to an officer of a company. There is a large distinction between reasonable compensation from an income tax standpoint and reasonable compensation in an appraisal situation. The partial analysis that ABC Appraisal Co. has included is used frequently to support deductions under Section 162 of the IRC relating to deductibility of ordinary and necessary business expenses.

Two cases that describe the use of a return on equity analysis are *Mad Auto Wrecking Inc. v. The Commissioner* (TC Memo 1995–153) and *Elliotts, Inc. v. Commissioner* (52 AFTR 2d 83-5976). These are both income tax cases dealing with reasonable compensation.

### EXHIBIT 24.3 Partial Critique of Fair Value Report

In a valuation context, the issue that we address is what is the replacement cost of the officer and not what is a reasonable amount for past efforts that may be tax deductible? According to Pratt (page 79), “in order to make the appropriate adjustments regarding executive compensation of the closely-held business, the valuation analyst identifies the total compensation from all sources being paid to the existing executive and compares that to the total compensation required to attract an executive of similar skills.” If public company executives are the appropriate basis for comparison, then total compensation from all sources paid to the public company executive (including stock options, bonus plans, pension plans, and perquisites) should be evaluated along with the contribution to the company provided by the executive. ABC Appraisal Co. did not do this analysis as part of their report.

**Page 18.** Continuing with the excess compensation analysis, discussing the Littleton Entities’ compound annual growth rates, ABC Appraisal Co. indicates at the top of the page that the Littleton Entities exceeded several market indexes over the same period. This indicates that Littleton outperformed the market. Once again, while attempting to justify a higher salary for Joe, ABC Appraisal Co. supports the notion that the Littleton Entities are considerably stronger, which should positively affect its value.

In the first full paragraph on the top of page 18, ABC Appraisal Co. states “it seems from the CAGR, since Joe took over the business and the level of dividends received by the shareholders, that all shareholders (particularly John) have been well compensated for their association with this successful business.” One of the ethical provisions of the valuation profession is that we are only supposed to be advocates for our opinion, and we are not supposed to advocate on behalf of a client. ABC Appraisal Co.’s parenthetical remark, as well as numerous remarks throughout this report, borderlines advocacy.

Ironically, when it comes to John’s compensation, they pull out a study and support his salary as being \$250,000. The real issue becomes, would it take \$3 million to compensate management in this company, if the company was sold? ABC Appraisal Co. tries to use an “independent investor test” to further support Joe’s \$2.75 million. They indicate “... this comparison shows that an independent investor would be willing to pay the level of compensation that we have deemed appropriate for Joe (\$2.75 million).” The question isn’t would they have been willing to pay this, but, would they have to pay this? On pages 75–77 of our report, we performed an analysis of reasonable compensation.

Furthermore, we have taken information from the 1995 proxy statements of the public companies, which I am showing below.

Company	Position	Salary and Bonus	Options Granted	Sales	Salary/Sales
American Freightways	President and CEO	\$ 266,191	50,000	\$ 572,100,000	0.05%
Arkansas Best	Executive V.P.	945,821		1,437,279,000	0.07%
Arnold	President and Chairman	635,140		330,136	0.19%
Builders Transport	CEO	327,014		289,527,000	0.11%
Heartland Transport	Chairman and President	300,000		191,507,000	0.16%
MS Carriers	Chairman and CEO	389,484		333,070,000	0.12%
Old Dominion	Chairman and CEO	474,103		248,079,000	0.19%
OTR Express	President and CEO	142,086	7,455	49,211,000	0.29%
PAM Transportation	President and CEO	294,875	50,000	91,595,000	0.32%
Swift Transportation	Chairman and President	801,303		458,165,000	0.17%
Transportation Corp. of America	CEO	299,890		144,254,000	0.21%
USA Truck	Chairman	380,984		102,400,000	0.37%
US Xpress	Co-Chairman	1,210,127		254,331,000	0.48%
Werner Enterprises	CEO	738,185		576,002,000	0.13%
Anuhco (Transfinancial Holdings)	President	188,264	10,000	97,444,000	0.19%

(continued)

### EXHIBIT 24.3 Partial Critique of Fair Value Report *(continued)*

It should be noted that the options granted in the preceding schedule were under water at the time of the grant, so looking at these public company executives, the highest paid executive earned \$1.2 million for a company that was twice the size of the Littleton Entities. Clearly, Joe could be replaced by the president, chairman, or CEO of one of these public companies for less than \$2.75 million. This shows the unreasonableness of the unsubstantiated compensation amount.

Table 2 of the ABC Appraisal Co. report, once again, indicates that the Littleton Entities were stronger than the guideline companies because they have a stronger EBIT margin. This further substantiates the fact that Littleton should be valued higher than ABC Appraisal Co. concluded.

**Pages 26–27.** The discussion for the adjustment for lack of marketability is flawed. Pratt includes a brief discussion about the fact that lack of control discounts are rejected in several instances. I am not going to elaborate on these cases because neither valuation analyst in the Littleton valuations actually took a minority discount. However, Pratt also highlights the fact that a control premium had been accepted by the Delaware Chancery Court under two specific circumstances. He lists these as follows:

1. When the base value is a publicly traded equivalent value derived by the guideline publicly traded company method.
2. When valuing a controlling ownership position in this subsidiary company.

In *Borruso* (see footnote 30), both experts agreed that a control premium should be applied. In fact, in *Rapid American Corporation v. Harris*,<sup>8</sup> the Delaware Supreme Court concluded that a control premium was appropriate, explaining “the exclusion of a control premium artificially and unrealistically treated Rapid as a minority shareholder.” In *LeBeau*, the Delaware Court of Chancery implicitly allowed a control premium by allowing the guideline merger and acquisition method to be used.

In *Quantifying Marketability Discounts* written by Z. Christopher Mercer, ASA, CFA, the author discusses various levels of value that are used in the appraisal process. Mercer states the following:

The controlling interest value represents the value of the enterprise as a whole. The controlling interest appraisal should, therefore, encompass the rights, risks and rewards of having controlling power in a business. In the context of this discussion, controlling interests and enterprises are considered to be marketable, and a marketability discount is not used. Some valuation analysts, however, do apply a marketability discount, which may reflect the costs of brokerage or transactions costs, to control values.

Basically, Mercer’s position is that because a controlling interest can readily be sold, there should not be a discount taken for lack of marketability. This would further suggest that if there is a discount to be taken, it would be no more than a brokerage cost, which, for a company the size of Littleton, would probably not exceed about 5 percent. Certainly, the discount for marketability taken by ABC Appraisal Co. represents a discount for a minority value and, as such, we believe that it unfairly penalizes John because we believe he should be entitled to a pro rata share of the entire business.

<sup>8</sup> *Rapid American Corporation v. Harris*, 603A.2d796 (DEL.1992).

The real kick in the head in the litigation that the critique came from was that the case went up on appeal for numerous reasons. When it was remanded for a new trial, the appellate court also changed the valuation date. We got to do the job a second time. The critique we did of the same expert’s report during the second litigation is shown in exhibit 24.4.

### EXHIBIT 24.4 Critique—The Second Time Around

This report is anything but an independent, objective valuation of the Littleton Entities. ABC Appraisal has relied on the former judge to support their position, rather than putting forth an argument to allow the new judge to understand the valuation issues. This report is loaded with advocacy, which is unethical for a valuation analyst.

Let me point out a difference between our two reports. You told me that the valuation date was November 29, 2000, and that for convenience, it was agreed that we could use Littleton’s year-end financial statements. All other calculations that were done in the guideline company analysis were based on November 29, 2000, meaning that we did not use the guideline companies’ year-end financial statements or stock prices. ABC Appraisal used December 31 as the basis for their entire report, including stock prices and financial information for their choice of guideline companies in the market approach.

## EXHIBIT 24.4 Critique—The Second Time Around

**Page 1.** It is ironic that ABC Appraisal references the previous judge's opinion of November 7, 2001, in which the judge concluded that John's interest was worth \$12,423,125. This was at a time when Littleton Trucking was doing about \$100 million in revenues. Now, years later, when the company is doing \$166 million in revenues, ABC Appraisal values John's interest at \$12.8 million.

ABC Appraisal concludes that the market approach is the most reliable methodology to determine the fair value of the interest. This is despite the thinly traded guideline companies, the undervalued guideline companies, and the fact that fair value is intended to measure what John is giving up. This is going to be a major point of difference between ABC Appraisal and me. They are assuming a sale of the company and totally ignore the fact that the business is going to continue in the hands of John's brother, Joe. They attempt to reduce value by assuming that Joe will be gone, but a sale would require Joe to help create a smooth transition so that Joe, as well as the other shareholders, could maximize their sale price. ABC Appraisal treats Joe as if he was going to die suddenly. The entire key person discount is premised on the sudden disappearance of Joe.

In reviewing chapter 15 of the *Guide to Business Valuations*, published by Thomson PPC, an interesting definitional issue is discussed relating to fair value. This publication quotes, *In re Shell Oil Co.*, 607 A.2d 1213, 1218 (Del. 1992), quoting *Tri-Continental Corp v. Battye*, 74 A.2d 71,72 (del. 1950) and states the following:

Another judicial definition states that fair value, 'measures that which has been taken from [the shareholder], viz., his proportionate interest in a going concern.'

This treatise also contains a discussion of the Delaware Block Method, and its applicability to fair value. Although the Delaware Block Method is not at issue in this case, the point was made that

In its decision, the court ruled that the Delaware Block Method was clearly outmoded because other valuation methods commonly accepted in the financial community were not considered. **In fact, the methodology used by the court in this case was the discounted cash flow method.** Although the Weinberger decision did not eliminate the use of the Delaware Block Method, it did allow other appropriate valuation methods to be accepted by the courts. See *Rosenblatt v. Getty Oil Co.* [493 A.2d 929 (Del. 1985)]; also, *Leader v. Hycor, Inc.* [395 Mass. 215, 479 N.E.2d 173 (Mass. 1985)]. **As a result, methods such as the discounted future returns methods, are now commonly used in fair value cases.** (Emphasis added).

This provides support for our use of the discounted cash flow (DCF) method. In fact, Shannon Pratt and Jay Fishman, the primary authors of the Thomson PPC treatise indicate, "As a result, methods such as the discounted future returns methods, are now commonly used in fair value cases."

ABC Appraisal states, "Because the Littleton Entities did not prepare financial forecasts, I could not perform a Discounted Cash Flow ("DCF") analysis, a form of the Income Approach." This is complete nonsense. The American Society of Appraisers teaches valuation analysts to do their own forecast if one is not available. I referenced the course materials in my report on page 70. It is also quite common for valuation analysts to prepare their own forecasts.

There are clear differences between the market approach and the income approach, and they are extremely difficult to reconcile if you have a company that is growing. Growth must be adjusted for in-the-market multiples, which can be very difficult because the publicly traded companies probably have different growth characteristics than the subject company. In the DCF method, growth appears in the forecasted revenues and cash flows of the subject company, and then the valuation analyst merely needs to determine a reasonable discount rate to reduce the forecast to present value.

ABC Appraisal then states, "Consistent with standard valuation and appraisal practices, our valuation was based on all information that was known or should have been known as of the Valuation Date." However, numerous times throughout their report, they refer to post-valuation date information. This occurs in the following places in their report:

(continued)

Sch 3b	Footnote 4 refers to company went private February 2006

ABC Appraisal states:

The Market Approach utilizes multiples that represent investor expectations for growth and profitability of public companies. Therefore, if such Littleton Entities forecasts had existed as of the Valuation Date, the value derived from a proper DCF analysis should be consistent with our determination of value.

Their statement is partially true, but overall, it is incorrect. I agree that the market approach is supposed to utilize multiples that take investor expectations into consideration, but the trucking industry has been an industry that underperformed on Wall Street for a long time. The investment houses that follow this industry have had strong buy recommendations on many of the public company stocks because the market is not valuing these companies based on their "true" worth. I quoted a few sources beginning on page 163 of my report.

Furthermore, in order for the market approach to truly work, the market needs to be active. Pratt states in *The Market Approach to Valuing Businesses*:

The market approach is especially relevant if the standard of value is **fair market value**. (Emphasis added).

Pratt discusses sections of Revenue Ruling 59-60 and points out the following:

Revenue Ruling 59-60 strongly advocates the guideline public company method within the market approach. Section 3.03 reads as follows:

.03 Valuation of securities is, in essence, a prophesy as to the future and must be based on facts available at the required date of appraisal. As a generalization, the prices of stocks which **are traded in volume** in a free and **active market** by informed persons best reflect the consensus of the investing public as to what the future holds for the corporations and industries represented. When a stock is closely held, is traded infrequently, or is traded in an erratic market, some other measure of value must be used. In many instances, the next best measure may be found in the prices at which the stocks of companies engaged in the same or a similar line of business are selling in a free and open market.

## EXHIBIT 24.4 Critique—The Second Time Around

Section 4.02(h) reads as follows:

(h) Section 2031(b) of the Code states, in effect, that in valuing unlisted securities the value of stock or securities of corporations engaged in the same or a similar line of business which are listed on an exchange should be taken into consideration along with all other factors. **An important consideration is that the corporations to be used for comparisons have capital stocks which are actively traded by the public.** In accordance with section 2031(b) of the Code, stocks listed on an exchange are to be considered first. However, if sufficient comparable companies whose stocks are listed on an exchange cannot be found, other comparable companies which have stocks actively traded on the over-the-counter market also may be used. The essential factor is that whether the stocks are sold on an exchange or over-the-counter there is evidence of an active, free public market for the stock as of the valuation date. In selecting corporations for comparative purposes, care should be taken to use only comparable companies. Although the only restrictive requirement as to comparable corporations specified in the statute is that their lines of business be the same or similar, yet it is obvious that consideration must be given to other relevant factors in order that the most valid comparison possible will be obtained. For illustration...a company with a declining business and decreasing markets is not comparable to one with a record of current progress and market expansion.

I highlighted the requirement of active trading because it is important if the valuation analyst is to get a true read of the investing public. We pointed out in our report the thin trading of the guideline companies. ABC Appraisal's selection of guideline companies included two companies that we rejected. The trading activity of their companies was as follows:

Company	Trading Volume
Arnold Industries	1.72%
Old Dominion	0.35%
PAM Transportation	0.05%
Transport Corp	0.64%
US Xpress	0.22%
USA Truck	0.82%

At least some of our guideline companies had trading activity. Their selection could not possibly reflect the active market required to have any confidence that the stock prices were truly reflecting the activity of the investing public. To make matters worse, PAM Transportation reported in its 2000 Form 10-K that it only had 284 shareholders at the time that the form was filed. For ABC Appraisal to ignore the active trading requirement indicates that they were negligent in following generally accepted valuation principles, or they were on a mission.

Their statement about a "proper DCF" would have proven to them that the market was not priced correctly at the valuation date. I agree that if the market is properly priced, the values should be close between the market approach and a DCF analysis. Because they never bothered to check their values with another approach, they would not know that their conclusion is wrong.

With respect to ABC Appraisal's statement "The Market Approach utilizes multiples that represent investor expectations for growth and profitability of public companies," there can be a tremendous difference between the fair market value of the public company's stock, as it is trading in the marketplace, and the true worth, or intrinsic value, of the company. When the intrinsic value of the company is different than the market value, fair value cannot be calculated using market multiples.

In *Valuing a Business*, the authors (Pratt, Reilly, and Schweih) discuss the definition of intrinsic value. In particular, the authors state that intrinsic value is

The amount that an investor considers, on the basis of an evaluation of available facts, to be the 'true' or 'real' worth of an item, usually an equity security. The value that will become the market value when other investors reach the same conclusions. The various approaches to determining intrinsic value in the finance literature are based on expectations and discounted cash flows.

(continued)

### EXHIBIT 24.4 Critique—The Second Time Around *(continued)*

In discussing the purposes of security analysis, the authors state the following:

The purpose of security analysis is to detect differences between the value of a security as determined by the market and a security's 'intrinsic value'—that is, the value that the security ought to have and will have when other investors have the same insight and knowledge as the analyst.

This indicates that market value will be different than intrinsic value, but the intrinsic value is really the underlying value of the security. The Littleton case is a situation in which ABC Appraisal has ignored the willing seller. They have discounted John's interest by 15 percent for Joe's key man status and 35 percent for marketability. I will point out later that these discounts are unreasonable, even if applicable (and I do not concede that they are applicable).

In *PPC's Guide to Business Valuations*, the authors make the statement that "the value of a business is equal to the present worth of the future benefits of ownership." Immediately following, they explain

That statement is a fundamental principle of business valuations. A rational buyer normally will invest in a company only if the present value of the expected benefits of ownership are at least equal to the purchase price. Likewise, a rational seller normally will not sell if the present value of those expected benefits is more than the selling price. Thus, a sale generally will occur only at an amount equal to the benefits of ownership.

By purely relying on historic information, and only the year 2000 at that, ABC Appraisal has ignored this "fundamental principle" of business valuation. They have chosen to ignore the future benefits of ownership.

In *Valuation of a Closely-Held Business*, published by Research Institute of America, there is probably one of the best definitions and discussions of intrinsic value in all the literature that I have reviewed. I believe that it is very applicable to this case. According to the authors

The intrinsic value of a business refers to the value derived on the basis of an analysis of the fundamental factors related to the business. Such factors as assets, earnings, and future growth are considered in arriving at a 'pure' value of the investment. This standard ignores the capriciousness of the market and determines a value which, theoretically, would be arrived at by sophisticated analysts. In this, its rather esoteric form, the intrinsic value standard has relatively little use or application to the real world of business valuation. **Its practical use is most often found within the realm of fair value.** (Emphasis added).

In *Valuing Small Businesses and Professional Practices*, Pratt discusses intrinsic value. In this instance, he quotes from a book entitled *Financial Decision Making*, which defines intrinsic value as follows:

A security's intrinsic value is the price that is justified for it when the primary factors of value are considered. In other words, it is the real worth of the debt or equity instrument as distinguished from the current market price. The financial manager estimates intrinsic value by carefully appraising the following fundamental factors that affect security values:

**Value of the firm's assets.** The physical assets held by the firm have some market value. They can be liquidated if need be to provide funds to repay debt and distribute to shareholders. In techniques of going concern valuation, asset values are usually omitted.

**Likely future interest and dividends.** For debt, the firm is committed to pay future interest and repay principal. For preferred and common stock, the firm makes attempts to declare and pay dividends. The likelihood of these payments affects present value.

**Likely future earnings.** The expected future earnings of the firm are generally viewed as the most important single factor affecting security value. Without a reasonable level of earnings, interest and dividend payments may be in jeopardy.

**Likely future growth rate.** A firm's prospects for future growth are carefully evaluated by investors and creditors and are a factor influencing intrinsic value.

### EXHIBIT 24.4 Critique—The Second Time Around

In Graham and Dodd's *Security Analysis*, the authors discuss three approaches to analysis and valuation. They indicate the following:

There are three broad concepts or approaches to the analysis and valuation of common stocks. The first and oldest approach places primary emphasis on anticipated market performance. In the true sense, this approach is not based on a valuation concept because it does not seek to value a stock apart from the market. Hence, we term it 'anticipation' approach. The second and third approaches clearly rest on valuation (one on intrinsic values, the other on relative values.

In essence, these authors discuss intrinsic value and fair value as being synonymous. The authors state

the intrinsic value approach is a normative concept that seeks to determine what a stock is worth, that is, the price at which it should sell if properly priced in a normal market.

In the fourth chapter of the book, the authors describe, "The traditional definition of intrinsic value emphasizes the role of facts: the value which is justified by assets, earnings, dividends, definite prospects, and the factor of management." In discussing valuation factors, the authors state the following:

These four earnings factors are the major components of the intrinsic value of a going concern:

1. Level of normal earning power and profitability in the employment of assets as distinguished from the reported earnings, which may be, and frequently are, distorted by transient influences
2. Dividends actually paid or the capacity to pay such dividends currently and in the future
3. A realistic expectation about the trend line growth of earning power
4. Stability and predictability of these quantitative and qualitative projections of the future economic value of the enterprise

ABC Appraisal has not addressed any of these factors in their report. They merely took six public companies and accepted the price at which the market was trading, regardless of how these factors affected the intrinsic value of these companies. They then used their multiples to justify the value of Littleton.

Graham and Dodd also indicate the following:

Intrinsic value is therefore dynamic in that it is a moving target which can be expected to move forward but in a much less volatile manner than typical cyclical or other gyrations of market price. Thus, if intrinsic value is accurately estimated, price will fluctuate about it.

In discussing the central tendency in pricing, the authors state

Therefore, intrinsic value is in essence the central tendency in price. Viewed in this manner, the actual coincidence between market price and the more stable central tendency in price will usually be brief.

If we translate what the authors are saying into information that should be used in this case, the market approach does not necessarily reflect the true value of a company, and it is rare that the market approach will be at a "correct" level because the reliance on the market prices of stocks of guideline companies will rarely reflect the true value of these companies. This causes the valuation analyst to use data which is applied to the subject company, in this case, Littleton, that is questionable. Not only that, but after all the subjective adjustments that must be made to make these companies comparable, a correct conclusion will be derived only if the valuation analyst is pretty lucky.

In an article that appeared in *Valuation Strategies*, Pratt discusses the fact that the three elements of fair value are investment value, market value, and asset value. Pratt states the following:

Courts have treated investment value (defined in this context as value based on earning capacity) as the most important of the three elements. In fact, in one case, the Delaware Chancery Court stated that the discounted cash flow (DCF) model is 'increasingly the model of choice for valuations in this Court.' (Citing *Grimes v. Vitalink Communications Corp.*, No. 12334. 1997 WL 538676 (Del.Ch., 1997)).

(continued)

### EXHIBIT 24.4 Critique—The Second Time Around *(continued)*

Finally, in an article published in *Business Valuation News*, March 1984, the author discusses the concept of intrinsic value. He discusses several treatises that are cited over and over again in court decisions by Professor Bonbright and Graham, Dodd, and Cottle. Intrinsic value is actually considered to be “that value which is justified by the facts.” In quoting Graham, Dodd, and Cottle, the author states the following:

The primary objective in using the adjective ‘intrinsic’ is to emphasize the distinction between value and current market price, but not to invest this ‘value’ with an aura of permanence. In truth, the computed intrinsic value is likely to change at least from year to year, as the various factors governing that value are modified. But in most cases intrinsic value changes less rapidly and drastically than market price...

This is another instance that differentiates between value and price, which can be explained by the drastic swings in market price from day to day. The author continues by discussing Professor Bonbright’s difference between intrinsic value, commercial value, or justified selling price, and market value:

But if strictly interpreted, the market value of an enterprise means the price at which it could actually be sold by its present owners to some outside buyers. While such an interpretation may be pertinent in an inheritance-tax case where the decedent was the sole owner of a small enterprise, it would hardly serve as a basis of valuation of a large incorporated business, the sale of which is not contemplated and the realization price of which would depend largely on the accident of a favorable negotiation with investment bankers.

In discussing the difference between normal value and its relationship to intrinsic value, Bonbright states the following:

Just as it is possible to appeal from the prices that are current on the market place to prices that would be current if the market acted intelligently, and thus to invoke a concept of ‘intrinsic value,’ so it is possible to appeal from the price at which a commodity is quoted in today’s market, to some average or trend in prices over a longer period of time. When this latter effort is made, it represents an attempt to make use of a concept of normal value, as distinct from the evanescent values (many appraisal writers prefer to call them merely ‘prices’) that are assumed to be of little practical significance.

Probably one of the best quotes cited in this article comes from The United States Tax Court in the *Estate of Oakley J. Hall*, 34 T.C.M. 648, 666 (1975). The Court found the following:

In times of wide speculation and resulting fluctuations in the stock market we are extremely doubtful that the price at which a stock is traded on the stock exchange on any particular day is a true reflection of what an investor would pay for the stock if he was looking primarily to the historical earnings of the corporation to determine a fair price.

**Page 2.** ABC Appraisal discusses their use of the “independent investor test” for their determination of reasonable compensation. I will address this later in this critique.

**Page 3.** I will address their 35 percent discount for lack of marketability later in this critique.

**Page 4.** ABC Appraisal ignores loans due from the shareholders even though they amount to \$10,444,659 at the valuation date. This would increase their figure for the entire company by that amount. They discuss the fact that John would have to repay his loans, but they never give the court the amount that should be on the balance sheet.

ABC Appraisal states the following:

We have used and relied upon the accuracy and completeness of various historical **and prospective** information provided to us.

What prospective information did they use and rely upon? What happened to known or knowable at the valuation date?

**Page 5.** It is ironic that ABC Appraisal references *Wheaton* in assisting them to define fair value, but they choose to ignore other parts of that decision in which the judge indicated “Even though ‘fair value’ is not synonymous with ‘fair market value,’ consideration of market price still can be a ‘valuable corroborative tool.’” To me, this means that the market price should be used to corroborate value and not necessarily solely to rely on it for the determination.

## EXHIBIT 24.4 Critique—The Second Time Around

ABC Appraisal indicates “Based on the statute, cases, and case commentary, we consider Fair Value to be based on the price that is ‘fair and equitable’ to both parties that would effectuate a transaction **in the Interest in the Littleton Entities** on the open market.” This definition is problematic for a number of reasons. First, by treating a partial interest as being sold on the open market, they are clearly indicating that their valuation will be on a minority basis (they presented their report with and without a control premium, and their discount for lack of marketability is based on minority studies). This is not the intent of the New Jersey statute because case law disfavors a minority discount in fair value oppression cases. Therefore, trading an interest in the Littleton Entities on the open market is very different from trading the Littleton Entities on the open market.

**Page 9.** ABC Appraisal starts their discussion of industry conditions in 2000 by stating “The fundamentals affecting the trucking industry as of the Valuation Date had a negative effect on the valuation and help explain the reduced market multiples relative to earlier periods.” This is the precise reason why fair market value does not necessarily equal fair value. Fair value should look to what the shareholder is giving up, and that is the right to hold the investment—not dispose of it at the time that the market may be down. The value of Littleton was growing based on the company’s own growth and expansion, despite the downturn in the market. Sure, Littleton is affected, as are the rest of the players in the industry, by industry-specific factors, but Littleton has been weathering the storm better than many of the other companies.

**Page 11.** ABC Appraisal starts laying their foundation for Joe’s importance, and in paragraph 8.2, lists the competitive advantage of the company being “Joe’s client relationships.” However, because Joe is not going anywhere, this should be good for the valuation. John was a shareholder of the company who would be entitled to his fair share of the company. What ABC Appraisal wants the court to effectively do is split the company by indicating that the per share value is greater for Joe than it is for John. That is not the intent of fair value.

This paragraph describes the Littleton Entities as a superstar. It has all of these great competitive advantages, but ABC Appraisal wants to reduce the intrinsic value of the company as if all of these positive attributes are going to disappear.

**Page 13.** ABC Appraisal discusses their benchmarking analysis of Littleton to the guideline companies, but they do so in a misleading manner. To begin with, ABC Appraisal totally ignores all years prior to 2000. Although the date closest to the valuation date is important, it is common practice to review trends for the subject company. The year 2000 also happens to be the least profitable year over the last several years.

Regardless, ABC Appraisal ignores some important points regarding the year 2000. For example:

1. Joe decided to stop distributions so that he could reinvest heavily in the new facility that came online after the valuation date. Instead of using bank financing, he used the company’s cash flow to fund the investment. This caused the company to have less cash at the end of the year.
2. Being a closely held company, Littleton has, in past years, made major distributions to the shareholders in the form of dividends, loans, and excess compensation, not including the personal expenses that were run through the company. The nature of a closely held corporation will frequently result in lower cash balances because of the sizeable distributions to the owners.
3. The nature of most closely held companies is that fixed assets are used for a longer period of time than the public companies. Because the money comes directly from a few shareholders’ pockets, the general attitude is, let’s run the assets as long as we can if we are not compromising the business. This is economically sound. ABC Appraisal makes it sound like it is a problem. Somewhere in the depositions, I recall reading Joe or someone stated that they keep the assets longer.

The box at the bottom of the page indicates “This family business in total had less tangible capital compared to its peers, as of the Valuation Date.” This is much ado about nothing. ABC Appraisal highlights it as if it is a big deal.

**Page 14.** ABC Appraisal discusses the concentration of customers but fails to mention that Littleton deals with many divisions of those customers and, therefore, is not subject to the same level of risk as if it was one company. They also disregard the long-term customer relationships that exist with many of these customers. ABC Appraisal also ignores the fact that even the large companies in the industry that also have customer concentration have not had a problem. ABC Appraisal fails to discuss the longer contracts, the increasing business from these customers, nor do they indicate that many of the guideline companies are in similar situations. This is an industry factor, so Littleton is not in any worse shape than its peers.

ABC Appraisal mentions Federated’s bankruptcy in 1990 but fails to mention that currently, Federated is expanding.

ABC Appraisal makes a big deal about bankruptcies. According to some of our follow-up research, the number of bankruptcies in the retail sector has been very small compared to the number of companies in the industry. This puts the risk at a fairly low level. You may want to get ABC Appraisal’s support for the number of bankruptcies that warranted their putting this in the report. Of course, they are probably referring to K-Mart, which occurred after the valuation date. This was not known or knowable.

*(continued)*

### EXHIBIT 24.4 Critique—The Second Time Around *(continued)*

In Section 8.5 of the report, ABC Appraisal discusses Joe's importance. What we have to make the judge realize is that this situation is no different than what Louis Gerstner was to IBM or what Lee Iacocca was to Chrysler. They were also important, but that does not mean that shares of those companies were worth less to some shareholders than to others. Compensation for these individuals still had to be at market rates.

**Page 15.** The discussion about Joe's importance refers to the time period of 1992–1994 when Joe was away from the business. It is ironic that the reason that Joe was away from the business was because he was in jail. What ABC Appraisal left out of their report is that the country was in a serious recession during this time frame. In fact, the Northeast did not start seeing daylight from the recession until about 1994, when Joe got out of jail. The decline in revenues from 1991–1992 shown in table 3 of the ABC Appraisal report has nothing to do with John running the company.

The other piece that is missing from ABC Appraisal's report is the fact that a good portion of the growth may have been attributable to the existing customers' growth during the late 90s because the economy was red hot during that period. The true question to find out is, if Joe is so good, how many new customers did he pick up during this period?

ABC Appraisal states:

During the full period of Joe's absence, revenue declined 10 percent and EBIT declined 21.6 percent. After Joe's return, revenue grew by 60.8 percent through 2000, and EBIT grew by 201.0 percent.

This should be an indication that the company had considerably more value at November 29, 2000, than in January 1996. If they believe that the previous judge was correct in determining the value of John's interest, then why is their value today the same as the judge's value back then?

**Page 16.** ABC Appraisal states:

The Market Approach and the Income Approach, properly applied, should produce comparable results. The Market Approach incorporates the stock market's outlook on the prospects of the guideline companies, which provides a proxy for the outlook of the Littleton Entities. We believe this approach correctly considers the Littleton Entities' future prospects as of the Valuation Date.

I agree with their first sentence. However, there are times that the market is not properly priced. Fair market value comes from the market. Fair value considers other factors besides the ups and downs of the market at any point in time.

Although the market approach is supposed to incorporate the stock market's outlook on the prospects of the guideline companies, it does not always do that. The trucking industry has historically been valued below the true worth of these companies. This has never been seen as a "sexy" industry that investors want to play in. The proof is that the public companies are generally very thinly traded, and many of them have strong buy recommendations by the brokerage firms that follow them. The strong buy is because the market undervalues the stocks. The effect of undervalued stocks on the market approach is to undervalue the subject company. This happened the first time we valued Littleton, and it is happening again this time.

The market approach is not perfect by any means. Its successful application depends on the valuation analyst's ability to

1. select good guideline companies.
2. understand what is driving the guideline company's stock price.
3. compare the subject and guideline companies to eliminate all differences.
4. select the correct type of multiple(s) to use for the subject company.
5. choose the correct multiple (amount) to apply against the subject company's income stream.
6. determine if a control premium is applicable to the result.
7. determine how much of a control premium is applicable by comparing Wall Street transactions to the subject company situation.
8. determine whether a discount for lack of marketability is appropriate.
9. if the discount is appropriate, determine how much to apply.

## EXHIBIT 24.4 Critique—The Second Time Around

There is a tremendous amount of subjectivity in the market approach that is frequently overlooked. I believe that in many instances, it is less subjective to perform a forecast and select a reasonable rate of return to discount the forecast to present value. When the income and market approaches are very different, the valuation analyst needs to understand what is causing the difference. Without performing at least two approaches to value in the same appraisal, the valuation analyst does not have the normal checks and balances required to overcome subjectivity that exists in all approaches. This is one of the reasons that the appraisal organizations recommend performing multiple approaches in the same valuation, so that there can be checks and balances on the valuation analyst's application of any one approach.

Another question that ABC Appraisal fails to address is how many of the guideline companies were about to go live with a state-of-the-art facility? How do the public company multiples consider this? ABC Appraisal fails to address this in the application of the market approach.

Instead of explaining why ABC Appraisal believes that the market approach is the best proxy for Littleton, they rely on the previous judge's opinion. Where is the independent thinking of the valuation analyst?

**Page 17.** ABC Appraisal states:

Applying the Market Approach provides an indication of the value “as if publicly traded” because the multiples are all derived from publicly traded stock. To value the Interest, we considered the following adjustments:

- Addition of a control premium.
- Application of a key man discount because the success of the Littleton Entities is dependent upon a key man, Joe Littleton.
- Adjustment for Step-Up of Pass-Through Entities: Because the guideline companies' profits are taxed at the entity level (the entities are C corporations) and dividends and capital gains are taxed a second time at the shareholder level, whereas the Littleton Entities are “pass-through” entities and profits are only taxed at the shareholder level, upon sale of the business, a buyer could benefit from a step-up in the basis of the underlying assets of the entities.
- Application of a discount for lack of marketability because the Littleton Entities stock is closely held.

Because ABC Appraisal has put all of their eggs in the market approach basket, there are other areas in the literature that we should address. In an article entitled, “Is the Subject Company Similar?” appearing in *Valuation Strategies*, May/June 1998, the author discusses the differences between private and public companies. The author mentions the following:

Any comparison between the universes of closely held companies and public companies also makes an assumption that the foundation for pricing between the two markets are indeed similar. There are at least several indications they are different.

One of the differences pointed out by the author is the fact that the public market is much more volatile than the pricing of the private market. The author references a study done by Ray Miles, Founder and Former Executive Director of the Institute of Business Appraisers to show that small companies do not appear to be time sensitive, nor do they shift in price with changes in the economy. Even though the reference is to small companies, much of this argument would also apply to a company the size of Littleton. The author concludes that “Thus, it appears that prices for private and public companies are derived independently and driven, in part, by different factors—market movements vs. static return-on-investment criteria.” This represents a big difference between the public company and the private company. This also shows the fact that changes in market movements will affect the market approach, whereas putting in reasonable return on investment criteria, which would allow us to calculate required rates of return or discount rates, would favor using a discounted cash flow methodology for a privately held company.

In an article entitled, “Random Walk and The Close Corporation,” appearing in *Business Valuation Review*, September 1988, the author discusses the suitability of using public company stock prices in determining the value of a privately owned company. The author states the following:

The question we ask is how suitable are stock market transactions in establishing the intrinsic value of a business enterprise. It may be argued that the appraiser wants to determine the hypothetical market price rather than market value.

This article discusses the volatility of the public market and factors affecting stock prices on a daily basis. The author references Professor Bonbright and states the following:

The prices that result from stock market trades are generally derived from small lots that represent only minority interests. It is well known that buyers and sellers of securities, no matter how large the sums they command, are not always intelligent in their evaluation of investment merits.

(continued)

### EXHIBIT 24.4 Critique—The Second Time Around *(continued)*

Citing a paper done under the auspices of the National Bureau of Economic Research, he states

... the authors concluded that stock prices are more volatile than can be justified on the basis of news about underlying fundamentals; a rational investor concerned about the short run may be better off guessing the guesses of others (the 'Keynesian' method); and making assets illiquid, and thus no longer subject to the whims of the market, as is done when a firm goes private, may enhance their value.

An interesting quote from the Council of the Stock Exchange (London) indicates that for valuation purposes

We desire to state authoritatively that Stock Exchange quotations are not related directly to the value of a company's assets, or to the amount of its profits, and consequently these quotations, no matter what date may be chosen for reference, cannot form a fair and equitable, or rational basis for compensation.

[Price is determined by] the actions and opinions of private and institutional investors all over the country and, indeed, the world. The actions and opinions are the result of hope, fear, guesswork, intelligent or otherwise, good or bad investment policy, and many other considerations. The quotations that result definitely do not represent a valuation of a company by reference to its assets and its earning potential.

In *Financial Valuation* by Zukin, the author of chapter 12, "Start-Ups, IPOs, and Private Placements," discusses the limitations of price earnings multiples. Although this is not the pricing multiple used by ABC Appraisal, it is a multiple used in the application of the market approach. The same holds true for other multiples, as well. The author states the following:

As even a casual follower of the public stock markets knows, price/earnings ratio levels are subject to fairly wide fluctuations, often with very imperfect correlations with the current performance of the economy.

This is further support that the appraiser is required to make subjective judgment calls when using these ratios to value the closely held company.

In a book entitled, *Investments: An Introduction to Analysis & Management*, the author discusses some guidelines in the use of the price-to-earnings ratio. Item number 13 on his list is "A company that pays a higher dividend tends to have a higher PIE ratio." Although ABC Appraisal did not use a P/E multiple in its analysis, the same would hold true for any pricing multiple in the market approach. ABC Appraisal totally ignored Littleton's history of making substantial distributions to the shareholders whether it was in the form of dividends, excess compensation, loans, or personal expenses that were paid for by the company on their behalf. This is especially true when ABC Appraisal indicates that Littleton is undercapitalized compared to the public companies.

From a valuation standpoint, Littleton has been able to grow and make the necessary investment in its fixed assets and still pay substantial dividends to its owners. This would be justification for a considerably higher multiple under a market approach. This is one of the reasons why ABC Appraisal undervalued the company using a market approach. That is why it was so important to use a secondary approach to valuation in order to really capture the true earnings capacity and cash flow of the company.

**Page 18.** ABC Appraisal starts their discussion about adjustments by referring to their use of the 2000 audited financial statements. It is ironic that they choose to use the year that is least profitable. There is no discussion about trends for Littleton, no discussion about why profitability in 2000 may be different than in prior years, no discussion about the substantial investment in the new facility. I seriously question whether or not they did any analysis of the prior years.

At the bottom of the page, ABC Appraisal addresses their compensation analysis. They only use 2000, partly because prior years had much greater salaries. In fact, salaries were as follows:

	1996	1997	1998	1999	2000
Officers' compensation	\$4,364,000	\$9,614,000	\$10,637,000	\$8,779,000	\$2,114,000

ABC Appraisal avoids the issue that what the shareholders received in previous years was so far above what even they considered to be reasonable, that it does not enter into their valuation. However, this is one more instance in which John's loss includes the loss of the level of salary that he was getting, far in excess of the value of the services rendered.

**Page 19.** ABC Appraisal attempts to support the reasonableness of the compensation being added in the dividends and subtracting the total taxes paid on the profits of the company. This is misleading. Reasonable compensation is based on a pretax compensation level. Imputing taxes in the fashion that they did is nothing more than an attempt to justify the fact that there is a considerable amount of money passing through to the owners of the company.

## EXHIBIT 24.4 Critique—The Second Time Around

ABC Appraisal relies on the previous judge to support the importance of Joe to the company and further attempts to use this to support the notion that he deserves a large amount of compensation. Comparing the results of the company from 1979–1991 to show Joe's importance ignores the fact that along the way, Joe received the benefits of his efforts. Besides being compensated through payroll and perquisites, he received dividends, and his investment in the company is worth many times what it was previously.

**Page 20.** ABC Appraisal starts off by stating “Based on the Court’s findings, Joe deserves a significant level of compensation for his efforts in leading the Littleton Entities.” Because the valuation report is supposed to be an independent opinion, hasn’t ABC Appraisal relied on the judge for the judge’s opinion, instead of supporting one of their own?

ABC Appraisal also states that “Because Joe is the principal contact with the customers, the loss of Joe would leave the Littleton Entities vulnerable to the loss of major customers.” The fact is that Joe is not going anywhere. He will be staying with the company. Even if Joe was to sell the company, a prudent willing buyer would insist on a reasonable employment contract to insure a smooth transition of the customer base. ABC Appraisal uses Joe’s importance to support higher compensation, a key person discount, and lower multiples than the guideline companies. They are effectively triple-counting in order to low-ball the final opinion of value.

ABC Appraisal refers to the “Independent Investor Test” to support reasonable compensation. Although this is one way to look at the reasonableness of compensation, it is not the only factor that should be considered. First of all, let’s put this test into perspective. It is generally used to determine the reasonableness of past compensation for income tax purposes. Next, while it has come up in several tax-related cases, other factors have also been raised as being pertinent.

ABC Appraisal footnotes *Exacto Spring Corporation v. Commissioner* of Internal Revenue to support the concept of the reasonable investor test. However, I found a newsletter that cites the following:

In *Metro Leasing and Development Corp. v. Commissioner*, 376 F.3d 1015 (9th Cir. 2004), the Court rejected in substantial part the ‘independent investor’ test for determining reasonable compensation, and held that a payment of income tax that was contested was not deductible from the base on which the accumulated earnings tax is computed. The former holding puts the Circuit in substantial conflict with the Seventh Circuit’s decision in *Exacto Spring Corp. v. Commissioner*, 196 F.3d 833 (7th Cir. 1999), as well as the Second Circuit’s in *Rapco Inc. v. Commissioner*, 85 F.3d 950 (2d Cir. 1996). The latter places the Ninth Circuit in clear conflict with the Fifth Circuit’s decision in *J.H. Rutter Rex Manufacturing Co. v. Commissioner*, 853 F.2d 1275 (5th Cir. 1987).<sup>1</sup>

The basis of ABC Appraisal’s analysis is the return on equity. However, because Littleton is a privately owned company, equity is capable of being manipulated because it is not an important number to the business owner. Public companies are operated to maximize shareholder value and, because of this, the value of equity is important at all times, and returns on equity are very important to the shareholders. Littleton, however, being privately owned, operates the business in the manner in which the Littleton family sees fit.

What is also extremely misleading is that ABC Appraisal uses results from 1979, when the company was considerably smaller, to help justify today’s (2000) compensation. On Schedule 6 of their report, they show returns for the Russell 2000, the Russell 1000, the S&P 500, and the Dow Jones Transportation Average. ABC Appraisal shows the S&P compound annual growth rate (CAGR) at 12.7 percent. According to Ibbotson Associates’ *Cost of Capital, 2000 Yearbook*, the S&P had an average return of 19.92 percent over the last 10 years. This would indicate that Littleton did not do as well during the most recent 10-year period. Ibbotson also shows that the compound annual equity returns for the Standard Industrial Classification (SIC) code 4213, Trucking Except Local, was 14.35 percent for the composite of the 32 companies in this group. Littleton’s rate of 12.9 percent is not as good as the industry overall.

In an attempt to see what the impact of using a shorter period of time would have on the Littleton rates of return, we performed a similar analysis as ABC Appraisal did in their Schedule 6. When we did ABC Appraisal’s analysis from 1990, instead of 1979, the results change dramatically. In fact, using their methodology, Littleton has negative returns of 3.20 percent, considerably below the industry average.

**Page 21.** In the middle of this page, ABC Appraisal starts to discuss their alternative compensation test relating to three positions in the company. This is similar to what we did, but we did more. ABC Appraisal cites data from the Economic Research Institute (ERI) database (see his schedule 9) to establish a reasonable compensation level per position. The source document that ABC Appraisal used is included as the next to the last page in their report.

<sup>1</sup> A.S. Pratt & Sons, Community Bank Tax Report, “Ninth Circuit Decision Limits: Independent Investor Test, Deduction of Paid Contested Taxes Against AET Base.”

(continued)

## EXHIBIT 24.4 Critique—The Second Time Around *(continued)*

When ABC Appraisal references the maximum reasonable cash compensation, as defined by the IRS, they are referring to the agreed upon figure that ERI can use in its database—not what the IRS will necessarily allow in a reasonable compensation case. I spoke with ERI about this figure. It represents two standard deviations above the mean. As ERI told me, this is a statistical figure that the IRS allowed to provide guidance about the reasonableness of the maximum compensation that might be allowed by the IRS, but the facts and circumstances of every situation must prevail. Therefore, this is not a guaranteed maximum figure.

Another consideration in the ERI figures is that the noncash compensation is frequently estimated, but not necessarily pertinent, to the specific companies in the data set. This makes the information less reliable.

The proxy analysis that ERI does in the data used by ABC Appraisal includes the following companies: CD&L, Forward Air Corp., Mobile Mini, Inc., Pacific CMA, Inc., Planar Systems, Inc., RPC, Inc., Smithway Motor Xpress Corp., Trailer Bridge, Inc., Transport Corporation of America, and U.S. 1 Industries, Inc. Other than Transport Corporation of America, none of these companies were guideline companies. Our analysis of the proxies went as far as to pull the actual proxies of companies that we considered to be relevant to Littleton. ABC Appraisal merely used this program, and it is not inclusive of their comparable companies, despite the SIC code used.

**Page 23.** Once again, ABC Appraisal displays complete advocacy as they discuss the adjustment for nonrecurring items. Discussing the expenses of Walder and Kass, ABC Appraisal states “As a matter of equity, the Court may wish to exclude this adjustment due to its conclusion that John was the oppressor.” This comment has no place in an independent, objective valuation. This is for legal counsel to argue and not the valuation analyst.

ABC Appraisal discusses their findings and the fact that they narrowed down the selection to only six guideline companies. They say that these are the “most comparable companies.” However, two of their six companies are not comparable. PAM Transportation derives a large percentage of its revenue from the automobile industry. US Xpress was growing through acquisition; it had made numerous acquisitions during the past several years.

They claim to have benchmarked the 24 companies for the latest 12-month period in terms of

- revenues (in terms of size and growth in revenues);
- EBITDA (earnings before interest, income taxes, depreciation and amortization); and
- EBIT (earnings before interest and income taxes).

However, using only these criteria ignores other attributes that make these companies good guideline companies. Some of the factors to consider in selecting guideline companies have been included in the writings of Graham, Dodd, and Cottle;<sup>2</sup> Stockdale;<sup>3</sup> and Bolten, Brockardt, and Mard.<sup>4</sup> The following are some of the factors to consider, though not necessarily in any special order.

- |  |  |
|--|--|
| • Past growth of sales and earnings                            | • Amount of investment in inventory                |
| • Rate of return on invested capital                           | • Level of technology employed                     |
| • Stability of past earnings                                   | • Level of skill required to perform the operation |
| • Dividend rate and record                                     | • Size   |
| • Quality of management  | • Financial position                               |
| • Nature and prospects of the industry                         | • Liquidity  |
| • Competitive position and individual prospects of the company | • Years in business                                |
| • Basic nature of the activity                                 | • Financial market environment                     |
| • General types of goods or services produced                  | • Quality of earnings                              |
| • Relative amounts of labor and capital employed               | • Marketability of shares                          |
| • Extent of materials conversion                               | • Operating efficiency                             |
| • Amount of investment in plant and equipment                  | • Geographical diversification                     |

It seems that his benchmarking was extremely limited. Personally, I think that it was designed to eliminate many of the guideline companies that, not only they, but we, used in our first reports, but it also eliminated many of the potential guideline companies that had higher multiples. This was one more attempt on their part to low-ball the final value.

**EXHIBIT 24.4 Critique—The Second Time Around**

**Page 24.** ABC Appraisal refers to their Schedules 3b and 3b.1 for a description of the 24 companies that they considered and why they rejected some. I agree with some of their selections, but disagree with others. I believe that their explanation of why they eliminated some of these companies is ridiculous. They refer to some of these companies being more than seven times Littleton's revenues as a reason for elimination. Knocking out a perfectly acceptable guideline company that is under 10 times the subject is without good justification, especially when these companies are a good fit to the subject. Furthermore, these are the companies that might very conceivably be the willing buyer of Littleton.

For ABC Appraisal's deposition, you probably want to ask them questions regarding their choice of guideline companies, where it differs from ours. For example, they include PAM Transportation, which admittedly gets about 46 percent of its revenues from the automotive industry. However, on Schedule 3b, they eliminate Allied Holdings Inc. Although they indicate that the primary reason was that the revenue was more than six times the size of the Littleton, they make it a point to indicate that this company is automotive-focused. With PAM Transportation getting approximately 46 percent of its revenues from the automotive industry, and approximately 33 percent of its revenues from one customer, GM, it seems that this company (PAM) is automotive-focused and should have been eliminated in their selection process. This is the reason why we eliminated this company.

With regards to US Xpress, we eliminated this company because according to the disclosures in their Form 10K, they have made approximately 10 acquisitions during the 1990s, with more than half of them coming in the latter half of the decade. We felt that because this company was in acquisition mode, and its growth was through acquisitions as opposed to internal growth, this was a company that was dissimilar to Littleton. Let's find out why ABC Appraisal believes that this company was a good guideline company.

With respect to some of the other companies that we included, and that ABC Appraisal omitted, some of these companies do not show up on his Schedule 3b. This indicates that either the company did not show up at all in their search, or they excluded them early in the process. Let's find out which it is. For example, JB Hunt does not show up at all in Schedule 3b. Besides the fact that we found it to be a reasonable guideline company, its multiples are as follows: MVIC to Revenues, 1.93; MVIC to EBITDA, 9.14; MVIC to EBIT, 9.90.

Another company not included on ABC Appraisal's list is Motor Cargo Industries. Once again, we need to find out why. The multiples for this company are as follows: MVIC to Revenues, 0.37; MVIC to EBITDA, 2.66; MVIC to EBIT, 5.33.

**Page 27.** In Section 10.4, ABC Appraisal states the following:

We determined the multiples of the guideline companies by dividing their adjusted total capital of the guideline companies as of December 31, 2000 by the appropriate adjusted financial parameter as of December 31, 2000.

This will cause a difference in their report from ours. We used Littleton's December 31, 2000 financial statements, but that was it. They used financial statements for the guideline companies and their stock prices as of December 31, 2000. Not only does this add an extra quarter of financial data to the analysis (because we cut off at September 30, 2000, to stay with what would have been known or knowable at November 29, 2000), but it also changes the multiples because of the stock price differences.

Before I demonstrate the differences in the multiples between the time periods, there is one other multiple that I need to address. ABC Appraisal calculates what they call "adjusted total capital" in Schedule 12b of their report. This calculation is performed in a relatively unorthodox format. By definition, invested capital typically represents long-term interest-bearing debt plus equity of a company. For convenience, many valuation analysts will use total interest-bearing debt. ABC Appraisal adds "book debt," which they reference to their Schedule 3. However, in reviewing what they have called book debt, I found that they included a cash overdraft for Transport Corp. of \$4.1 million and \$1.5 million for USA Truck. Cash overdrafts are typically treated as accounts payable, not interest-bearing debt under generally accepted accounting principles. Therefore, they have overstated the invested capital for these two guideline companies.

Another item that needs to be discussed is the fact that ABC Appraisal subtracts non-operating assets from the guideline companies' equity in the determination of his "adjusted total capital." Because the investors in the public market pay a price for the stock of these companies knowing that these assets are included in the equity of the company, I feel that it is inappropriate to make this subtraction.

*(continued)*

**EXHIBIT 24.4 Critique—The Second Time Around** *(continued)*

The following table shows the differences in the stock prices and multiples based on the information reported in the Form 10-Ks (before making the adjustments that ABC Appraisal made regarding the leases and excluding the cash overdraft):

	Stock Price		MVIC/EBITDA		MVIC/EBIT	
	Dec. 31	Nov. 29	Dec. 31	Nov. 29	Dec. 31	Nov. 29
Arnold Industries	18.00	18.73	4.54	4.82	6.91	7.34
Old Dominion	9.50	9.88	3.02	3.06	6.05	5.92
Pam Transportation	8.03	8.00	3.34	3.36	6.58	6.33
Transport Corp.	4.38	4.66	3.38	3.41	9.33	10.24
US Xpress	5.56	6.69	4.78	4.96	13.03	11.10
USA Truck	5.50	6.00	4.01	3.66	23.31	12.54
		Median	3.69	3.53	8.12	8.79

As you can see, the stock price was lower for five of the six guideline companies at December 31, as compared to November 29. The median multiple actually rose slightly for EBITDA, but declined for EBIT. This would cause ABC Appraisal's overall figures to decline again by using the December 31 figures, as compared to November 29 (latest 12 months September 30).

**Page 28.** One of the many problems in using the guideline company method is that you cannot always correlate the multiples. In looking at table 6 of ABC Appraisal's report, let's concentrate on the EBITDA and EBIT multiples. The only difference between these two multiples is that depreciation and amortization is added back in order to derive EBITDA. But look at how different these multiples are when you compare the variance from one multiple to the next for the same company:

	EBITDA	EBIT	EBITDA/EBIT
Arnold Industries	4.43	6.84	64.77%
Old Dominion	2.71	6.32	42.88%
PAM Transportation	3.09	6.06	50.99%
Transport Corp.	2.86	8.19	34.92%
US Xpress	3.05	11.90	25.60%
USA Truck	4.01	22.56	17.77%

This indicates that these guideline companies have such a different degree of depreciation and amortization from each other (and from Littleton) that the use of both of these multiples renders one of them meaningless. This is the reason that we used an EBIT multiple and did not use the EBITDA multiple in this valuation. We also used debt-free net income so that we had a second multiple. This just highlights one more of the problems in determining comparability of Littleton to these public companies. Even the public companies are different.

**Page 30.** ABC Appraisal discusses the analysis of transaction multiples on this page. They indicate that they located 18 transactions but could not use 14 of them. They show the four transactions that are used on Schedule 4. First of all, there are not enough transactions for this to really be useful, other than at most, a sanity check. However, if you look at the transactions on Schedule 4, you will notice that three of these companies are considerably smaller than Littleton. That eliminates them for comparability. Also, it is known in the valuation field that larger companies typically sell for larger multiples. That is one of the reasons that ABC Appraisal eliminated some of the larger companies from their guideline company analysis.

**EXHIBIT 24.4 Critique—The Second Time Around**

The four transactions look like this:

Target	Sales	Multiples	
		Sales	EBITDA
Jevic	226.1	0.90	6.70
Bestway	40.9	0.40	1.50
Dedicated	44.0	0.10	3.00
Carco	66.7	0.50	3.60
Average		0.48	3.72
Median		0.44	3.30
<b>Closer to Littleton</b>	<b>226.1</b>	<b>0.90</b>	<b>6.70</b>

ABC Appraisal uses the median and mean to justify the multiple from the public companies, but the reality is that even these transactions are being used by them to mislead the judge. The only preceding transaction that is remotely similar to Littleton is Jevic, which results in multiples that are almost twice the median and mean. I do want to emphasize, however, that only one transaction cannot be used for much without having a tremendous amount of detail, which is not available from the transaction databases. This is another display of trying to mislead the reader of their report that this information is relevant.

They attempt to explain away the higher multiple by indicating that a control premium can be observed for only one transaction. If that is true, which it is not, the premium would be almost 100 percent!

**Page 31.** Table 8 indicates the percentage growth in Littleton compared to the guideline companies. ABC Appraisal uses this information to indicate how Littleton compares to these companies. However, once again, this analysis, by itself, is misleading. ABC Appraisal never discusses the fact that the growth rates for several of the guideline companies are attributable to acquisitions, as opposed to real growth. They also are only looking at historical information (another drawback of using the market approach in this fashion). Historical growth rates do not translate into stock prices. It is the future growth that investors are buying. Merely looking at history does not allow an informed decision to be made about future prospects. What this table shows is that on a revenue basis, Littleton has done incredibly well (except 1998) in comparison to the guideline companies because none of their growth has come from acquisitions.

Based on profitability, Littleton is superior in its EBITDA margin and almost as good in its EBIT margin. Once again, ABC Appraisal attributes this to Joe. Regardless of who caused it, the value is clearly there for Littleton.

It seems that every time ABC Appraisal has to say something positive about Littleton, they attribute it to Joe, or they attempt to downplay it. The fact is, John is entitled to the value of his interest, regardless of who runs the company.

**Page 32.** At the top of the page, there is another attempt to downplay the multiples that would be applicable to Littleton. They state the following:

In addition, an investor would consider an investment in the Littleton Entities riskier than the guideline companies in the following respects:

- The Littleton Entities had a high customer concentration level.
- The Littleton Entities was smaller than the majority of the guideline companies.
- The Littleton Entities had less net tangible assets per dollar of revenue relative to its peers. An investor may need to invest additional funds relative to the guideline companies to maintain a comparable level of earnings in the future.
- The Littleton Entities has a great reliance on one key person, Joe.

(continued)

**EXHIBIT 24.4 Critique—The Second Time Around** *(continued)*

If we look at each one of these statements separately, we can see that it really should not matter that much. According to ABC Appraisal's own description of these companies (beginning on page 24), customer concentration is as follows (for the top five customers):

Arnold Industries	43%
Old Dominion	6%
Pam Transportation	55%
Transport Corp.	43%
US Xpress	4%
USA Truck	31%*

\*10 customers

Many of the guideline companies have customer concentration risk, as well.

As far as being small, this is true. However, here also, it is not that much of an issue for all the companies. Transport Corp., USA Truck, and Pam Transportation have revenues of \$290,611, \$226,585, and \$205,245, respectively, compared to Littleton at \$166,173. When companies are this size, they are very similar. Even the other companies used by ABC Appraisal could be deemed similar to Littleton. The only company in their group that is really larger than Littleton is US Xpress (\$787,085), which we eliminated as a guideline company because it has been on an acquisition spree.

In terms of having less net tangible assets per dollar of revenue relative to its peers, ABC Appraisal takes the position that "an investor may need to invest additional funds relative to the guideline companies to maintain a comparable level of earnings in the future." I believe that this indicates that Littleton is run more efficiently than the guideline companies, and an investor would see better asset utilization than the other companies.

Once again, the reliability is on Joe. Talent can be purchased. This is the trucking industry and not rocket science. ABC Appraisal cannot really believe that an adequate replacement cannot be found to run a trucking company, as well, if not better than, the manner in which Joe runs the company. There are many CEOs of other trucking companies, both public and private, that can be put in Joe's shoes. This is not as much of an issue as they keep emphasizing.

In the conclusion section of the report, ABC Appraisal states the following:

While the additional factors above would warrant a reduction in the multiples, we have assumed market multiples at or above the median multiples of the guideline companies in order to be conservative (favorable to John).

They have already eliminated the guideline companies with higher multiples. They have chosen to ignore a DCF method because of the growth of Littleton. They have ignored the new state of the art facility. They have overstated Joe's worth to support reasonable compensation. And now, they choose median multiples "in order to be conservative (favorable to John)." Who are they kidding?

They attempt to use the transaction multiples to justify what they have done here. I have already demonstrated why this is not reasonable.

**Pages 33 and 34.** At the bottom of the page and the top of the next page, ABC Appraisal justifies their weighting the multiples, 20 percent for the revenue multiple with the balance split evenly between the other two multiples. They indicate the following:

But we do not believe a buyer would ignore the value indicated by using the Revenue multiple because the buyer will be concerned whether the profit margins of the Littleton Entities can be maintained and if the profitability will revert to a more average margin in order to retain the customers.

## EXHIBIT 24.4 Critique—The Second Time Around

This is nothing more than an attempt to put some weight on a multiple that is lower than the others. It brings down the value. The revenue multiples have a range from 0.38–0.95 (table 6 of their report). Looking at means and medians without an analysis of what caused growth and profitability for the guideline companies does not prove that there is any correlation between the multiples that these companies are trading at and revenues. In our analysis (using the guideline companies that we selected) we found a very poor correlation in the revenue multiples. That is the reason that we eliminated it from consideration.

We ran a simple regression analysis using ABC Appraisal's multiples to determine if there was any statistical reliability in them. The only multiple that showed any reliability was his EBITDA multiple. The revenue multiple had a  $R^2$  of 0.54 (the closer to one, the better) and the coefficient of variation was 0.36 (the lower, the better). The EBIT multiple has a  $R^2$  of 0.77, but a coefficient of variation of 0.62. This means although the  $R^2$  is within an acceptable range, the coefficient of variation shows a wide swing in the multiples. This is evidenced by the fact that the multiples range from 6.06–22.57. This would make this multiple unreliable. Both statistics are acceptable for their EBITDA multiple, which indicates consistency in the guideline company multiples. This does not mean, however, that their value is correct because I believe they chose inadequate guideline companies.

**Page 35.** They indicate the following:

We also believe that giving John the benefit of an additional control premium would be to be unfair to Joe and Mary (the third shareholder), as their ability to receive such a premium would require both that the Littleton Entities be sold, and that it would warrant a premium over its going-concern value in such a sale.

It is interesting that ABC Appraisal makes this remark because their entire valuation is premised on the assertion that the company will be sold. For them to say “such a premium would require both that the Littleton Entities be sold...” seems to be the very premise that they operated under all along. They are being contradictory.

In table 12, they are, once again, being cute with the transactions. They are showing how close they came to the average and median multiples. Where they fail is in their analysis.

**Page 36.** Section 11.3 is ABC Appraisal's discussion of their key person discount for Joe. They list factors that show that Joe is “great.” They omit, of course, the negative impact that Joe probably had on the company because he went to jail. They also discuss the decline in the company during Joe's absence (1992–1994), but again, they forget to mention anything about the serious recession that the country, and particularly the Northeast, was in during that time frame.

ABC Appraisal footnotes an article from *The Business Owner* relating to personal goodwill:

It is harder to sell a business in which the owner is active in the business and, even more so, was hard to replace. Furthermore, such a business will command a lower price.

However, if you read through this article, you will see that it pertains to small businesses and not companies the size of Littleton. The author cites a presentation that I attended at a conference entitled “Separating Personal and Business Goodwill of Operating Companies in Divorce Valuations.” This presentation had to do with valuing small companies in a divorce setting. The presenter, Rod Burkert is from Pennsylvania, a state that does not permit personal goodwill to be part of “equitable distribution.”

If you answer the many questions in the article with a “p” for personal and a “b” for business, you can see that the vast majority of Littleton Trucking's goodwill is business-related and not personal. The questions raised are as follows:

### Type of Service

- Is the product creation process labor-intensive (P) or machine-intensive (B)?
- Are orders received by the owner or his staff, or both, (P) or automatically (B)?
- Do customers interact with the owner-manager personally (P) or mostly just with employees (B)?
- Do customers associate quality with the owner-manager (P) or with the company (B)?
- If a reputation of quality, honesty, and fair dealing exists, is it attributed to the owner-manager (P) or the business (B)?

### Customers

- Do customer referrals come to the owner-manager personally (P) or to the business (B)?
- Do the customers speak of the owner (P) or the business (B)?
- Does most revenue come from repeat business (P) or new customers (B)?
- Are there just a few customers (P) or many (B)?

(continued)

### EXHIBIT 24.4 Critique—The Second Time Around *(continued)*

#### The Company

- Start-up (P) or mature business (B)?
- Is the business named after the owner (P) or not (B)?
- Is there one owner working in the business (P) or many (B)?
- Does the owner-manager handle all core tasks (P) or delegate them to a talented team (B)?
- Are the systems, processes, and methods “in the owner’s head” (P) or are they documented and carried out by others (B)?

#### The Owner

- Does the owner work many hours in or on the business (P) or few (B)?
- Is the owner well-known in the industry and community (P) or not really (B)?
- Does the business require a high level of knowledge, skill, and ability (P) or could the business be run by any one of a great many people (B)?

#### Other

- Can personal relationships influence customer decisions to buy (P) or are customers large and interested only in price, terms, and service quality (B)?
- Is the business financing personally guaranteed by the owner (P) or not (B)?
- If the business was purchased, was a covenant not to compete a part of the terms (P) or not (B)?
- Can the ownership interest be sold without restrictive covenants on the owner (B) or would the buyer likely require the seller to agree to restrictive covenants (P)?
- Would the loss of the owner’s services result in a decline in revenue (P) or not (B)?

With regard to the other article, “Key Person Discount” from *Valuation Strategies*, the full name of the article is “Key Person Discount: Overlooked and Underutilized.” This article starts off with the following sentence:

In **small closely held entities**, it is quite common to find many if not all elements of management concentrated in one or two people. (Emphasis added)

It then states the following:

The IRS has long recognized the fact that a reduction in value is appropriate and it stated in Rev. Rul. 59-60:

The loss of the manager of a so-called “one-man” business may have a depressing effect on the value of the stock of such business, particularly if there is a lack of trained personnel capable of succeeding to the management of the enterprise. In valuing the stock of this type of business, therefore, the effect of the loss of the manager on the future expectancy of the business and the absence of management succession potentialities are pertinent factors to be taken into consideration.

Littleton trucking is certainly not a “one-man” business. It also has at least \$1 million of life insurance as mitigation of the loss of Joe. By the way, if Joe is so important, why wasn’t this policy amount increased?

The studies included in this article show ranges that are all over the place. There is not enough information to determine how applicable each situation would be to Littleton.

What is also interesting is the court case determinations (and keep in mind that this is all in the context of fair market value and not fair value), and particularly, the *Estate of Paul Mitchell*. The court in *Estate of Mitchell* allowed a 10 percent discount to reflect the value of the decedent’s creativity to the business. Paul Mitchell was considered the heart of the company’s connection with its customers; he was a creative trendsetter, and his hair sculpting techniques revolutionized hair styling.

According to the author “It appears from the empirical data (although that data is somewhat thin) that a range of 8% to 35% may be appropriate.” However, if you look at the table that they include to summarize the cases, they show the following:

**EXHIBIT 24.4 Critique—The Second Time Around**

Exhibit 2. Summary of Cases Case	
	Discount
<i>Estate of Huntsman</i>	11.2% and 9.1%
<i>Estate of Yeager</i>	10.0%
<i>Estate of Feldmar</i>	25.0%
<i>Estate of Rodriguez</i>	27.4%
<i>Estate of Mitchell</i>	10.0%
<i>Furman</i>	10.0%

In the two cases that allowed higher discounts (*Feldmar* and *Rodriguez*), the key person had a tremendous impact on the business. In *Rodriguez*, the company was small (average three-year earnings were under \$300,000), and in *Feldmar* (company had about \$31.0 million in revenues), the decedent was responsible for marketing its insurance product in a unique way. Neither of these cases would apply to Littleton.

In Pratt's *Business Valuation Discounts and Premiums*, the author discusses factors to consider in analyzing the key person discount. Pratt states the following:

Some of the factors to consider in estimating the magnitude of a key person discount, in addition to special characteristics of the person listed above, include:

- Services rendered by the key person and degree of dependence on that person
- Likelihood of loss of the key person (if still active)
- Depth and quality of other company management
- Availability and adequacy of potential replacement
- Compensation paid to key person and probable compensation for replacement
- Value of irreplaceable factors lost, such as vital customer and supplier relationships, insight and recognition, and personal management styles to ensure companywide harmony among employees
- Risks associated with disruption and operation under new management
- Lost debt capacity

Pratt then goes on to discuss items that mitigate the potential loss:

There are three potential offsets to the loss of a key person:

1. Life or disability insurance proceeds payable to the company and not earmarked for other purposes, such as repurchase of a decedent's stock
2. Compensation saved (after any continuing obligations) if the compensation to the key person was greater than the cost of replacement
3. Employment and/or noncompete agreements

Pratt references an article on this subject as follows:

Jerome Osteryoung and Derek Newman propose a fairly rigorous analytical approach to quantifying the key person discount. In the summary to their article, they write:

This paper suggests that the key person impact on the valuation of a business is important. The smaller the business the more important the key person becomes.

The key person impact cannot be thought of as applying a certain percentage to normal valuation of the business. This is not appropriate for two reasons. First, there is no viable research or theory that substantiates this point. Second, the key person loss will be different with each type of business.

(continued)

**EXHIBIT 24.4 Critique—The Second Time Around** *(continued)*

In order to evaluate the loss of a key person on the value of a business, each component in the future income and cash-flow stream must be evaluated for the exiting key person. Only by undertaking such a rigorous approach can any losses resulting from [sic] the departure of the key person be quantified?<sup>5</sup>

Notwithstanding the above, the fact is that most practitioners and most courts do express their estimate of the key person discount as a percentage of the otherwise undiscounted enterprise value.

Note the explanation regarding the methodology for evaluating the key person impact on the valuation. Osteryoung and Newman state the following:

**Methodology for Evaluating Key Person Impact on Valuation**

In this section, a definition of a key person is suggested for the purpose of the appraisal of the privately held firm and methods of evaluating the contribution of the key person are described.

A key person is defined as the owner/manager of a privately held business. It is very important to note that in the discussion of key person valuation issues, the key person is defined as both the owner and manager. This distinction is important because if the owner is not the manager, then the owner is remote from the daily operation of the business and the impact is not as great as that of the owner/manager. Additionally, the manager who is not an owner is not considered as a key person as this person is assumed to be continuing with the business for valuation purposes.

The establishment of the fair market value of a business begins with a forecast of the firm's earnings and cash flows. While there are many approaches for this process, this paper will only highlight the necessary adjustments for this process to account for the key person impact.

Mathematically, the key person discount is the percentage decline in the value of the business resulting from the replacement of the key person. While this is normally thought of as a discount, there are many times when the value of a business will be enhanced with the replacement of a key person. If an owner/manager was ineffective, then the replacement of that person should be considered a key person premium.

In every valuation, the impact of the key person needs to be ascertained. Shown below are the key elements to evaluate the key person's impact on the income stream of the business:

**Elements in Key Person Evaluation**

1. the salary paid to the key person,
2. the salary expected to be paid to the replacement of the key person,
3. the perquisites paid to the key person,
4. the perquisites expected to be paid to the replacement of the key person,
5. the ease of finding a replacement for the key person and the time necessary to accomplish such a replacement,
6. the non-replaceable reduction in sales from key person departure, and
7. the non-replaceable reduction in costs from key person departure.

The salary paid to the key person must be compared to the expected salary of the replacement. The salary paid to the key person can either be too high or too low depending on the specifics. What is relevant is the change in salary to the business after the change in ownership takes place. For example, if the key person was extracting an annual salary of \$45,000 a year but the new person would require \$75,000 for an equivalent performance then the \$75,000 is appropriate for the valuation process.

With perks, the same type of analysis is required. The perks that the key person is receiving must be compared with those of a replacement. If the key person was taking \$54,000 in perquisites and the new replacement will only extract \$16,000, then the relevant figure here is the \$16,000 as this will be the figure that impacts the projected income flows of the business.

Very often the key person of the business is performing two or three jobs that any prospective purchaser of the business would not be able to accomplish. Some time in the valuation process must be spent going over the role and responsibility of the key person to ferret out what the job performance really is. This might entail spending a day or two just following the key person around to actually see what he does. Frequently, the key person is the CEO, marketing manager, and the production supervisor. In this case, the marginal expenses of hiring the additional people to perform these jobs must be computed and incorporated into the valuation's projected income flows.

<sup>5</sup> Osteryoung, Jerome S. and Derek Newman, "Key Person Valuation Issues for Private Businesses," *Business Valuation Review*, 1994: 116.

## EXHIBIT 24.4 Critique—The Second Time Around

Frequently, it may take months to find an adequate replacement for the key person. It should not be assumed in the valuation process that, automatically, the new purchaser will have the skills to run the business. Rather, the assumption should be made that it will take time, effort, and sometimes a monetary expense to find or train the replacement. All of these elements need to be considered and built into the forecast of future income and cash flows.

One critical element in the valuation process is to estimate the amount of sales that will be lost with the departure of the key person. The closer the key person is to the sales function the higher this number will be. For example, a business with a key person in a manufacturing operation who normally does not get involved in marketing but has a marketing manager will not normally lose sales. However, a legal or medical practice will lose substantial revenue if the lead attorney or physician departs from the business. These departures are significant since there is a personal relationship built up between the client and the key person. The closer the key person is to the purchaser of goods or services the greater the loss of revenue.

This key person sales loss must be built into the revenue forecast of the valuation. Of course, the difficulty is in estimating the decrease in revenue because of the key person departure. The following is a list which allows the ascertainment of the amount of the sales declines which occurs with a loss of the key person.

### Elements in Estimating Revenue Change

1. The clients should be asked discretely how they would respond if the key person was busy, or would another professional in the firm be a satisfactory substitute? The more willing a client would be to let another professional meet his needs, the less the sales decline on the departure of the key person.
2. The effects of actual departures on the revenues of similar firms should be evaluated.
3. The frequency of contact between the customer and the key person should be evaluated. The greater the frequency, the less likely the client will be to willingly and/or automatically stay with the firm.
4. The nature of the service the key person is providing should be evaluated. If this service is highly personal (e.g. lawyer, doctor, and interior designer), then a great majority of these accounts and clients may be lost.

Sometimes the key person can have a dramatic impact on the costs of a business. A key person may be a very knowledgeable buyer and get goods at very reasonable prices. Additionally, the key person, through diligence and knowledge, can shift down the entire cost structure of a business.

One way to evaluate the effectiveness of the key person in reducing costs is to compare the costs of this business on a line by line basis. If the costs are significantly below the industry averages, then one reason for this may be the cost awareness of the key person.

To incorporate these cost savings from the departing key person is important to the valuation in forecasting the future income and cash flows. One way to do this would be to use the costs that would be expected under normal conditions (e.g. industry averages).

I realize that this quote was long, but it really provides a road map of the factors that should be considered. ABC Appraisal probably did not consider any of them. They merely accepted Joe's importance based on their client's say so and, of course, the previous judge.

**Page 37.** Continuing their discussion about key person discounts, ABC Appraisal states the following:

If we assume that approximately 50 percent of this intangible value, or \$14.7 million, is attributable to the key person value of Joe Littleton, this represents approximately 27.2 percent of the total equity value of the Littleton Entities (before applying a control premium).

This is nothing more than grabbing numbers out of the air. There is no basis for an assumption of 50 percent. ABC Appraisal refers to one of their trucking industry comparables to support the key person discount that resulted because of the death of the founder and chairman of Transport Corp. (TCAM). According to the 1999 Form 10-K filed in March 2000, TCAM's stock prices ranged as follows during 1999 and 1998:

*(continued)*

**EXHIBIT 24.4 Critique—The Second Time Around** *(continued)*

Period	High	Low
1999		
1st Quarter	13.750	11.250
2nd Quarter	13.438	9.750
3rd Quarter	16.250	12.375
4th Quarter	13.500	10.563
1998		
1st Quarter	18.250	14.250
2nd Quarter	18.250	16.250
3rd Quarter	17.250	10.000
4th Quarter	12.875	10.875

This data demonstrates that this company's stock prices fluctuated widely. In fact, the stock price declined through 1998 and bounced all over the place in 1999. The death of the founder and chairman was of so little importance to the company that it was not mention in the Form 10K. Earnings per share dropped by \$0.44 per share from a year earlier. Fully diluted earnings per share for 1999 were as follows:

1st Quarter	2nd Quarter	3rd Quarter	4th Quarter
\$0.25	\$0.46	\$0.31	(\$0.05)

Seeing the decline in profitability, the market's reaction had little to do with the death of the founder. Furthermore, according to a *New York Times* article published on February 10, 2000

Shares of the Transport Corporation of America Inc. fell yesterday after the company said fourth-quarter profit declined more than forecast, and the USFreightways Corporation scrapped a plan to buy the company for \$132.7 million in stock. Stock in Transport, a long distance trucker, slid \$5.625 to \$9.4375 in NASDAQ trading. The stock of both companies tumbled after they said on Jan. 18 that shareholders of Transport, which is based in Eagan, Minn., would receive 0.412 share of USFreightways for each of their shares, a 31 percent premium at the time. The stock of USFreightways was up 75 cents yesterday, to \$39.375, in NASDAQ trading.

The announcement of this transaction took place in January 2000. Once again, there is no mention that the decline had anything to do with the death of Jim Aronson.

ABC Appraisal then tries to justify why they did not think that this discount was important in their earlier report, but it is now. If the previous judge had decided based on a January 31, 1996 valuation that Joe was so important, why is this now justified? Joe's importance has not changed. If anything, it seems that Ray has taken over a lot of the day-to-day issues as President (at least according to Ray's deposition).

**Page 38.** The only part of the analysis that I disagree with about the pass-through status is the concept of prorating the pass-through entities tax shield because they had not elected S status 10 years ago. Because there is no intention of selling the company, this tax benefit will be realized by Joe and Mary. This is another calculation to bring down the value.

## EXHIBIT 24.4 Critique—The Second Time Around

**Pages 39 and 40.** The discussion that takes place in this section about the discount for lack of marketability is completely misleading and, in my opinion, inappropriate. First, ABC Appraisal starts off using *Balsamides* to help support a 35 percent discount. What makes matters worse is they intentionally attempt to mislead the court by stating

A 35 percent discount for lack of marketability is also consistent with published research that indicates that private placements typically occur at prices approximately 50 percent below subsequent public offering prices.

'Average differentials between private transactions prices and public market prices varied under different market conditions, ranging from about 40 percent to 63 percent, after eliminating the outliers.' These studies effectively compare the same company under private and public ownership, and indicate a substantial premium when the shares are easily traded in a liquid market. (Footnotes omitted).

ABC Appraisal references studies that appear in Pratt's *Valuing a Business*, but omit one critical item. The last sentence in the conclusion states the following:

This is very strong support for the hypothesis that the **fair market value of non-controlling ownership interests** in privately held businesses are greatly discounted from their publicly traded counterparts. (Emphasis added).

The error that took place in *Balsamides* was the fact that the court had poor testimony from the experts. Although I agree with the notion that you should consider the illiquid nature of the closely held company, the expert whose testimony was accepted used inappropriate data. The studies that he cited were restricted stock studies which pertain to noncontrolling ownership blocks. Effectively, the court allowed a discount for lack of marketability as if the business was being valued on a minority basis.

ABC Appraisal knows better, and they are trying to get the court to go along with this discount, which is applicable to minority interests. If the Littleton Enterprise were sold, Joe and Mary would not suffer a discount of 35 percent. Application of this discount would be a windfall for them.

ABC Appraisal also tries to use the Tax Court's benchmarks of 35 percent to 45 percent (again, minority interests) to support the factors that they considered in this appraisal. The nature of a closely held company that has owner/employees is that the holding period is a long-term investment. This should not come as any great surprise. Considering the other factors that ABC Appraisal listed, there should be little to no discount.

The major mitigating factor to illiquidity is the large distributions (excess salary from previous and current years, and distributions) that provide strong liquidity to the stockholders while the company is on the market. The financial strength of the company and the fact that the new facility is about to start early in the next period also affords strength. There are no shareholder agreements, so there are no restrictions on stock transferability. The company is not going public, so there are no costs associated with a public offering.

**Page 41.** ABC Appraisal states that customer concentration would make it difficult to sell the company. However, they ignore the fact that three of the six guideline companies that they chose had similar situations. They already discounted the company for Joe, but now they want to consider it again. There is no undercapitalization of the company because the owners (Joe) have chosen to distribute large amounts of cash over the years. Finally, the sub-segment of the trucking industry will not be a problem given the strength of the company. There is no justification for this discount.

### SOME MISCELLANEOUS POINTS AND REFERENCES FOR TRIAL

**Discounted Cash Flow.** In *Business Analysis & Valuation*, the authors discuss the concept of detailed valuation versus the use of multiples. They indicate the following:

Of course, how much is gained (or lost!) by relying on the market's pricing of other firms depends critically on how closely comparable those firms are. Such reliance also involves a certain circularity. If all equity valuation were based solely on comparables, then mispricing of one firm would translate into mispricing in another firm, and so on. To avoid this never-ending spiral, someone must ultimately conduct an analysis based on something other than mere comparables.

Each of the alternatives offers its own set of advantages. There is no 'best' valuation method, which explains why analysts tend to 'triangulate' by applying several methods in the same context.

(continued)

### EXHIBIT 24.4 Critique—The Second Time Around *(continued)*

In *Valuing Financial Institutions*, Z. Christopher Mercer, a well-respected business appraiser and author discusses relating P/Es and other historical valuation approaches to discounted cash flow methodologies. Mercer states the following:

Discounted cash flow methodologies are, from a theoretical viewpoint, the most correct and precise methods for valuing businesses. After all, what could better describe the value of a business today than the present value (determined at an appropriate discount rate) of all its future cash flows (or earnings)?

In discussing earnings forecasts, Mercer states, “Finally, for existing companies or financial institutions, the analyst must bridge the gap between actual historical performance and projected future performance.” Clearly, you cannot just rely on history, but you need to project the future and then understand the difference between the two.

In the *Valuation Reference Manual*, in the discussion of discounted earnings, the author states, “The real value of any going business is its future earning power. Accordingly, the discounted cash flow approach, more than any other, determines the true value of your business.”

In an article appearing in *Business Week* entitled, “Taking the Measure of a Stock—Discounted Cash Flow Tells What Other Methods Don’t” appearing May 14, 2001, the author discusses a valuation performed by Aswath Damodaran, a New York University finance professor. The article discusses that stock market prices are based on many factors, but the discounted cash flow model really gets to the underlying value of the company itself. In fact, the author says this:

What these models really give you is an appreciation for what drives stock values. Changes in the long-term growth rate seem to have the greatest impact on growth companies, with next year’s earnings projection and, of course, changes in interest rates, also making a big difference.

The author then goes on to say

With all the caveats, Damodaran still argues that discounted-cash flow models make the best valuation tools. He says analysts who rely on price-earnings ratios also make assumptions about growth when they decide what p-e is justifiable for a stock. They just don’t bother doing it explicitly. Without weighing all the elements that are in the discounted-cash-flow model, says Damodaran, valuation becomes a beauty contest—with stocks compared with each other rather than judged on intrinsic value. ‘If the companies you are comparing your company to are all overpriced,’ says Damodaran, ‘what you end up with is a stock that drops by 60% or 65%.’ That’s something easier to imagine now than it was two years ago. ‘Besides,’ he says, ‘focusing only on earnings puts investors at the mercy of companies adept at jiggering the bottom line. Cash flows are more difficult to manipulate.’

**Forecasting.** In *Business Analysis & Valuation*, the authors discuss the process of forecasting. Regarding the overall structure of the forecast, they indicate the following:

The best way to forecast future performance is to do it comprehensively, by producing not only an earnings forecast, but a forecast of cash flows and the balance sheet as well.

They also indicate:

Forecasting represents the first step of prospective analysis, and serves to summarize the forward-looking view that emanates from business strategy analysis, accounting analysis, and financial analysis.

The authors conclude this section of the book by stating the following:

There are a variety of contexts (including but not limited to security analysis) where the forecast is usefully summarized in the form of an estimate of the firm’s value—an estimate that, after all, can be viewed as the best attempt to reflect in a single summary statistic the manager’s or analyst’s view of the firm’s prospects. That process of converting a forecast into a value estimate is labeled valuation.

## EXHIBIT 24.4 Critique—The Second Time Around

In *PPC's Guide to Business Valuations*, the authors provide a step-by-step summary of how to complete a discounted future returns method. In step 1, they indicate, "Obtain (or Prepare) a Financial Forecast." As you can see, the authors tell us that even if we do not obtain one, we certainly prepare one. The argument that ABC Appraisal uses for not using a discounted future returns methodology is because management did not have a forecast available; that is nonsense. Later in the chapter, the authors indicate:

In some cases, the valuation consultant may be able to obtain a forecast of future operations from the company being valued or from that company's independent accountant. This is the preferred approach and should be encouraged whenever feasible. In many cases, however, the consultant may have to prepare the forecast.

As the authors elaborate on forecasts, they indicate:

Since the valuation consultant **prepares the financial forecast in most instances**, (emphasis added) the consultant should base the forecast on normalized assumptions presented in accordance with GAAP.

In the seminar material, *Business Valuation for Accountants, Brokers and Appraisers*, by The Institute of Business Appraisers, the materials discuss forecasting as an "essential part of appraising" and "often overlooked or ignored by otherwise competent appraisers." In discussing forecasting techniques, various methodologies are indicated in these materials. For example, they talk about mathematical analysis of history, however, the materials also state, "but an analysis of history, no matter how sophisticated in the mathematical sense, is not a forecast."

Finally, with regard to the use of judgment, and possibly being wrong about the forecast, these materials indicate:

Fortunately, appraisers are not required to be infallible forecasters; they are expected only to reach conclusions such as would be reached by a reasonable person, given the available information.

These materials end with a quote from Justice Holmes in *Ithaca Trust Co. v. U.S.*:

Values . . . depend largely on more or less certain prophecies of the future; and the value is not less real at the time if later the prophecy turns out to be false...

In an article "Traditional Equity Valuation Methods," published by the Association for Investment Management and Research, the author discusses traditional valuation methods versus "new" valuation methods. The traditional methods fall into more of a market approach concept because the author discusses price-to-book ratio, price-to-sales ratio, price-to-earnings ratio, and a dividend discount model. While discussing the pros and cons of these different methodologies, the author states, "the DDM (Dividend Discount Model) is intellectually and ideally the best model for valuing companies." Although they chose to ignore dividend-paying capacity because he claimed it was not important for a controlling interest, clearly, this dividend model is considered to be important.

In the second article in this series, "New Methodologies for Equity Analysis and Valuation," this presentation discusses "two of the new equity valuation methodologies—economic value added (EVA) and discounted cash flow (DCF)—that have particular appeal in global analysis." These concepts are based on making the forecast and determining the present value of this stream of income.

The author points out

Modern theory has outgrown the old approaches. Finance professors have in some instances stopped teaching the valuation yardsticks of the previous generation, such as P/E, price-to-sales (P/S), and return on-equity approaches. In fact, Putnam Investment Management recruits heavily from one business school where the students are not allowed to discuss P/E but, rather, only the results from PV methodologies. This change is symptomatic of an ongoing evolutionary trend, both in academic circles and among practitioners, toward new methodologies. The old methodologies focus on earnings-based measures, with some consideration of yield; 5 or 10 years ago, the dominant valuation approaches included P/E, P/S, and among a distinct minority of practitioners, the dividend discount model (DDM). The new methodologies focus much more carefully on the creation or destruction of value; they emphasize the future benefits from investing capital now. The PV calculations permit analysts to value the cash flows from a firm as it now exists and from its use of cash and its financing capability, whether that capability is used to expand the business, repurchase stock, or pay dividends.

(continued)

**EXHIBIT 24.4 Critique—The Second Time Around** *(continued)*

The author discusses both the EVA and DCF methods and states the following:

The EVA and DCF disciplines do, however, focus analysts' attention explicitly on economic earnings, rather than on accounting earnings, and on the productive use of capital, rather than on the growth of reported income per share. These disciplines are also more systematic and sophisticated than the ratio approaches (i.e., P/E and P/S) but, admittedly, at the cost of being more labor intensive. In addition, the PV approaches force disciplined thinking and conscious evaluation of appropriate discount rates. Significantly, they provide a lens to look through various accounting systems at underlying real economic phenomena.

Clearly, what the author is saying is that these approaches are much more difficult and much more labor-intensive, but they are clearly the manner in which valuations should be performed. ABC Appraisal took the easy way out by not attempting to perform this labor-intensive exercise. ABC Appraisal clearly was looking to lowball their figures, so they wanted to avoid using a DCF methodology.

Another important point discussed in this article is the holding period relating to an investment in a company. Clearly, the market approach emphasizes a short-term expectation based on the market prices and growth expectations in the public market. An investment in a closely held company, however, has a longer-term holding period and, as such, in order to properly value it, a longer holding period needs to be considered. The authors in this article state the following:

Finally, the new methodologies, by their very focus on future benefits, share an explicitly longer-term view of a firm's prospects than do the more traditional measures. Ratio analysis tends to depend heavily on historical norms and can easily miss changes taking place in companies, as well as the valuation implications of those changes. Because the PV approaches require explicit forecasting of important future variables for several years, at a minimum, they almost force the analyst to have a greater reliance on future rather than present results.

In discussing the advantages and disadvantages of the methodology, the author states the following:

First, they provide a consistent and clear framework for valuation...Second, the new methodologies do not depend on GAAP financial reporting. Third, the financial inputs are consistent, allowing more realistic company-to-company, industry-to-industry, and cross-border comparisons. The final advantage, which is potentially the most substantial but also the most difficult to make real, is that these disciplines can make the relationship between expected or forecasted returns and the fair price for the stock quantifiable, specific, and sometimes even transparent. The primary advantage of PV-based disciplines, in fact, is the ability to say that a given asset is intrinsically undervalued, overvalued, or fairly valued.

The disadvantage pointed out by the author primarily is the fact that the analysis requires an extensive amount of labor and, therefore, becomes expensive. Clearly, the author also indicates that in performing forecasts, calculating growth rates, and discount rates, a small variation can affect the valuation. However, there is a clear bias towards using the new methodologies.

In the third article in this series, "Cash Flow Analysis and Equity Valuation," the author states, "The basic idea behind any valuation approach is to estimate the intrinsic value of a company." He also states that "The focus is on the business and its ability to generate cash." In discussing problems with an earnings focus, the author points out

In general, earnings realizations depend substantially on generally accepted accounting principles (GAAP), and companies have discretion and can manage their earnings by using their choice of accounting principles.

While the intention of this article is to point out the difference between using cash flow versus earnings in the valuation process, this quote becomes somewhat important because the public companies that would be responsible for reporting their earnings to their shareholders could, in fact, manipulate their earnings by applying generally accepted accounting principles in a fashion that would be favorable to them. However, this may not prove to be a good comparison to the Littleton Entities, which has concerned itself with its ability to generate as much cash as possible to the shareholders.

The Littleton Entities have been operated for the purpose of generating cash flow to its owners, proven by its track record of large distributions. Using the public companies could end up being somewhat misleading. A better approach to valuation would be relying on the cash flow generated by Littleton because that would provide the intrinsic value of Littleton, which would not be prejudiced by any of the manipulations or the volatility of the guideline companies.

**EXHIBIT 24.4 Critique—The Second Time Around**

In an article entitled, “Valuation of Closely-Held Firms” published in *Business Valuation Review*, December 1990, the authors discuss various valuation techniques recommended in the literature. They also provide the results of a survey that they conducted among practitioners. In discussing the different valuation methodologies, they state the following:

Respondents ‘covered the waterfront’ in stating the most practical approach in valuing a small or closely-held business. The single factor that dominates all others is that most replies indicated the use of the net present value approach as offered, discussed and recommended by most theoreticians and practitioners alike.

They also state:

The message is clear that no single approach is the best in all cases. The literature suggests using multiple approaches in each valuation as a check against other approaches, when sufficient data are available to apply different techniques.

This further supports our position that more than one approach should have been used in this valuation.

In an article entitled, “Market Comparables and Valuation: The Lotz Case Revisited,” the authors discuss the use of the market approach in this valuation. This was a California Court of Appeal case (*In re Marriage of Lotz* (1981) (120 Cal. App.3d 379, 174 Cal. Rptr. 618)). The essence of the article is that the authors discuss the ruling by saying, “Simply stated, the court held that the valuation of the closely held company using a comparison with public companies was based on an invalid assumption.” They go on to state the following:

In hearing the case, the Court of Appeals ruled that considerable difference exists between public and private companies and that, therefore, the use of the price/earnings method of valuation as a determinant of market value for a closely held corporation was inappropriate. Consequently, a valuation based on a procedure with such a singular focus, which contained an invalid assumption, was also invalid.

The authors discuss the fact that the court, although not outright rejecting the market approach, said that by using it as a sole approach, because of assumptions that could be faulty, it would flaw a valuation.

In Pratt’s *Valuing a Business*, he starts a discussion on generally accepted theory by stating

In the simplest sense, the theory surrounding the value of an interest in a business depends upon the future benefits that will accrue to the owner of it. The value of the business interest, then, depends upon an estimate of the future benefits and the required rate of return at which those future benefits are discounted back to the valuation date.

Thus, the theoretically correct approach is to project some category or categories of the future benefits of ownership (usually some measure of economic income, such as cash flow, earnings, or dividends), and estimate the present value of those future benefits by discounting them based upon the time value of money and the risks associated with ownership. Direct implementation of this theoretically correct approach is discussed in chapter 9, “Income Approach: Discounted Future Economic Income Method.” That chapter focuses heavily on net cash flow as a measure of economic income, both for conceptual reasons and also because it is the focus of most merger and acquisition income value analysis.

Pratt concludes this section of his book by stating the following:

In general, approaches using current or historical data, if properly carried out, should yield a result that is reasonably reconcilable with what a well-implemented discounted economic income method would derive.

Pratt continues his discussion of basic theory by referring to Professor Bonbright’s work on the valuation of property. This discussion pertains to the concept of realized earnings (historical earnings) versus prophesied earnings (future earnings). ABC Appraisal’s entire valuation was performed based on historical earnings of the company. Pratt quotes Bonbright as follows:

The truth is that, when earnings have once been ‘realized,’ so that they can be expressed with some approach to accuracy in the company’s accounts, they are already water under the mill and have no direct bearing on what the property in question is now worth. Value, under any plausible theory of capitalized earning power, is necessarily forward looking. It is an expression of the advantage that the owner of the property may expect to secure from the ownership in the future. The past earnings are therefore beside the point, save as a possible index of future earnings.

(continued)

### EXHIBIT 24.4 Critique—The Second Time Around *(continued)*

With so many valuation treatises and court cases quoting Professor Bonbright's work, this may be a good treatise to lead the judge to further support our position.

In discussing basic variables affecting value, Pratt states the following:

One way or another, the financial benefits of ownership of an interest in the business enterprise must come from the following sources:

1. Dividends, distributions, or other type of cash flow:
  - a. from operations, or
  - b. from investments (e.g., interest).
2. Liquidation or hypothecation of assets.
3. Sale of the interest.

Therefore, any valuation approach—at least from a financial point of view—must focus on quantifying the ability of the business interest to provide benefits to its owner from one or some combination of the above sources.

In discussing the theory of valuation, Pratt starts off with two quotes: one from *Investment Analysis and Portfolio Management* and one from *Principles of Corporate Finance*. The first quote is as follows:

... the value of an asset is the present value of its expected returns. Specifically, you expect an asset to provide a stream of returns during the period of time that you own it. To convert this estimated stream of returns to a value for the security you must discount this stream at your required rate of return. This process of valuation requires estimates of (1) the stream of expected returns, and (2) the required rate of return on the investment.

The second follows:

Value today always equals future cash flow discounted at the opportunity cost of capital.

As I have been saying all along in this matter, value is equal to the present value of the future cash flows. No matter what methodologies are used, if they do not resemble the future cash flows, the appraiser is not truly measuring value. By relying so heavily on the market approach to determine multiples and ignoring the particular attributes of the Littleton contracts, growth rates, and performance measures, ABC Appraisal has ignored the valuation of Littleton. What they have done, instead, is superimposed into their valuation that if the Littleton Entities were a generic company, trading at the same types of multiples as the public companies, they would be worth a particular amount. In fact, the exercise is to value Littleton, and not a generic company, as if it was just going to be sold in the marketplace. Because the measure of fair value that we are trying to achieve is the value that John Littleton will be giving up, it seems only appropriate that we should be valuing the Littleton trucking companies and not some generic enterprise.

Throughout his writing, Pratt emphasizes the fact that future income is what is being purchased, and that the theory clearly says that you should be discounting it to present value. In chapter 11 of *Valuing a Business*, Pratt discusses the guideline publicly traded company method. He indicates that it is clearly most useful when valuing a marketable, minority ownership interest using the premise of value and continued uses of a going concern business. What he indicates though is, "The method can be used in conjunction with a valuation for any standard of value, certainly most importantly for fair market value." In discussing the application of this methodology to the various standards of value, under fair value, Pratt states the following:

As a generality, in most states it is a broader standard that incorporates market value along with values indicated by income and asset approaches. Therefore, we would state that a guideline publicly traded company method usually would be a part of the analysis when fair value is the standard.

The important concept in this statement is that it should be part of the analysis. It should not be the sole analysis, which, once again, is what ABC Appraisal did.

Referring once again to *Valuing a Business*, chapter 19, Pratt discusses the reconciliation process performed at the end of the valuation. He states the following:

If, after careful review, one of the valuation methods that appears to have merit still produces an outlier, then it becomes a matter of the analyst's professional judgment as to the extent to which the factors reflected in the valuation method actually contribute to the estimate of value of the subject business or business interest. And, the analyst will weight that outlier method accordingly in the final value estimate.

**EXHIBIT 24.4 Critique—The Second Time Around**

Clearly, there is no substitute for judgment if the different methodologies and approaches yield very different results. This is precisely what we did in attempting to reconcile the market approach valuation with the income approach valuation. What is of importance is that Pratt, in discussing the weighting of the results says this:

The analyst should ask, 'What attributes of the ownership of the subject business or business interest create the economic value associated with its ownership?' If the income available for distribution to the business owner is the primary value driver, then it may be appropriate that one or more methods within the income approach dominate the value conclusion. Of course, a capitalization (1) of dividends (for a noncontrolling ownership interest) or (2) of dividend paying capacity (for a controlling ownership interest) within the market approach could very well also capture this income-related value.

In an article "The Myth of Public Company Comparisons," appearing in *Business Valuation Review*, June 1992, the author discusses various problems with using public company methodologies. In fact, he starts off by stating the following:

But the simple fact is, that determining the value of a privately held company based purely on a cursory review of a group of ostensibly comparable public companies can only produce reasonable results quite by accident.

He then states:

The insurmountable problem is that we can never completely discover why investors bought and sold those specific securities for those prices. And without that knowledge we cannot even begin to hypothesize how those transactions may indicate what an investor would pay for the shares of our client's private company.

The author then points out this:

Another problem with using public market data is that we are compelled to examine historical information while the marketplace is anticipating the future.

The author illustrates a group of P/E ratios for different industries that are very broad. For example, in the electronics industry, the P/E range was from 8.7–72.7, with a mean of 19.5, and a standard deviation of 12.4. What he states is as follows:

It is evident that this range permits a great deal of discretion in the ultimate selection of the P/E ratios to be used. Attempts to calculate a hypothetical share value for one of the publicly traded companies using 'comparable' data from the rest of the industry would generally produce ludicrous results when compared to its actual price. And this is for companies with virtually no differences in security attributes (i.e., actively traded, widely held). How then, can the methodology be expected to actually reflect the value of private shares?

Towards the end of the article, the author states the following:

Let's end the charade. Is it not preferable to determine the value of a controlling interest by examining the expected cash flow to that interest and the risk inherent in holding that interest? Similarly, isn't it better to determine the value of a minority interest by examining the cash flow to that interest and its relative risk? The assessment of risk can be based on investment hurdle rates or long term equity rates of return as adjusted for the specific characteristics of the subject company, the size of the interest relative to other interests, and other factors. This basis is clearly superior to using the P/E ratios of companies that are subject to multi-variate market influences we can have no hope of fathoming.

An article entitled, "Appraising The Close Corporation, Lotz, Hewitson, and Ronald Not Withstanding," appearing in *Business Valuation Review*, December 1986, includes a statement by the author regarding the market approach:

Some of the elements that determine the price earnings ratio (or its reciprocal the capitalization rate) are past growth, profitability, stability of earnings, financial strength, quality of management, prospects for the industry and, most importantly, the expected growth rate of earnings per share; along with such outside factors as the level of interest rates and current stock market conditions. It is evident from the reaction of the public securities markets that stock market valuations are influenced appreciably by the prospects for immediate increase or decrease in earnings. It is the long-range prospects, however, that furnish the basis for intrinsic value. Thus, the appraiser must be alert for what may be temporary aberrations in the stock market. (Footnotes omitted).

Clearly, the long-range nature of the closely held investment is more important than the short range, which could lead to aberrations in the public market. This, once again, is a danger in applying the market approach.

Obviously, all of these materials tend to support the theory that we have based our valuation on, and in many instances, negate or show the deficiencies in what ABC Appraisal has done. I hope that these materials are useful in preparing for depositions and trial.

After reading exhibits 24.3 and 24.4, it's probably obvious that I was not overly happy with the work of the opposing valuation analyst. However, much of the theory that I cited in the earlier chapters of this book showed up in these critiques with many quoted sources. There are many others besides me who not only write about this stuff but also have strong opinions. These exhibits should serve as a great refresher for so much of the rest of this book.

Because many of the readers of this book are involved with smaller companies, I have included a sample report of an interest in a smaller firm in an oppressed shareholder suit with the other downloadable samples. Happy plagiarism!

## Conclusion

If I did my job, you now have a better understanding of valuations to be used in shareholder disputes. If I did not do my job, or if you just want more information on this subject, see Pratt's *Valuing a Business* or *The Handbook of Advanced Business Valuation*. If you are looking for a book that has many of the leading cases included, purchase *BVR's Guide to Fair Value in Shareholder Dissent, Oppression, and Marital Dissolution*, published by Business Valuation Resources. These are dandy resources.

# Chapter 25

## Other Valuation Assignments

### Learning Objectives

In this chapter, I am going to explain some general information on specialized valuation assignments that valuation analysts often encounter. This chapter will discuss valuation issues related to the following:

- Stock options
- Warrants
- Preferred stock
- Debt
- Early-stage companies

### Introduction

In the past, valuation analysts who primarily valued small- to medium-sized businesses rarely came across many of the items that are going to be covered in this chapter. However, times have changed. Other types of securities are becoming more of the norm for businesses, regardless of the size of the entities. As valuation analysts, we are often engaged to perform services that extend beyond the valuation of businesses and business interests. Therefore, it has become essential to have knowledge about the valuation of these other securities. This chapter only presents a general overview of the valuation issues related to a select group of securities and is not intended to make anyone an expert on the valuation of these securities. Furthermore, there are numerous other complex securities that will not be covered in this book. If you find that you have an interest in any of these specific topics, there is an extensive amount of literature out there that goes into more detail about these issues.

### Stock Options

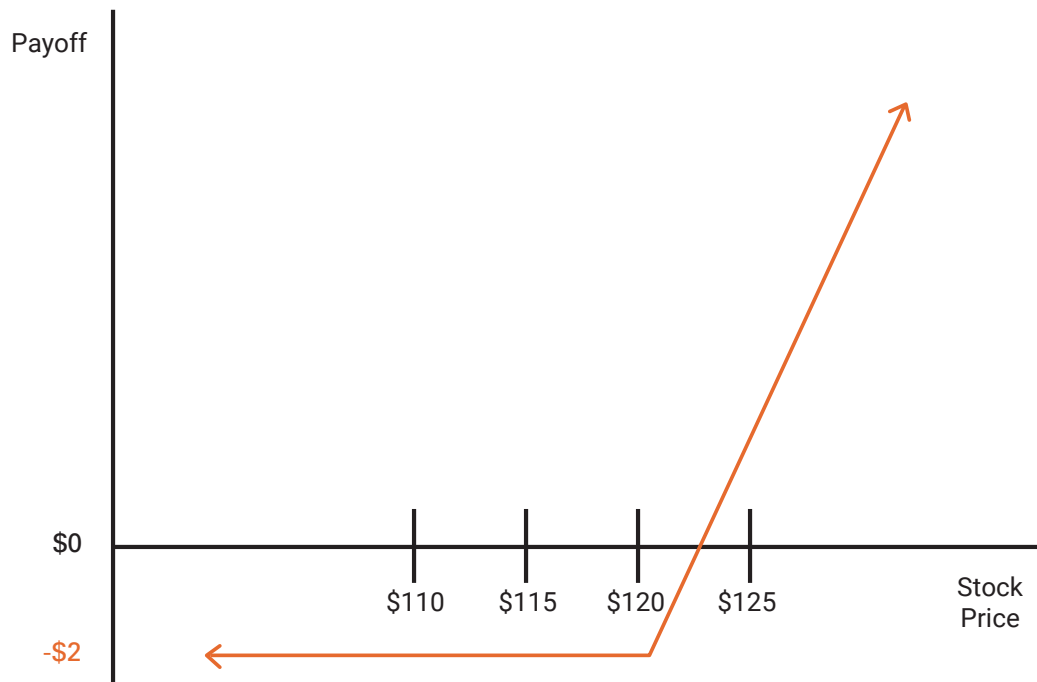

If you've ever read *The Wall Street Journal* or read through the benefits package offered by an employer, the term *stock option* may have appeared from time to time. An option is a derivative instrument, which means that its value is dependent upon (or derived from) another asset. Nearly anything with a random outcome can have an option on it: stock prices, interest rates, commodity prices, and so on. In this textbook, the discussion will be limited to stock options.

Options can take one of two forms: either *call* or *put* options. The owner of a call option has the right, but not the obligation, to purchase the underlying asset at a specified price, known as the *exercise price*, on or before a specified date in time, known as the *expiration date*. A put option works in exactly the opposite fashion. The owner of a put option has the right, but not the obligation, to sell the asset underlying the option at a specified price, on or before the expiration date. The expiration date for the option depends on whether the option is an American option or a European option. An American option allows the owner of the option to exercise before the expiration date. With a European option, the option cannot be exercised early.

When purchased in the market, investors buy options for a price known as the *option premium*. The buyer is paying for the rights granted by the option (to buy or sell). The owner of the call option will exercise his or her right to buy the underlying stock when the market price of the stock is greater than the exercise, or "strike" price. The owner of a put option will exercise his or her rights when the price of the underlying stock is less than the strike price. In both of these cases, an option that can be exercised is said to be *in the money*.

The best way to understand the basic concept of an option is to look at the pay-off diagrams for each type. Let's start with a call option. Suppose I purchase a call option on McDonald's stock for \$2 and the exercise price is \$120. Given this information, the option payoff appears graphically in figure 25.1.

**Figure 25.1 Call Option Payoff**

The pay-off diagram for the call option is illustrated in figure 25.1. When the stock price exceeds \$120, the potential profit generated from the option begins to increase. However, remember that the option costs \$2. Therefore, the stock price needs to reach \$122 in order to break even. My cost would be my initial \$2 plus the cost to exercise the option of \$120, or \$122. Once the stock price reaches \$122, the profit I can generate is unlimited because there is no ceiling on the stock price. For example, suppose the stock price is \$130 at the expiration date. This means I exercise my option to purchase the stock at \$120 and sell it in the market for \$130. When considering the \$2 option premium, I would generate an \$8 profit in this instance.

The advantage of an option is that the profit upside is unlimited, whereas the maximum amount that you can lose on an option is the option premium. Think of it as an insurance policy against the loss in value of the stock. As you can see in figure 25.1, if the stock price is \$115, the option would expire and all I would lose is the \$2 premium that I paid for the option.

Now let's discuss put options. In this instance, I have the right, but not the obligation, to *sell* the stock at the exercise price at a certain point in the future. So, let's assume I purchase a put option on McDonald's stock for \$2 with an exercise price of \$120. The pay-off diagram would be the opposite of the call option diagram. This appears in figure 25.2.

**Figure 25.2 Put Option Graph**

In this instance, the option becomes profitable when the stock price decreases. If the stock price is \$110 at expiration, I can buy the stock in the marketplace for \$110, then exercise my option to sell it for \$120. If the stock price exceeds \$120, the option expires and the maximum amount I can lose is the \$2 option premium.

## Valuation of Options

Now that we've covered the basic concept of call and put options, we can discuss the valuation of these derivatives. First and foremost, when an investor purchases an option, he or she does not hold a direct interest in the stock of that company. Therefore, because an option's value is based on the value of the underlying stock, the typical methodologies to value the stock using the asset-based, income, and market approaches to value do not apply. Nobody said this was going to be easy!

For simplicity purposes, we will begin with a discussion on valuing call options. At expiration, a call option is worth the stock price less the exercise price. Prior to expiration, a call option is worth the stock price less the present value of the strike price after both prices are adjusted for the riskiness of the option. The valuation of options that are not at expiration is performed using mathematical models developed specifically for this purpose.

The most commonly used option pricing models are the Black-Scholes-Merton (BSM) and binomial models. Each of these models is based on the volatility of the underlying stock price, the difference between the current stock price and the strike price, and the length of time until expiration. This stuff can get very complicated, but I am going to intentionally keep the discussion as simple as I can. There are many finance books that contain the more complex version.

## Black-Scholes-Merton Option Pricing Model

The Black-Scholes-Merton option pricing model (also referred to as the Black-Scholes Option Pricing Model) is named after its founders Fischer Black, Myron Scholes, and Robert Merton. Fischer Black and Myron Scholes originally published a paper in 1973 called "The Pricing of Options and Corporate Liabilities" in the *Journal of Political Economy* (just the name of the publication should give a pretty good indication that this topic is

not going to be easy). In this paper, the authors derived an equation that estimates the price of an option over time. Robert Merton devised another method to derive the formula, expanded the mathematical understanding of the formula, and coined the term “Black-Scholes Option Pricing Model.” In 1997, Merton and Scholes received the Nobel Prize for their work on option pricing. Although Fischer Black was not alive to receive the prize, he was mentioned as a contributor by the Swedish Academy.<sup>1</sup> Given Merton’s contribution to this model, I will refer to the model as the Black-Scholes-Merton or BSM model throughout this textbook.

The following formula gives the BSM model for a call option:

$$C_t = e^{-d(T-t)} S_t N(d_1) - X e^{-r(T-t)} N(d_2)$$

where:

(1)  $N(\cdot)$  = cumulative normal distribution function

$$(2) \quad d_1 = \frac{\ln\left(\frac{S_t}{X}\right) + (r - d + 0.5\sigma^2)(T - t)}{\sigma\sqrt{T - t}}$$

$$(3) \quad d_2 = d_1 - \sigma\sqrt{T - t}$$

$C_t$  = The price of a call in period  $t$ .

$S_t$  = Stock price in period  $t$ .

$\ln$  = Natural logarithm.

$X$  = The call’s strike price.

$e$  = 2.71828, the base of the natural log function.

$r$  = The risk-free interest rate (annualized and continuously compounded) having the same maturity as the option.

$T$  = Call expiration date.

$t$  = Valuation date.

$\sigma^2$  = Variance of the annualized continuously compounded rate of return on the stock.

$\sigma$  = Standard deviation of the annualized continuously compounded rate of return on the stock.

$d$  = Annual Dividend Yield (Percent of Stock Price)

How’s that for a formula? I can promise that I do not have the capacity to make this up by myself. The BSM model uses what is known as *continuous mathematics*. This is one of two forms a mathematical expression can take, the other being *discrete mathematics*. The difference between continuous and discrete mathematics can be understood by explaining the difference between a ramp and a flight of stairs. A flight of stairs has a specific number of steps. In mathematics, these are considered to be discrete periods; there are  $x$  number of stairs; therefore, it is a discrete number. A ramp is continuous. If you are the type of person that wears a Fitbit, and you want to get in your 10,000 steps, you can take very small steps. However, if you are a large person with long legs, and you are in a rush, you may take half the number of steps to get up the ramp. In contrast, if a flight of stairs is the same size as the ramp, and has 20 stairs, it is climbed by a person in 20 steps (unless you cheat and take two at a time).

To obtain a result from the BSM model, the value of a call must equal or exceed the difference between the stock price and the present value of the exercise price. Although this model is complex, taken in pieces, it is not as daunting as it seems. I am going to break down the formula into little pieces to better understand the components.

<sup>1</sup> Nobel Prize Foundation, 1997 Press release. October 14, 1997, [www.nobelprize.org/nobel\\_prizes/economic-sciences/laureates/1997/press.html](http://www.nobelprize.org/nobel_prizes/economic-sciences/laureates/1997/press.html) (Accessed August 24, 2016).

The first term is the stock price times the cumulative normal distribution function. A distribution describes how observations from a sample are clustered or spread out. The standard normal distribution is the most widely used distribution in statistics. The standard normal distribution looks like a bell-shaped curve with small “tails” or ends. The center of the bell represents the location of the average of the distribution. This was already mentioned in chapter 7.

A normal distribution’s curve is symmetrical, which means both sides of the bell are the same size. This is because a standard normal distribution has an equal number of data points on each side of the average. The width of the bell is determined by how close to the average the data points are. The more tightly packed the data points are around the mean, the narrower the bell. The more disperse the data points are from the mean, the wider the bell. The width of a distribution is described by its standard deviation. A standard normal distribution is used to estimate probabilities that a variable is equal to a certain value. The cumulative normal distribution adds these probabilities to give the probability that a variable is less than or equal to a certain value.

For example, if  $d_1$  in the first term of the BSM equation was 1.25,  $N(1.25)$  measures the probability that a standard normal variable will have a value of 1.25 or less. Although an explanation of how these probabilities are calculated goes beyond the scope of this book, it is sufficient to say that the probabilities for standard normal variables can be referenced in established statistical tables found in almost any statistics textbook. It is important to note that the BSM model is very sensitive to rounding errors. Therefore, it may be more appropriate to calculate these probabilities using a software program, such as Microsoft Excel, in order to derive more precise results.

In the first term,  $d_1$  is used to represent the sub-equation I have labeled as (2) in the preceding list. The first term in this equation is the natural logarithm of the stock price divided by the option’s exercise price. The natural logarithm is the inverse (or opposite) of the mathematical constant  $e$ , which will be discussed shortly. The stock price is the market price on the valuation date. The exercise price, also known as the *strike price*, is the price someone can purchase the underlying stock for with the option. For example, a strike price of \$20 means that the call option holder can buy the underlying stock for \$20. All things being equal, a higher stock price results in a higher call price.

The second term of (2) in the preceding list begins with  $r$ , the risk-free rate of interest annualized and continuously compounded. This measures the rate of return one would receive for investing in a “riskless” security. In chapter 13, I already stated that there is no such thing as a “riskless” security, but securities that are backed by the full faith and guarantee of the United States government are considered to be a good surrogate. The interest rate on these securities compensates the holder for inflation risk and, as the maturity of the Treasury security gets longer, horizon risk, or the risk of things changing over time.

The theoretical risk-free interest rate to be used in the BSM model is one with the same maturity as the option. Although in reality this is often difficult to accomplish, the model is not very sensitive to this parameter; therefore, estimates can be used without a material loss of computational accuracy. All things being equal, an increase in the risk-free interest rate results in a higher call price. This is because the investor is earning a higher rate of interest on the money set aside to pay the exercise price.

The  $d$  in the equation refers to the dividend yield. When a business pays dividends, it is reducing the value of its equity by the total value of the distribution. On a business’s balance sheet, the cash account is reduced by the amount of the distribution, which is balanced by a reduction in stockholders’ equity. The dividend reduces the value of the shareholders’ equity by the value of the distribution. On a per share basis, the value of one share of stock is reduced by the dividend amount.

In the case of an *in the money* call option, the option value would be reduced by the value of the dividend. Merton produced an extension of the BSM model that could account for the decrease in value over time that is associated with dividend payments. The model is based on the assumption that a business will make continuous dividend payments.

The next variable in the second term of sub-equation (2) is  $.5\sigma^2$ , one-half of the variance of the daily returns on the underlying stock. The variance is equal to the standard deviation of the underlying stock squared. The standard deviation is a measure of volatility. Stock prices move up and down daily. Some stocks have greater fluctuations in their prices than others. This is what the standard deviation measures: the amount of movement in the underlying stock price. The greater this volatility measure, the higher the option price, all other things being equal. This is because the greater the volatility, the greater the chance the stock price will move higher over the life of the option. As stated by Frank K. Reilly PhD, CFA:

The only variable that is not directly observable is the standard deviation, often called the *volatility*, of the continuously compounded return on the stock over the life of the option. This value can be estimated using past returns on the stock, but what you really want is the future volatility of the stock which is quite naturally unknown. Of course, if everyone agreed on the expected volatility, then everyone would agree on the option price. The fact is, it is differences of opinion about the expected volatility that create an incentive for trading options.<sup>2</sup>

As Dr. Reilly states, there is no rule about the time period over which volatility is computed. Some analysts will use shorter periods to find the “instantaneous” standard deviation. The difficulty with doing this is not having enough data points to create a statistically significant measurement. In practice, my firm uses daily stock prices to perform this calculation, thereby allowing us to have enough data points that we are more comfortable with the statistical measurement of this variable.

The third term in sub-equation (2) is the length of time from the valuation date to the exercise date. All things being equal, the longer the period of time until expiration, the higher the call price. This is because the option has more time to move into the money.

The last term in sub-equation (2) is  $\sigma \sqrt{T-t}$ . As stated previously, all other things being equal, a call option's price will increase for either an increase in volatility or an increase in the period until expiration. This term is used to capture the interactions between volatility and time, showing that the call price will move in conjunction with volatility, multiplied by the square root of the amount of time until expiration.

In principle,  $N(d_1)$  assesses the risk associated with the stock price increasing. Combining the current stock price with this probability to form the first term in the BSM equation results in what in simple terms can be called a *risk-adjusted current stock price*.

The second term of the BSM equation starts with  $X$ , the exercise price, which I have already discussed. The next term is  $e$ . This symbol represents a number that has special mathematical properties. The number is approximately 2.718. I say approximately because the decimal does not terminate and does not have a repeating pattern. This number has a special use in continuous mathematics. When used in conjunction with an interest rate and a period of time, as it is in this instance, this number calculates continuous compounding and discounting factors. In this instance, the factors are present value factors. They are used to take the exercise price, which is a price in the future, and reduce it to a price as of the valuation date.

The remaining variables in the BSM equation have all been described previously. The term  $N(d_2)$  is only slightly different from  $N(d_1)$ , but all the variables should be familiar at this point.

Taken together, the second term in the BSM equation represents the risk-adjusted present value of the exercise price. When I say “present value,” I mean as of the date of the valuation. Because the goal is to develop

#### Author's Note

By now, if none of this stuff looks familiar, it may be causing some concerns. Be patient, at the end of the explanation, I am going to show some number-crunching. There are also models available on the Internet to compute this stuff. As with all models that a valuation analyst uses, he or she must understand what the model is doing. That is the foundation that I am laying right now. Stay calm, grab a drink, and we will continue.

<sup>2</sup> Frank Reilly, *Investment Analysis and Portfolio Management*, 4th edition (Fort Worth: The Dryden Press) 1994, 773.

the call option price as of the valuation date, and the strike price is for a future date, it must be discounted to present value. Thus, under the BSM model, a call option is worth the difference between its risk-adjusted stock price and the present value of the risk-adjusted exercise price.

The key to understand is that the price of a call option is based on the probability that the stock price will be greater than the strike price on the exercise date. This probability is risk-adjusted to reflect the risk in the up and down movements of the underlying stock price. In addition, it is affected by the length of time to exercise and the level of interest rates.

With respect to a put option, the BSM formula differs slightly. This appears as follows:

$$P_t = Xe^{-r(T-t)}[1 - N(d_2)] - S_t[1 - N(d_1)]$$

Though I will not go through the same detail in explaining the formula for the put option, the concept remains the same. The major difference is that in this case, the put option is worth the difference between the present value of the risk-adjusted exercise price and the risk-adjusted stock price. In other words, the price is based on the probability that the stock price will be lower than the strike price on the exercise date.

Certain inputs into the BSM model affect put options differently than call options. These differences are highlighted in box 25.1.

The reasons for the different impacts of the variables for call and put options can be explained as follows:

- **Share Price.** If you own a call option, you benefit when the stock price goes up. Therefore, an increase in the stock price results in an increase in value of a call option. The put option is the exact opposite.
- **Exercise Price.** The exercise price is the price at which you have the option to purchase the stock in the case of a call option and sell the stock in the case of a put option. With respect to a call option, a higher exercise price means that you have to pay more at expiration. Therefore, a call option is more valuable when the exercise price is lower. With a put option, a higher exercise price is beneficial because you get to sell at a higher price during expiration.
- **Volatility.** Both call and put options become more valuable with a higher level of volatility because the more volatile the stock, the higher the probability of going deeper *in the money*.
- **Risk-Free Rate.** By buying a call option, you save money by not having to buy the stock at full price. Therefore, when interest rates are higher, you can take your savings and invest at higher rates. Therefore, a higher interest rate makes a call option more valuable. On the contrary, a put option gives you the right to sell the stock at a future date. In other words, you don't receive the cash proceeds until expiration. By forgoing this *cash in hand* until expiration, you are bypassing the opportunity to invest this cash in these higher rates. Therefore, higher interest rates make put options less valuable.
- **Expiration Date.** Longer expiration dates make both call and put options more valuable because this means there is more time for the stock to go deeper *into the money*.
- **Dividend Yield.** When a company pays a dividend, it removes cash from its balance sheet and shareholders' equity declines. This decline results in a lower stock price. As discussed previously, a lower stock price makes a call option less valuable and a put option more valuable.

Now that you have an understanding of the mathematics of the BSM model (ha ha), and the various inputs that affect the value of the option, the next step is to understand the underlying assumptions of the model. As with any valuation model, it is essential to understand the assumptions behind the model and determine if it is appropriate to use in a particular instance.

**BOX 25.1****Variables Affecting Option Value**

	Impact on Option Price	
	Call	Put
Share Price	Increase	Decrease
Exercise Price	Decrease	Increase
Volatility	Increase	Increase
Risk-Free Rate	Increase	Decrease
Expiration Date	Increase	Increase
Dividend Yield	Decrease	Increase

1. *The stock price follows a lognormal distribution.*

I hate to confuse things more than I probably already have, but this is an important assumption of the BSM model. A lognormal distribution assumes that the log returns of the stock are normally distributed (remember the bell-shaped curve previously discussed?). For example, suppose you buy a stock for \$10 and sell it for \$15. Your return on the stock is 50 percent, but the log return on the stock is  $\ln(\$15/\$10) = 40.54\%$ . A log return is just another name for a continuously compounded return. If the historic log returns form a bell-shaped curve, they are assumed to be lognormally distributed. A lognormal distribution appears graphically as follows:

As you can see, the return is truncated to the left and stretches out further to the right. This limitation exists so that the price of the stock cannot be worth less than zero.

2. *The risk-free rate and volatility of the asset are known and constant.*

These assumptions are critical because interest rates and the volatility of the stock are typically not constant over time, especially during periods of economic turmoil.

3. *There are no taxes or transaction costs.*

This sounds like an assumption in the capital asset pricing model, right? It did not make sense then either.

4. *There are no cash flows over the term of the option.*

Although the model makes this assumption, there are ways to adjust for it. However, such adjustments are way beyond the scope of this textbook.

5. *The options are European.*

Remember that a European option cannot be exercised early and the option must be held until expiration. Therefore, if you are valuing an option that can be exercised prior to expiration, another model (such as the binomial model that will be discussed next) may be appropriate.

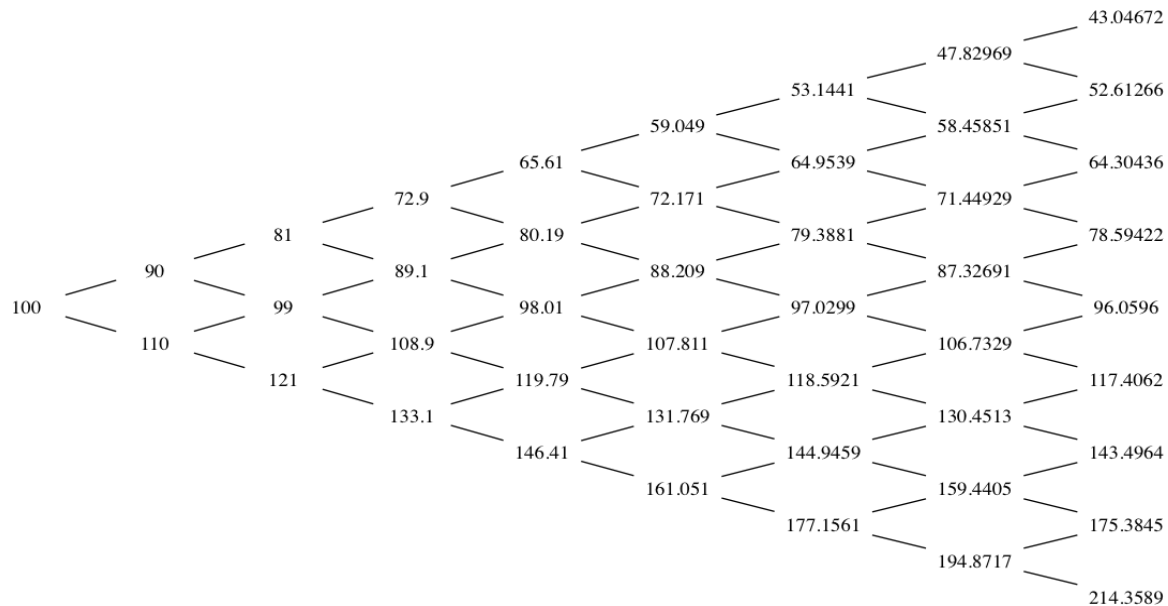

## The Binomial Option Pricing Model

The Binomial Option Pricing Model is a *discrete* model. This means that it is computed using a finite number of periods, in contrast to the BSM model, in which a time period is considered to be *continuous*.

The word *binomial* refers to the fact that in a given period, a stock price can move up or down, creating two potential outcomes. In this instance, the two potential outcomes refer to either an up or down movement in

the stock price. Extending one period further, each of those results can have two possible outcomes, an up or down stock price movement. This process can be extended for any number of periods when each new outcome has two possible outcomes. Each potential outcome for a given period is summed and discounted to present value to estimate the option price. After a number of periods, the binomial model begins to look like a tree laying on its side as the number of outcomes increases with each period. Graphically, a binomial tree may end up looking like this:

An advantage of the binomial model over the BSM model is that it can be used to more accurately price American options. This is because with the binomial model, it is possible to check at every point in an option's life (that is, at every step of the binomial tree) for the possibility of early exercise. Where an early exercise point is found, it is assumed that the option holder would elect to exercise, and the option price can be adjusted to reflect its value at that point. The binomial model basically solves the same equation as the BSM model, while providing opportunities along the way to check for early exercise for American options. As a result, for European options, the binomial model converges with the BSM formula as the number of binomial calculation steps increases. In fact, the BSM model for European options is really a special case of the binomial model in which the number of binomial steps is infinite. In other words, the binomial model provides discrete approximations to the continuous process underlying the BSM model.<sup>3</sup>

The first step in this model is to calculate the expected up-and-down movement of the underlying stock price at each step. The equations are as follows:

$$U = e^{\sigma \sqrt{\text{Step}}}$$

$$D = \frac{1}{U}$$

Where:

- U = The up factor, or the factor by which the stock will rise in any given time step, which is estimated using the stock's volatility.
- e = 2.718, the base of the natural log function.
- $\sigma$  = Standard deviation of the annualized continuously compounded rate of return on the stock.
- Step = Time steps. The time (in years) until expiration divided by the number of steps in the binomial tree.
- D = The down factor, or the factor by which the stock will decline in any given time step. It is the reciprocal of the up factor.

<sup>3</sup> See [www.hoadley.net/options/bs.htm](http://www.hoadley.net/options/bs.htm) (Accessed September 23, 2013).

Similar to the BSM model, the Binomial model estimates the movement of the stock price based on the historic volatility of the stock. Once the up-and-down movements are calculated, the next step is to determine the price of the option. The binomial model assumes that the price of the option today is the weighted average of the next two possible prices (the potential up-and-down movements). The weighted average of these potential price movements is then discounted to present value by the risk-free rate (another input into the BSM model). The formula to calculate the weights appears as follows:

$$P = \frac{e^{(r - \text{div})(\text{step})} - D}{U - D}$$

Where:

- P = The risk-neutral probability of an up move
- e = 2.71828, the base of the natural log function
- r = The risk-free rate
- div = The annualized dividend yield
- step = Time steps
- U = The up factor
- D = The down factor

The preceding formula is what is referred to as a risk-neutral (don't worry, we will get to this in a second) probability of an up move. The risk-neutral probability of a down movement is calculated as (1-P) or one minus the risk-neutral probability of the up movement. Because there are only two potential outcomes, the sum of the probability of the up movement and the probability of the down movement should be equal to one.

In interpreting the binomial model, it is important not to confuse these weights with actual probabilities. They are not probabilities of an up or down movement in the price of the stock. These weights are the probabilities that would exist if investors were *risk-neutral*. Risk-neutral means that an investor is not risk-averse or risk-seeking. In other words, the investor's decisions are not affected by the degree of certainty in a set of outcomes. Given two outcomes, with equal expected payoffs, the risk-neutral investor is indifferent between the two choices, even if one of the choices may be riskier.

Therefore, a risk-neutral investor values an asset as the expected future value of that asset, discounted to present value at the risk-free rate. In contrast, a risk-averse investor would value this same asset as the expected future value of the asset discounted to present value at the risk-free rate plus a risk premium as was discussed in the chapter 13.

Right now, the valuation analyst would probably be thinking "wait a minute, nobody in the real world would accept a risk-free rate of return for a risky investment." Well, think about what a stock price is. A stock price already reflects the expected future cash flows of the business, discounted to present value by the risk-adjusted rate of return. It already incorporates the risk profile of the universe of investors. Therefore, when valuing options, the risk preferences of investors are irrelevant because they are already reflected in the stock price. Option valuation is based on this framework.

Before we get to the number-crunching, let me discuss some real-world stuff. I do not know of a single valuation analyst who calculates any of this stuff without using a model that is readily available. For example, there are numerous models on the Internet that allows the analyst to just plug in the correct variables and out comes the answer. Various stock option models, including BSM, binomial, and others, can be found at [www.hoadley.net/options/calculators.htm](http://www.hoadley.net/options/calculators.htm).

Now, let's look at some examples. My firm has had several valuation engagements in which we have had to value options for a variety of reasons. An excerpt from a report where we applied both the binomial and BSM models is included in exhibit 25.1.

## Exhibit 25.1 Option Valuation

Trugman Valuation Associates, Inc. was retained by Sam Jones to perform a business valuation of 94,723 stock options of the common stock of Public Company as of October 5, 2012.

### BACKGROUND INFORMATION<sup>1</sup>

Public Company (PC or The Company), a Delaware corporation, is a leading media and marketing information services firm. The Company's stock is traded on the New York Stock Exchange under the symbol PC.

On May 27, 2009, each continuing director of PC received an annual grant of options to purchase 15,719 shares of The Company's common stock. These options had an exercise price of \$20.52 per share, were fully vested on the date of the grant, and became exercisable six months after the date of the grant. The options have a 10-year term, expiring on May 27, 2019.

Pursuant to an employment agreement, PC granted an initial equity award, which included 45,254 stock options. Assuming continued employment, the stock options would vest in equal amounts over a 3-year period following the date of the grant.

On March 4, 2010, PC established the performance objectives and other terms of The Company's 2010 Long-Term Incentive Plan for officers and eligible employees of The Company. As part of the 2010 Long-Term Incentive Plan, Mr. Jones was granted 73,251 stock options, which will vest in equal amounts over the 3-year period following the date of the grant, assuming continued employment.

A summary of the stock options owned by Mr. Jones as of the valuation date is presented in table 1.

**TABLE 1 Stock Options Owned by Mr. Jones**

Grant Date	Vested Options			
	Number of Options	Exercise Price	Expiration Date	Years Until Maturity
5/27/2009	15,719	20.52	5/27/2019	6.64
2/11/2010	30,170	24.94	2/11/2020	7.36
3/4/2010	48,834	22.17	3/4/2020	7.42
<b>Total</b>	<b>94,723</b>			

Grant Date	Unvested Options				Years Until Maturity
	Number of Options	Exercise Price	Vesting Date	Expiration Date	
2/11/2010	15,084	24.94	2/11/2013	2/11/2020	7.36
3/4/2010	24,417	22.17	3/4/2013	3/4/2020	7.42
Total	39,501				
<b>TOTAL</b>	<b>134,224</b>				

As shown in the data in table 1, as of the valuation date, Mr. Jones owned 134,244 stock options, of which 94,723 were vested and the remaining 39,501 will vest in early 2013. Our valuation engagement is to value the 94,723 stock options that were vested as of October 5, 2012.

<sup>1</sup> Much of this section was adapted from Public Company's Form 10-K for the fiscal year ended December 31, 2012, and Form DEF14A filed with the SEC.

**Exhibit 25.1 Option Valuation** *(continued)***BLACK-SCHOLES-MERTON MODEL**

We have utilized the BSM model to value the options owned by Mr. Jones. A summary of these calculations is presented in table 2.

**TABLE 2 BSM Model Computations**

<b>INPUTS VARIABLES</b>			
Grant Date	5/27/2009	2/11/2010	3/4/2010
Expiration Date	5/27/2019	2/11/2020	3/4/2020
Average Stock Price As of 10/5/2012:	\$ 37.66	\$ 37.66	\$ 37.66
Exercise Price:	\$ 20.52	\$ 24.94	\$ 22.17
Term (In Years):	6.64	7.36	7.42
Volatility (Annual):	34.88%	34.88%	34.88%
Annual Yield of Quarterly Dividends:	1.10%	1.10%	1.10%
Risk-Free Rate:	1.13%	1.13%	1.13%
Call Option Value	\$ 19.23	\$ 17.29	\$ 18.61
Number of Options	15,719	30,170	48,834
Value of Options	\$ 302,221	\$ 521,549	\$ 908,674
<b>TOTAL VALUE OF OPTIONS USING BSM MODEL</b>		<b>\$1,732,444</b>	

Note: Figures may be off due to rounding.

The value of the options is determined by multiplying the number of options for each group by the option price. The total value of the options was determined to be \$1,732,444 as of the valuation date.

**BINOMIAL MODEL**

In order to substantiate the values derived using the BSM model, we constructed a binomial tree for each group of options. By using the binomial model, we can analyze the impact that early exercise has on the option values. In using the binomial model, we relied on the same assumptions that were used to calculate the values of the options under the BSM model.

The first step in this model is to calculate the expected up-and-down movement of the underlying stock price at each step. The equations are as follows:<sup>2</sup>

<sup>2</sup> Futures, options, and swaps.

**Exhibit 25.1 Option Valuation**

$$U = e^{\sigma \sqrt{\text{Step}}}$$

$$D = \frac{1}{U}$$

Where:

- U = The up factor, or the factor by which the stock will rise in any given time step, which is estimated using the stock's volatility.
- e = 2.718, the base of the natural log function.
- $\sigma$  = Standard deviation of the annualized continuously compounded rate of return on the stock.
- Step = Time steps. The time (in years) until expiration divided by the number of steps in the binomial tree. In this instance, seven steps were included in the binomial tree, which approximates the time to expiration for the stock options.
- D = The down factor, or the factor by which the stock will decline in any given time step. It is the reciprocal of the up factor.

Using the same inputs that were used in the BSM model, the up-and-down factors were calculated as follows:

Grant Date	5/27/2009	2/11/2010	3/4/2010
Expiration Date	5/27/2019	2/11/2020	3/4/2020
Volatility	34.88%	34.88%	34.88%
Time to Expiration (Years)	6.64	7.36	7.42
Number of Steps	7	7	7
Up Factor	1.40	1.43	1.43
Down Factor	0.71	0.70	0.70

The next step is to calculate the probabilities of the stock price moving up or down. These equations are as follows:

$$P = \frac{e^{(r - \text{div})(\text{step})} - D}{U - D}$$

Where:

- P = The probability of an up move
- e = 2.71828, the base of the natural log function
- r = The risk-free rate
- div = The annualized dividend yield
- step = Time steps
- U = The up factor
- D = The down factor

(continued)

**Exhibit 25.1 Option Valuation** *(continued)*

Using this information as the inputs into the preceding equation results in the following probabilities:

Expiration Date	Probability of an Up Move	Probability of a Down Move
5/27/2019	0.42	0.58
2/11/2020	0.41	0.59
3/4/2020	0.41	0.59

Now that we have all the necessary inputs, the next step is to calculate the value of each group of stock options using the binomial option pricing method. The binomial trees for each group of options are presented in tables 3–5 on the following pages.

Exhibit 25.1 Option Valuation

TABLE 3 Binomial Model for Options Expiring on May 27, 2019

(continued)

Exhibit 25.1 Option Valuation (continued)

TABLE 4 Binomial Model for Options Expiring on February 11, 2020

Exhibit 25.1 Option Valuation

TABLE 5 Binomial Model for Options Expiring on March 4, 2020

(continued)

### Exhibit 25.1 Option Valuation *(continued)*

The figures in tables 3–5 show the valuation calculations of the stock options using the binomial model. The black numbers represent stock prices, while the red numbers represent the option values at each node.

As of the valuation date, XYZ's stock price was \$37.66. This is the number that appears in column 0 in all three calculations. As we move forward through each period, the stock price is assumed to increase by the up factor or decrease by the down factor. For example, in table 3, in period 1, it is assumed that XYZ's stock price would either increase from \$37.66 to \$52.90 (a factor of 1.40) or decrease to \$26.81 (a factor of 0.71). This calculation is carried through to the final nodes.

The red numbers represent the value of the options at each node. Starting in column 7, the value of the option is simply the greater of either the stock price minus the exercise price, or zero. This is the value of the option at expiration.

Starting in column 6, and working backwards, the value of the option at each node is calculated as the probability weighted average of the possible call option values in the next period, discounted by the risk-free rate. For example, in looking at table 3, if the stock were to increase in 6 consecutive periods, the price would be \$289.36 in period 6. At that point, it can either increase by a factor of 1.40, resulting in a price of \$406.47, or decrease by a factor of 0.71, resulting in a price of \$205.99. If the stock price increases to \$406.47, the value of the call option would be \$385.95 at expiration (\$406.47 less the strike price of \$20.52). If the stock price decreases to \$205.99, the call option would have a value of \$185.47 at expiration. We have previously calculated the probability of an up move and a down move at 0.42 and 0.58, respectively. Therefore, in order to calculate the value of the call option in the previous period, we simply calculate a weighted average value, weighting each potential call option value by the appropriate probability. This calculation is as follows:

	Value	×	Probability	=	Weighted Average
Call Option Value—Up Move	\$385.95		0.42		\$162.10
Call Option Value—Down Move	185.47		0.58		107.57
			<b>1.00</b>		<b>\$269.67</b>

Performing the calculations results in a weighted average value of \$269.67. The next step is to discount this value by the risk-free rate to arrive at the call option value at that particular node. Discounting this value by the risk-free rate of 1.13 percent results in a call option value of \$265.90.<sup>3</sup> Working backwards, this same calculation is performed at each node until column 0, which shows the value of the call option.

Based on the values derived using the binomial model, the total value of the stock options is calculated as follows:

Expiration Date	# of Options	Call Option Value	Total
5/27/2019	15,719	\$19.31	\$ 303,534
2/11/2020	30,170	17.16	517,717
3/4/2020	48,834	18.74	915,149
<b>TOTAL VALUE OF OPTIONS USING BINOMIAL MODEL</b>			<b>\$1,736,400</b>

This value is approximately the same as the value derived under the BSM model because the dividend yield is small and the time to expiration is relatively short. Therefore, the use of either model renders a reasonable conclusion of value.

<sup>3</sup> The discounting formula for continuous compounding is  $e - (\text{risk free rate}) \times \text{weighted average value}$ .

## Warrants

A *warrant* is another type of derivative instrument that gives the holder the right, but not the obligation, to buy or sell an asset at a predetermined price at a specified date. Sounds a lot like an option, right? Warrants are similar to options, except there are several glaring differences. These include the following:

1. The time to expiration for warrants is typically much longer than that of options, and in my practice, we have seen warrants that have had periods as long as 10 years. With respect to options, the time to maturity is typically measured in months.
2. Warrants are typically issued by a company or a financial institution. Oftentimes you will see a company finance a portion of a transaction (merger, acquisition, employee stock ownership plan [ESOP] transactions, and so on) by issuing warrants. Individual investors can buy or sell options.
3. One stock option typically represents 100 shares of stock. One warrant can represent any number of shares. Warrants typically have conversion ratios that represent the number of shares that can be converted from each warrant. You may see a conversion ratio of 3:1, which means that the holder needs three warrants to purchase one share.
4. Warrants that are issued by a business have a dilutive effect. That means, upon exercise, the company's number of shares outstanding increases, resulting in a lower price per share (the total market value of equity is distributed across a larger number of shares). Options, on the other hand, are not dilutive. Upon exercise, the owner of the option receives an existing share from the secondary market.

Although these differences don't seem to be significant, they need to be considered when performing valuations. Too often, we see warrant valuations in which the valuation analyst blindly relies on the BSM model and completely disregards the terms of the warrant agreements. This is not to say that the BSM model cannot be used, but when doing so, the valuation analyst must consider the facts and circumstances of the valuation.

In fact, in *The Pricing of Options and Corporate Liabilities*, published by Fischer Black and Myron Scholes, the authors discussed the challenges associated with using an option pricing model to value warrants. The paper states the following:

A warrant is an option that is a liability of a corporation. The holder of a warrant has the right to buy the corporation's stock (or other assets) on specified terms. The analysis of warrants is often much more complicated than the analysis of simple options, because:

- a) The life of a warrant is typically measured in years, rather than months. Over a period of years, the variance rate of the return on the stock may be expected to change substantially.
- b) The exercise price of the warrant is usually not adjusted at all for dividends. The possibility that dividends will be paid requires a modification of the valuation formula.
- c) The exercise price of a warrant sometimes changes on specified dates. It may pay to exercise a warrant just before its exercise price changes. This too requires a modification of the valuation formula.
- d) If the company is involved in a merger, the adjustment that is made in the terms of the warrant may change its value.
- e) Sometimes the exercise price can be paid using bonds of the corporation at face value, even though they may at the time be selling at a discount. This complicates the analysis and means that early exercise may sometimes be desirable.
- f) The exercise of a large number of warrants may sometimes result in a significant increase in the number of common shares outstanding.

In some cases, these complications can be treated as insignificant, and equation (13) can be used as an approximation to give an estimate of the warrant value. In other cases, some simple modifications of equation (13) will improve the approximation.<sup>4</sup> [Author's clarification: Equation 13 in this quote is referring to the Black Scholes Option Pricing Model.]

<sup>4</sup> Fischer Black and Myron Scholes, "The Pricing of Options and Corporate Liabilities." *Journal of Political Economy*, Vol. 81, No. 3 (May-June, 1973): 637-654.

The paper offers several suggestions on how to account for these various issues. However, given these differences, the ending result is usually an approximation of the value of the warrant. As the article states, one such consideration is that the option value must be adjusted to reflect the dilutive effect of warrants. Not doing so will result in an overstatement of the warrant price. Also, the terms of the warrant agreement will affect the type of model that can be used. For example, my firm performed valuation work for an ESOP transaction where as part of the transaction, warrants were issued. The warrants had a term of 15 years, were not exercisable until the transaction debt was paid in full, and the upside potential for the warrants was capped. The valuation analyst who performed the valuation for the trustees of the ESOP utilized the BSM model to value these warrants. It turned out that the use of the BSM model was inappropriate for a number of reasons, including that (1) the warrants could be exercised early (when the transaction debt is paid off); (2) the upside potential was capped (if you remember the call option diagram, the profit potential for a call option is unlimited); and (3) the warrants were dilutive if the stock price was within a certain range at expiration. Based on these facts, the valuation analyst should have utilized a model other than the BSM model to adjust for these specific factors.

Ignoring these factors can result in significant errors when trying to determine the values of the warrants. To illustrate, the following excerpt came from the valuation analyst's report that was provided to the trustees of the ESOP:

As part of the transaction, the selling shareholders were issued warrants giving them the right to purchase 94,494 shares of Class-A Voting shares, representing 42% of the fully diluted shares outstanding. Details of the warrants are as follows:

- The warrants will have a strike price of \$47.62 per share.
- The warrants will be exercisable for 15 years from the date of issuance
- The Company has a call option, exercisable once the initial Transaction debt is paid off, to purchase some or all of the warrants at a price of \$153.45 per share, reduced by the exercise price of the Warrant representing a maximum payment to the Selling Shareholders of \$10 million net of the aggregate exercise price.

The value of the warrants was estimated by applying the BSM model using the following inputs:

Current Stock Price	57.62
Exercise Price	47.62
Volatility of the Stock	20%
Risk-Free Interest Rate for the Term of the Option	2.16%
Dividend Yield	0.00%
Years Until Expiration	15

The resulting value was \$28.16 per warrant or \$2,661,348 in total.

As the preceding excerpt indicates, the valuation analyst valued the warrants as a call option using the Black-Scholes Option Pricing Model. In addition to the challenges already discussed, a traditional Black-Scholes calculation does not provide an accurate indication of value for the warrants in this instance because the payoff for a traditional call option has an unlimited upside. However, in this instance, the upside potential is capped due to the presence of a call option that allows the company to purchase the warrants at a price of \$153.45 per share less the exercise price. In other words, if the stock price of the company exceeds \$153.45, the company can exercise this call option and buy back the warrants. This puts a cap on the upside potential for the selling shareholders because the maximum amount they can receive for their warrants is \$153.45 less the exercise price. Because these warrants do not have an unlimited payoff, they are worth less than a traditional call option.

Based on these factors, the value derived by the valuation analyst was overstated. In this instance, the warrants owned by the selling shareholders should have been considered as two separate option positions, the first being the purchase of a call option with an exercise price of \$47.62, and the second being the sale of a call option with an exercise price of \$153.45. The pay-off diagram for this position is shown in figure 25.3.

**Figure 25.3 Warrant Payoff**

The calculations that should have been performed based on the same inputs that the other valuation analyst used are as follows:

INPUTS VARIABLES	Date	Purchase of Call Option	Sale of Call Option
Stock Price as of	1/26/2011	\$ 57.62	\$ 57.62
<b>Exercise Price:</b>		<b>\$ 47.62</b>	<b>\$ 153.42</b>
Term (In Years):		15	15
Volatility (Annual):		20.00%	20.00%
Annual Rate of Quarterly Dividends:		0%	0%
Risk-Free Rate:		2.16%	2.16%
<b>Call Option Value</b>		<b>\$ 28.16</b>	<b>\$ 6.54</b>
<b>Value of Warrants Before Dilution</b>	<b>\$21.63</b>		

As indicated previously, the warrants were valued as if the selling shareholders purchased a call option with an exercise price of \$47.62 and sold a call option with an exercise price of \$153.42. Performing this transaction would result in a net purchase price of \$21.63 because the income from selling the option offsets the cost of purchasing the option.

Next, we have to consider dilution. In this instance, the company had 130,895 shares of common stock outstanding and warrants to purchase an additional 94,494 shares. This results in 225,389 common shares outstanding on a fully diluted basis. In order to adjust the warrant price, we calculated a dilution factor of 1.72, which is the ratio of fully diluted shares outstanding to the current number of shares outstanding ( $225,389/130,895 = 1.72$ ). It should be noted that this adjustment is strictly an approximation to estimate the impact of dilution. Based on this adjustment, the value of the warrants would be estimated as follows:

<b>Value of Warrants Before Dilution</b>	<b>\$ 21.63</b>
Dilution Factor	÷ 1.72
Value of Warrant	\$ 12.56
Number of Warrants	× 94,494
<b>Total Value of Warrants</b>	<b>\$ 1,186,782</b>

As indicated previously, the calculations resulted in a total estimated warrant value of \$1,186,782, which is significantly lower than the \$2,661,348 calculated by the valuation analyst. This demonstrates how blindly applying an option model to value a warrant can result in significant errors.

## Preferred Stock

Every so often, valuation analysts encounter companies that have multiple classes of stock. The equity of a business can be in the form of either common or preferred stock. Within each category, there may also be several classes of common and preferred stock that have different voting and dividend rights. From a legal standpoint, after all creditors have been paid, preferred shareholders have preference over common shareholders with respect to liquidation proceeds and frequently with respect to dividends.

Preferred stock can be looked at as a hybrid security that combines features of both debt and equity. Like debt, preferred shareholders can receive a fixed income stream (in the form of a dividend) and get preferential treatment over common shareholders in the event of liquidation. Similar to other forms of equity, preferred shareholders can also benefit from the appreciation in the value of the business.

There are a variety of forms of preferred stock with different features. Before we get into the valuation of preferred stock, it is important to have a general understanding of these features.

## Dividend Rights

Preferred shares typically have a right to receive a dividend that must be paid out before dividends can be paid to common stockholders. The dividend rate for preferred shares is typically stated as a percentage of the par value of the shares. For example, if a share of preferred stock has a par value of \$100, and a dividend rate of 4 percent, the shares will pay a dividend of \$4 to the preferred shareholder. Dividend rates on preferred shares can be either fixed or variable.

Preferred shares can either be *cumulative* or *noncumulative*. Cumulative preferred stock includes a provision that all preferred dividend payments that have been forgone in the past will accrue and must be paid to the preferred shareholders before common shareholders can receive any distributions. Noncumulative preferred stock does not include this feature and all forgone dividend payments will be disregarded.

## Options

Redeemable (or callable) preferred stock allows the issuer to buy back and retire the preferred shares. This works in favor of the issuer because a company can get rid of the preferred equity if the cost becomes too

expensive. In certain instances, an issuer may be required to set aside funds to redeem the shares over a certain period of time. This is referred to as a *sinking fund provision*.

Preferred stock can also include put options, which gives the owner the right, but not the obligation, to sell the shares back to the company at a predetermined price at a particular point in time.

## Voting Rights

Preferred stock can come with voting or nonvoting rights. The valuation analyst must have a clear understanding of the rights and control features of the preferred shares in order to assess the degree in which these features can affect value.

## Participation Rights

An owner of participating preferred stock has the right to receive an additional dividend over and above the specified rate of the preferred shares. This typically occurs when the dividend for the common shares exceeds the dividend for the preferred shares. For example, suppose an investor owns participating preferred shares with a fixed dividend rate of \$5 per share. If the company announces a dividend of \$10 per share, the participating preferred shareholder will be entitled to an additional \$5 dividend, bringing his or her total to \$10.

Participation rights also entitle the investor to “double dip” in the total equity of the company in the event of sale or liquidation. For example, suppose ABC Pharmaceutical Company has \$10 million of outstanding participating preferred stock, representing 50 percent of the company’s total capital structure. The remaining 50 percent consists of common stock. If the company sells for \$50 million, the participating preferred shareholders will receive \$10 million for their preferred shares, resulting in a residual balance of \$40 million to be distributed among all remaining equity holders. This remaining \$40 million will be allocated 50/50 to the participating preferred shareholders and the common stockholders. Therefore, as a result of this transaction, the participating preferred shareholders walk home with a total of \$30 million (\$10 million for their preferred shares and \$20 million of the remaining proceeds), whereas the common stockholders end up with \$20 million of the total. However, in contrast to this situation, a nonparticipating shareholder would only be entitled to \$10 million as a result of this transaction (assuming that there are no unpaid dividends).

## Conversion Rights

Conversion rights grant the preferred shareholder the option to convert his or her preferred shares to common shares. Conversion rights allow the investor to participate in the value appreciation of the company. Converting from preferred stock to common stock becomes optimal when the value of the company reaches a point at which the investor would receive more as a common stockholder than he or she would receive as a preferred shareholder.

When issuing convertible preferred stock, a company usually sets a conversion ratio, which represents the number of common shares that the preferred shareholders can receive in exchange for each of their preferred shares. For example, suppose ABC Pharmaceutical Company issues convertible preferred shares with a conversion ratio of five. This allows investors to convert one preferred share for five shares of common stock. Now suppose that the preferred shares are priced at \$100 per share. The question becomes, at what price does it become optimal for the preferred shareholder to convert his or her shares into common stock?

This question can be answered by dividing the price of the preferred shares by the conversion ratio. In this instance, the conversion price would be \$20 (\$100 price of preferred shares divided by the conversion ratio of five). In other words, the investor would gain value by converting his or her shares if the common stock price of the company exceeds \$20. For example, if the company’s stock price is \$25, the preferred shareholder can take one of two actions: either keep the preferred share at a price of \$100 or convert the preferred share into five common shares worth \$25, providing a total value of \$125.

It should be noted that if preferred shares contain participating features, with no caps on the preferred liquidation preference, there is never a need to convert the shares because the preferred shareholder would get to

double dip in the preferred and common equity of the company. This demonstrates the importance of understanding the rights and preferences of the preferred shares that are being valued.

## Valuation of Preferred Stock

As is the case with any financial security, the value of preferred stock is the present value of the expected future cash flows expected to be generated by the shares, discounted by a rate of return reflective of the risk associated with the security. For dividend-paying preferred shares, an income approach can be utilized by discounting the future expected preferred dividends to present value. The par value and the dividend rate are typically known and specified in the various legal documents associated with the issuance of preferred shares. The challenge is determining the appropriate discount rate that reflects the risks associated with the preferred shares. As is the case with common shares, rates of return for preferred shares can also be obtained from the public market. However, the valuation analyst must perform a significant amount of qualitative analysis and have a thorough understanding of the financial condition of the company and the rights of the preferred shares. Important considerations include the following:

- The ability of the subject company to pay the preferred dividends
- The strength of the company's balance sheet, which affects the company's ability to fund the liquidation preference of the preferred shares
- The rights and features of the preferred shares that were discussed earlier in this section

Guidance on the valuation of preferred shares is discussed in detail in Revenue Ruling 83-120. According to Section 4: Approach to Valuation-Preferred Stock of this Revenue Ruling:

.01 In general the most important factors to be considered in determining the value of preferred stock are its yield, dividend coverage and protection of its liquidation preference.

.02 Whether the yield of the preferred stock supports a valuation of the stock at par value depends in part on the adequacy of the dividend rate. The adequacy of the dividend rate should be determined by comparing its dividend rate with the dividend rate of high-grade publicly traded preferred stock. A lower yield than that of high-grade preferred stock indicates a preferred stock value of less than par. If the rate of interest charged by independent creditors to the corporation on loans is higher than the rate such independent creditors charge their most credit worthy borrowers, then the yield on the preferred stock should be correspondingly higher than the yield on high quality preferred stock. A yield which is not correspondingly higher reduces the value of the preferred stock. In addition, whether the preferred stock has a fixed dividend rate and is non-participating influences the value of the preferred stock. A publicly traded preferred stock for a company having a similar business and similar assets with similar liquidation preferences, voting rights and other similar terms would be the ideal comparable for determining yield required in arms-length transactions for closely held stock. Such ideal comparables will frequently not exist. In such circumstances, the most comparable publicly-traded issues should be selected for comparison and appropriate adjustments made for differing factors.

.03 The actual dividend rate on a preferred stock can be assumed to be its stated rate if the issuing corporation will be able to pay its stated dividends in a timely manner and will, in fact, pay such dividends. The risk that the corporation may be unable to timely pay the stated dividends on the preferred stock can be measured by the coverage of such stated dividends by the corporation's earnings. Coverage of the dividend is measured by the ratio of the sum of pre-tax and pre-interest earnings to the sum of the total interest to be paid and the pre-tax earnings needed to pay the after-tax dividends. *Standard & Poor's Ratings Guide*, 58 (1979). Inadequate coverage exists where a decline in corporate profits would be likely to jeopardize the corporation's ability to pay dividends on the preferred stock. The ratio for the preferred stock in question should be compared with the ratios for high quality preferred stock to determine whether the preferred stock has adequate coverage. Prior earnings history is important in this determination. Inadequate coverage indicates that the value of preferred stock is lower than its par value. Moreover, the absence of a provision that preferred dividends are cumulative raises substantial questions concerning whether the stated dividend rate will, in fact, be paid. Accordingly, preferred stock with noncumulative dividend features will normally have a value substantially lower than a cumulative preferred stock with the same yield, liquidation preference and dividend coverage.

.04 Whether the issuing corporation will be able to pay the full liquidation preference at liquidation must be taken into account in determining fair market value. This risk can be measured by the protection afforded by the corporation's net assets. Such protection can be measured by the ratio of the excess of the current market value of the corporation's assets over its liabilities to the aggregate liquidation preference. The protection ratio should be compared with the ratios for high quality preferred stock to determine adequacy of coverage. Inadequate asset protection exists where any unforeseen business reverses would be likely to jeopardize the corporation's ability to pay the full liquidation preference to the holders of the preferred stock.

.05 Another factor to be considered in valuing the preferred stock is whether it has voting rights and, if so, whether the preferred stock has voting control.

.06 Peculiar covenants or provisions of the preferred stock of a type not ordinarily found in publicly traded preferred stock should be carefully evaluated to determine the effects of such covenants on the value of the preferred stock. In general, if covenants would inhibit the marketability of the stock or the power of the holder to enforce dividend or liquidation rights, such provisions will reduce the value of the preferred stock by comparison to the value of preferred stock not containing such covenants or provisions.

.07 Whether the preferred stock contains a redemption privilege is another factor to be considered in determining the value of the preferred stock. The value of a redemption privilege triggered by death of the preferred shareholder will not exceed the present value of the redemption premium payable at the preferred shareholder's death (i.e., the present value of the excess of the redemption price over the fair market value of the preferred stock upon its issuance). The value of the redemption privilege should be reduced to reflect any risk that the corporation may not possess sufficient assets to redeem its preferred stock at the stated redemption price. See .03 above.

The Revenue Ruling demonstrates the detailed level of financial analysis and qualitative analysis that must be performed in valuing preferred stock. The financial condition of the business and the ability of the company to pay the dividend and the liquidation preference are important considerations. A ratio analysis comparing the financial condition of the subject company to the publicly traded preferred stocks can be a useful tool. Furthermore, many of the features that were discussed earlier in this chapter must be considered because these features affect the risk profile of the underlying securities. An excerpt from a valuation report that addressed a company that owned common and preferred stock is contained in exhibit 25.2.

### Exhibit 25.2 Preferred Stock Valuation

The first step in the valuation of the preferred stock is to determine whether the dividend yield on The Company's classes of preferred stock adequately reflect the risk inherent in Machine Co., Inc. In order to determine this, we turned to preferred stock yields in the public marketplace.

The first source of information analyzed was historical price and dividend data from the iShares Standard & Poor's U.S. Preferred Stock Index (PFF). Standard & Poor's website defines this index as follows:

The S&P U.S. Preferred Stock Index is designed to serve the investment communities need for an investable benchmark representing the U.S. preferred stock market. Preferred stocks are a class of capital stock that pays dividends at a specified rate and has a preference over common stock in the payment of dividends and the liquidation of assets.

We calculated the dividend yield for PFF by taking the total amount of dividends paid by the index in 2009 and dividing it by the average monthly price for 2009. Monthly prices are calculated by taking the average of the highest closing price and the lowest closing price for the month. The result of this calculation is as follows:

Dividends Paid—2009	\$ 2.440
Average Price—2009	÷ 30,245
Dividend Yield	<u>8.07%</u>

(continued)

### Exhibit 25.2 Preferred Stock Valuation *(continued)*

The calculations indicate that the average dividend yield for PFF in 2009 was 8.07 percent. This is higher than that of Machine Co., Inc.'s two classes of preferred stock, which pay yields of 6 and 8 percent. However, Machine Co., Inc.'s preferred stock is cumulative, meaning that if any dividends to preferred shareholders have been omitted in the past, they must be paid to preferred shareholders before common shareholders can receive dividends. In addition, when dividends are cumulative, dividends in arrears must be paid, in addition to the stated liquidation preference, before making any assets available for distribution to common shareholders.<sup>1</sup> As a result, a lower yield for Machine Co., Inc.'s preferred shares is warranted because its preferred shares are cumulative, which makes them less risky than the index which includes non-cumulative shares.

Another factor considered is Machine Co., Inc.'s net asset value. We calculated The Company's net asset value at \$1.68 million. In other words, after paying all of its liabilities, Machine Co., Inc. has \$1.68 million to fund its preferred stock obligations (liquidation value and accrued dividends), which also reduces the risk of these shares. In addition, Machine Co., Inc. has no debt in its capital structure. As a result, The Company's preferred shares are the most senior class of securities in The Company's capital structure. This makes The Company's preferred shares more "bond-like" as these shareholders have initial claims on Machine Co., Inc.'s assets in the event of liquidation.

Taking this into consideration, we also analyzed bond yields as a basis of comparison for the dividend yields on Machine Co., Inc.'s preferred shares. As of the valuation date, Moody's Aaa (highest quality) and Baa (moderate credit risk) corporate bonds were paying yields of 5.30 percent and 6.24 percent, respectively. These yields are below those of Machine Co., Inc.'s 8 percent cumulative preferred shares. The yield of The Company's 6 percent cumulative preferred shares falls below those of Moody's Baa Corporate bonds and above those of the Aaa bonds. Taking these factors into consideration, we believe that the yields offered on Machine Co., Inc.'s preferred shares are reasonable because both classes offer yields above those of Moody's Aaa bonds reflecting the additional risk associated with them. In addition, Machine Co., Inc.'s preferred shares offer yields either above or slightly below those of Moody's Baa Corporate bonds. An argument can be made that Machine Co., Inc.'s 6 percent cumulative preferred shares should offer a yield higher than Moody's Baa Corporate bonds due to The Company's lack of profitability and declining sales. However, The Company's cash and marketable securities balance was \$430,561 as of the valuation date, which is more than enough to fund the total par value of \$67,700 of The Company's preferred shares. Even after removing all of The Company's current liabilities, which have a balance of \$124,286, The Company would still have \$306,275 to fund its obligations to preferred shareholders. This essentially eliminates the risk that preferred shareholders would receive less than par value for their shares. Therefore, we believe that the yields on Machine Co., Inc.'s preferred shares are adequate to support par value and that no adjustments are necessary.

The next step in the analysis is to determine the amount of unpaid dividends owed to Machine Co., Inc.'s preferred shareholders. Before we can calculate the value of The Company's common equity, we must first deduct the value of the preferred shares and all unpaid dividends. The 8 percent cumulative preferred shares have a par value of \$15,000 (or \$100 per share) resulting in annual dividends of \$1,200 ( $\$15,000 \times 8\%$ ). The 6 percent cumulative preferred shares have a par value of \$52,700 (or \$100 per share) resulting in annual dividends of \$3,162 ( $\$52,700 \times 6\%$ ). Preferred dividends paid by Machine Co., Inc. since 2000 are as follows:

Year	6% Cumulative Preferred	8% Cumulative Preferred
2000	\$3,162	\$1,200
2001	3,162	1,200
2002	3,162	1,200
2003	3,162	1,200
2004	3,162	1,200
2005	3,162	—
2006	3,462	—
2007	3,462	—
2008	3,462	—
2009	—	—

<sup>1</sup> Shannon Pratt, *Valuing a Business*, 5th edition: 569.

### Exhibit 25.2 Preferred Stock Valuation

As the preceding data indicates, The Company stopped paying dividends on its 8 percent cumulative preferred stock in 2005. This amounts to five years of unpaid dividends, or \$6,000.

From 2006–2008, The Company paid \$300 extra on its 6 percent cumulative preferred for a total of \$900. No dividend payment was made in 2009. Therefore, The Company still owes \$2,262 (\$3,162 – 900) on these preferred shares.

Taking all of these factors into consideration, the value of Machine Co., Inc.'s common equity has been derived as follows:

Value of Total Equity	\$ 1,680,000
Less: Value of 6% Cumulative Preferred	(52,700)
Less: Unpaid Dividends—6% Cumulative Preferred	(2,262)
Less: Value of 8% Cumulative Preferred	(15,000)
Less: Unpaid Dividends—8% Cumulative Preferred	(6,000)
<b>Total Common Equity</b>	<b>\$ 1,604,038</b>

Therefore, the value of the common shares is calculated as follows:

Common Equity	\$1,604,038
Number of Common Shares	÷ 1,000
<b>Value per Common Share</b>	<b>\$ 1,604</b>

As a result of the preceding analysis, the values of the various subject interests are as follows:

6 Percent Cumulative Preferred	
Value Per Share	\$ 100
Number of Shares	277
<b>Value of 6 Percent Cumulative Preferred</b>	<b>\$ 27,700</b>

8 Percent Cumulative Preferred	
Value Per Share	\$ 100
Number of Shares	75
<b>Value of 8 Percent Cumulative Preferred</b>	<b>\$ 7,500</b>

500 Common Shares	
Value per Share	\$ 1,604
Appraisal Subject	500
<b>Value of Common</b>	<b>\$ 802,000</b>

## Debt Securities

Debt instruments come in many forms, including the following:

- Government bonds
- Corporate bonds
- Bank loans
- Promissory notes
- Stockholder loans
- Other related party loans

The fundamental concepts for valuing debt securities are no different than the valuation theory discussed throughout this textbook: The value of a debt security is equal to the present value of the future stream of income that the security is expected to generate, discounted back to present value using a discount rate that is reflective of the risks associated with the debt instrument. The valuation process involves the following steps:

- Determine the expected cash flows that the debt security is expected to generate
- Determine the appropriate required rate of return that should be used to discount the cash flows to present value

A debt security typically has both of the following features:

- A principal amount (or par value), which is the amount the borrower of the debt agrees to repay the debtholder by the maturity date
- A coupon (interest) rate, which is the rate that the borrower of the debt agrees to pay periodically

There are also zero coupon bonds, which are not contracted to make periodic payments. In this instance, the holder of the bond generates interest by purchasing the bond at a discount from par value.

In order to value a debt security, it is important to understand the relationship between interest rates and value. The price of a debt security moves in the opposite direction of the market rate of interest. When prevailing interest rates rise, newer debt securities become more attractive investments because they will offer higher yields. As a result, a current debt security with a fixed rate of interest becomes less valuable. When prevailing interest rates fall, current debt securities become more valuable because the yields on the current debt securities will be higher than the newer securities in the market place. In summary, the relationship of the par value, coupon rate, and market interest rate can be summarized as follows:

- If the coupon rate **equals** the required market rate of return, the price of the bond is **equal** to its par value.
- If the coupon rate **exceeds** the required market rate of return, the price of the debt security **exceeds** its par value.
- If the coupon rate is **lower** than the required market rate of return, the price of the debt security is **lower** than its par value.

To demonstrate, consider the following example. Suppose an investor buys a bond with a par value of 1,000, a coupon rate of 5 percent with 5 years to maturity. The future cash flows of the bond are as follows:

Year 1	\$ 50
Year 2	50
Year 3	50
Year 4	50
Year 5	1,050

Based on the preceding cash flows, consider the following three scenarios when the required market rate of interest is 3 percent, 5 percent, and 7 percent. The market value of the bond under each of these scenarios is calculated as follows:

	Cash Flows	Present Value at 3%	Present Value at 5%	Present Value at 7%
Year 1	\$ 50	\$ 48.54	\$ 47.62	\$ 46.73
Year 2	50	47.13	45.35	43.67
Year 3	50	45.76	43.19	40.81
Year 4	50	44.42	41.14	38.14
Year 5	1,050	905.74	822.70	748.64
<b>Market Value</b>		<b>\$1,091.59</b>	<b>\$1,000.00</b>	<b>\$918.00</b>

The calculations in the preceding table demonstrate the relationship between the market rate of interest and the value of the debt security. If the market rate of interest is 3 percent, the value of the bond exceeds its par value because the coupon interest being generated from the bond exceeds the market rate of interest. If the market rate of interest is 7 percent, the bond value declines.

Typically, the cash flows expected to be generated by the debt security can be calculated by analyzing the loan documents. There are situations in which the cash flows can be more difficult to predict (that is, variable rate debt, asset-backed securities, callable and putable bonds, and so on); however, these unique debt securities are beyond the scope of this textbook. The most challenging part of valuing a debt security is determining the appropriate required market rate of return.

Developing a discount rate for a debt security can be performed in the same manner that is used for equity securities. The valuation analyst can use a build-up method starting with a risk-free rate of interest (such as a Treasury security of similar maturity as the valuation subject) and applying risk premiums to account for the risk characteristics specific to the debt instrument. Common risk factors associated with debt securities include the following:

- *Interest rate risk.* The risk that a change in interest rates may reduce the market value of the debt security. This results from the inverse relationship between the market price of the debt security and the market rate of interest.
- *Default risk.* The chance that the borrower will be unable to make the required interest or principal payments, or both, on the debt obligations. In order to assess default risk, the valuation analyst should perform a detailed financial analysis of the subject company to determine the likelihood that the company will be unable to fund the debt obligations. The various debt ratios that were discussed in chapter 6 can be useful in analyzing default risk.
- *Prepayment risk.* This relates to the possibility that the debt security gets called or refinanced. When interest rates decline, the likelihood that a borrower pays off a loan and refinances the debt at a lower interest rate increases. In this instance, the investor in the debt security may not realize all the anticipated future cash flows that were expected to be generated from the investment.
- *Reinvestment risk.* This results when the debt security gets called or refinanced. When interest rates decline, and a borrower calls, pays off, or refinances the debt, the lender is now forced to reinvest the funds at a lower interest rate.

At a minimum, all of these risks should be considered when performing a valuation of debt securities. A challenge that valuation analysts typically encounter is quantifying these various risks. Luckily, with respect to debt securities, there is an abundance of information available related to yields on debt securities that can assist the valuation analyst in determining an appropriate required rate of return. The U.S. Treasury Department contains yields for Treasury securities, corporate bonds, bank loans, and various other market rates of interest over a

significant period of time. Furthermore, credit rating agencies such as Moody's and Standard & Poor's publish detailed bond rating reports that include financial ratios and yields for the securities classified under various credit ratings, which can assist the analyst in performing a comparative financial analysis. Furthermore, the analyst can look at public filings and use the borrowing rates for the guideline publicly traded companies as a basis to quantify the risk associated with an investment in the valuation subject. Duff & Phelps' *Valuation Handbook Industry Cost of Capital* also contains borrowing rates and debt ratios broken down by industry and size composite.

The valuation analyst should also consider the prevailing interest rate environment when valuing debt securities. The proper way to value the cash flows generated by a debt security is to use a different discount rate in each period that is reflective of the expected interest rate environment on a prospective basis. If economic forecasts indicate that interest rates are expected to steadily increase over the next several years, the valuation analyst should consider building the forecasts of future interest rates into the valuation of the debt security.

Nevertheless, there is a significant amount of data available to assist the valuation analyst in determining an appropriate rate of return for debt held by a closely held company. A sample report of a valuation of a promissory note is included in exhibit 25.3.

### EXHIBIT 25.3 Valuation of Debt

#### DESCRIPTION OF THE NOTES

On April 13, 1997, Sam Jones, Michael Jones Jr., and Sandy Jones (the Debtors) issued three unsecured promissory notes of \$1,216,856 each, payable to Michael Jones, Sr.

On October 1, 2002, the notes were assigned to Helen Jones (now deceased) as part of a court judgment regarding the Estate of Michael L. Jones, Sr., deceased. Further, The Court decreed accrued interest on each of the notes of \$172,855, resulting in a total balance due of \$1,389,711 from each note as of October 1, 2002.

As of the valuation date, the Estate of Helen Jones owned a fractional interest in the notes. As a result of transfers made by Helen Jones to family members, other individuals own fractional interests in each of the notes. The ownership of each note is shown in table 1.

**TABLE 1 Ownership of the Notes**

Notes Defined	Estate of Helen Jones Interest	Number of Additional Creditors	Total Fractional Interests Ownership
The "Sam Note"	79%	15	21%
The "Michael Jr. Note"	45%	11	54%
The "Sandy Note"	74%	13	26%

The notes do not require minimum monthly payments of interest or principal, and no such payments have been recorded since their issuance. Meanwhile, the notes are not secured by any assets of the debtors, and there are no covenants in place protecting the creditors of the notes. The notes simply state: "on demand, after April 13, 1987, I promise to pay to the order of Michael L. Jones \$1,216,856..."

Although the notes have no stated maturity date, they are payable on demand. However, the creditors may not attempt to collect on the notes unless they attempt in good faith to collect equally from all the other related debtors holdings similar notes. Additionally, an assignee of a fractional interest (such as the interest) cannot proceed unilaterally to enforce any particular note without joining the holders of all the other fractional interests. In effect, all 39 co-holders would have to act simultaneously in order for them to collect the notes.

**EXHIBIT 25.3 Valuation of Debt**

The notes' balances, subsequent to the October 1, 2002 judgment date, have accrued interest based on the rates set forth in the agreements. These rates varied from 7.5 to 3.5 percent. As of the valuation date, the total balance due on each note is \$2,238,740, as computed in table 2.

**TABLE 2 Computation of Accrued Interest on Notes**

	Measurement Date	Measurement Period (Years)	Interest Rate	Accrued Interest	Note Balance
Original Note Date	4/13/97				\$1,216,856
Accrued Interest	10/1/02			\$172,855	1,389,711
	1/1/03	0.2	7.50%	26,271	1,415,982
	1/1/04	1.0	5.50%	77,879	1,493,861
	1/1/05	1.0	3.50%	52,285	1,546,146
	1/1/06	1.0	3.50%	54,115	1,600,261
	1/1/07	1.0	5.50%	88,014	1,688,276
	1/1/08	1.0	5.50%	92,855	1,781,131
	1/1/09	1.0	5.50%	97,962	1,879,093
	1/1/10	1.0	5.00%	93,955	1,973,048
	1/1/11	1.0	5.50%	108,518	2,081,565
	1/1/12	1.0	6.00%	124,894	2,206,459
Valuation Date	3/31/12	0.2	6.00%	32,281	2,238,740

According to the representatives of Michael L. Jones, Jr., and Sandy Jones, only Michael has the financial means to repay his note. Sandy has reported a net worth of \$454,000 as of December 2012, which consists of fractional interests in various real estate holding companies. These fractional interests in real estate holding companies are considered to be noncontrolling and illiquid assets. Therefore, the fair market values of these interests are considered to be approximately \$340,000 on a controlling marketable basis.

As of the valuation date, Sam Jones is deceased, and all but an immaterial portion of his estate's assets have been distributed. As a result, for the creditors to collect from this estate, they would be forced to take legal action and assert a claim against the distributed assets. Although such an action would likely result in a favorable outcome for the creditors, the legal process could be both lengthy and costly, adversely affecting the value of the estate.

**VALUATION CALCULATIONS**

We have considered several methods in the process of valuing the notes. Valuation analysts typically group valuation methodologies into three broad categories known as the market, asset-based, and income approaches. The market approach involves analyzing transactions of assets similar to the one being valued to determine pricing multiples that can be used to estimate value. The asset-based approach, also known as the *cost approach*, focuses on the cost of the underlying assets of a valuation subject. Using this approach, a valuation analyst estimates the cost of duplicating or replacing the individual elements that constitute an asset. The income approach, sometimes referred to as an *investment value approach*, considers the future benefit stream to the holder of an asset. Under this approach, value is equal to the present value of the future expected benefit streams. The narrative that follows discusses the methodology employed within each approach.

(continued)

**EXHIBIT 25.3 Valuation of Debt** *(continued)***THE MARKET APPROACH**

We considered markets of various debt securities in an attempt to use the market approach. The market approach consists of a comparison between the appraisal subject and other securities with the same or similar characteristics that are publicly traded.

The valuation analyst performed a computerized search for corporate and agency non-investment-grade U.S. bonds. Generally, a bond is a debt instrument, similar to promissory notes, which is issued for a period of more than one year for the purpose of raising capital and a promise to repay the principal along with interest (coupons) on a specified date. Bonds are often divided into different categories based on tax status, credit quality, issuer type, maturity, and whether the bond is secured or unsecured.

The query resulted in a total of 50 bonds. Although there were some resemblances between the note and the bonds, we have not used a market approach to indicate value. The reasons for not using this approach are due to the unique characteristics of the notes, which created a disparity in risk profile between the debt securities and the fact that there is no available information regarding an active market for promissory notes.

**THE ASSET-BASED APPROACH**

The asset-based approach, sometimes referred to as the *replacement cost approach*, is an asset-oriented approach, rather than a market-oriented approach. Under this approach, we considered the face value of the promissory notes plus any accrued interest. We do not believe that the original face value of the notes plus their accrued interest represent the fair market value. In fact, the only foreseeable value of the notes depends on their expected cash flows or liquidation value, or both, which are addressed as part of the income approach.

**THE INCOME APPROACH**

The application of the income approach will be accomplished using the present value of the amounts estimated to be collected from the promissory notes, minus any collection costs involved in the process, taking into consideration the amount of time that it might take to collect the owed sums. In order to estimate the duration, costs, and probabilities of collecting the notes, the valuation analyst began the analysis by contacting a collection attorney.

According to attorney Peter Barnes, graduate of Harvard Law School, with more than 40 years of experience in the collection industry, the maximum amount to be collected from each note would be \$340,000, with an approximate collection time of 3 years. Moreover, he estimated a time of at least 200 hours at a rate of \$250 to \$350 per hour for a range of \$50,000 to \$70,000 for collection costs.

Mr. Barnes suggested that there is great likelihood that creditors will be unable to reach an agreement on how to proceed in collecting the notes. The solution is for the estate, as one of the creditors, to ask The Court for directions on how to proceed, assuming there are recalcitrant creditors. Additionally, the collection process requires a search for assets owned by the debtors. This can be done by the service of an information subpoena on the debtor, obtaining a court order requiring the debtor to answer questions under oath pertaining to his or her assets, and hiring an investigator to discover assets.

Based on the previously described facts of the promissory notes, it is known that Sandy Jones has very few liquid assets, and the other two debtors have sufficient assets to pay the notes, but one of them is deceased and his estate has been distributed. Although the Estate of Sam Jones has already been distributed, the payment of the promissory note could still be collected through a litigation process, which, if tried, could be as costly as the declaratory judgment litigation.

The collectibility of these notes is dependent on the financial status of the debtors and limited to the judge's order to collect equally. Therefore, the maximum collectible amount would come from the least affluent debtor. Sandy Jones has estimated assets of \$340,000, establishing a cap in the amount collectible from the other Debtors.

The fair market value of the promissory notes would be equal to the present value of the expected collectible amounts, after any collection costs. A collection cost of \$20,000 per note, or a consolidated \$60,000 for the three notes was deemed likely, according to Mr. Barnes's opinion. The estimated collectible amount from the notes would be discounted back to the present using a discount rate that embodies the risk associated with an investment in a similarly risky asset. In this case, a discount rate of 30.7 percent has been deemed applicable (see section of this report entitled "Discount Rates"). The formula for the present value of the debt security is:

**EXHIBIT 25.3 Valuation of Debt**

$$\text{Present Value} = \frac{\text{PMT}^1}{(1+K_d)^1} + \frac{\text{PMT}^2}{(1+K_d)^2} + \frac{\text{PMT}^3}{(1+K_d)^3} + \frac{\text{PMT}^n}{(1+K_d)^n} + \frac{\text{Face Value}}{(1+K_d)^n}$$

PMT= Payments

 $K_d$  = Market discount rate on debt

Because no minimum monthly payments of interest or principal are specified in the agreement and no such payments have been made under the notes since their issuance, we assumed that no payments will be made during the next three years, leaving the formula as follow:

$$\text{Note Value} = \frac{\text{Collectible amount}}{(1+K_d)^3}$$

$$\text{Present Value of Note} = (\$340,000)/(1+30.7)^3$$

Present Value of the Note	\$152,283
Less: Collection Costs	(20,000)
Value	\$132,283
Rounded	<b>\$132,000</b>

Note	Note Value	Estate of Helen Jones Interest	Fractional Values
The "Sam Note"	\$132,000	79%	\$104,280
The "Michael Jr. Note"	132,000	45%	59,400
The "Sandy Note"	132,000	74%	97,680
<b>Total</b>			<b>\$261,360</b>

**DISCOUNT RATES**

In order to apply an appropriate discount rate in this valuation, the valuation analyst searched for different categories of similar debt instruments as a guide to estimate the discount rate for the notes in this assignment. The valuation analyst deemed the use of non-investment-grade bonds' effective yield as the discount rate to be used for the promissory notes to be appropriate. The different credit rating categories for bonds are shown in table 3.

*(continued)*

**EXHIBIT 25.3 Valuation of Debt** *(continued)***TABLE 3 Credit Ratings**

Moody's	Standard & Poor's	Fitch	
Aaa	AAA	AAA	<b>Investment Grade</b>
Aa1	AA+	AA+

C	D	D	

To attract investors to buy distressed debt instruments, the issuer would have to compensate them for the attendant risks associated with the instrument by paying a higher rate of interest than bonds with higher investment-grade ratings. This, in turn, generates a higher "yield" for investors.

Although we have estimated that \$340,000 could be collected from each note at the end of a three-year period, there are still some risks that could affect the total amount that could be collected.

Based on the facts surrounding these notes, we have decided to use the stated yield to maturity of poor quality and the most speculative corporate bonds to determine our discount rate. We used the Standard & Poor's (S&P) credit ratings to select what we believe to be a reasonable proxy for these notes. S&P's ratings are based on the capacity and willingness of the obligor to meet its financial commitment on an obligation, the nature of and provisions of the obligation and protection afforded by the obligation in the event of bankruptcy, reorganization, or other arrangement under the laws of bankruptcy and other laws affecting creditors' rights.

**EXHIBIT 25.3 Valuation of Debt**

The valuation analyst searched Merrill Lynch's Index Systems for information regarding high-yield bonds, specifically C-rated bonds. This type of bond is described by S&P as applying to situations when a default has not yet occurred, but S&P Global Ratings expects default to be a virtual certainty, regardless of the anticipated time to default. According to Merrill Lynch's analysts, constrained indexes have a maximum weight of 2.0 percent per holding in their indexes.

Additionally, the valuation analyst searched the *Dow Jones Newswire* database for a list of high-yield bonds traded on March 28, 2013. The following table shows the bonds by name, ratings, coupons, maturity, and YLD—the lower of yield to maturity and yield to call.

**TABLE 4 High-Yield Bonds—March 28, 2013**

Name	Type/Rating	Coup.	Mat.	Yld.-y

Price quotes follow accrued interest conventions. a-Senior. b-Senior Sub. c-Senior, Zero To Full. d-Senior, split Cpn. e-Secured. y-yield is the lower of yield to maturity and yield to call. z-omitted for reset or bankrupt bonds, negative yields, or yields above 35%.

*(continued)*

**EXHIBIT 25.3 Valuation of Debt** *(continued)*

The valuation analyst selected those bonds with CCC ratings or lower because they better mirror the notes to be valued. There was a total of five bonds with this rating, and a no-rating bond with YLD is considered to be similar to those with CCC ratings. The selected bonds are shown in table 5.

**TABLE 5 Selected High-Yield Bonds**

Name	Type/Rating	Mat	YLD.-y
ABC Co.	e/CCC	May-16	21.61
RMS, Inc.	a/CCC-	Feb-16	27.83
Level 3	a/CCC-	May-18	16.77
Media Co.	a/NR	May-18	21.38
Charter, Inc.	a/CCC-	Apr-19	27.06
Crown, Inc.	e/CCC	Aug-21	12.20
	Mean		21.14
	St. Deviation		5.99
	Lower Quartile		17.92
	Median		21.50
	Upper Quartile		25.70

Due to the uniqueness of the notes and the high uncertainty of collecting them, the valuation analyst has chosen to use 25.7 percent, the upper YLD quartile, as the starting point for the discount rate.

Some of the risks that could diminish the probabilities of collecting the notes are as follows:

- The need for all 39 co-holders to act simultaneously in order for them to collect the notes.
- Even after all creditors attempt to collect the notes simultaneously, the maximum collectible amount would come from the least affluent debtor.
- The most optimistic collectible estimate for the notes is derived from the assumption that the fractional interests owned by Sandy Jones in various real estate holding companies would be sold after three years for \$340,000.
- Because the Estate of Sam Jones has already been distributed, there is a chance of creditors not being able to collect any of the already assigned estate.

As a result, the valuation analyst increased the discount rate to 30.7 percent, an increase of 500 basis points, because of the higher risk of the Notes over the previously described bonds. Some of those high-yield bonds were considered to be secured because they were backed by collateral with larger and greater financial resources than the creditors of the notes.

## Early Stage Companies

Up to now, this chapter has discussed different types of securities. This section addresses the valuation of early stage companies. The valuation of early stage companies presents challenges to valuation analysts for a number of reasons, namely many of these companies have little to no revenues, no history of earnings, and have probably incurred significant operating losses. However, this does not mean that these companies do not have value. If you review companies whose shares trade in the public market, there are many instances

in which companies with no revenues or earnings have multi-billion dollar market capitalizations. Always remember that valuation is a prophecy of the future. As a result, the early stage companies should not be valued based on their performance to date but, rather, the expectation of the early stage company's future performance.

There are various reasons why early stage companies need to be valued. These include, but are not limited to, the following:

- Litigation
- Estate and gift tax
- Share based compensation
- Financing
- Financial reporting

Regardless of the purpose of the valuation, the same valuation approaches and methodologies should be considered.

I am only going to provide a general overview of the valuation of early stage companies. There are many books that address this topic. One such publication that I have in my library is *Valuation of Privately-Held-Company Equity Securities Issued as Compensation*, published by the AICPA.<sup>5</sup> Before I go into detail on the valuation approaches, I will provide some background information on the characteristics and stages of development for early stage companies.

## Stages of Development

When valuing an early stage company, the valuation analyst should first have an understanding of the early stages of a company's life cycle and where the subject company falls within these stages. A summary of the six stages of a company's life cycle is included in table 25.1.

**TABLE 25.1 Six Stages of a Company's Life Cycle**

Stage	Description
1	Enterprise has no product revenue to date and limited expense history and typically an incomplete management team with an idea, plan, and possibly some initial product development. Typically, seed capital or first-round financing is provided during this stage by friends and family, angels, or venture capital firms focusing on early-stage enterprises, and the securities issued to those investors are occasionally in the form of common stock but are more commonly in the form of preferred stock.
2	Enterprise has no product revenue but substantive expense history, as product development is under way and business challenges are thought to be understood. Typically, a second or third round of financing occurs during this stage. Typical investors are venture capital firms, which may provide additional management or board of directors' expertise. The typical securities issued to those investors are in the form of preferred stock.
3	Enterprise has made significant progress in product development; key development milestones have been met (for example, hiring of a management team) and development is near completion (for example, alpha and beta testing), but, generally, there is no product revenue. Typically, later rounds of financing occur during this stage. Typical investors are venture capital firms and strategic business partners. The typical securities issued to those investors are in the form of preferred stock.

*(Table continued)*

<sup>5</sup> American Institute of Certified Public Accountants, *Valuation of Privately-Held-Company Equity Securities Issued as Compensation*, (New York, NY: American Institute of Certified Public Accountants, Inc., 2013).

**TABLE 25.1 Six Stages of a Company's Life Cycle** *(continued)*

Stage	Description
4	Enterprise has met additional key development milestones (for example, first customer orders, first revenue shipments) and has some product revenue but is still operating at a loss. Typically, mezzanine rounds of financing occur during this stage. Also, it is frequently in this stage that discussions would start with investment banks for an IPO.
5	Enterprise has product revenue and has recently achieved breakthrough measures of financial success such as operating profitability or break-even or positive cash flows. A liquidity event of some sort, such as an IPO or a sale of the enterprise, could occur in this stage. The form of securities issued is typically all common stock, with any outstanding preferred stock converting to common stock upon an IPO (and perhaps also upon other liquidity events).
6	Enterprise has an established financial history of profitable operations or generation of positive cash flows. An IPO could also occur during this stage.

(Source: Valuation of Privately-Held-Company Equity Securities Issued as Compensation.)

A company may go through other stages that are not included in table 25.1 or may fit the description of more than one of the stages discussed. Nevertheless, this table can assist the valuation analyst in performing the risk analysis and locating potential guideline public companies or transactions of similar types of companies.

Throughout the early stages of a company's development, the company may hit certain milestones. These various milestones, when met, could potentially increase the value of the company and reduce the amount of risk and uncertainty. According to *Valuation of Privately-Held-Company Equity Securities Issued as Compensation*, common milestones for early stage companies include the following:

- Finalizing the original business plan.
- Obtain an initial round of financing other than from family and friends.
- Beta test the product or service. At this point, the enterprise may begin to receive some cash inflows, demonstrating that customers are willing to buy the enterprise's product or service.
- Assemble the management team.
- Develop a manufacturing plan.
- Execute contracts with customers.
- Obtain regulatory approval (for example, U.S. Food and Drug Administration approval of a new drug for a pharmaceutical company).
- Achieve profitability.
- Achieve positive cash flows.
- Deliver the product or service to customers.<sup>6</sup>

Although this list is not all-inclusive, it gives the valuation analyst a starting point for the various types of factors that should be considered when analyzing the growth prospects and risk characteristics of the early stage company. Furthermore, the same level of analysis that is performed for any other company should also be performed for early stage valuations. This includes an analysis of the subject company (products and services, customers, suppliers, and so on), economic and industry conditions, competitive landscape, depth of management, and so on. No matter what stage of development a business is in, these same factors still need to be considered when performing a valuation.

## Valuation Approaches

Because chapters 9, 10, 11, and 12 include a detailed discussion of the three approaches to valuation, I am not going to repeat that stuff here. This section will include a discussion of how to apply the valuation approaches in the context of early stage companies and the different challenges that the valuation analyst will face in applying them.

<sup>6</sup> *Ibid.*, 19.

## Asset-Based Approach

The asset-based approach is typically not used in the valuation of companies in the later stages of development because it does not capture the value of the company as a going concern. Assets that you typically see on the balance sheet of a start-up company are capitalized costs related to research and development, software, and other similar start-up costs. Although a cost approach can be used to value certain assets, such as software, this process can be costly and rigorous, and it requires a significant amount of documentation that the valuation analyst's client may not have available.

In certain instances, the valuation subject may be a company in an earlier stage of development that has yet to generate any rounds of financing or revenues. An asset-based approach may provide an indication of value under this circumstance in the event that a reliable income approach or market approach cannot be performed.

## Market Approach

The two most commonly used valuation methodologies under the market approach are the *guideline public company method* and the *guideline transaction method*. Performing these methodologies for an early stage company can prove to be difficult for various reasons, including the following:

- Early stage companies typically lack the traditional revenue and earnings-based pricing metrics to perform these methodologies. (This explains the reason for the emergence of made up valuation metrics such as “price to clicks” and “price to page views” that were used in the late 1990s that created more problems than solutions in the era of the dot.com bust).
- It is difficult to find comparable companies that are in the same stage of development as the subject company and have similar risk and growth characteristics. Even if you are lucky enough to find some companies, chances are that there will not be enough information available to truly compare the subject to these companies.
- A public company has access to financing that the early stage closely held company may not. This may especially be true if the early stage company is a private company.
- In certain instances, early stage companies are either offering a new product or service or operating in an emerging industry. In these instances, publicly traded companies or transactions within the industry may not exist.
- There may not be sufficient data made public about the transactions of guideline companies that will allow the valuation analyst to calculate multiples and understand the terms of the transaction.
- If the guideline public companies are also in the early stages of development, they may also have no revenues or earnings, which makes it difficult to derive multiples that can be used in the valuation.

These are only some of the challenges that valuation analysts face in applying a guideline public company or guideline transaction method to an early stage company.

One of the more commonly used methodologies under the market approach that is used for early stage companies is the internal transaction method. If the early stage company has completed a recent round of financing, these internal transactions can be used as a basis to determine the implied value of the company.

The challenge that valuation analysts face is that early stage companies typically issue preferred stock, rather than common stock, to obtain financing. Preferred stock is not the same as common stock because the rights and liquidation preferences of these two classes of equity differ. Therefore, suppose a group of investors purchase a 10 percent preferred stock interest in a company for \$1 million. This does not imply that the value of the company is \$10 million. In order to determine what the implied value of the company was based on this transaction, the valuation analyst needs to consider the rights of common stockholders versus those of preferred stockholders.

A methodology to determine the implied value of a company based on a prior sale of preferred stock is commonly referred to as the *backsolve method*. According to *Valuation of Privately-Held-Company Equity Securities Issued as Compensation* “In many cases, it may be possible to use the price from a transaction to solve for the total equity value of the enterprise and the value of the other securities within the enterprise (the backsolve method).”<sup>7</sup>

.....  
<sup>7</sup> *Ibid*, 85.

The backsolve method models the equity value of the business as a series of call options. As discussed earlier in this chapter, a call option is the right, but not the obligation, to purchase a stock at a specific price (the exercise price) at a specific date in the future. For example, suppose an investor has a call option on a stock with an exercise price of \$100. This gives him or her the right to purchase the stock at \$100 at a certain point in the future. If the stock price is below \$100, the option will expire. If the stock price is \$120, the investor can exercise this option, purchase the stock for \$100, and earn a profit of \$20.

This pay-off structure also applies to the equity value of a business. If a liquidity event occurred, the common shareholders would not receive any cash until the preferred shareholders receive their liquidation preference. In the preceding example, if the liquidation preference for the preferred shareholders was \$100, the common shareholders would receive nothing unless the value of the business exceeded \$100. Due to the similarities in the pay-off structure between an option holder and an equity holder, an option model can be used to determine the implied equity value of the business. An example of a report where the backsolve method was used for a litigation assignment is included in exhibit 25.4. In this instance, the valuation subject was a start-up technology company that had completed the sale of preferred units shortly before the valuation date.

### EXHIBIT 25.4 Backsolve Method

The value of Software Startup using an income approach was determined to be \$5.2 million. Because Software Startup had some actual transactions in itself, we also considered what actual purchasers paid for an interest in The Company. Software Startup sold Series-A Preferred units to outside investors on or about March 15, 2013. The Company sold 111,110 shares at a purchase price of \$4.50 per unit, resulting in total proceeds of \$499,995. The sale represented a 10 percent interest in The Company. However, it should be noted that this is not an indication that the value of Software Startup is \$4,995,995 ( $\$499,995 \div 10\%$ ). In order to determine the implied equity value of The Company, we must consider the rights of the preferred units versus those of the common units.

According to *Valuation of Privately-Held-Company Equity Securities Issued as Compensation*, published by the AICPA, "In many cases, it may be possible to use the price from a transaction to solve for the total equity value of the enterprise and the value of the other securities within the enterprise (the backsolve method)."<sup>1</sup> Because Software Startup had closed on a sale of Series-A Preferred units, we have an actual arms-length transaction that can be used to determine the implied equity value of The Company.

As indicated previously, Software Startup sold 111,110 Series-A Preferred units, at a purchase price of \$4.50 (representing 10 percent of The Company) to outside investors for total proceeds of \$499,995. However, this does not mean that the implied value of The Company was \$4,999,995 ( $\$499,995 \div 10\%$ ). Because preferred units have different rights and preferences than common units, we must consider these differences in the valuation of the different units before determining the implied value of the total equity of The Company. After completion of the transactions, ownership in Software Startup was as follows:

Member	Type of Unit	# of Units	% of Total	Price Paid Per Share	Date of Transaction	Total Amount Paid
1	Common	640,000	57.6%	Founder		
2	Common	180,000	16.2%	Founder		
3	Common	180,000	16.2%	Founder		
4	Series-A Preferred	33,333	3.0%	\$4.50	3/15/2013	149,999
5	Series-A Preferred	11,111	1.0%	\$4.50	3/15/2013	50,000
6	Series-A Preferred	11,111	1.0%	\$4.50	3/15/2013	50,000
7	Series-A Preferred	22,222	2.0%	\$4.50	3/15/2013	99,999
8	Series-A Preferred	22,222	2.0%	\$4.50	3/15/2013	99,999
9	Series-A Preferred	11,111	1.0%	\$4.50	3/15/2013	50,000
<b>Total Units</b>		<b>1,111,110</b>				<b>499,995</b>

<sup>1</sup> AICPA, *Valuation of Privately-Held-Company Equity Securities Issued as Compensation*, (New York, NY, 2013): 85.

## EXHIBIT 25.4 Backsolve Method

Based on the sale price of the \$4.50 per preferred unit, we can determine the implied equity value of the business using what is referred to as the “backsolve method.” The AICPA defines the backsolve method as “a method within the market approach where the equity value for a privately-held company is derived from a recent transaction in the company’s own securities.”<sup>2</sup> The AICPA defines early-stage companies by stage of development. According to *Valuation of Privately-Held-Company Equity Securities Issued as Compensation*, the backsolve method should be considered regardless of which stage of development the company is in.<sup>3</sup>

The backsolve method models the equity value of the business as a series of “call options.” A call option is the right, but not the obligation, to purchase a stock at a specific price (the exercise price) at a specific date in the future. For example, suppose an investor has a call option on a stock with an exercise price of \$100. This gives him or her the right to purchase the stock at \$100 at a certain point in the future. If the stock price is below \$100, the option will expire worthless. If the stock price is \$120, the investor can exercise this option, purchase the stock for \$100, and earn a profit of \$20. This appears graphically in the next chart:

### Equity Value Is Similar to a Call Option

As indicated previously, at any price below \$100, the payoff of the option is \$0. At any price above \$100, the investor begins to earn a profit. This pay-off structure also applies to the equity value of a business. If a liquidity event occurred, the common shareholders would not receive any cash until the preferred shareholders receive their liquidation preference. In the preceding example, if the liquidation preference for the preferred shareholders was \$100, the common shareholders would receive nothing unless the value of the business exceeded \$100. Due to the similarities in the pay-off structure between an option holder and an equity holder, an option model can be used to determine the implied equity value of the business.

Therefore, we proceeded to determine the implied value of Software Startup based on The Company’s actual sale of Series-A Preferred units using the backsolve method. The steps that are required to apply this methodology are as follows:

- Step 1—Identify “breakpoints”
- Step 2—Estimate required inputs for option pricing model
- Step 3—Calculate enterprise value of the business
- Step 4—Apply premiums or discounts, or both, for control and marketability (if necessary)

#### Step 1—Identify “Breakpoints”

A *breakpoint* is the equity value at which the recipient of the sale or liquidation proceeds changes. In the preceding call option example, if the liquidation preference for the preferred shareholders is \$100, this would represent a breakpoint because at any point above \$100, the common shareholders begin to share the equity value of the business. In order to determine the breakpoints for the equity value of Software Startup, we must analyze The Company’s Operating Agreement (The Agreement) to determine the liquidation preferences for the various classes of equity. A summary of The Agreement is as follows:

**Classes of units:** The Company has two classes of membership units: Common Units and Series-A Preferred units. Each Series-A Preferred unit is convertible at a one-to-one ratio. This ratio can change if an additional round of equity financing occurs.

<sup>2</sup> *Ibid*, 223-224.

<sup>3</sup> *Ibid*, 97-101.

(continued)

### EXHIBIT 25.4 Backsolve Method *(continued)*

**Voting rights:** A majority vote of more than 50 percent of the unit holders is required to approve most matters. However, a supermajority vote of 70 percent of the unit holders is required to approve a sale of 5 percent or more of the business, borrow funds in excess of \$250,000, and change Software Startup's primary line of business. Furthermore, a supermajority vote is required to elect managers of The Company.

**Distributions and liquidation preferences:** Distributions of cash flow and proceeds from a liquidation or sale of the business are made in the following order:

1. Series-A Preferred Units. The liquidation preference for the preferred unit holders, which is equal to the initial capital contribution less any distributions received. In this instance, the common unit holders will not be paid until the preferred unit holders receive \$499,995.
2. Common Units. After the preferred unit holders recover their initial capital investment, the common unit holders are entitled to a catch-up accrual. A *catch-up accrual* is defined as "an amount equal to the amount distributed to each Series-A Preferred Unit then outstanding in connection with such Series-A Preferred Unit Distribution." A Series-A Preferred distribution can be a distribution of cash flow or a payment of proceeds in the event of liquidation. Therefore, once the preferred unit holders receive \$499,995, the common unit holders would be entitled to receive all amounts over and above \$499,995 until the amount of the total sales proceeds reaches \$999,990.
3. Pro rata. Once the preferred-unit holders receive their liquidation preference and the common unit holders receive their catch-up accrual, all amounts thereafter will be allocated pro rata based on percentage ownership. Therefore, any amounts over and above \$999,990, shall be distributed pro rata.

Based on our analysis of The Agreement, we determined that the breakpoints are as follows:

1. Liquidation Preference for Preferred Units 499,995
2. Catch-Up Accruals for Common Units 999,990

The payout structure appears graphically as follows:

#### Step 2—Estimate required inputs for option pricing model

The most widely accepted option pricing model is the Black-Scholes-Merton (BSM) option pricing model. The BSM model requires the following inputs:

**Exercise Prices**—We determined that the equity structure of Software Startup has two breakpoints: \$499,995 (Series-A Preferred Liquidation Preference) and \$999,990 (Catchup Accruals for the common units). These breakpoints will be the exercise prices in the option model.

**Term**—The BSM model requires an assumption about the term of the option. In this instance, the term needs to reflect the estimated amount of time that it would take Software Startup to reach a liquidity event. Median periods to liquidity were located in *Ernst & Young's Venture Capital Insights*®—2014. According to this publication, the median time to liquidity via initial public offering for United States-based companies ranged from 5–10 years, while the median time to liquidity via merger or acquisition ranged from 3–7 years from 2004 through June 2014. Furthermore, according to Software Startup's investor presentation, the performance target was 5 to 10 times the original investment within 5 years for the preferred units. Based on this information, a term of 5 years was selected for this analysis.

### EXHIBIT 25.4 Backsolve Method

**Volatility**—The BSM model requires an input for volatility, which is an indicator of the amount of variation in a stock price over a certain period of time. Since Software Startup’s units are not publicly traded, we turned to publicly-traded proxies.

We searched PitchBook/BVR’s Guideline Public Company Comps Tool for publicly traded companies that could be used as a benchmark for volatility for Software Startup. The search criteria were as follows:

- The company had to be classified under one of the following industry categories:
  - Information Technology—Software
  - Information Technology—Other
  - Standard Industrial Classification Code (SIC) 7374—Computer Processing and Data Preparation and Processing Services
  - SIC 7375—Information Retrieval Services
  - SIC 7372—Prepackaged Software
  - SIC 7379—Computer Services, Not Elsewhere Classified
- Revenues—We searched for companies with revenues of no more than \$25 million in order to develop a composite consisting of companies of similar size to Software Startup.
- Stock Price—The Company’s stock had to trade above \$1 on every trading day over the past five years or since inception, if five years of trading activity was not available.
- Companies that lacked sufficient volume and trading history were eliminated.

Our search returned seven companies that met our criteria. For each of these companies, volatility was calculated as the annualized standard deviation of daily stock returns for the five years leading up to March 15, 2013, the approximate date for the transaction. The average and median volatilities for these companies were 105.2 percent and 98.2 percent, respectively. We then compared Software Startup’s financial performance to those of the companies included in the composite. Although Software Startup was smaller, The Company was less leveraged than most of the companies included in the composite. Therefore, we used the median percentile volatility of 98.2 percent to account for Software Startup’s favorable leverage position.

**Dividends**—We assumed no dividends, as it was assumed that Software Startup would be reinvesting its cash flow over the next several years.

**Risk-Free Rate**—A risk-free rate of 0.84 percent was used, which was the rate of return for a five-year Treasury Note as of March 15, 2013.

#### Step 3—Calculate the enterprise value of the business

Once we determined the assumptions, we created the valuation model to determine the implied equity value of Software Startup based on The Company’s sale of Series-A Preferred units. The valuation model is summarized in the following chart:

		Enterprise Value	Breakpoint 1	Breakpoint 2	Residual
<b>INPUTS VARIABLES</b>		???	???	???	
Stock Price As of:					
Excise Price:		\$ 499,995	\$ 999,990		
Term (In Years):			5	5	
Volatility (Annual):			98.25%	98.25%	
Annual Rate of Quarterly Dividends:			0%	0%	
Risk Free Rate:			0.84%	0.84%	
Call Option Value			-	-	
Incremental Call Option Value			-	-	
Series A Preferred Stock			100%	0%	10.00%
Common Stock			0%	100%	90.00%
<b>Total</b>			<b>100.00%</b>	<b>100.00%</b>	<b>100.00%</b>
Series A Preferred Stock	499,995		-	-	-
Common Stock	???		-	-	-
<b>Total</b>	<b>???</b>		-	-	-

We solve for what is the implied enterprise value of the business based on a Series-A Preferred Stock sale of \$499,995?

(continued)

**EXHIBIT 25.4 Backsolve Method** *(continued)*

The Series-A Preferred equity had a value of \$499,995 as of March 15, 2013. However, this does not tell us what the value of the business was as of that date. We need to solve for this figure based on the rights and liquidation preferences of the various classes of equity and the assumptions in the option pricing model. The items highlighted in yellow reflect the assumptions of the option pricing model. Because we determined that there are two breakpoints, we needed to calculate the value of two different options; the first with an exercise price of \$499,995 and the second with an exercise price of \$999,990. Once we calculated the values of these options, the residual value could be determined, resulting in the amount that would be distributed to all of the members on a pro rata basis. Solving for the equity value of the business results in the following:

		Enterprise Value	Breakpoint 1	Breakpoint 2	Residual
Stock Price As of:		2,780,127	\$ 2,780,127	\$ 2,780,127	
Exercise Price:			\$ 499,995	\$ 999,990	
Term (In Years):			5	5	
Volatility (Annual):			98.25%	98.25%	
Annual Rate of Quarterly Dividends:			0%	0%	
Risk Free Rate:			0.84%	0.84%	
Call Option Value			\$ 2,516,521	\$ 2,363,888	
Incremental Call Option Value		2,780,127	\$ 263,606	\$ 152,632	\$ 2,363,888
Series A Preferred Stock			100%	0%	10.00%
Common Stock			0%	100%	90.00%
Total			100.00%	100.00%	100.00%
Series A Preferred Stock	499,995		\$ 263,606	\$ -	\$ 236,389
Common Stock	2,280,132		\$ -	\$ 152,632	\$ 2,127,499
<b>Total</b>	<b>\$ 2,780,127</b>		<b>\$ 263,606</b>	<b>\$ 152,632</b>	<b>\$ 2,363,888</b>

**Backsolve Method (as of 3/15/13)**

Based on the rights of the common and preferred units and the assumptions in the option pricing model, the implied enterprise value of Company was \$2,780,127

Based on the rights and preferences of the common and preferred units and the assumptions in the option pricing model, the implied equity value of Software Startup was \$2,780,127 as of March 15, 2013. The preceding calculations can be explained as follows:

1. The first row represents the implied equity value of the business based on a value of the preferred equity of \$499,995. This is the value that we solved for.
2. The yellow highlighted items are the assumptions that were input into the option pricing model.
3. Based on the assumptions, the values of the call options were calculated at each breakpoint. At the first breakpoint, the value of the call option is \$2,516,521. At the second breakpoint, the value of the call option is \$2,363,888.
4. Next, we calculated the incremental option value at each breakpoint. At the first breakpoint, the incremental option value was calculated as the equity value of the company (\$2,780,127) less the value of the option (\$2,516,521) representing an incremental option value of \$263,606. At the second breakpoint, the incremental option value was calculated as the option value at the first breakpoint of \$2,516,521 minus the value of the second option of \$2,363,888, resulting in an incremental option value of \$152,632. Once the incremental option values are allocated to each breakpoint, the residual can be calculated as the equity value of The Company minus each of the incremental option values.
5. The incremental option values and the residual amount were then allocated at the various breakpoints based on the liquidation preferences for the various classes of equity. At the first breakpoint of \$499,995, the preferred unit holders will receive 100 percent of the proceeds. Thereafter, up until the equity value reaches \$999,990, the common unit holders will receive 100 percent of the proceeds. Finally, the common and preferred unit holders will split the proceeds pro rata based on percentage ownership. At this stage, the preferred unit holders share 10 percent of the remaining proceeds, while the common unit holders share 90 percent.
6. Once the option values and the residual amounts are allocated among the various classes of equity, the amounts were totaled to derive the total equity value of The Company. As indicated previously, the amount allocated to the preferred unit holders totals the \$499,995 purchase price. The amount allocated to the common unit holders totals \$2,280,132. Summing these amounts results in a total equity value of \$2,780,127 for Software Startup as of March 15, 2013.

**Step 4—Apply premiums and discounts for control and marketability**

According to Software Startup's Operating Agreement, most major decisions require a majority vote of 50 percent or more of the unit holders, while a super majority vote of 70 percent is required for major actions such as the sale or liquidation of The Company. Therefore, the purchase price paid by the preferred unit holders is a minority interest because they purchased the units without any prerogatives of control. The preferred unit holders cannot appoint management, determine the amount of distributions, or sell or liquidate the business. Therefore, in order to reflect this transaction on a control basis, we applied a control premium to the implied equity value.

## EXHIBIT 25.4 Backsolve Method

We searched the Factset Mergerstat®/BVR Control Premium Study™ for data on acquisition premiums for SIC Codes 7372, 7375, and 7379 that took place between January 1, 2010 and March 15, 2013. The search returned 69 transactions with a median control premium of 31.5 percent.

Based on the data from Mergerstat, we applied a control premium of 31.5 percent to the implied equity value of \$2,780,127. This results in a control value of \$3,655,867 as of March 15, 2013.

The next step in the analysis is to bring this value forward to September 30, 2014. According to *Valuation of Privately-Held-Company Equity Securities Issued as Compensation*

In applying the backsolve method, a valuation specialist should consider any events that were known or knowable as of the valuation date, including significant value-creating milestones, that could affect the value of the enterprise and that have occurred since the latest financing round (or that are expected to occur prior to the next financing round, if the next financing round is pending).<sup>4</sup>

From 2012 to the latest 12-month period ended September 30, 2014, Software Startup's revenues increased from \$107,938 to \$944,471, nearly 9 times. The Company increased its number of customers from 6 to 35 over this time period. Based on these factors, we determined that it was necessary to bring the value of The Company forward to reflect the increase in the implied value from March 15, 2013 to September 30, 2014. We looked at rates of return over this time period for several alternative investments. These are summarized as follows:

Cambridge Associates U.S. Venture Capital Index®	38.05%
Duff & Phelps Industry Cost of Capital (SIC 7374)	35.25%
Duff & Phelps Industry Cost of Capital (SIC 737)	38.40%
<b>Average</b>	<b>37.23%</b>

Based on the rates of return earned over the 1.5-year period in similar industry investments, the implied value of Software Startup as of September 30, 2014 was calculated as follows:

Implied Equity Value - Minority, Nonmarketable as of 3/15/13		\$ 2,780,127
Control Premium	31.50%	\$ 875,740
Indication of Value—Control, Nonmarketable as of 3/15/2013		\$ 3,655,867
Factor to Bring Value Forward to 9/30/14		37.23%
<b>Implied Equity Value—Control, Nonmarketable as of 9/30/14</b>		<b>\$ 5,017,069</b>
<b>Rounded</b>		<b>\$ 5,000,000</b>

Based on the subject company transaction method, the value of Software Startup was determined to be \$5 million as of September 30, 2014.

<sup>4</sup> *Ibid.*, 30.

(continued)

**EXHIBIT 25.4 Backsolve Method** *(continued)*

Several methodologies were used to calculate the value of Software Startup as of September 30, 2014. These are summarized as follows:

<b>Income Approach</b>	
Discounted Future Benefits Method	\$5,200,000
<b>Market Approach</b>	
Subject Company Transaction Method	\$5,000,000
<b>Final Conclusion of Value</b>	<b>\$5,100,000</b>

In this instance, both indications of value result in approximately the same value. Therefore, in our opinion, the lost value of Software Startup as a result of the actions of the defendant was approximately \$5.1 million.

Upon reviewing the example in exhibit 25.4, it should become obvious that performing the backsolve method requires a thorough understanding of the liquidation preferences and rights of the common and preferred shareholders. The dividend rights, liquidation preferences, and features of the various securities included in the company's capital structure form the basis for constructing the option model. This valuation methodology can become more complicated when a company has debt in its capital structure or the preferred shares have some of the features that were discussed earlier in this chapter.

When performing the backsolve method, the valuation analyst should be aware that the model is only as good as its inputs. Option models are extremely sensitive to the volatility and time to expiration variables. Therefore, a slight change in the volatility or the assumed holding period could have a significant impact on the implied value. Furthermore, it should be noted that the intended purpose of these option models is not to value closely held businesses but, rather, derivatives. Nevertheless, this model can be a useful tool to derive an indication of value for an early stage company, especially when the company's forecasts are unreliable and limited market data is available.

## Income Approach

When valuing early stage companies, the application of the income approach typically begins with analyzing business plans and forecasts that have been prepared by management. Refer to chapter 8 of this textbook for a complete discussion on forecasting and the factors that need to be considered when evaluating a forecast prepared by management.

The challenge in performing an income approach for an early stage company is that the valuation subject typically has a limited operating history and an unproven product and market. In certain instances, there may not be any companies or benchmark data available to assess the reasonableness of the projected profitability, capital spending, and working capital needs. Based on these factors, forecasts for early stage companies contain a significant amount of risk and uncertainty. There are two primary ways that the valuation analyst can account for these risks and uncertainties: 1) in the income stream or 2) in the discount rate.

When using an income approach to value an early stage company, one way to capture the risks and uncertainties is to perform various forecast scenarios and analyze the impact that changes to key variables have on value. These key variables can include the timing of when the company is expected to begin to generate revenue and the growth rates for revenues and operating expenses. One factor that valuation analysts need to consider is how long the company can continue to incur losses before an additional round of financing is needed. Start-up companies typically burn cash rapidly because these companies have significant working

capital and capital spending needs and incur significant overhead expenses before generating any revenues. As a result, when forecasting future cash flows for early stage companies, valuation analysts typically have to build the additional financing and required repayments into the valuation model.

At my firm, we typically perform best case, worst case, and most likely scenarios when forecasting future cash flows for early stage companies. In this instance, the worst-case scenario is usually a failure scenario in which the subject company does not hit its milestones, does not obtain any additional financing, and runs out of cash. Depending on the complexity of the forecast, we could end up with over 10 different forecast scenarios. When performing a scenario analysis, be careful not to double count the risks that have been captured in the cash flow streams in the discount rate.

Another manner in which to account for the risks and uncertainty in the forecasts of early stage companies is by accounting for these risks in the discount rate. Over the years, several studies of venture capital rates of return have been performed. A summary of these studies is presented in box 25.2.

<b>BOX 25.2</b>		<b>Venture Capital Studies</b>			
Stage of Development	Plummer <sup>1</sup>	Schleris and Sahlman <sup>2</sup>	Sahlman and Others <sup>3</sup>	Wetzel <sup>4</sup>	Ruhnka/Young <sup>5</sup>
Start-Up	50%-70%	50%-70%	50%-100%	50%	54.8%-73%
First Stage or Early Development	40%-60%	40%-60%	40%-60%	37.50%	42.20%
Second Stage or Expansion	35%-50%	30%-50%	30%-40%	30%	35%
Bridge/Initial Public Offering (IPO)	25%-35%	20%-35%	20%-30%	22.00%	35%

 5 Ruhnka, J.C., and J.E. Young, 1991, Some Hypotheses about Risk in Venture Capital Investing. *Journal of Business Venturing* 6(2), 115-133.

The rates of return that appear in box 25.2 can be used as a starting point to deriving a discount rate for an early stage company. However, valuation analysts should use caution when relying on this data because some of these studies were performed over 20 years ago. There are various indexes that track rates of return for venture capital funds, including the Cambridge Associates U.S. Venture Capital Index.<sup>®</sup> However, these indexes typically track venture capital funds, which are diversified portfolios of venture capital investments. A portfolio of investments is less risky than a stand-alone early stage company. When performing a risk analysis for an early stage company, the valuation analyst should rely on as many sources as possible.

## Conclusion

Valuation analysts often encounter valuation engagements of other unique securities. At my firm, we have even valued legal settlements and loan guarantees. Life as a valuation analyst is a never-ending learning experience. When performing a valuation assignment of any kind, the valuation analyst should always keep in mind that the value of any asset is the present value of the anticipated future benefits that the asset is expected to generate, discounted by a rate of return that is reflective of the risk of the projected future benefits. With respect to the more complex valuation assignments, the various models should be looked at as tools that can assist the valuation analyst in forming a well-supported conclusion of value.

# Chapter 26

## Economic Damages

### Learning Objectives

In this chapter, I will attempt to explain the following:

- The similarities of an economic damages analysis to a business valuation assignment
- Types of economic damages claims
- How to perform a lost profits analysis
- Different methodologies available to perform a lost profits analysis
- Other types of damages measurements

### Introduction

Business damages can arise from many different situations, and it would be nearly impossible to cover every variation that the CPA, economist, or valuation analyst will encounter. Some damages may relate to lost profits, whereas others may relate to the diminution in value of the business enterprise. This chapter is intended to address some of the principles of business damages from the perspective of the CPA expert. In many instances, the services offered in this area of practice are similar to the application of business valuation techniques. For example, in a lost profits analysis, the expert may need to project the future income that might have occurred *but for* the actions of the defendant in the litigation. These lost profits are then discounted to present value. This should sound like the same process that I discussed in the application of a multi-period discounting model.

This type of service can also involve the valuation of the business enterprise if it was completely destroyed. Sometimes, both lost profits and lost business value may be applicable in the same assignment. The expert must be careful not to double count the elements of damages when doing this stuff. I will explain more about this in a little while.

Although this book is certainly not intended to cover all aspects of economic damages, I decided to add this chapter because many who offer business valuation services, particularly in a litigation setting, also are requested, from time to time, to address economic damages. As an expert, you are, once again, faced with finding out about the case law in the jurisdiction of the litigation. The expert should work with the client's attorney to get the most relevant cases. Enough of the introduction stuff—let's get on to the meat and potatoes.

### Lost Profits

A business enterprise may suffer lost profits when, as a result of someone's actions, any of the following takes place:

- Revenues are lower than they would have been had the act not occurred.
- Costs are higher than they would have been had the act not occurred.
- Some combination of revenues being lower and costs being higher.

## Elements of a Lost Profits Claim

I'm no lawyer, but let me provide some background on this stuff from my perspective. However, checking with a lawyer about this stuff would still be a good idea. In order to claim lost profits, a plaintiff must generally prove the following:

- The defendant breached a legal duty to the plaintiff.
- The defendant's actions or failures to act damaged the plaintiff.
- The plaintiff's damages are directly related to the defendant's actions or failures to act.

### Breach of a Legal Duty

A claim for lost profits can arise from either a broken contract between two parties, or a *tort* (that's "tort" and not "tart"—a tart is something you eat!). A breach of contract claim involves the alleged breach of an agreement between the parties. For example, a company might sue a general contractor for its lost profits due to the contractor's delay in completing renovations on the company's facility. A sales person may sue a manufacturer for breaching its exclusive marketing agreement in the designated territory. A medical group might sue a former employee/doctor for violating a non-compete agreement. The most common types of contractual disputes that lead to lost profit claims are listed in box 26.1. In a tort claim, the plaintiff accuses the defendant of owing a legal duty to the plaintiff and that the defendant breached that duty. For example, a self-employed individual might sue a gas company for the profits lost as a result of an explosion caused by the gas company's negligent repair that destroyed the plaintiff's business. I performed an assignment involving a pizza shop that got blown up because the gas company goofed. A movie studio might sue a movie critic for its lost profits resulting from the critic's malicious attempt to damage the movie studio by printing false allegations rather than honest opinions. See, if the movie really stinks, it is okay to say it. Honesty is a defense. However, you cannot just say the movie was horrible if the intent is to intentionally get others not to go and see it. The most common types of torts that lead to lost profit claims are listed in box 26.2.

BOX 26.1	Breaches of Contract That May Lead to Lost Profit Claims	BOX 26.2	Torts That May Lead to Lost Profit Claims
	<ul style="list-style-type: none"> <li>• Agency agreements, such as manufacturer's sales representatives</li> <li>• Breaches of express or implied warranties</li> <li>• Construction contracts</li> <li>• Non-compete agreements</li> <li>• Employment contracts</li> <li>• Failures to pay or provide services</li> <li>• Franchise agreements</li> <li>• Insurance contracts</li> <li>• Real estate transactions</li> <li>• Sales of businesses</li> <li>• Sales of goods (to which the Uniform Commercial Code may apply)</li> <li>• Sales of stock</li> </ul>		<ul style="list-style-type: none"> <li>• Acts of simple or gross negligence</li> <li>• Conversion or theft of funds</li> <li>• Damage to income producing property</li> <li>• Defamation</li> <li>• Fraud (for example, when a supplier pays kickbacks to a company's employees resulting in higher costs)</li> <li>• Intentional interference with business or contractual relationships</li> <li>• Malicious prosecution</li> <li>• Patent or trademark infringement</li> <li>• Professional malpractice</li> <li>• Unfair trade practices</li> </ul>

### Causation

The second element of a lost profits claim is causation. Whether a claim relates to a tort or a breach of contract, the plaintiff must prove that the defendant's actions caused the damage to the plaintiff. Although causation may seem obvious, proving this element of damages can frequently be challenging. For example, assume a defendant admits responsibility for the fire that closed the plaintiff's hardware store for six months. Also, assume, however, that The Home Depot opened across the street from the plaintiff's business six weeks before the fire. Although the plaintiff can demonstrate that the business was closed for six months and the lost profits during this period of time, the amount of profits lost due to the fire, and the amount of profits that would have been lost in any event due to the increased competition, is a matter of great uncertainty. I used

to get calls from business owners who wanted damages based on a claim that the telephone company left an ad out of the telephone book. Think about how to prove that there is a direct link between the ad being left out and the loss of earnings for the business. Unless really good records are maintained by the business about where customers come from, this is not easy. The more important question for many of the readers of this book is have you ever seen a telephone book? It was something that came in white and yellow pages and has mostly been replaced by the Internet.

## Damages Must Be Directly Related to the Defendant's Actions

The third element of proof that must be demonstrated by the plaintiff is the amount of damages that are directly related to the defendant's actions. This causal relationship is sometimes referred to as the *but for* rule. In other words, *but for* the actions of the defendant, the plaintiff would have made an additional \$2 million in profits. *But for* the defendant's negligence, the plaintiff would not have incurred \$650,000 in replacement costs and property damage. *But for* the breach of the contract, the plaintiff would have earned royalties of \$300,000. *But for* writing this book, I would be spending more time on vacation. (I'm only kidding! I would not let this book interfere with my vacations!)

In theory, a well-prepared *but for* analysis of the plaintiff's claim calculates the limit of damages related to the defendant's actions. However, even though we think the client got royally shafted, the law rarely allows the plaintiff's recovery to go that far. For example, assume a dairy farmer intentionally pollutes a competing dairy farmer's land in hopes of driving him out of business. The polluter does not know, however, that the competing farmer has a heart condition and that, upon seeing hundreds of his cows lying dead in the field, he has a heart attack and drops dead himself. There is probably no question that the polluter breached a legal duty to the poor guy who died and that his actions are what caused the decedent's loss of profits on the sale of dairy products, as well as his death. However, the law generally allows the decedent's estate to only recover for his loss of profits because the decedent's death was not a foreseeable consequence of polluting the field. Therefore, it can be said that damages are directly related to an act when they are foreseeable. You have to love this legal stuff to do these assignments. Some guy causes another guy to croak and the jury has to worry about his lost profits because of dead cows. So what if he had a heart attack along the way!

## Types of Damages

A typical lawsuit includes many types of damages. Some damages that might be awarded are classified as either *compensatory* or *punitive*. Damages can be compensatory or punitive in nature, depending on whether they are awarded as a measure of actual loss suffered or punishment for the behavior of the defendant. Let's hang the guy who killed the cows. Compensatory damages consist of what are referred to as *general* and *special damages*.

Consequential damages represent a special type of compensatory damages. *Consequential damages* do not flow directly and immediately from the act of the party but only from some of the consequences or results of the act. Lost profits as discussed in this chapter are consequential damages.

## The Lost Profits Analysis

Experts will frequently participate in many types of lost profits cases. Because the rules of recovery will vary from one jurisdiction to the next, and from one type of case to the next, the specific procedures that the expert will apply will also vary from case to case. The expert needs to make sure that he or she is working with a lawyer when he or she does this stuff. Many similarities are common to all lost profits engagements. In fact, the procedures that should be applied are basically the same, regardless of the facts of the case. (Dead cows, lost sheep, who cares!) Let's discuss the procedures for a lost profits analysis.

## Meet With the Client and Client's Attorney to Determine the Objectives of the Assignment

A good place to start is at the beginning. Sometimes, I start in the middle, but I get confused and lose track of what I am doing. It doesn't take a genius to realize that the plaintiff and the defendant have different objectives in the case. The plaintiff seeks to maximize the damages of his or her claim (the dead farmer's family wants lots of money or maybe revenge), whereas the defendant seeks to minimize or deny damages (the cows would have died from foot and mouth disease, so I did that farmer a favor). The expert's job in working with the plaintiff's attorney is to develop a carefully reasoned, well-justified damages estimate using accepted methodology in the field that will withstand pointed cross-examination and potential challenge by the other side. In other words, no "junk science" type of stuff.

In working with the defendant's attorney, the expert's job is to challenge the estimate prepared by the plaintiff's expert when it does not meet these objectives. For example, a four-month old business gets destroyed from an explosion at the business next door. The owners of the destroyed business purchased the assets four months ago for about \$200,000. The expert for the plaintiff calculates damages for this four-month old business totaling \$7 million. If you were working for the defendant's attorney, your job would be to show how absurd the other expert's opinion is. Think about it: a four-month old business, with no history, and an investment of about \$200,000 with damages of \$7 million? What is wrong with this picture?

## Determine the Known Facts and Assumptions of the Case

The client will usually have a pretty good idea of what is going on in the case, including details of the contract that was breached (or the nature of the tort that was committed) and the extent of financial damages that have been incurred. Therefore, the expert should discuss the known facts of the case with the client and the client's attorney as a means of gaining an overview of the situation.

If the expert ends up testifying to this stuff, he or she will probably have to make a series of assumptions. It is really important for the client's attorney to know all the key assumptions, as well as the basis for those assumptions. I like to lay them out in my report so that my process is clear to the reader of my report. This is not too different from including assumptions when the valuation analyst prepares a forecast. Common assumptions that the damages expert may rely on include the following:

- Assumptions about the facts
- Assumptions involving the opinions of other experts
- Economic and financial assumptions

## Assumptions About the Facts

Depending on the case, the expert will obtain certain information that is purported to be factual and be asked to assume it is correct. Generally, the attorney will give this stuff to the expert or the expert may pick it up by reading the complaint that alleges what happened. Sometimes, the information will be presented during a deposition or trial testimony. Some of these facts may need to be verified. The expert will have to use his or her judgment to decide which of these to verify.

## Assumptions Involving the Opinions of Other Experts

Additional experts may be employed to analyze different aspects of the damages claim. Other experts may include valuation analysts, industry experts, and engineering experts, among others. It may be necessary to consolidate all of these other opinions into an overall conclusion of the amount of damages.

## Economic and Financial Assumptions

A damages expert may also have to make general economic and financial assumptions in the analyses. This is the same stuff that we do in a business valuation assignment: research and support the assumptions.

## Plaster Your Files With Support

Documentary evidence is a critical element of all litigation services, including those involving lost profits. The expert must make sure that his or her working papers are loaded with support. The primary source of the documentation may be the plaintiff's business records. If the expert is representing the plaintiff, getting these records will generally not be a problem (unless, of course, the job is like the pizza joint that I did, where the records all got blown up in the explosion). If, however, the expert is engaged to represent the defendant, his or her client's attorney may need to use a request for production of documents or a subpoena to get this stuff. There should be some documentation that is available to everybody, including the following:

- The plaintiff's verified complaint, the defendant's answer, all counterclaims, and all third party demands.
- The answers to all interrogatories and requests for production of documents of all parties to the proceeding.
- Transcripts of the deposition testimony of all parties and witnesses.
- The plaintiff's financial and tax information for a period of years before the breach or tort occurred and for all subsequent periods through the present. This information would include income tax returns, sales tax returns, payroll tax returns, quarterly and annual financial statements, adjusted trial balances and detailed general ledgers (including adjusting journal entries), accounts receivable and payable subsidiary ledgers, depreciation schedules and other fixed asset reports, business plans and financial forecasts, loan documents and agreements, contracts involving the sales of assets, lease agreements, employment contracts, and all of the other stuff that we discussed in the valuation checklist in chapter 3.
- Copies of reports and working papers prepared by other experts involved in the litigation.

Usually, this type of financial information will only be provided for the plaintiff. This information is typically not needed for the defendant's business because the claim relates to the plaintiff's loss of profits. However, sometimes the damages expert may be able to measure the plaintiff's lost profits from the defendant's results of operations. For example, the defendant may have breached an agreement not to compete against the plaintiff for a period of time in a specified area. The easiest way for the plaintiff to prove its loss of profits may be to determine the amount of profits made by the defendant during the prohibited time in the prohibited location. Obviously, in this case, the plaintiff must have access to the defendant's records in order to prove the amount of the defendant's profits. This usually requires the lawyers to do their thing. No one seems to voluntarily turn over these records.

## Obtaining Documents and Records From the Opposing Side

The damages expert should ask for the records that will be required from the other side of the litigation to perform a proper analysis. Documents and records may be obtained from the other side by having the attorney send out a request for production of documents. This is really no different than using an information request in a business valuation assignment. The damages expert may need some different types of records because of the nature of the case.

Sometimes, the other side will object to the production of the information on the grounds that it contains proprietary or trade secret information. For example, a damages expert may request the source code from a rival software company to prove the rival copied the plaintiff's source code. Disclosure of the source code will require the disclosure of proprietary and trade secret information. When this kind of information is involved, the damages expert may have to sign a confidentiality agreement, or be subject to a court-imposed protective order, limiting the use of the materials to only the disputed issue. The protective order usually provides that the parties (including their attorneys and experts) will return all information produced subject to the order to the producing party at the conclusion of the litigation. In addition, a damages expert cannot blab about the substance of the information in any manner other than in using it to prove the claim or defense in the assignment. The damages expert must be careful not to violate a protective order. That's not a good thing.

## Should the Damages Expert Work With Original Documents or Copies?

Courts do not always require original documents to be presented as evidence. Generally, photocopies may serve as evidence unless the authenticity of a document is challenged. The client's attorney has to guide the analyst on this one. For example, in a lost profits case involving an alleged breach of contract, the defense may assert that the contract presented by the plaintiff has been forged or altered in some way. When one side to a dispute doubts the authenticity of a document that the opposing side presents as evidence, the court will usually insist that the original document, rather than a photocopy, be presented as evidence.

## Get Information From the Client and the Other Side

In addition to the written documentation, the damages expert can conduct management interviews aimed at getting more information that is needed to perform a proper analysis. This stuff begins to look like a business valuation assignment. Like I said before—it really is similar in many respects.

## Interviewing Client and Opposing Personnel

Rarely will a damages expert be able to draw accurate conclusions by only looking at a bunch of documents. It is also appropriate to interview client personnel. These are the folks who can provide explanations about the documents and answer any questions that the damages expert might have about the documents. Client interviews are especially important when the damages expert represents the plaintiff. Be careful, however, because the expert's client may provide information that, in many cases, needs to be reviewed for reasonableness. For example, a client tells the expert that *but for* the actions of the defendant the business could have achieved \$10 million in sales in the next two years. When the expert looks at the history of the business, the best year reflected sales of \$1.5 million. How realistic is the growth being forecasted if the expert finds out that the industry is expecting a downturn because of a change in a regulation affecting the use of the company's product?

In some cases, the damages expert may also be able to interview officers and employees of the other side. These interviews may help the expert to understand their positions. The interviews may enable the expert to uncover important information that should be considered in the analysis. If the damages expert can't interview officers or employees of the other side, there is no need to panic. The expert may have to depend on interrogatories and depositions to obtain needed information. The expert can get the information with the help of the attorney.

## Performing the Lost Profits Computation

Once the damages expert has received the documentation that has been requested (or at least once he or she realizes that they are not going to get any more documentation) and all of the interviews are completed, the damages expert should be in a position to start the number crunching. The assignment will probably require the damages expert to estimate the lost revenues, relevant costs, and determine if there is any appropriate mitigation of the damages. *Mitigation of the damages* is a legal concept that requires an injured party to do whatever is appropriate to reduce the ongoing damages. For example, if being fired from a job is the grounds for the damages, the injured party has an obligation to look for new employment, rather than stay unemployed and allow the damages to accrue. This process will also require the damages expert to determine these items by estimating the appropriate period of loss, possibly an appropriate discounting method, and the appropriate discount rate.

The specific components of the lost profits computation will vary somewhat from one engagement to the next, but damages experts will almost always be dealing with a pretrial and an after-trial component. The first step in computing lost profits is to determine the amount of lost revenues before the trial. This process also can be described as determining the revenues that the plaintiff could have earned *but for* the defendant's actions. There are three generally accepted ways to estimate lost revenues that can ultimately be used to calculate lost profits:

- The before and after method
- The yardstick method
- The *but for* method

## The Before and After Method

The simplest way to estimate revenues lost by the plaintiff as a result of the defendant's actions is to conduct a before and after analysis. Just like the name implies, the expert compares the plaintiff's revenues before the alleged breach or tort to the revenues after the event. Any reduction in revenues after the alleged breach or tort is presumed to be caused by the event. This, of course, assumes that the plaintiff's operations before and after the event were comparable, which requires the expert to analyze the business before and after the event to ensure comparability. Important differences (such as an owner who worked 60 hours per week in the business before the event and only works 20 hours per week after the event) should be considered in estimating the amount of lost revenues that relate to the event. The expert also should make sure that the business results are reported in a consistent manner. Somehow, our training as accountants gets us into this consistency thing.

To illustrate the use of the before and after method, assume John Smith is a salesman for ABC Electronics and he breaches his employment contract by establishing a competing business on January 1, 2014. Mr. Smith's contract required him to provide services to the company through December 31, 2015. The contract also contained a three-year non-compete clause. Therefore, under the terms of the contract, Mr. Smith was not supposed to compete with ABC Electronics through December 31, 2018. Mr. Smith is liable to the company for any damages from the breach. Assume the company's gross revenues were \$14 million in 2013 (the year before Mr. Smith began competing with the company) and dropped to \$10 million in 2014. Further, assume that the company recruited and hired a new salesman on January 1, 2015, to take Mr. Smith's place, and revenues returned to \$14 million in 2015.

Before Mr. Smith's breach, the company had revenues of \$14 million. After Mr. Smith's breach, the company had revenues of \$10 million. Under this fact pattern, it appears that Mr. Smith's actions caused the company to lose \$4 million of revenues in 2014. Damages in subsequent years were mitigated by the fact that the company hired a replacement for Mr. Smith in 2015, resulting in revenues returning to \$14 million in 2015. The *before and after* approach gives a quick and easy approximation of the amount of revenues lost by the company as a result of Mr. Smith's breach of contract. This, of course, assumes that all else remained constant during this time.

As a real-life example, we were once engaged to calculate the damages suffered by a business in the refuse industry (garbage pick-up) that had lost a portion of its customer base as the result of former employees downloading and distributing the company's customer list to a competitor. We determined that the before and after method was the most appropriate way in which to calculate lost profits in this matter. Damages were calculated by starting with the amount of revenues lost by the business and subtracting those expenses that would no longer be incurred by the company as a result of no longer having those revenues.

We began by analyzing information related to the company's lost customers. We determined that the best way to calculate damages was to first group the customers into different categories. Lost customers were broken down into the following categories:

- *Lost customers versus price roll-back customers.* In addition to losing a portion of its customer base, the company had other customers that forced it to reduce its prices for its services as the result of the alleged actions of the defendants. Therefore, we separated the company's customers into two categories: lost customers and price roll-back customers.
- *County.* We calculated damages separately for each of the three counties in which the company either lost customers or were forced to reduce its prices for its retained customers.
- *Cancellation notes.* Some customers cited service as a reason for the cancellation of its contract with the subject company. For these customers, we were unable to determine whether they changed service due to the alleged actions of the defendants or because of service issues with the subject company. Therefore, we categorized customers that had service notations separately.
- *Garbage truck type.* The type of garbage truck makes a difference in the expense structure and, therefore, requires separate calculations for each. In this instance, the business operated two types of trucks: front-load and rear-load. Oh, the things that we learn by being an expert!

The next step in our analysis was to determine the annual lost revenues. Because the company had less than one year of operating history available, we reviewed the monthly payments made by the customers, determined which appeared to be normal ongoing payments, and determined the average monthly revenue for that customer. We then annualized that amount.

The average lost revenues were calculated differently for the lost customers and the price roll-back customers. For lost customers, we calculated the monthly revenues that the company received prior to cancellation. For the price roll-back customers, we calculated the difference between the average monthly revenues before the roll-back minus the average monthly revenues after the roll-back. We calculated lost revenues over a 9.2-year period. In this instance, the company had an expert who would testify that the average customer life for this type of business was 9.2 years.

Once lost revenues were calculated, we had to determine the saved expenses to offset these revenues. For lost customers, incremental expenses were allocated to the revenues based on truck type. For price roll-back customers, no expenses were allocated because the company continued to have the same expenses for each one of these customers.

In calculating expenses, we analyzed the historical financial statements for the company and identified all variable and fixed expenses. We then reviewed these items further to determine those expenses that would be incremental to a damages analysis. After identifying these expenses, we then addressed labor costs, which were calculated separately from other operating expenses. First, we determined labor costs per hour from the company's internal financial reports. After that, we calculated labor costs as a percentage of revenues broken down by county, type of truck, and for all identified customers lost.

After performing this analysis, we calculated total lost profits consisting of the following three categories within each of the three counties:

1. Lost profits related to lost customers for front-load trucks
2. Lost profits related to lost customers for rear-load trucks
3. Lost profits related to price roll-back customers

After calculating lost profits for each county, we combined these totals and discounted them to present value to arrive at a total damages figure.

The preceding example shows the type of detailed analysis that is required in order to properly apply the before and after method. In this assignment, we had to analyze the company's historical sales and expense data into various groupings in order to ensure the proper matching of revenues and expenses. In addition, we had to make sure that the customers being included in our damages calculations were, in fact, customers that were lost or experienced price reductions due to the alleged actions of the defendants.

## The Yardstick Method

Another common approach to estimating revenues lost in this type of litigation assignment is known as the yardstick method. This method compares the plaintiff's earnings against those of a similar business, product, or comparable measure. Let's assume from an earlier example that the company demonstrated that Mr. Smith's 2014 and 2015 revenues were derived from former customers of the business. These revenues may approximate the amount of revenues the business lost as a result of Mr. Smith's breach of contract.

The best "yardstick" for a closely held business is a business of similar size and nature in the same geographic area as the plaintiff. If the plaintiff has multiple locations, the expert can compare a related entity's results of operations to the plaintiff's. The plaintiff's competitors are also a good source of comparative information, but they will not usually disclose confidential financial information. If the competitors are public companies, the

expert can use the great skills that were discussed in chapter 9 to find good guideline public companies. This also can be a perfect time to use Microbilt's Integra database. Gee, we can really get our money's worth from this product if we use it for all the different types of engagements that we perform (and no, I still do not own a piece of the database).

The biggest challenge in performing the yardstick method is identifying a company that is similar enough to the subject company to use as a basis for comparison. In one instance, we were involved in a litigation in which the opposing expert used a multimillion dollar public company that had a market share of over 80 percent as a yardstick for an unproven start-up company. These types of comparisons demonstrate a lack of understanding of the growth cycle of a start-up business. I will go into more detail about this example when I discuss the common errors made by damages experts.

### The *But For* Method

The methods already discussed can be used when the facts are fairly straightforward and the amount in controversy does not justify a more precise estimation of the revenues lost by the plaintiff *but for* the actions of the defendant. The problem with those methods is that they do not always consider other factors that might increase or decrease the amount of the plaintiff's lost earnings. To illustrate again using the ABC Electronics example, if Mr. Smith had not breached his employment contract, the revenue of the company could have far exceeded \$14 million in 2014 and 2015. Mr. Smith's efforts could have increased the company's customer base, leading to new referral business. What might really happen is that the other sales people's attention might be diverted from the business to help the attorney make the case for the lawsuit against Mr. Smith. On the other hand, other factors that reduced the company's revenues may have nothing to do with Mr. Smith's departure. For example, a change in the economy could have also reduced sales.

In a perfect world, a good *but for* analysis will consider as many of the potential factors as possible working in concert with each other that affect the plaintiff's earnings during the period under consideration and will, in turn, segregate those that were caused by the defendant from those that were not. This sometimes is easier said than done.

Exhibit 26.1 includes a *but for* analysis that we performed in a case of a supplement company that sued its supplier for manufacturing defective products. As you will see in this report, our report contained a detailed trend analysis of the sales of defective products and also incorporated industry data into the lost sales forecast.

#### EXHIBIT 26.1 The Lost Profits Analysis

The next element of damages results from Protein Supplements, Inc. being unable to sell recalled products. As a result, The Company lost its ability to continue to earn profits and build its brand.

We started our analysis by considering the products that were recalled. In order to properly identify these items within Protein Supplements, Inc.'s accounting system, we first had to determine the proper SKU numbers that were being used for these products. In order to determine the lost profits, we started our analysis by reviewing the potential revenues that would have been earned *but for* the actions of Supplement Manufacturing Company. Therefore, we reviewed the monthly sales data for the recalled and predecessor products for the same SKU numbers back to 2007. We summarized this data by month. It should be noted that the September 2011 sales reflected in this table are for a partial month because the recall took place at that time.

(continued)

Graphically, the historical sales trend, although somewhat flat, started to significantly increase in 2011. As a result, we had to determine an appropriate methodology to use to forecast what the future sales would have been *but for* the actions of Supplement Manufacturing Company. That would be the starting point of our lost profits analysis.

**EXHIBIT 26.1 The Lost Profits Analysis**

Because the data had been relatively flat and then quickly accelerated in the most recent period, we felt that a linear regression model would overestimate the potential sales going forward. Instead, we decided that a moving average of this data would have the impact of “smoothing” the data over time and provide a more meaningful analysis for a forecast. A moving average (also called a *rolling average* or a *running average*) is the average value of the previous “x” number of data points. For example, a 4-month moving average is the average sales of the most recent 4 months. A moving average smooths out fluctuations in the data and shows the pattern of a trend more clearly. We calculated moving averages ranging from 2–24 months to see which monthly moving average most accurately forecasted the annual sales of the recalled SKUs. The results are as follows:

**TABLE 2 Moving Average Analysis**

	2008	2009	2010	Jan.—Aug. 2011
Actual Sales	1,256,276	873,514	893,026	1,054,341

(continued)

**EXHIBIT 26.1 The Lost Profits Analysis** *(continued)*

The data contained in the preceding table is the actual data for Protein Supplements, Inc.'s sales of the 12 recalled products (and the predecessor products), as well as the moving averages that we calculated based on a 2- to 12-month basis. As a result of the significant upward trend during 2011, using a longer term moving average, results in a large margin of error when comparing the results to the actual sales figures. A similar error occurs in the 2009 data, when sales declined, because the moving average attempts to compensate for the decline in the sales. Given the upward trend in the sales leading up to the valuation date, we determined that the 2-month moving average would best capture the recent trends in The Company's sales of the recalled products.

The following graph illustrates the comparison of the actual sales with the moving average that we forecasted. The moving average takes the variability out of the forecast and provides a more stable estimate of near-term forecasted sales. The moving average forecast was extended through the end of 2013.

According to the expert report of John Smith of Professional Brands, Inc., it will take approximately three years for The Company to regain the level of brand awareness in the marketplace that was present before the recall had occurred, particularly because Protein Supplements, Inc. was without the recalled products for an extended period of time. Based on this information, we forecasted sales through the end of 2015. For the years 2014 and 2015, sales were increased by 4.54 percent per year; the forecasted growth rate for the nutrition and dietary supplement market from 2011–2016, according to *The US Nutritional and Dietary Supplements Market and Forecast to 2016: Edition 2012*, prepared by Ken Research.

Therefore, as a result of our analysis, the sales forecast from the date of the recall through the end of 2015 is shown in the following table.

**TABLE 3 Forecasted Revenues**

9/12/2001– 12/31/2011	2012	2013	2014	2015
\$981,151	\$2,608,914	\$2,613,964	\$2,732,638	\$2,856,700

**EXHIBIT 26.1 The Lost Profits Analysis**

The next portion of our analysis must now address what costs should be offset against the expected forecasted revenues.

Now that revenues for the recalled products have been forecasted, we must determine the gross profits that Protein Supplements, Inc. would have earned on these forecasted revenues. We analyzed sales and cost data for all the recalled products for the years 2010 and 2011, the period of time that Protein Supplements, Inc. was selling the Supplement Manufacturing Company products that were recalled. As shown in the following table, Protein Supplements, Inc. generated a gross profit margin of 30.5 percent, on average, on the recalled products during 2010.

**TABLE 4 2010 Gross Profit**

	Material	Invcd. qty	Cost	Sales	Gross Profit	Gross Profit (%)

20193.793	/Prol Pure Whey Straw 5Lb V3	5,391	114,089.76	198,961.29	84,871.53	42.7%
<b>Total Sales of Recalled Items for 2011</b>			<b>907,970.88</b>	<b>1,320,278.69</b>	<b>412,307.81</b>	<b>31.2%</b>

Gross profits were forecasted at a margin of 30.9 percent, the average gross profit margin on the recalled products for 2010 and 2011. Therefore, *but for* the actions of Supplement Manufacturing Company, had Protein Supplements, Inc. continued to sell the Supplement Manufacturing Company products, it is our belief that this average gross profit margin could have been maintained into the future. This is shown as follows.

**TABLE 6 Forecasted Gross Profit Margin**

2010	30.5%
2011	31.2%
<b>Average</b>	<b>30.9%</b>

**EXHIBIT 26.1 The Lost Profits Analysis**

We reviewed the financial statements of Protein Supplements, Inc. to determine if there were additional expenses that should be offset against the gross profit margin attributable to selling the recalled products. In our opinion, there were no other incremental expenses that could be directly allocable to these products. Because other products were sold to the same customer base, the other expenses were not avoidable. Therefore, the lost profits were unavailable for Protein Supplements, Inc. to use to cover many of the costs that had been covered using the contribution from the recalled products.

**TABLE 7 Lost Profits**

	9/12/11– 12/31/11	2012	2013	2014	2015
Sales	981,151	2,608,914	2,613,964	2,732,638	2,856,700
Gross Profit %	× 30.9%	× 30.9%	× 30.9%	× 30.9%	× 30.9%
<b>Loss Profits</b>	<b>302,875</b>	<b>805,354</b>	<b>806,913</b>	<b>843,547</b>	<b>881,844</b>

Lost profits were calculated by applying the 30.9 percent gross profit margin to the forecasted sales.

**Mitigation of Damages**

The plaintiff has a duty to mitigate its damages. This means that the plaintiff has a responsibility to do whatever it takes to reasonably overcome the damages caused by the defendant's breach or tort. In determining the plaintiff's lost earnings, the amount of earnings lost as a result of the plaintiff's failure to mitigate its own damages are not recoverable. The damages expert probably should speak to the client's attorney about this.

Returning to the ABC Electronics example previously discussed, the company mitigated its damages by replacing Mr. Smith on January 1, 2015. Had the company not replaced Mr. Smith, its claim for lost earnings might be reduced by the amount of money the replacement salesman could have generated over and above his or her salary and other benefits.

**Period of Recovery**

Because the plaintiff has a duty to mitigate damages, the plaintiff cannot expect to be awarded lost profits from the date of the harmful event until the end of time (although, I have seen some experts forecast damages until the plaintiff's great grandchildren might be born and become president). Somehow, forecasts of lost earnings for the next 62 years may be hard to support. The plaintiff is entitled to recover earnings lost as a result of the defendant's actions for that period of time directly related to those actions. The shorter the period, the easier it is to demonstrate a direct link to the defendant's acts. As the period increases, other factors may be responsible for the plaintiff's losses. These may include general economic conditions, increased competition, poor business judgment, or the plaintiff's failure to mitigate its damages. In the case of the supplement company example, which appears in exhibit 26.1, we relied on the opinion of a branding expert to assist us in the determination of the appropriate period of recovery. Other than in very special circumstances, it is usually difficult to establish the direct link between current earnings and the actions of a defendant more than only a few years into the past. Likewise, lost earnings are equally difficult to project more than a few years into the future without losing a direct link to the cause of the future losses. There are just too many variables that can affect the forecasts. This is where statistical analyses can come in handy if a strong relationship between variables can be shown.

## Variable Cost of Lost Revenues

Once the lost revenues have been determined, the next step is to estimate the variable costs that would have been incurred had the revenues not been lost. For example, assume that a plumbing distributor lost \$350,000 in gross revenues as a result of a breach of an exclusive distribution agreement by one of its major suppliers. Under the agreement, the distributor was to be the exclusive source for the supplier's merchandise in a particular market area. When the agreement was breached, the distributor didn't suffer \$350,000 in damages. Instead, the distributor actually lost revenues of \$350,000 less whatever variable costs (including cost of goods sold) it would have incurred to sell the \$350,000 of merchandise.

For the nonaccountants reading this book, a company's costs are usually divided into fixed and variable categories. Sometimes costs may be semi-fixed or semi-variable. Fixed costs remain the same regardless of how much revenue a company generates. Rent is an example of a fixed cost. You sign a lease and pay the rent whether you produce one widget or 200 widgets. Variable costs, on the other hand, vary with the company's revenues. The higher the company's sales, the higher the variable costs. Cost of goods sold, for example, is a variable cost.

In reality, many costs have both a fixed and a variable component and are referred to as *mixed costs* (semi-fixed or semi-variable—it's like asking, "Is the glass half full or half empty?"). For example, business rent may be a fixed cost assuming the current level of production. Once the level of production increases to a certain point, the existing facility may need to be expanded, thereby raising the rent expense.

Usually, mixed costs tend to be fixed when the damages period is short but exhibit mixed characteristics when the damages period is long. For example, if the defendant failed to supply goods to the plaintiff, which caused a 30-day shutdown of the plaintiff's production line, the rent paid by the plaintiff on its physical plant would probably remain fixed. Rent, therefore, would not be a variable cost saved by the plaintiff as a result of the defendant's actions. On the other hand, if the defendant's failure to supply goods prevented the plaintiff from opening a new production line in a new manufacturing plant, the rent saved by the plaintiff would be a variable cost, which must be netted against the plaintiff's lost revenues.

Determining whether an expense will vary with the level of revenues takes a great deal of judgment. The damages expert will need to analyze each expense item during the damages period and carefully assess whether the expense is fixed or variable. For those that are variable (or are mixed with a variable component), the damages expert will need to try to estimate the amount of the expense that would have been incurred during the damages period if the lost revenues had actually been generated. In many cases, the estimate can be based on historical ratios or percentages. For example, if a company's gross profit percentage has traditionally been 35 percent, it may be reasonable for the expert to estimate that cost of goods sold will be 65 percent (100 percent – 35 percent) of lost revenues.

## Incremental Revenues and Expenses—Not Fixed or Variable

There will be some assignments in which you will have to be concerned about incremental revenues and expenses, rather than variable or fixed expenses. The business may have expenses that would normally be considered variable, but adding revenues may not add all that much in expenses. An analysis from a report that we did is contained in exhibit 26.2. In this assignment, we were asked to critique the work of another expert. Not only will you see the incorrect treatment of incremental expenses but a whole lot of other errors, as well. This is a good example of what not to do in an assignment.

**Exhibit 26.2 Financial Results of Help Desk Company, Inc.**

In order to establish a baseline about Help Desk Company, Inc.'s operational performance, we have summarized the reported profitability as included in Help Desk Company, Inc.'s tax returns from 2005–2009. The 2010 tax return was not provided to us.

**TABLE 1 Comparative Financial Statements for the Years Ended December 31,**

	2005	2006	2007	2008	2009
Total Revenues	\$ 77,631	\$ 846,620	\$ 861,664	\$ 1,071,059	\$ 819,107
Operating Expenses

(Source: Help Desk Company, Inc.'s Tax Returns.)

As shown in The Company's tax returns, Help Desk Company, Inc.'s profitability has ranged from a profit of \$155,846 to a loss of \$38,599. On a percentage basis, this range is from 18.41 percent to negative 4.48 percent. The profitability of The Company has not been stable.

Schedule E, Compensation of Officers, on these tax returns does not include any compensation for the 100 percent owner, Bob Smith. This means that if compensation was paid to Mr. Smith., the profit would be lower or the losses would be greater. If Mr. Smith received his compensation in the category called "consultation services," The Company appears to be violating the tax code by failing to pay payroll taxes on these amounts. The small amount of payroll taxes shown in table 1 would be insufficient to account for hundreds of thousands of dollars that are listed as "consultation services." Either way, expenses appear to be understated for The Company.

Our review of the deposition transcripts in this matter has made us aware of the fact that subsequent to the alleged breach of contract, Help Desk Company, Inc. has claimed that it has started to provide help desk services to two other companies. Both the Plaintiff and its expert are using the initial results of these services to support the ability of Help Desk Company, Inc. to generate a profit from its alleged contract with Mobile Services, Inc.

It appears that the requirements for the services provided to these two other companies, on a direct basis, are dissimilar to the requirements to perform help desk services that would have been outlined in the subcontractor agreement that would have been in existence with Mobile Services, Inc. According to the deposition testimony of Jason Parks, the HCI contract called for 12 employees, both full- and part-time, and the Capital Blue Cross documents only required two employees and their supervisors, or four employees in total. The Mobile Services, Inc. contract would have required 7 full-time, Tier 1 help desk employees with adequate coverage for overlap and employee vacancies. Furthermore, the actual scope of the Mobile Services, Inc. contract called for 13 help desk employees, meaning that Help Desk Company, Inc. was to supply only some of the people. These people would have been required to work in a different location than at Help Desk Company, Inc.'s offices in order for proper supervision of the entire help desk team to take place. Our review of the HCI Consulting Services Agreement also appears to provide for more of an outreach (telemarketing) type service as opposed to a true "help desk" service. There appear to be clear differences in the types of services being offered, and as such, there would be a different expectation of the type of individuals who would be required to staff the help desk.

## Exhibit 26.2 Financial Results of Help Desk Company, Inc.

Our review of the Blue Cross documentation indicates that the services offered are also extremely dissimilar from the help desk technical services required by Mobile Services, Inc. Therefore, there is no proper foundation for relying on the services being rendered under this dissimilar contract to help establish a baseline for damages calculations. The end result is that Help Desk Company, Inc. is a “new” business with no experience performing help desk services. This creates a large degree of risk associated with any potential forecasts, as well as The Company’s ability to provide the required services under the alleged contract with Mobile Services, Inc.

Another factor that raises doubt about the comparison with Help Desk Company, Inc.’s current operations is the relatively short time that it has been in operation. There is an inadequate amount of history to rely on because one contract started in April 2010 and the other in November 2010.<sup>1</sup>

### Page 4

The Opposing Expert Report includes four additional categories of expenses that are used to reflect the “Total Help Desk Operational Cost.” The first item, “Hiring and Screening,” is inconsistent with the spreadsheet provided in discovery by Help Desk Company, Inc. Page 12 of the Opposing Expert Report includes \$1,200 per employee for this category. The Opposing Expert Report only includes \$500 per employee and limits this expense, assuming little employee turnover for these low-paid positions.

The paragraph included on this page states the following:

Initial start up costs in year one include screening 13 employees at a projected cost of \$500 each for interviewing, selecting candidates, background checks and follow up towards hiring 3 full time employees and 4 part time employees. After year one, the projection includes at least 2 new hires per year due to employee turnover at a projected cost of \$500 each.

No documentation was provided to support a cost of only \$500 per employee. A review of the limited payroll documentation that was provided to us as part of the discovery in this matter reflects the fact that employee turnover is considerably greater than two employees per year.

According to the 2011 payroll records that were produced, the following 2010 employees were no longer employed by Help Desk Company, Inc.:

George Daniels  
Jennifer Curry  
Jerry James  
Steven Davis  
Cameron Neal  
Christina Samuels  
Barry Johnson

This indicates that employee turnover is much greater than the Opposing Expert Report provides for. It is not a surprise to see low-paid employees turn over at a rapid pace. This understates the expense that Help Desk Company, Inc. would incur relating to replacement personnel.

Later in this critique we will also use the \$1,200 per employee that Help Desk Company, Inc. included in its spreadsheets to recalculate this amount.

### Page 5

The Opposing Expert Report reflects an inconsistency in the number of call center employees from not only the cost data that was submitted to Mobile Services, Inc., but also the requirement of the alleged contract. For example, page 12 of the Opposing Expert Report, is consistent with the spreadsheet provided in discovery by Help Desk Company, Inc. This document includes seven full-time employees. Despite that, the Opposing Expert Report includes only three full-time and four part-time employees that account for seven positions. This would make it impossible to cover the seven employees required for the help desk on a full-time basis. Furthermore, there are no back-up employees listed to cover absences due to vacation, illness, lunch breaks, or other breaks. Therefore, the number of employees is understated, causing not only an understatement of wage expense, but also the cost of fringe benefits for those additional employees.<sup>2</sup>

<sup>1</sup> Jason Parks Deposition, pages 13 and 14.

<sup>2</sup> According to the actual contract, page 8, subsection 6 requires “1 Help Desk Team Lead plus 7 Full-time Desk Agents.” Furthermore, page 9 of this contract also requires: Subcontractor will provide an overlap of 1 hour between shifts of one resource per scheduled shift. Subcontractor will provide coverage over lunch, dinner and break periods.

(continued)

## Exhibit 26.2 Financial Results of Help Desk Company, Inc. (continued)

The possibility of Help Desk Company, Inc. being able to work with only seven full-time employees is highly unlikely. Just a simple issue of covering lunch breaks for seven full-time employees working on a single shift would require additional employees, probably at least three more people based on three separate lunch hours. This still does not account for vacations, sickness, and other employee absences.

In addition to the understated number of employees, the Opposing Expert Report also contains another error on this page. Under the column labeled “Benefits” there is an amount of \$4,800 shown. According to the paragraph under the table on this page, these benefits were based on an average cost of \$400 per month. That means that \$4,800 is merely the cost of one employee ( $\$400 \times 12 = \$4,800$ ) and not the three employees shown as full-time. Not only does the math need to be corrected for all full-time employees (at least 10), but we found the \$400 monthly amount for benefits to be incorrect as well.

We reviewed the invoices provided in discovery in order to determine the reasonableness of the \$400 average cost for the fringe benefits. The Opposing Expert Report includes this analysis on page 8 of that document. We will address this further under the subheading for page 8.

One other item that is highly questionable on page 5 of the Opposing Expert Report are the salaries listed for “Management.” According to a Labor Distribution Report, Jason Parks’ earnings are shown as \$37,000.08 for the period December 27, 2009 through December 25, 2010. This report also reflects only 640 hours worked. According to Mr. Parks’ deposition testimony, he became employed by Help Desk Company, Inc. in August 2009.<sup>3</sup> This means that the payroll report should have included closer to 2,000 hours worked for the year. This could mean that the \$37,000 is for only part of the year. We could not reconcile this difference based on the documents provided by Help Desk Company, Inc.

There is an allocation included on this page for an “Administrative” staff wage allocation that appears to be completely arbitrary because only 5 percent was allocated to this contract. However, there is no explanation about how this was derived. Included in that amount is 5 percent of the “Consultation Services” (discussed previously), which seems to relate to Mr. Smith’s compensation. It seems highly unlikely that only 5 percent of Mr. Smith’s time would be spent on the portion of The Company’s revenues that were expected to generate over \$500,000 per year. In 2009, company revenues were about \$819,000. This means that Mr. Smith was expected to only spend 5 percent of his time on what would amount to almost 38 percent of the total revenue ( $\$500,000 \div \$819,000$ ). This makes little sense. It would seem that an allocation of about 38 percent, based on revenues per business segment, would be more appropriate for this calculation.

### Page 6

The Opposing Expert Report contains an error on this page as well. Real estate taxes should have been \$10,958, rather than \$9,221. Although the rounded figure is unaffected, the figures are incorrect nevertheless. Furthermore, by using the 2009 figures, the Opposing Expert Report ignores the added costs that most likely exist relating to setting up the new help desks. An allocation is done relating to a level of expenses that does not include any expenses for the other two clients that were not picked up until various times in 2010 and not 2009. These amounts exclude at least all additional telephone, utilities, and office expenses related to the actual call centers located on the first floor of Help Desk Company, Inc.’s office building beginning in 2010. This makes these figures unreliable.

### Page 8

As previously discussed, the calculation of employee benefits is incorrect. We reviewed the underlying documentation that the Opposing Expert Report shows in the analysis of this expense that was supplied by Help Desk Company, Inc.

The average premium of \$400 ignores the actual trend that was evident by reviewing the monthly average premiums per employee.<sup>4</sup> In order to estimate the monthly average premium per employee, we used a linear forecast based on the actual figures included in the Opposing Expert Report. This appears as table 2.

<sup>3</sup> Deposition Page 11, Lines 2–3.

<sup>4</sup> The Opposing Expert Report incorrectly labels that column as “Cumulative Weighted Average Hourly Rate.”

Bolded figures are the result of a linear trendline being calculated continuing the trend established by the actual data.

*(continued)*

**Exhibit 26.2 Financial Results of Help Desk Company, Inc. (continued)**

As the data in table 2 indicates, the trend is much greater than \$400 per month per employee. This is understandable when we look at the cost of health care and health insurance premiums over time. We will recalculate the average annual benefits per employee based on this trend line. The results are as follows for the 10-year projection:

Year	Average Monthly Premium per Employee	Growth Rate
2010	\$ 356	
2011	428	20.19%
2012	508	18.78%
2013	585	15.23%
2014	663	13.22%
2015	740	11.67%
2016	817	10.45%
2017	895	9.46%
2018	972	8.65%
2019	1,049	7.96%

As indicated by the data in table 3, the trend in health insurance premiums is much greater than the 3 percent used in the Opposing Expert Report.

**ONE ADDITIONAL ITEM**

In the overall summary included on page 2, the Opposing Expert Report includes revenues with no expenses relating to a “Project Manager” position. According to the Help Desk Company, Inc. spreadsheets submitted in this matter, this item relates to the lobbying activities that Help Desk Company, Inc. expected to provide for Mobile Services, Inc. No expenses were allocated to these amounts as the Opposing Expert Report indicates in the assumptions that it has accepted management’s representation that there are no other expenses to be incurred by The Company. These assumptions are highly questionable in light of the fact that Mr. Smith testified in his deposition that he was ill. Surely, Mr. Smith’s illness may incapacitate him for periods of time, which will require others to complete his duties with respect to the services to be rendered for Mobile Services, Inc. This not only would potentially add to the expense, but it also raises a doubt about whether his company could have fulfilled its obligations under a seven-year contract with three, one-year extensions.

Despite this statement, economic damages are not intended to provide a windfall to an injured party. Therefore, it is the profit, and not the revenues, that must be considered in determining the alleged damages. If current employees are used to provide these services, they would no longer be available to perform services elsewhere. Therefore, there is a cost for these employees to provide additional services. There are also overhead costs that would most likely increase due to additional services being rendered, such as office expense, telephone, entertainment, automobile, and so on.

According to the Microbilt/Integra benchmarking database, firms in Standard Industrial Classification Code 8743, defined as “Public Relations Services,” reported an operating income of 2.4 percent to 2.9 percent during the years 2006–2010. This data includes 4,000 companies. Even if we accept the notion that Help Desk Company, Inc. can operate more efficiently than the 4,000 companies included in this database, it does not seem likely that the profitability of these services would exceed 15 percent. To support this estimate, we turned to Help Desk Company, Inc.’s 2005 through 2009 tax returns presented earlier in this report.

**Exhibit 26.2 Financial Results of Help Desk Company, Inc.**

	2005	2006	2007	2008	2009
Revenues	\$577,631	\$846,620	\$861,664	\$1,071,059	\$819,107
Operating Profit	78,822	191,224	(10,439)	117,186	143,393
Percentage	13.6%	22.6%	—	10.9%	17.5%

**IMPACT OF CORRECTING THE VARIOUS ERRORS IN THE OPPOSING EXPERT REPORT**

As a result of the various errors that have previously been discussed, table 4 provides a corrected calculation using the model from The Opposing Expert Report of alleged economic damages as suffered by Help Desk Company, Inc. if liability is proven:

**TABLE 4 Recalculation of Lost Profits Based on the Opposing Expert Report**

Contract Year	Help Desk Operating Profit	+	Revenue Earned Manager and Change Analyst	+	Revenue Earned Projected Manager	-	Fixed Overhead Allocation	=	Total Operating Profit
2010	\$ (148,112)		\$ 181,500		\$ 14,775		\$ 33,000		\$ 15,163
2011	(118,134)		186,945		15,218		33,990		50,039
2012	(129,681)		192,553		15,675		35,010		43,537
2013	(140,929)		198,330		16,145		36,060		37,486

An explanation of how the figures in table 4 are calculated is required to properly understand the figures. We will address each column separately. The derivation of the "Help Desk Operating Profit" begins with table 5.

(continued)

**Exhibit 26.2 Financial Results of Help Desk Company, Inc. (continued)****TABLE 5 Calculation of Projected Operating Profit on the Help Desk Portion of the Mobile Services, Inc. Contract**

Contract Year	Help Desk Contract Revenue	-	Help Desk Labor Costs	+	Help Desk Operational Costs	=	Help Desk Total Costs	=	Help Desk Operating Profit
2010	\$ 372,400		\$ 476,912		\$43,600		\$ 520,512		\$ (148,112)
2011	383,572		498,556		3,150		501,706		(118,134)
2012	395,079		521,610		3,150		524,760		(129,681)
2013	406,932		544,711		3,150		547,861		(140,929)
2014	419,139		568,227		13,400		580,627		(162,488)
2015	431,714		592,170		3,150		595,320		(163,606)
2016	444,665		616,553		3,150		619,703		(175,038)
Subtotal	\$2,853,501		\$3,818,739		\$72,750		\$3,891,489		\$(1,037,988)
2017	458,005		641,388		3,150		644,538		(186,533)
2018	471,745		666,691		13,400		680,091		(208,346)
2019	485,898		692,474		3,400		695,874		(209,976)
<b>Total</b>	<b>\$4,269,149</b>		<b>\$5,819,292</b>		<b>\$92,700</b>		<b>\$5,911,992</b>		<b>\$(1,642,843)</b>

The data in table 5 reflect the recalculation of the Help Desk Operating Profit. Changes made to the Opposing Expert Report include labor costs and operational costs. Our revisions to these calculations are included in table 6.

**TABLE 6 Calculation of Total Wages**

Year	Total Hours	×	Wage	=	Total Hourly Wages Paid	+	Manager Salaries	+	Administration Staff	=	Total Wages Paid
2010	20,800		\$10.25		\$213,200		\$62,000		\$132,593		\$407,793
2011	20,800		10.56		219,596		63,860		136,571		420,027

**Exhibit 26.2 Financial Results of Help Desk Company, Inc.**

The total number of hours was recalculated to include 10 full-time employees to cover the help desk pursuant to the alleged contract. Because the Opposing Expert Report also included the “Manager Salaries” and “Administrative Salaries” in the calculation of Help Desk Labor, we kept it here, as well. The Administrative Salaries were adjusted from the Opposing Expert Report to include 38 percent of these expenses, rather than only 5 percent. This new percentage was based on the approximate proportion of Mobile Services, Inc.’s revenues to the entire revenues for Help Desk Company, Inc. (based on 2009). We also made one other adjustment: We removed \$200,000 from Mr. Smith’s compensation to lower the amount chargeable in this calculation. We did this to avoid double-counting when we allocated expenses against the “Program Manager” portion of the damages.

After making these adjustments, we also had to adjust fringe benefits, payroll taxes, and workers’ compensation insurance costs that must now include the increased number of people at the newly calculated levels of compensation. We also recalculated the fringe benefits costs based on the data that was provided in table 3.

**TABLE 7 Projection of Help Desk Labor Costs**

Year	Total Wages	+	Number of Employees	×	Annual Benefits per Employee	=	Total Benefits	+	Payroll Taxes	+	Workers’ Compensation (.33 of every \$100)	=	Total Labor Cost
2010	\$407,793		10		\$ 4,269		\$ 42,688		\$25,085		\$1,346		\$476,912
2011	420,027		10		5,131		51,306		25,837		1,386		498,556
2012	432,628		10		6,094		60,942		26,612		1,428		521,610
2013	445,607		10		7,022		70,223		27,411		1,471		544,711
2014	458,975		10		7,950		79,504		28,233		1,515		568,227
2015	472,744		10		8,879		88,785		29,080		1,560		592,170
2016	486,927		10		9,807		98,066		29,953		1,607		616,553
2017	501,534		10		10,735		107,348		30,851		1,655		641,388
2018	516,580		10		11,663		116,629		31,777		1,705		666,691
2019	532,078		10		12,591		125,910		32,730		1,756		692,474

Payroll taxes were calculated as indicated in table 8.

(continued)

**Exhibit 26.2 Financial Results of Help Desk Company, Inc. (continued)****TABLE 8 Payroll Tax Calculation**

Employee	Total Wages	FICA/MED Tax (7.65%)	Number of Employees	Federal Unemployment (0.8% on first \$7,000/Employee)	PA Unemployment (3.5% on first \$8,000/Employee)	Total Unemployment	Total Payroll Taxes
<i>Call Center Operations</i>							
3 FT Employees	\$63,960	\$4,893	3	\$168	\$ 840	\$1,008	\$ 5,901
4 FT Employees	85,280	6,524	4	224	1,120	1,344	7,868
3 FT Floaters	63,960	4,893	3	168	840	1,008	5,901
<i>Management</i>							
1 FT Manager	25,000	1,913	1	56	280	336	2,249
1 FT Project Supervisor	37,000	2,831	1	56	280	336	3,167
<b>Total</b>							<b>\$25,085</b>

Payroll tax expense has been grown by 3 percent in the years subsequent to 2010 in the same manner as the Opposing Expert Report. Workers' compensation has been assumed at \$0.33 per \$100 of wages paid (as assumed in the Opposing Expert Report).

Help desk operational costs were recalculated and are presented in table 9. The revised figures are based on a cost of \$1,200 for the "hiring and screening" of new employees. The Opposing Expert Report reflected only \$500 per individual in this category. Furthermore, the Opposing Expert Report assumed an employee turnover rate of only two people per year. Although we kept this assumption constant, we have already demonstrated the high degree of employee turnover suffered by Help Desk Company, Inc. from 2010–2011.

**TABLE 9 Projected Operational Costs for Help Desk**

Contract Year	Hiring and Screening	Computer Equipment	Office Furniture	Cabling, Electrical, and Miscellaneous	Total Help Desk Operational Costs
2010	\$15,600	\$ 6,000	\$20,000	\$2,000	\$43,600
2011	2,400	500	—	250	3,150
2012	2,400	500	—	250	3,150
2013	2,400	500	—	250	3,150
2014	2,400	6,000	4,000	1,000	13,400
2015	2,400	500	—	250	3,150
2016	2,400	500	—	250	3,150
Subtotal	\$30,000	\$14,500	\$24,000	\$4,250	\$72,750
2017	2,400	500	—	250	3,150
2018	2,400	8,000	2,000	1,000	13,400
2019	2,400	500	—	500	3,400
<b>Total</b>	<b>\$37,200</b>	<b>\$23,500</b>	<b>\$26,000</b>	<b>\$6,000</b>	<b>\$92,700</b>

**Exhibit 26.2 Financial Results of Help Desk Company, Inc.**

Revenues earned for the Manager and Change Analyst, as shown in table 4, were kept consistent with the assumptions used in the Opposing Expert Report. The Revenue Earned for the Project Manager was reduced to account for the expenses associated with The Company's expected lobbying efforts. This has been previously explained in this report.

Fixed Overhead Allocations in the Opposing Expert Report failed to include all expenses, updated expenses, and a proper allocation for the Mobile Services, Inc. help desk operations. We recalculated these items in table 10.

**TABLE 10 Calculation of Fixed Overhead Allocation**

	2009	Est. 2010	Allocation Based on Building Usage	Allocation Based on Operation	Total Allocated Expense
Depreciation Expense	\$21,981	\$ 22,640	33.3%	40.0%	\$ 3,016
Real Estate Taxes	10,958	11,287	33.3%	40.0%	1,503
Insurance	23,252	25,577		38.0%	9,719
Office Supplies and Expenses	11,279	12,407		38.0%	4,715
Telephone and Utilities	23,719	35,579		38.0%	13,520
Total	\$91,189	\$107,490			\$32,473
				<b>Rounded</b>	<b>\$33,000</b>

The Company's operations in 2009 only included lobbying activities. Thus, expenses in that year do not account for any additional expenses generated by help desk operations. As a result, expenses in 2010 must be increased. Overhead expenses in 2009 were increased by the following growth rates:

Depreciation Expense	3%
Real Estate Taxes	3%
Insurance	10%
Office Supplies and Expenses	10%
Telephone and Utilities	50%

The preceding growth rates are an estimate because the 2010 tax return was not provided to us in discovery. The real estate expenses grew due to an inflationary factor, whereas the other expenses would be expected to grow due to the increased business volume of The Company. Telephone and utilities would be expected to grow considerably as a result of the call centers being established.

The 2010 building expense (depreciation expense and real estate taxes) were allocated based on facility usage. The Mobile Services, Inc. help desk operations, according to the Opposing Expert Report, would be located on the first floor of the North Street facility, which is a three-story building located in Fort Myers, Florida. Because the Mobile Services, Inc. help desk would share the first floor with two other call centers, we allocated approximately 40 percent of the first-floor building expenses to the Mobile Services, Inc. help desk operation based on an estimated headcount of the employees.

(continued)

**Exhibit 26.2 Financial Results of Help Desk Company, Inc. (continued)**

Operating expenses (insurance, office supplies and expenses, and telephone and utilities) were allocated based on the Mobile Services, Inc. help desk's contribution to The Company's total revenues (38 percent). We believe that this is a more appropriate allocation of those expenses.

The adjusted calculations reflect such a large difference from the results provided in the Opposing Expert Report that the finding in the Opposing Expert Report would not provide the trier of fact with a useful determination of alleged economic damages suffered by the Plaintiff. Of course, we respectfully defer to The Court to decide upon its usefulness. It should be noted, however, that the preceding calculations are only intended to provide rebuttal calculations based on the information that was made available to us. Because the 2010 financial information was not provided to us, nor used in the Opposing Expert Report, we cannot calculate the alleged damages suffered by Help Desk Company, Inc. within a reasonable degree of economic certainty. However, we believe that the Opposing Expert Report does not meet this important requirement either.

## Should Lost Net Earnings Be Reduced for Income Taxes?

Remember the discussion that we had in the conventional business valuation chapters about pretax and after-tax stuff? Here, it really matters. Although income taxes are considered to be a variable expense, it is usually not subtracted from lost revenues to arrive at lost net earnings. Most commercial lost profits calculations are based on pretax amounts because damages awards are usually taxable to the plaintiff. That is the extent of the tax stuff that I plan to discuss. The damages expert should find out how the jurisdiction of the litigation handles taxes, but don't forget to remember Uncle Sam. If the expert is unsure, he or she should consult with a tax person. At a minimum, ask the client's attorney!

## Prejudgment Interest

Once the lost profits are calculated, the damages expert may need to calculate prejudgment interest. This is intended to compensate the plaintiff for not having the use of the lost profits from the time that the damages were sustained until the recovery of the damages (usually the trial) is made. However, prejudgment interest is not allowed in all jurisdictions. In addition, many attorneys would rather keep the interest out of the calculations, even though they expect the courts to award it. Before computing prejudgment interest, the damages expert should find out from the attorney if he or she should calculate it. The expert also may want to find out if there is a statutory interest rate that is required to be used. I had one case when the statutory rate was 11 percent at a time when interest rates were about 4 percent. The damages recovery was a good investment once the client got past the aggravation of the litigation. Other items that the damages expert should probably speak to the attorney about include when the interest begins to run and should the interest be compound or simple.

## Projected Lost Revenues After Trial

Many times, the damages will extend to after the trial date. This component of the damages involves obtaining estimated future revenue and expense amounts from the plaintiff and reviewing the estimates for reasonableness. In some cases, if financial forecasts are not available from the plaintiff, the damages expert may have to prepare them. Because such estimates are based on events that have not yet occurred, the expert must be careful. This is like doing a discounted cash flow analysis under the income approach. Make sure that the assumptions that enter into the forecast are reasonable. If they are too speculative, the judge may throw them out.

When the damages expert estimates future damages, a two-step approach can be used. First, project the future gross revenues, assuming the breach of contract or tort had never occurred. This projection should include gross revenues but for the defendant's acts. Second, a forecast of the future gross revenues actually expected to be realized should be prepared. This forecast should include the reduced gross revenues that result from the defendant's acts.

## Discounting Projected Lost Profits After Trial to Present Value

After estimating the amount of future lost revenues and variable expenses that relate to the defendant's actions, the damages expert will probably have to discount the projected lost net earnings to present value as of the trial date. This can be done in a number of ways. There is a great deal of controversy about what discount rate should be used in a lost profits case. Some experts prefer to apply a risk-free rate of return (that is, a personal injury type model). Others prefer to include business risk in their calculations (that is, use a business valuation model). The damages expert can use the guidance from chapter 13 to help him or her develop the appropriate discount rate. The only decision that I cannot help the expert with is whether he or she should use a risk-free rate or an equity discount rate. This will depend on the jurisdiction as well as the facts and circumstances of the case.

## Ex-Ante Versus Ex-Post

When performing a lost profits analysis, the damages expert must consider the following:

- What information should be considered in the damages calculation? Only that information that was known or knowable as of the date of the alleged wrongdoing? Or all information that was available up through the date of the trial?
- Should the damages be measured as of the date of the alleged breach or as of the date of the trial?

The preceding questions highlight the primary differences between the ex-ante and the ex-post methodologies to calculating damages.

The term *ex-ante* is Latin for "before the fact." Under the ex-ante methodology, only that information that was known or knowable as of the date of the alleged breach is to be considered. All future lost profits are discounted back to present value as of the date of the alleged breach. In other words, after performing the damages calculation, you will have calculated a lump sum (the present value of all future lost profits) as of the date of the alleged breach. Depending on the jurisdiction, prejudgment interest can be applied to this lump sum to reflect its present value as of the date of the trial. The known or knowable concept behind the ex-ante methodology to calculating damages is similar to the concept used in business valuation.

As an example, consider an economic damages assignment in which a contract was breached on November 15, 2014. The trial date for this assignment is February 12, 2017. Under the ex-ante methodology, only that information that was known or knowable as of November 15, 2014, is to be considered in the analysis. When projecting future lost profits, the starting point for the forecast and the measurement date for the damages calculations would also be November 15, 2014. In other words, all future lost profits would be discounted back to November 15, 2014, resulting in a total damages figure as of that date. Once this damages figure is calculated, depending on the jurisdiction, prejudgment interest would be applied to this amount up until the February 12, 2017 trial date.

An argument for the use of the ex-ante methodology is that it accounts for the various risks, uncertainties, and circumstances that existed at the time of the alleged wrongdoing. In the preceding example, the plaintiff could have owned an asset as of November 15, 2014, that could have been sold for cash. Therefore, in order to make this individual whole, an argument can be made that the plaintiff would have to be compensated in such a way that awards him or her the value of the damaged asset as of November 15, 2014, plus interest. Events that occurred subsequent to November 15, 2014, may not be relevant because the plaintiff could have exchanged the damaged asset for cash prior to these events taking place. In addition, by determining the value as of the date of the breach, the damages expert is probably incorporating the various risks, expectations, and uncertainties into the damages figures.

The ex-ante methodology also prevents the defendants from attempting to minimize the amount of damages by destroying the value of the asset in question. For example, in a case involving lost business value, the defendants could intentionally perform actions against the best interests of its shareholders in order to lower the value of the company. If information after the date of the alleged wrongdoing is to be considered, these destructive actions would lower the amount of damages due to the plaintiff. By definition, the ex-ante

methodology does not factor in information that was not known or knowable as of the date of the alleged wrongdoing so these actions by the defendant would not be considered in the damages process.

The most apparent disadvantage of applying the ex-ante method is the fact that you would be ignoring what actually happened in the marketplace between the date of the alleged breach and the date of the trial. This can be problematic, especially when pertinent information subsequent to the alleged breach becomes available such as a severe economic downturn, which adversely affects the business, or a sale of the company, at a significant premium over its fair market value. These are just some of the issues that could potentially arise when applying the ex-ante methodology to calculating damages.

The term *ex-post* is Latin for “after the fact.” The ex-post methodology allows all information that is known or knowable up until the date of trial to be considered. Under this methodology, lost profits are measured as of the date of the trial. In most instances, the damages expert will have pretrial lost profits (lost profits that occurred before the trial date) and post-trial lost profits (lost profits that occurred after the trial date). Depending on the jurisdiction, prejudgment interest would be applied to pretrial lost profits up until the date of the trial, while post trial lost profits would be discounted back to the date of the trial.

In the case of an economic damages assignment in which a breach of contract took place on November 15, 2014, with a trial date of February 12, 2017. Under the ex-post methodology, all information that was available up until the February 12, 2017, the trial date is to be considered. As is the case with the ex-ante approach, the starting point for the lost profits forecast would be November 15, 2014. However, the measurement date for the damages would be as of the February 12, 2017, the trial date. Pretrial lost profits would be those that occurred between November 15, 2014, (the date of the breach) and February 12, 2017 (the trial date). Prejudgment interest would be applied to these amounts up until the trial date. Post-trial lost profits would be those lost profits that occurred after the February 12, 2017 trial date. These amounts would be discounted back to present value as of the February 12, 2017 trial date.

An argument in favor of the ex-post methodology is that it gives the damages expert the luxury of 20-20 hindsight. The expert can make the plaintiff whole by calculating a damages award that provides him or her the actual economic benefits that were generated by the damaged asset during the period in question. All information up until the trial date can be considered, which removes some of the speculation associated with the damages figures.

The disadvantage of the ex-post methodology is that it allows the defendant to destroy the value of the damaged asset in order to minimize the amount of damages that could be awarded to the plaintiff. The ex-post methodology also does not account for the risks and uncertainties involving the economic benefits that would expect to be generated by the damaged asset at the time of the alleged wrongdoing. For example, let’s again assume that at the time of the alleged wrongdoing, the plaintiff held an asset that could be exchanged for cash. The value of this asset as of that date would be the economic benefits that it would be expected to generate over its economic life at that particular point in time. It may not be proper to incorporate information subsequent to the alleged wrongdoing into this value.

In some instances, it may be appropriate to apply a hybrid approach. In this instance, as is the case with the ex-ante method, all future lost profits are discounted back to the date of the alleged breach. However, like the ex-post methodology, all information that was available up to the date of the trial can be considered. In other words, a hybrid approach allows for the use of ex-post information, while using an ex-ante measurement date. A hybrid approach might be appropriate in instances in which it is determined that the economic benefits that were actually generated by the contract during the period in question cannot be ignored.

Referring back to our original example, under the hybrid approach, all information that was available as of the February 12, 2017 trial date could be considered. However, the measurement date for the damages would still be as of November 15, 2014.

The differences between the ex-ante, ex-post, and hybrid approaches relate to the use of information subsequent to the alleged breach, the date in which damages are calculated, and the discounting of future

damages. Whether or not to use the ex-ante, ex-post, or hybrid approach will depend on the facts and circumstances of the particular case. No single approach will be appropriate in all instances. Before selecting which approach to use, the damages expert should have a clear understanding of the facts of the case and all relevant case law in the jurisdiction of the litigation.

## Don't Forget to Check the Lost Profits Computation for Reasonableness

After completing the last step, the damages expert should have an idea of the damages involved in the case. Before reporting the results to the client and the client's attorney, however, he or she must review the results of the computations and make sure that the results are reasonable. After all, the expert may have to defend the computations and his or her underlying assumptions under aggressive cross-examination from the opposing attorney if the case goes to trial.

## Other Situations

Sometimes the damages expert may be faced with more than just a lost profits calculation. The entire business may have been destroyed. Other times, the expert may have a relatively new business that has been affected by a defendant. Here are some tips about those situations.

### Destruction of a Business

If the business has been completely destroyed, most courts have ruled that the proper measure of damages is the fair market value of the business on the day of the loss. The theory behind this rule is that the plaintiff who recovers damages equal to the value of the business has, in effect, sold the business to the defendant. The plaintiff should not be able to recover future lost profits, as well as the value of the imputed sale.

In this instance, the damages expert will most likely be asked to value the business. Use all of the stuff that was explained in the earlier chapters of this book to get there. If it's already been forgotten, re-read it!

### Start-Up Businesses

In a lost profits case, the plaintiff's damages must be proven to a reasonable certainty and may not be based merely on speculation or conjecture. Most new business ventures fail. Accordingly, the *new business rule* generally precludes a start-up business from recovering lost profits, because there is usually no evidence that the business would have been able to generate a profit, *but for* the defendant's actions.

The new business rule does, however, have some exceptions. Some of the more common exceptions include the following:

- If the new business has begun operations, it may be able to demonstrate that it is capable of producing revenues and profits. If this is the case, its projection of lost revenues and profits may be based on more than mere speculation.
- If the new business is a franchise operation or a new location of an existing business, it may be able to demonstrate the historical revenue and profit results of similar franchises or locations. If the plaintiff has a demonstrated track record of success with similar endeavors, its projection of profits lost from the new business may rise to the level of a reasonable certainty.
- If the new business would have enjoyed a competitive advantage over existing businesses in the industry, projecting this advantage in terms of lost profits over and above existing competitors' results of operations may be accepted as reasonable. Any such projection should be limited to the period of time it would have taken the competition to "catch up" to the new business.

If the damages expert represents the plaintiff, he or she must be extremely creative to overcome the new business rule. All financial data that implies that the plaintiff's new business could have made a profit should be referred to and relied upon in projecting the lost profits of a start-up business. A list of factors that damages experts should consider in assessing the likelihood of the plaintiff's success is contained in box 26.3.

A lost profits analysis for a software start-up company is included in exhibit 26.3. In this instance, we determined that the actions of the defendant's in this matter caused a total destruction of the plaintiff's business and, as a result, lost business value was the appropriate measure of damages. As you will see in this example, we received an extremely aggressive forecast from management and had to perform a thorough analysis to determine the reasonableness of management's assumptions. It should be noted that in this assignment, the software company had recently completed a sale of Series A preferred shares to a group of unrelated investors. Therefore, we were able to use this sale of preferred shares as the basis for a market approach to substantiate the indication of value derived using the income approach.

**BOX 26.3****Factors to Consider in Assessing the Likelihood of the Plaintiff's Success**

- The plaintiff's business plan
- The availability of the required capital for the business
- The plaintiff's prior experience in the area
- The plaintiff's level of expertise
- The plaintiff's subsequent experience
- Barriers to entry in the industry
- The quality of the available records
- The economy in which the business operates
- The experience of other similarly situated businesses

**Exhibit 26.3 Lost Profits or Lost Value?**

In early 2013, as Software Startup was positioning itself for growth, management decided to raise some capital by selling shares of preferred stock to investors. In order to accomplish this, management had prepared the following forecast that was shared with potential investors.

Revenues	2013	2014	2015	2016	2017
Clients (Traditional)	100	200	300	400	500
Average Fee (Traditional)	\$ 30,000.00	\$ 30,000.00	\$ 30,000.00	\$ 30,000.00	\$ 30,000.00
<b>Total Fee (Traditional)</b>	<b>\$ 3,000,000.00</b>	<b>\$ 6,000,000.00</b>	<b>\$ 9,000,000.00</b>	<b>\$ 12,000,000.00</b>	<b>\$ 15,000,000.00</b>
Clients (New Industry)	\$ —	20	100	200	400
Average Fee (New Industry)	\$ —	\$ 8,000.00	\$ 8,000.00	\$ 8,000.00	\$ 8,000.00
<b>Total Fee (New Industry)</b>	<b>\$ —</b>	<b>\$ 160,000.00</b>	<b>\$ 800,000.00</b>	<b>\$ 1,600,000.00</b>	<b>\$ 3,200,000.00</b>
<b>Annual Revenue</b>	<b>\$ 3,000,000.00</b>	<b>\$ 6,160,000.00</b>	<b>\$ 9,800,000.00</b>	<b>\$ 13,600,000.00</b>	<b>\$ 18,200,000.00</b>
<b>Annual Expenses</b>	<b>\$ 773,400.00</b>	<b>\$ 1,329,650.00</b>	<b>\$ 1,949,522.50</b>	<b>\$ 2,654,811.13</b>	<b>\$ 3,352,025.93</b>
<b>NET INCOME</b>	<b>\$ 2,226,600.00</b>	<b>\$ 4,830,350.00</b>	<b>\$ 7,850,477.50</b>	<b>\$ 10,945,188.88</b>	<b>\$ 14,847,974.07</b>

On February 13, 2013, management made a presentation to potential investors for a Series-A Preferred unit offering. Because this forecast was included as part of a presentation to potential investors, we analyzed this forecast as a starting point in order to perform the income approach. Management's assumptions in this forecast were as follows:

- Traditional clients would increase from 100 in 2013 to 500 in 2017.
- Traditional clients would pay an average fee of \$30,000.
- The Company would break into a new industry in 2014. Clients in this new industry would grow from 20 in 2014 to 400 in 2017.
- Clients in the new industry would pay an average fee of \$8,000.
- Operating expenses were forecast based on management's estimated new hires and other general and administrative expenses necessary to achieve projected growth.

**Exhibit 26.3**

We tested the assumptions that appeared in management’s forecast by analyzing the historic trends in new customers obtained in the months leading up to September 30, 2014. In particular, we calculated several moving averages over various periods of time to determine the trends in the number of new customers that Software Startup was generating on a monthly and quarterly basis. We performed these calculations on a monthly and quarterly basis so that we had enough data points to provide a reasonable statistical basis for our analysis. Of particular note was the growth that was taking place over the last 12-month period prior to the problems with the Defendant.

The monthly new clients being picked up by Software Startup were as follows:

**TABLE1 New Customers By Month**

Month	New Customers	Month	New Customers	Month	New Customers
Jan-13	1	Jan-14	0	Jan-15	2
Feb-13	1	Feb-14	2	Feb-15	0
Mar-13	0	Mar-14	1	Mar-15	0
Apr-13	1	Apr-14	3	Apr-15	1
May-13	0	May-14	2	May-15	2
Jun-13	2	Jun-14	1	Jun-15	1
Jul-13	2	Jul-14	2		
Aug-13	1	Aug-14	2		
Sep-13	2	Sep-14	1		
Oct-13	2	Oct-14	1		
Nov-13	3	Nov-14	0		
Dec-13	4	Dec-14	2		

Graphically, this appears as follows:

(continued)

**Exhibit 26.3** (continued)

As illustrated in the preceding graph, Software Startup was in the midst of a growth spurt at the time that the Defendant began interfering with its business. An immediate impact can be seen regarding the picking up of new customers by Software Startup. The final decline occurred when the Defendant began its campaign to contact Software Startup’s customers by letter or telephone about “illegal activities” being alleged against Software Startup. The Company’s ability to pick up new customers not only slowed down considerably, but it was only smaller, fee-paying customers that came on board. This has sent Software Startup into an unrecoverable downward spiral.

The trend in new customers can be seen in the following graph.

As the dotted line indicates, during 2013, Software Startup was on a significantly upward trend. In fact, although we thought that management’s projections used for its investor presentation may have been aggressive, the trend indicates that management may have had a good indication of the market and its ability to bring on new customers.

We calculated moving annual averages, this time using only the 2013 figures, and the forecast that results from that time period indicates the following:

Time Period	Annual Trend
2 Month Moving Average	44
3 Month Moving Average	40
4 Month Moving Average	37
5 Month Moving Average	34
6 Month Moving Average	32
7 Month Moving Average	31
<b>8 Month Moving Average</b>	29
<b>9 Month Moving Average</b>	27
<b>10 Month Moving Average</b>	26
<b>11 Month Moving Average</b>	24
<b>12 Month Moving Average</b>	23

**Using moving averages to measure the trend in new customers**

**Exhibit 26.3**

The annual trend in new customers is heavily skewed when the moving average is shorter due to the growth that was taking place towards the end of 2013. We used the longer time periods to generate our own forecast for Software Startup for the determination of lost value of the company. Our assumptions were as follows:

- Traditional client growth was increased based on the 8–12 month moving average analysis.
- The average fee was increased by 5 percent per year based on historic levels.
- Assumed that Software Startup would not generate revenues from clients from the new industry because The Company has no experience in this field.

Our revenue forecast appears as follows.

	LTM 2014	2015	2016	2017	2018	2019
Clients	35	58	82	108	135	164
Client Growth		23	24	26	27	29
Average Fee	\$ 26,985	\$ 28,334	\$ 29,751	\$ 31,238	\$ 32,800	\$ 34,440
Revenues	\$944,471	\$1,643,380	\$2,439,569	\$3,373,745	\$4,428,040	\$5,648,211

The revenue forecast adds a slower customer growth trend than management forecasted in its own investor presentation. We also grew the average fee by 5 percent per year, a growth rate that was considerably less than the actual growth in the average fees being experienced by Software Startup.

We forecasted operating expenses using benchmark data from companies in the same industry as Software Startup. Because Software Startup was a relatively young company, we did not feel that it would be prudent to use The Company's actual expense structure to forecast future operating expenses. Historic expenses included many expenses that were incurred as a startup that would most likely not be repeated prospectively. Because management's forecast included many expenses that were based on much greater revenue growth, we also did not feel that this would be appropriate to use in this forecast. Therefore, operating expenses were forecast using the Risk Management Association's *Annual Statement Studies* (RMA).

In this instance, we determined that Software Startup's appropriate industry classification code was North American Industry Classification System Code 518210: Data Processing, Hosting and Related Services. The RMA data contained 34 companies with sales ranging from \$1 million to \$3 million and 31 companies with sales ranging from \$3 million to \$5 million. The only item that we segregated was depreciation expense because we determined that the difference between the RMA data and Software Startup's actual fixed asset depreciation was too great to use the benchmarking data for. The result would have been skewed profitability.

The following chart presents our estimation of operating expenses using the benchmark data.

**TABLE 3 Operating Expenses (Based on Industry Benchmark Data)**

	2015	2016	2017	2018	2019
Revenues	\$1,643,380	\$2,439,569	\$3,373,745	\$4,428,040	\$5,648,211
G&A Expenses (RMA)	1,452,748	2,156,579	3,019,502	3,963,096	5,032,556
RMA (SG&A Less Depr.)	88.4%	88.4%	89.5%	89.5%	89.1%

(continued)

**Exhibit 26.3** (continued)

This results in a determination of profitability as follows:

**TABLE 4 Income Statement Forecast**

	2015	2016	2017	2018	2019
Sales	\$1,643,380	\$2,439,569	\$3,373,745	\$4,428,040	\$5,648,211
Operating Expenses	1,452,748	2,156,579	3,019,502	3,963,096	5,032,556
EBITDA	\$ 190,632	\$ 282,990	\$ 354,243	\$ 64,944	\$ 615,655
Depreciation	13,185	13,185	13,185	13,185	13,185
<b>New Operating Profit</b>	<b>\$ 177,447</b>	<b>\$ 269,805</b>	<b>\$ 341,058</b>	<b>\$ 451,759</b>	<b>\$ 602,470</b>

Because Software Startup operates as a Limited Liability Company, no taxes would be paid at the enterprise level. Therefore, we have not included taxes in the forecast. Using a discount rate of 14.6 percent, calculated using a classic build-up method, we determined the value of Software Startup to be as follows under the income approach:

**TABLE 5 Indication of Value**

	Net Income	14.6% PV Factors	PV Net Income
2015	\$ 177,447	0.9341	\$ 165,753
2016	269,805	0.8151	219,918
2017	341,058	0.7113	242,595
2018	451,759	0.6207	280,470
2019	602,470	0.5416	326,298
Terminal Value	7,425,793	0.5416	4,021,810
<b>Market Value of Invested Capital</b>			<b>\$5,256,780</b>
Less Interest Bearing Debt			(27,716)
<b>Indication of Value</b>			<b>\$5,229,064</b>
<b>Rounded</b>			<b>\$5,200,000</b>

These types of assignments can be extremely time consuming, and it may be very difficult for the damages expert to estimate fees. I know that none of my clients are ever happy with the concept of giving me an open checkbook, but other than charging on an hourly basis for our time, it is sometimes impossible to know how much time you will spend on the analysis. The damages expert needs to be very careful that he or she does not get trapped into quoting a fixed fee when there is a large unknown such as how much time will be required to perform the assignment. The expert may find that the job becomes a real loser.

## Lost Profits or Lost Business Value?

A topic that has been up for debate among damages experts is the relationship between lost profits and lost business value. A lost profits analysis and the income approach to business valuation have similar principles. Both involve forecasting future economic benefits and discounting them to present value using a rate of return reflective of the riskiness of the benefits stream. However, these two measurements of damages will often be different for a variety of reasons. These differences primarily lie in the stream of economic benefits, period of damages, discount rate, the treatment of taxes, and the use of post-valuation date information.

A major difference between a business valuation and a lost profits analysis lies in the economic benefits stream that is being forecast into the future. In a business valuation, the forecasted economic benefit stream is usually the net cash flow or the net earnings of the entire business that a buyer would expect the company to generate prospectively. The revenues generated by the business are offset by all variable and fixed expenses that the business would likely incur as a going concern. In a lost profits analysis, the economic benefits stream represents only that income lost by the plaintiff *but for* the actions of the defendant, mitigated by the costs that would need to be incurred in order to achieve that level of income. Oftentimes, with a lost profits calculation, only those avoided variable expenses would be used to offset the lost revenues because fixed costs would have been incurred regardless of whether the business was damaged. There are some instances in which it may be appropriate to include fixed costs in a lost profits calculation. Examples include a lost profits calculation for a start-up operation with no operating history or an instance in which the acquisition of additional office space, equipment, and so on is needed to achieve the projected revenues for the damaged asset.

Once the economic benefits stream is forecast, the next question becomes, how long would the plaintiff continue to receive these benefits? In a business valuation, economic benefits are forecast until the business reaches stability. Once the business reaches stabilization, a terminal value is calculated, which represents the value of the company's stabilized operations into perpetuity. The damages period for a lost profits analysis depends on the facts of the case and the relevant case law in the jurisdiction of the litigation but is usually calculated over a finite period of time. For example, the time period for a lost profits calculation can be the life of the contract or the estimated economic life of the damaged asset. In these instances, the present value of the future lost profits will typically not include the value of a perpetual stream of income.

When performing a business valuation, the discount rate is based on the cost of equity or the weighted average cost of capital for the entire company. The discount rate is the required rate of return reflecting the risk of not achieving the projected benefits stream. Although this same concept can often apply to lost profits calculations, it is not always the case. Some jurisdictions require that future lost profits be discounted to present value using a risk-free rate. The damages expert should seek legal guidance to assist himself or herself in determining the appropriate manner in which to discount future lost profits back to present value.

Another difference that can arise relates to the treatment of taxes. Damages awards to the plaintiff are usually taxable and, as a result, it may not be appropriate to tax affect the earnings in a lost profits calculation. In contrast, a business valuation in a litigation setting involves calculating the lost value to a partner, member, or shareholder. In some instances, the available earnings or cash flow available to the owner of a business interest will be received after payment of federal and state income taxes. Nevertheless, the damages expert should also seek legal guidance regarding the treatment of taxes.

Lastly, the use of post valuation date information differs between a business valuation and a lost profits analysis. A business valuation typically involves an ex-ante methodology, whereas a lost profits analysis frequently involves an ex-post methodology.

There is another issue that is constantly coming up for debate among damages experts as we meet at the local tavern. That issue is whether or not the present value of the lost profits can exceed the value of the business. Some experts argue that lost profits damages can exceed the value of the business, whereas others

have taken the opposite position. Based on the differences between a business valuation and a lost profits analysis discussed previously, it is clear that the value of the business and lost profits damages can differ and, in some circumstances, it is possible that the present value of lost profits may be higher. However, some argue that the value of a business interest is the present value of the future economic benefits that the owner can receive from his or her interest. As a result, if a plaintiff is awarded damages that exceed that value, he or she would be receiving an award greater than the value of what he or she lost. So, the answer to whether or not lost profits damages can exceed the value of the business is “it depends.” The relationship between lost profits damages and business value depends on the facts and circumstances of the case and the relevant jurisdictional case law.

## Other Types of Damages Measurements

A damages expert may need to calculate other types of damages that do not include commercial lost profits or lost business value. These types of damages can include such items as out-of-pocket expenses and personal economic damages related to lost compensation. There are others, but this book is already long enough without adding more pages to it.

## Out-of-Pocket Expenses

Oftentimes, a plaintiff may have incurred out-of-pocket expenses related to the issue that caused the economic damages. For example, the plaintiff could have incurred various costs related to construction, financing, advertising, and labor in preparation for the launch of a venture that the defendant interfered with. In these instances, the damages expert may need to accumulate the out-of-pocket expenses to be reimbursed as part of the damages in order to make the plaintiff whole.

When calculating out-of-pocket expenses, the damages expert should always try to obtain a sufficient amount of supporting documentation and not merely rely on the client’s say-so. This documentation can include invoices, canceled checks, receipts, bank statements, wire transfer confirmations, or any combination of these documents. The damages expert should have enough documentation to show that the expense was legitimate and actually incurred by the plaintiff. Because out-of-pocket expenses occur before the trial date, it is often appropriate to apply prejudgment interest to these expenses through the trial date.

In some jurisdictions, the plaintiff is allowed to claim lost profits and out-of-pocket expenses, whereas other jurisdictions do not allow the plaintiff to claim both. Whether or not to account for out-of-pocket expenses as a separate item or to combine it with lost profits damages depends on the facts and circumstances of the case and the relevant jurisdictional case law. The damages expert should seek legal counsel to determine how to deal with out-of-pocket expenses.

## Personal Economic Damages

A damages expert may be asked to calculate economic damages for an individual related to a number of different circumstances, including but not limited to, medical malpractice, wrongful termination, sexual discrimination, personal injury, employment discrimination, and so on. When calculating personal economic damages, the damages expert must quantify the economic losses, net of any applicable mitigation that has been suffered by the plaintiff. Examples of the various economic and monetary losses in personal damages cases appear in box 26.4.

### BOX 26.4

#### Economic and Monetary Losses in Personal Damages Cases

- Earnings
- Fringe benefits
- Other income, costs, or both
- Household services that can no longer be performed
- Medical and rehabilitation costs
- Personal consumption

(Source: AICPA Practice Aid No. 98-2, Calculation of Damages From Personal Injury, Wrongful Death, and Employment Discrimination (1999): 6.)

A personal economic damages assignment usually begins with an information-gathering stage. For example, in the case of a wrongful termination claim, the damages expert should obtain documentation, such as employment contracts, personal tax returns, and W-2 forms, to determine the plaintiff's historical earnings. The expert should also obtain information on the types of fringe benefits that the plaintiff received from his or her employer. Ideally, enough information should be collected so that the expert can identify trends in the plaintiff's historical earnings.

If possible, the employment history should also be obtained so that a review of past wages can be analyzed from the standpoint of raises due to promotions versus merely cost-of-living increases. A list of the types of data that are generally obtained for any personal damages engagement is included in box 26.5.

Depending on the type of damages suffered by the plaintiff, the damages period for a personal economic damages assignment is usually the plaintiff's life expectancy (how long the individual is expected to live) or work-life expectancy (how long the individual is expected to work). Information related to the life expectancy of an individual (or, in some cases, the joint life expectancy of two individuals) can be found in various sources, including but not limited to, the IRS, Bureau of Labor Statistics, and various state publications. Information related to the work-life expectancy of an individual can be found in various scholarly journals related to forensic economics.

When calculating personal economic damages, there are various factors that should be considered in the calculation of lost earnings. These include the following:

- Historical actual annual earnings of the plaintiff before the injury
- Historical information regarding the plaintiff's job positions, performance ratings, salary, and benefit information, including information on positions held before the position at the date of the loss incident
- The plaintiff's employment status before the injury
- Actual or expected occupation or position, including likelihood that the plaintiff would have enjoyed future advancement
- Information concerning the efforts extended by the plaintiff to find alternative employment
- Actual or expected educational level of the plaintiff
- Actual earnings of individuals working in comparable employment positions
- Actual earnings of individuals working in similar industries<sup>1</sup>

A personal damages assignment may require the damages expert to forecast the plaintiff's economic and monetary losses into the future. In forecasting future earnings or losses to the plaintiff, the expert can use many of the forecasting methods referenced in chapter 8 of this book, such as trend line models and historical averages. In the case of wrongful termination claims, employment contracts, if any, may also provide guidance to what the plaintiff's earnings would have been going forward. In certain situations, the expert may be able to obtain the payroll records or payroll chart that pertains to comparable positions in the same company. Sometimes, the plaintiff's compensation could be a function of the company's financial performance. If this is the case, the expert should get the financial records from the employer and attempt to establish some sort of relationship between the employer's financial performance (perhaps revenues or earnings) and the plaintiff's compensation.

**BOX 26.5****Types of Information Generally Obtained for Any Personal Damages Assignment**

- Name of plaintiff
- Date of birth, race, and sex
- Date of injury, death, or incident
- Educational level of plaintiff
- Professional licenses or certifications held by plaintiff
- Marital status of plaintiff
- Spouse's name and date of birth
- Income tax returns
- Forms W-2 and 1099
- Personal employment records
- Educational records
- Medical records
- Vocational report
- Report of independent medical examiner
- Depositions
- Lawsuit complaint or petition; pleadings
- Report of opposing experts

(Source: AICPA Practice Aid No. 98-2, Calculation of Damages From Personal Injury, Wrongful Death, and Employment Discrimination (1999): 15.)

<sup>1</sup> AICPA Practice Aid No. 98-2, *Calculation of Damages From Personal Injury, Wrongful Death, and Employment Discrimination* (1999): 7.

Once lost wages and fringe benefits are calculated, the damages expert should consider mitigation of the damages by (1) all compensation that the plaintiff actually earned or costs that the plaintiff may have saved during the damages period and (2) in some instances, all compensation that the plaintiff could receive from obtaining alternative employment. Compensation and wage growth information related to alternative employment can be obtained from industry salary surveys, salary websites, and postings of similar jobs, as well as from employment experts. When calculating mitigation, it may be appropriate to make an assumption about how long it would take the plaintiff to find new employment, particularly in an unfavorable job market.

Once all economic and monetary losses, net of all applicable mitigation, has been forecast, the damages expert would then discount these amounts to present value. Experts often use risk-free rates to discount lost compensation as measured by U.S. Treasury securities. The assumption here is that the plaintiff has the ability to earn a rate of interest on his or her earnings from the safest investments. As is the case with a business valuation, the discount rate should reflect a rate of return reflective of the investment horizon. For example, if the plaintiff has a long (short) work-life expectancy, long- (short-) term Treasury bonds should be used. Another factor to consider is how interest rates are expected to change going forward. In order to account for anticipated interest rate fluctuations, it may be appropriate to calculate a historical average Treasury rate as opposed to using the rates that are currently present in the marketplace.

The plaintiff may have incurred out of pocket costs such as job search costs, commuting costs, or other out of pocket expenses. Depending on the jurisdictional case law, the plaintiff may be able to claim these expenses plus prejudgment interest in addition to other economic and monetary losses suffered.

There are many cases in which a working shareholder of a business would want to claim lost profits or lost business value related to his or her ownership interest in the business, as well as lost wages and fringe benefits. In these instances, damages experts will be asked to calculate commercial damages related to either lost profits or lost business value for a working shareholder, as well as personal damages related to wrongful termination. These situations can be tricky due to the interaction between officer's compensation and business value. If the damages expert determines that the market rate of compensation for the plaintiff is rather high, this will result in a lower value for his or her lost profits damages or business interests.

An example of a personal economic damages assignment is presented in exhibit 26.4. This assignment was a wrongful termination claim and involved the forecasting of lost wages and fringe benefits, as well as various commuting costs and other expenses.

## EXHIBIT 26.4 Damages Related to a Wrongful Termination Claim

### BACKGROUND

According to the allegations included in the complaint filed in this matter, Ms. Hale was hired by The Hospital as the Associate Director of Patient Care for Mental Health Service on March 24, 2008. Ms. Hale was promoted to “Acting” Director of Patient Care Services on April 16, 2008. On April 18, 2008, Ms. Hale was terminated from her position at The Hospital.

### DAMAGES

Damages have been calculated based on the underlying documentation that was reviewed in this matter. We have assumed that liability will be proven, and we are not offering any opinion regarding the legal claims.

The damages calculated in this matter are based on the salary and fringe benefits that Jane Hale would have earned at The Hospital throughout the balance of her career based on the work-life expectancy indicated in Mr. Boston’s report. These expected earnings and benefits have been offset by actual and expected amounts that Ms. Hale will now earn using her actual earnings for 2008 and 2009 and estimated earnings using the highest indication of Ms. Hale’s earning power as presented by Mr. Boston. We are relying on Mr. Boston’s experience and expertise in this area.

Assumptions and facts entering into these calculations include the following:

1. Ms. Hale’s starting salary at The Hospital was \$115,000.
2. The base salary would have grown annually until retirement by a cost-of-living increase averaging 2.82 percent.<sup>1</sup>
3. Ms. Hale began employment on August 8, 2008, with New Hospital as a Nurse Practitioner within the State
4. After New Hospital did not succeed in securing the contract with State, Ms. Hale assumed the same position at Correctional Facility, which became the new provider of health care services for the Department of Corrections in July 2009.
5. Ms. Hale provided her services at the Correctional Facility
6. Ms. Hale resigned from her position at Correctional Facility in December 2009. This position, which involved working with prisoners, caused such severe stress that Ms. Hale was forced to seek medical care.
7. Certain fringe benefits provided by The Hospital were also provided by Ms. Hale’s subsequent employers.
8. Damages relating to lost fringe benefits are caused by the benefits that are solely calculated as a percentage of wages, as well as two specific items<sup>2</sup> that were offered by The Hospital and not the subsequent employers.
9. An additional element of damages relates to the cost to mitigate at the new employers. Instead of taking the train to The Hospital at a cost of \$71.25 per month, Ms. Hale had to drive 56 miles per day, commuting back and forth from her home. Commuting costs were calculated using the IRS’s annual standard mileage rates for business miles driven.
10. Future mitigation was assumed to take place at the highest indicated level of earnings as a General Duty Nurse based on Mr. Boston’s report.
11. Growth in mitigation wages was based on average annual increases of 4.65<sup>3</sup> percent.
12. Discount rate used in this report is based on the average 10-year U.S. Treasury Security for the period 1999–2008.

<sup>1</sup> Average percent change in the consumer price index from 1999–2008.

<sup>2</sup> Leadership allowance and flex dollars.

<sup>3</sup> Calculated based on data included in Advance for Nurse Practitioners, “2009 National Salary & Workplace Survey, Good News in Troubled Economy,” January 2010.

*(continued)*

**EXHIBIT 26.4 Damages Related to a Wrongful Termination Claim** *(continued)*

Using the foregoing assumptions and facts, damages have been calculated as follows:

Period Beginning	Period Ended	Wages			Fringe Benefits			Loss			Present Value	
		Would Have Earned	Mitigation	Loss	Would Have Earned	Mitigation	Loss	Wages	Fringe Benefits	Total Loss	Total Loss	PV Lost Earnings
4/18/2008	4/17/2009	\$115,000	\$61,209	\$53,791	\$25,742	\$14,249	\$11,492	\$53,791	\$11,492	\$65,283	\$65,283	\$ 66,419

### EXHIBIT 26.4 Damages Related to a Wrongful Termination Claim

In addition to the lost earnings and fringe benefits, Ms. Hale incurred an additional expense relating to her commutation to her new employment. Using the automobile allowance rate published by the IRS of \$0.505 and \$0.550, for 2008 and 2009, respectively, the additional cost to commute to the new place of employment during these years was estimated as follows:

2008 Commute to Correctional Facility		2009 Commute to Correctional Facility	
Miles Driven per Day	56	Miles Driven Per Day	56
Miles Driven Per Month (22 work days/month)	1,232	Miles Driven Per Month (22 work days/month)	1,232
Months Worked	5.29	Months Worked	11.74
Total Miles Driven	6,518	Total Miles Driven	14,466
IRS Mileage Rate-2008	0.505	IRS Mileage Rate-2009	0.550
Driving Cost	3,291	Driving Cost	7,956
Tolls Paid (\$3.50 per work day)	407	Tolls Paid (\$3.50 per work day)	904
<b>Total Commute Cost</b>	<b>\$3,699</b>	<b>Total Commute Cost</b>	<b>\$8,860</b>
2008 Commute to The Hospital		2009 Commute to The Hospital	
Monthly Cost-Train	71.25	Monthly Cost-Train	71.25
Number of Months at The Hospital	8.4	Number of Months at The Hospital	12
Cost of Metrorail-2008	\$598.5	Cost of Metrorail-2009	\$855
<b>Total Damages</b>	<b>\$3,100</b>	<b>Total Damages</b>	<b>\$8,005</b>

Using the same rate to discount these amounts to present value results in the present value of the commuting damages to be \$11,199.

#### FINAL DETERMINATION OF DAMAGES

The final determination of damages in this matter to a reasonable degree of economic certainty is as follows:

Lost Wages and Benefits	\$549,471
Cost to Commute	11,199
<b>Total Damages</b>	<b>\$560,670</b>

We reserve the right to update this report if additional information is provided to us.

### Plaintiff or Defense?

The damages expert may be called upon to work for the plaintiff or the defense in a damages litigation. Obviously, as stated earlier, the objectives of both sides are very different. If the expert represents the plaintiff, his or her job is to help establish the actual amount of damages. The damages expert is not the liability expert, so the expert wants to keep the analysis to the economics of the situation (unless his or her role is also as a liability expert). It is always a good idea to state early in the report that the report assumes that there is liability,

but the damages expert is not offering an opinion in that regard. If there is no liability found, the numbers are meaningless.

When the damages expert works for the defense, his or her job will frequently be to shoot holes in the plaintiff's expert's report and, sometimes, conclude his or her own estimate of damages. The damages expert can use his or her skills and resources as a business valuation analyst to his or her advantage if he or she really tries.

## Common Mistakes Made By Damages Experts

In litigation assignments, my firm is often retained to critique the work of another damages expert. In performing these critiques, we often come across significant errors made by experts. Some of the more common errors that we see over and over again will be discussed in the following sections.

### Unsupported Lost Revenue Assumptions

One of the most common errors in lost profits analyses are unsupported revenue assumptions. When preparing a revenue forecast for a lost profits analysis, the damages expert should perform the same detailed analysis that he or she would perform as if the assignment was a business valuation. This means understanding the current economic environment and future outlook, the outlook and growth prospects for the industry, and the amount of competition prevalent in the marketplace. This also means analyzing historical revenues and profitability for the damaged asset when such information is available. We often see revenue forecasts that assume an unproven start-up operation will immediately penetrate a saturated market and steal a significant percentage of market share from a group of large, mature companies. These types of assumptions demonstrate a lack of understanding of the industry in which the company was trying to operate.

### Improper Use of Statistics

Statistics can be a valuable tool to quantitatively support different assumptions in a lost profits analysis. However, the use of statistics can also be dangerous when applied improperly. As a real-life example, there was one instance in which an opposing expert used a correlation coefficient to help support a statistical relationship between the decline in the performance of the NASDAQ Composite Index and the decline in the performance of the valuation subject. However, the expert did not calculate a correlation coefficient. Instead, he determined that a correlation coefficient of 0.50 was appropriate based on his "judgment." In addition, during cross-examination, the expert stated that the possible range for a correlation coefficient was from 0 to 1. The problem is that the possible range is actually  $-1$  to  $1$ . This expert's opinion was eventually thrown out of the case because he was determined not to be an expert in statistics. Ouch!

This example demonstrates the importance of having an understanding of all the pieces of information that go into forming an opinion on damages. If the damages expert is planning to use a statistical analysis to help support an opinion, he or she must take the time to understand the strengths and weaknesses of such analysis and be prepared to be questioned heavily about it during testimony. At a minimum, if the damages expert does not have a statistics background, he or she should hire good staff!

### Understatement of Costs

Oftentimes, when reviewing an opposing expert's report, we will encounter a damages calculation that will underestimate the costs that were avoided *but for* the actions of the defendant. These costs can relate to labor, advertising, maintenance, insurance, and other variable expenses.

When performing a lost profits calculation, the lost revenues should be offset by all expenses that are tied directly to the damaged asset. If the lost revenues relate to a business unit or a contract, the damages expert will need to allocate all the variable expenses and, in some cases, fixed expenses that would relate to that particular revenue stream. The best way to determine these expenses is to look at the company's historical financial records, if such information is available. Alternatively, he or she can attempt to locate benchmarking data for companies with similar operations.

## Not Obtaining All Necessary Documentation

Before performing an economic damages analysis, it is imperative that the damages expert obtain all relevant back-up documentation related to the matter. There are some instances in which attorneys will attempt to spoon-feed only those pieces of documentation that the attorney feels the expert will need to perform the analysis. The expert must insure that he or she does not get caught in this situation. It is the expert's reputation that will be damaged if he or she ignores important information.

## Things Not to Do If the Expert Wants to Get It Right

A sample critique of a plaintiff expert's work is provided in exhibit 26.5. This should provide the damages expert with a starting point if he or she has never done this stuff before.

### EXHIBIT 26.5 Critique of An Expert's Report

#### PART 1—CRITIQUE OF THE OPPOSING EXPERT REPORT

We have been asked to comment on the economic damages issues contained in the reports issued by the Opposing Expert Economics Group (Opposing Expert Report) dated September 16, 2010 and December 31, 2012, and not issues relating to legal liability in this matter. Our comments are limited to the damages calculations.

#### OPINIONS REGARDING THE OPPOSING EXPERT REPORT

In our opinion, the Opposing Expert Report does the following:

1. Improperly calculates damages resulting from the alleged actions of the defendants
2. Is based on unsupported assumptions
3. Is highly speculative
4. Reaches illogical conclusions
5. Blindly relies on expert reports of others without any independent verification of the merits of the conclusions of the other experts
6. Reaches opinions that are not within any degree of economic certainty
7. Is fatally flawed because the damages calculated in the Opposing Expert Report would provide a substantial windfall to the Plaintiff, rather than make it whole for its *true* economic loss, if any

The balance of this section of the report is intended to highlight the deficiencies in the Opposing Expert Report. In order to provide the reader with an easy format to follow, we will address the Opposing Expert Report in page order of that report.

#### IMPROPER MEASURE OF DAMAGES

The Opposing Economics Group performs a lost profits calculation as its primary determination of the economic damages suffered by T&C Marketing Services, Inc. (T&C). In this instance, this method of determining economic damages is improper. It is our understanding that T&C is no longer in business. The Plaintiff claims that it was put out of business as a result of the alleged actions of the defendants.

According to Patrick Gaughan

A number of cases involving firms that went out of business due to the actions of the defendant have held that the value of the damages is equal to the market value of the business on the date the operations ceased.<sup>1</sup>

Gaughan also states

When a defendant damages a plaintiff to such an extent that the plaintiff's business fails, the question arises: *How should damages be valued?* Given that the plaintiff has lost profits, should estimated past and projected future profits be the manner in which damages are measured? Abundant case law clearly states that **the proper measure of damages is the value of the business, not projected profits**. When this is the case, then the methodological approach to measure damages is different from in a typical business interruption case.<sup>2</sup> (Emphasis added).

<sup>1</sup> Gaughan, Patrick A., *Measuring Business Interruption Losses and Other Commercial Damages*, 2nd ed., (John Wiley & Sons, Inc. 2009): 71.

<sup>2</sup> *Ibid*, 285.

(continued)

## EXHIBIT 26.5 Critique of An Expert's Report *(continued)*

According to Robert Dunn, Esq.

If a business has not been just injured, but has been destroyed, almost all of the few cases in point hold that lost profits damages are not recoverable. The measure of damages is said to be the market value of the business on the date of destruction, less any salvage value in the assets. This measure of damages may also be expressed as the difference in the value of the business before and after its destruction.<sup>3</sup>

According to Thomas Burrage

A business damages claim may be properly calculated as either the lost profits of the business or the lost value of the business. Courts have stated the general rule permitting the alternate theories of recovery as follows:

[I]f a business is completely destroyed, [then] the proper total measure of damages is the market value of the business on the date of the loss. If the business is not completely destroyed, then it may recover lost profits. A business may not recover both lost profits and the market value of the business.<sup>2</sup>

Stated another way:

Numerous jurisdictions hold to the view that when the loss of business is alleged to be caused by the wrongful acts of another, damages are measured by one of two alternative methods: (1) the going concern value; or (2) lost future profits. [T]he courts allow a plaintiff to recover either the present value of lost future earnings or the present market value of the lost business, but not both. The 'going concern value' is the price a willing buyer would pay and a willing seller would accept in a free marketplace for the business in question. It measures damages by awarding the difference between the going concern value and the price actually received by the plaintiff upon sale of the business.<sup>3</sup>

Footnotes in Quote:

<sup>2</sup> *Montage Group, Ltd. v. Athle-Tech Computer Systems, Inc.* 889 So.2d 180, 191 (Fla. App. 2004) (internal citations omitted).

<sup>3</sup> *Protectors Insurance Service, Inc. v. U.S. Fidelity & Guaranty Co.*, 132 F.3d 612 (10th Cir. 1998) (Disallowing jury award of lost profit damages in addition to lost business value as improper double recovery.) *But see Cooper Distributing Co. v. Amana Refrigeration, Inc.*, 180 F.3d 542 (3rd Cir. 1999) (Damages should be valued according to either the present value of lost future earnings or the present market value of the lost business, but not both. However, in a case in which defendant's breach caused the plaintiff to lose profits prior to the date at which the defendant's actions destroyed the franchise, nothing in the general rule prohibits proof of lost profits prior to destruction to make the plaintiff whole.) For more discussion on whether the plaintiff is entitled to both classes of damages, see "Comparative Summary of Lost Profits vs. Lost Business Claims" in this chapter.<sup>4</sup>

PPC's *Guide to Litigation Support Services* states the following:

If the business has been completely destroyed, many courts have ruled that the proper measure of damages is the value of the business on the day of the loss. [*True North Composites, LLC v. Trinity Industries, Inc.*, 191 F. Supp. 2d 484 (D. Del. 2002)] The measure of damages for destruction of a business is the value of that business.] The theory behind this rule is that the plaintiff who recovers damages equal to the value of the business has, in effect, sold the business to the defendant.<sup>5</sup>

Furthermore, in a paper delivered at the AICPA's 2004 National Business Valuation Conference, Brian Brinig, JD, CPA presented the following:

**Profits and Value.** In its simplest conceptual form, value is the present sum of all anticipated profits.

1. When anticipated profits are discounted at a risk-adjusted rate commensurate with the security of the investment, their present sum equals the value of the business.
2. In some circumstances, particularly *small* businesses, the risk-adjusted rate may be dramatically different from the risk-free rate.
  - a. In very small businesses, it is not unusual to conclude that an appropriate risk-adjusted discount rate is 40%, 50%, or even as high as 100%. (Stated inversely, these discount rates amount to multiples of income of 2.5x, 2.0x, and 1.0x, respectively).

<sup>3</sup> Dunn, Robert L., *Recovery of Damages for Lost Profits*, 6th ed., Lawpress Corp., 2005 with annual supplements: 538.

<sup>4</sup> Burrage, Thomas, *The Comprehensive Guide to Lost Profits Damages for Experts and Attorneys*, Nancy Fannon, Editor, 2011 ed., (Business Valuation Resources, LLC): 457.

<sup>5</sup> Brinig, Brian, et al., *PPC's Guide to Litigation Support Services*, Volume 1, 17th ed. (Thomson Reuters, 2012): 403.94.

**EXHIBIT 26.5 Critique of An Expert's Report**

3. **Given the relationship of value to profits (value equals PV of profits), the present value of a business' lost profits cannot logically exceed the value of the business.**
4. **If the present value of lost profits exceeds the value of the business, a plaintiff would be compensated for more than it lost.**<sup>6</sup> (Emphasis added).

In this instance, the literature is clear that a complete destruction of a business would lead to a lost business value calculation and not lost profits. Therefore, the Opposing Expert Report uses an inappropriate methodology for the calculation of damages.

**OTHER PROBLEMS WITH THE OPPOSING EXPERT REPORT****Page 2<sup>7</sup>**

The Opposing Expert Report lists the documents reviewed in the preparation of the analysis. Considering the thousands of pages of discovery that were furnished from both sides and the third-party defendant in this action, the list of documents contained in the Opposing Expert Report demonstrates that only a superficial analysis could have been done. There is no indication that any depositions were reviewed, even of the stockholder of T&C, Mr. Jones, let alone all the other individuals who the Plaintiff is relying on in this matter.

Furthermore, general ledgers and other accounting-type documents were not reviewed for the purpose of verifying the reasonableness of the tax returns and financial statements that were relied on in performing a profitability analysis and damages calculations. As will be discussed in much greater detail later in this report, the records reflect many problems that should have been addressed before a proper calculation of damages could have been performed within a reasonable degree of economic certainty.

**Page 4**

The most recent version of the Opposing Expert Report indicates that the purpose of the appraisal is "to evaluate the economic loss to T&C Marketing Services, Inc. and Mr. Jones, as a result of the action of defendants."

Mr. Jones was added to the preceding statement because he was not in the previous version of the Opposing Expert Report. However, Mr. Jones is nothing more than a third-party defendant to this lawsuit and would not be entitled to a damage recovery. The Opposing Expert Economics Group has been in practice for many years. As such, the authors of the Opposing Expert Report should know that damages can only be awarded to T&C and not Mr. Jones because it was the corporation, and not the individual, that had a contract with the defendants. Although, as damages experts, we are not attorneys, our vocation tells us that it would be unreasonable to allow an individual to operate behind a corporate veil, and we should allow that individual to step out from behind the corporation to recover damages, if any, that might belong to the corporation.

**Page 5**

In the changes made to this version of the Opposing Expert Report, the authors state the following:

It was later revealed that ABC Labs had engaged in a massive marketing campaign which was never disclosed or contractually approved by T&C. It is reported that T&C was never given the opportunity to rebill and issue additional invoices based on the additional marketing activity that was planned and contracted for by ABC Labs several months before the start of ABC Benefits. [SOURCE: *Complaint with Jury Demand*, October 14, 2009]

The source reference in this quote is the *Complaint with Jury Demand*, dated October 14, 2009. However, this allegation does not appear in the Complaint. Besides having an incorrect reference, there is no rational basis for making this statement other than attempting to introduce new elements of damages that were based on unsupported calculations that the authors of The Opposing Expert Report rely on from the *Fifth Addendum to Operations Analysis of ABC Labs/Pharmacy Co. ABC Benefits Program* signed by Mr. Parker. We will address the Parker calculations later in this report.

<sup>6</sup> Brinig, Brian, J.D., CPA, "Business Damages: Lost Profits or Lost Business Value?," AICPA National Business Valuation Conference, 2004: 12-8.

<sup>7</sup> This page reference, as well as all future page references, refer to the page of the Opposing Expert Report dated December 31, 2012.

(continued)

**EXHIBIT 26.5 Critique of An Expert's Report** *(continued)*

The Opposing Expert Report states that "It is reported that T&C was never given the opportunity to rebill and issue additional invoices based on the additional marketing activity that was planned and contracted for by ABC Labs several months before the start of ABC Benefits." There is no support for this statement because the Opposing Expert Report cannot even tell the reader by whom "it is reported." Furthermore, T&C would have benefitted from any increased call volume resulting from additional programs due to the markup on its charges to ABC Labs. This would be part of the almost \$1.9 million that ABC Labs paid to T&C for the program that started out as being for \$218,251. This will be discussed further at the appropriate time.

**Page 6**

The Opposing Expert Report states the following:

In addition, T&C experienced significant difficulty marketing the traditional version of DollarRewards to other potential sponsors. These problems led T&C to have compromised relationships with other clients and ultimately to pull the DollarRewards program entirely.

There are several problems with this statement. First, the Opposing Expert Report provides no data or analysis that supports the phrase, "These problems led T&C to have compromised relationships with other clients..." The Opposing Expert Report does not indicate that any investigation was performed to prove that any client relationships were "compromised" as a direct result of the actions of the defendants. In fact, our review of the Opposing Expert files that were submitted during discovery indicate that the Opposing Expert Economic Group failed to review any of the underlying documentation that was provided by their own client.

Even if the preceding phrase is assumed to be correct, the Opposing Expert Report provides no data or analysis that supports the subsequent phrase, "...and ultimately to pull the DollarRewards Program entirely." The Opposing Expert Report provides no support for the fact that the DollarRewards Program (its original program) had to be terminated. Even if there were problems with the ABC Labs/Pharmacy Co. ABC Benefits Program, the Opposing Expert Report presents no data or analysis to support that T&C had "to pull the DollarRewards program entirely." Furthermore, the damages that were calculated in the Opposing Expert Report are not based solely on the loss of the DollarRewards Program, but other programs as well. Yet, The Opposing Expert Report does not even mention these other programs and the cause for their supposed failures.

**Page 7**

At the top of this page, the Opposing Expert Report includes the following table:

Year	Revenue	Expenses	Net Profit/ (Loss) [(2)-(3)]	Accounting Adjustment	Adjusted Net Profit/ (Loss) [(4)-(5)]
(1)	(2)	(3)	(4)	(5)	(6)
2002	\$ 472,081	\$ 379,255	\$ 92,826	\$ 9,580	\$ 83,246
2003	291,196	202,946	88,250	357	87,893
2004	378,472	294,720	83,752	1,800	81,952
2005	542,278	458,227	84,051	456	83,595
2006	447,900	352,966	94,934	9,437	85,497
2007	865,412	795,584	69,828	10,833	58,995
2008	1,970,246	1,887,750	82,496	1,094	81,402
2009	254,064	69,845	184,219	—	184,219
2010*	7,500	14,074	(6,574)	—	(6,574)

\* Through May.

**EXHIBIT 26.5 Critique of An Expert's Report**

T&C's revenues, expenses, and profits and losses during the years 2002–2009, as well as the period January through May 2010, are shown in table 1.<sup>8</sup> A review of this data indicates that T&C's revenues during 2007 and 2008 were significantly greater than during any previous year. This is because of the substantial payments ABC Labs made to T&C in excess of the original ABC Benefits Program contract amount. By failing to address why T&C's revenues were so much larger in 2007 and 2008, the Opposing Expert Report leaves the reader with an inaccurate impression regarding T&C's ability to generate revenues. The Opposing Expert Report uses this extraordinary revenue amount to calculate damages in this matter. We will address this item shortly.

During the period 2002–2006, T&C's revenues ranged from \$291,196 to \$542,278 and averaged \$424,897. In order to understand T&C's ability to generate revenues, the amounts that ABC Labs paid to T&C in excess of the original contract amount should have been subtracted from the amounts shown for 2007 and 2008 in the Opposing Expert Report. Only then can the reader see a more normal level of revenues that might have been used as a base in the damages calculations employed in the Opposing Expert Report.

According to the original ABC Benefits Program contract, ABC Labs was to pay T&C a flat fee of \$218,251.10. Instead, T&C recognized revenue from the ABC Benefits Program of \$467,100 and \$1,415,325, during 2007 and 2008, respectively. A determination of T&C's revenues, adjusted for ABC Labs's excess payments, are calculated as follows:

**TABLE 2 T&C Revenue Adjusted for ABC Labs' Excess Payments**

	2007	2008
T&C Revenues per Tax Return	\$865,412	\$1,970,246
Revenues From ABC Labs	(467,100)	(1,415,325)
Original ABC Benefits Contract Amount	218,251	0
Adjusted Revenue	\$616,563	\$ 554,921

T&C's 2007 and 2008 adjusted revenues are more consistent with 2000–2006 revenues as depicted in figure 1.

<sup>8</sup> Under the column "Adjusted Net Profit/(Loss)," the Opposing Expert Report shows the 2008 amount to be \$81,402. However, both T&C's tax return and financial statements show this amount to be \$81,372. Despite referencing our reports, the Opposing Expert group never bothered to make this correction in its new report.

(continued)

### EXHIBIT 26.5 Critique of An Expert's Report *(continued)*

On this page, the Opposing Expert Report discusses compensation paid to management of T&C. The Opposing Expert group changed the wording from its original report, which stated

For the purpose of our analysis, we add compensation to management to net profit to arrive at adjusted net profit (loss) before compensation...

to

Because T&C is wholly owned by Mr. Jones, for the purpose of our analysis, we add compensation to management to net profit to arrive at adjusted net profit (loss) before compensation...

First, the change was made in an attempt to claim that Mr. Jones, as the sole shareholder of T&C, is the same as T&C, the corporation. If this was permissible under the law, there would never be a distinction between a corporation and its shareholders. It does not matter whether there is one stockholder or many. According to BusinessDictionary.com, the definition of *corporation* is as follows:

Firm that meets certain legal requirements to be recognized as having a legal existence, as **an entity separate and distinct from its owners**. Corporations are owned by their stockholders (shareholders) who share in profits and losses generated through the firm's operations, and have three distinct characteristics (1) Legal existence: a firm can (like a person) buy, sell, own, enter into a contract, and sue other persons and firms, and be sued by them. It can do good and be rewarded, and can commit offence and be punished. (2) Limited liability: a firm and its owners are limited in their liability to the creditors and other obligors only up to the resources of the firm, unless the owners give personal-guaranties. (3) Continuity of existence: a firm can live beyond the life spans and capacity of its owners, because its ownership can be transferred through a sale or gift of shares.<sup>9</sup> (Emphasis added).

This is an inappropriate manner in which damages to the corporation should be estimated. All expenses incurred in generating the program revenues must be subtracted in determining the net profit of the corporation. By adding back the management compensation, the Opposing Expert Report is calculating damages to the management of T&C, in addition to T&C, despite the fact that the management of T&C is not a party to the litigation. Not only does this provide a windfall to a nonparty to the litigation, it is an incorrect manner in which to calculate damages to T&C.

According to Robert Dunn, Esq.

Small businesses sometimes pay no compensation, as such, to the proprietor for services. However, the value of the proprietor's services, even if not directly compensated, should be included as labor costs and deducted when relevant to compute net profits. A calculation that does not deduct reasonable proprietor's compensation is, in effect, an impermissible attempt to recover gross profits, rather than net profits.<sup>10</sup>

The true profitability of a business must be measured after compensating management for the services that it provides to the business. The benefits of managerial efforts are reflected in the revenues and operational efficiency of the business. Management costs must be matched to revenues and operations. In fact, the Opposing Expert Report makes the point that "Any projected revenue must be reduced by the expenses associated with earning that revenue." However, the Opposing Expert Report reflects profitability in a manner that is inconsistent with the author's own statement.

The following excerpts from professional treatises indicate that the actual level of officer's compensation should be replaced with a market level of compensation:

- The item that most often begs adjustment on the income statement of a privately held entity is the compensation to the owners. Actual compensation tends to be based on what the entity can afford or how the owners desire to be compensated and may bear little or no relationship to the economic value of the services the owners actually perform.
- The general idea of the compensation adjustment is to substitute the cost of hiring and paying a nonowner employee for the compensation actually paid to the owner to perform the same function. Another way to look at it is to compare the actual compensation paid to some average amount that other people normally are compensated for performing similar services. For example, if we are valuing a small restaurant where the owner is being paid \$50,000 per year, and if a competent, full-charge manager could be hired for \$30,000 to perform the same services, the owner's compensation would be adjusted downward by \$20,000 on the adjusted income statement, resulting in a \$20,000 addition to pretax profit.<sup>11</sup>

<sup>10</sup> *Recovery of Damages for Lost Profits*: 514.

<sup>11</sup> P. Schweih, *Valuing Small Businesses & Professional Practices*, 3rd ed. (New York, McGraw-Hill, 1998): 118.

### EXHIBIT 26.5 Critique of An Expert's Report

- In closely held companies, compensation and perquisites to owners and managers may be based on the owners' personal desires and the company's ability to pay, rather than on the value of the services these individuals perform. How much to adjust the earnings base to reflect discrepancies between compensation paid and value of service performed depends on the valuation's purpose.<sup>12</sup>
- For example, in one case, the plaintiff sued for \$1,030,000 in lost profits, including wages lost by its anesthesiologists under a contract their practice had with the hospital. The trial court awarded only \$14,883, which represented the practice's lost income, net of expenses saved. *'We therefore conclude that professional corporations must be treated like other corporations for purposes of calculating damages. Unpaid salaries of corporate shareholders ought to be treated as saved expenses.'*<sup>13</sup>

The last quote addresses saved expenses, but it should be obvious that the determination of profits should include a deduction for compensation.

In documents submitted in this litigation, T&C invoiced ABC Labs for Mr. Jones's managerial efforts at a rate of \$400 per hour. Thus, T&C ascribes value to the services provided by Mr. Jones. This shows that managerial compensation should be subtracted as a necessary expense of doing business. However, the amount of compensation, just as the amount that was billed to ABC Labs, needs further examination. We address the amount billed to ABC Labs in the next part of this report. However, we find it to be very curious that the Opposing Expert Report expects T&C to bill ABC Labs for Mr. Jones's time, but then takes the position that he should not be compensated by T&C. This would amount to a double recovery if it was permitted to occur.

To demonstrate how far off the Opposing Expert Report is, due to the addback of total management compensation, we will use data available in the *Executive Assessor* database provided by the Economic Research Institute (ERI). ERI provides executive compensation information for positions across numerous industries throughout the United States. Using the ERI data for marketing firms located in California, we recalculated the profitability that was reflected in the Opposing Expert Report.

**TABLE 3 Restated Profitability from Opposing Expert Report**

Year	Adjusted Net Profit/(Loss) Before Compensation <sup>1</sup>	-	Market Replacement Cost for Mr. Jones <sup>2</sup>	=	Corrected Net Profit/(Loss)
2002	\$208,246		\$151,513		\$56,733
2003	212,893		155,914		56,979
2004	204,085		160,281		43,804
2005	169,345		164,600		4,745
2006	207,572		168,789		38,783
2007 <sup>3</sup>	385,632		173,060		212,572

(continued)

**EXHIBIT 26.5 Critique of An Expert's Report** *(continued)*

Once net profit (loss) is correctly determined, it is apparent that T&C was minimally profitable, even using a market rate of salary, rather than the entire management fee that was removed from the business. During the period 2002–2006, T&C's net profit (loss) ranged from \$4,745 to \$56,979, and averaged \$40,209. At this point, it is appropriate to ask, "How could a company that was generating an average net profit of \$40,209 have lost profits of \$8.4 million?"

**Page 8**

At the top of this page, the Opposing Expert Report includes the following table:

**TABLE 4 From Opposing Expert Report**

Year	Revenue	Adjusted Profit/(Loss) Before Compensation	Profit/(Loss) as Percentage of Revenues
(1)	(2)	(3)	(4)
2002	\$ 472,081	\$ 208,246	44.11%
2003	291,196	212,893	73.11%
2004	378,472	204,085	53.92%
2005	542,278	169,345	31.23%
2006	447,900	207,572	46.34%
2007	865,412	385,632	44.56%
2008	1,970,246	864,434	43.87%
2009	254,064	205,636	80.94%
2010*	7,500	(6,574)	–87.66%

\* Through May.

The purpose of this table is to show how profitable T&C was as a percentage of revenue. However, the column titled "Profit/(Loss) as Percentage of Revenue" is incorrectly labeled. This column is not calculated based on T&C's profit (loss). Instead, the column should have been correctly labeled as "Profit/(Loss) Before Owner's Compensation as Percentage of Revenue." As a result of the mislabeling, the percentages presented in the Opposing Expert Report give the false impression that T&C was much more profitable than its actual profitability. In reality, if a company does not pay any of its officers, it will always be more profitable. Damages to the corporation are supposed to be calculated after and not before officers' compensation.

In table 5 we contrast T&C's actual profit percentages with the profit percentages used in the Opposing Expert Report. During the period 2002–2006, T&C's net profit (loss) as a percentage of revenues ranged from 0.9 percent to 19.6 percent, and averaged 10.5 percent. Again, it is important to note that the profit percentages from 2007 and 2008 were distorted by ABC Labs's excess payments to T&C. Just because T&C took advantage of the program changes as a reason to overcharge ABC Labs and generate much more profit than ever before is no reason to assume that T&C would be able to generate these excessive amounts of revenue and, therefore, profits, from every new client it works for in the future. History demonstrates that this has not been the case. In fact, several of the prospective clients told T&C that their program was too expensive.

## EXHIBIT 26.5 Critique of An Expert's Report

TABLE 5 Contrast of Historical Profits With the Opposing Expert Report

Year	Corrected Net Profit/(Loss)	÷	Revenue	=	T&C's Actual Profit Percentage	Opposing Expert Report Profit Percentage
2002	\$ 56,733		\$ 472,081		12.0%	44.11%
2003	56,979		291,196		19.6%	73.11%
2004	43,804		378,472		11.6%	53.92%
2005	4,745		542,278		0.9%	31.23%
2006	38,783		447,900		8.7%	46.34%
2007 <sup>1</sup>	212,572		865,412		24.6%	44.56%
2008 <sup>1</sup>	654,978		1,970,246		33.2%	43.87%
2009	23,592		254,064		9.3%	80.94%
					<b>'02-'06 Minimum</b>	<b>0.9%</b>
					<b>'02-'06 Average</b>	<b>10.5%</b>
					<b>'02-'06 Maximum</b>	<b>19.6%</b>

## Notes:

1. Distorted due to ABC Labs payments to T&C.

The Opposing Expert Report states the following:

Between 2006 and 2008, T&C retained approximately 44% of revenue as adjusted net profit before management compensation. We use this figure to determine the profitability of the alleged lost business.

Clearly, there are several problems with this statement from the Opposing Expert Report. The years 2007 and 2008 were distorted by ABC Labs' excess payments to T&C. Damages calculations for years subsequent to 2008 should not be based on data from 2007 and 2008 because these were not typical years. The only reason that the excessive profits were earned during 2007 and 2008 was due to the overcharges that were made to ABC Labs by T&C. These overcharges will be addressed in the next part of our report as part of the damages stemming from ABC Labs' counterclaim against T&C.

T&C did not "retain" the percentages indicated by the Opposing Expert Report. Most of the amounts that the Opposing Expert Report indicates as "retained" were actually paid to Mr. Jones. As previously discussed at length, a company's actual profitability is determined after subtracting a market level of compensation for managerial time and effort. Thus, T&C's profitability was nowhere close to the 44 percent indicated in the Opposing Expert Report; T&C's actual net profit as a percentage of revenues averaged 10.5 percent during the period 2002–2006. Even if T&C is able to prove liability by the defendants, T&C should be returned to the position that it was in before the damages took place. The purpose of economic damages is not to provide a windfall to the plaintiff.

In the section of the Opposing Expert Report titled "T&C Lost Clients," the Opposing Expert Report cites two documents that were relied on to draw the conclusion that T&C would lose business: "Marketing Analysis of ABC Labs/Pharmacy Co. ABC Benefits Program, prepared by Marketing Co. Limited, undated," and "Operations Analysis of ABC Labs/Pharmacy Co. ABC Benefits Program, prepared by XYZ Services, undated." The Opposing Expert Report's reliance on these documents is extremely problematic.

(continued)

## EXHIBIT 26.5 Critique of An Expert's Report *(continued)*

The XYZ Report provides opinions without documented support, data, or analysis as a basis for those opinions. Additionally, other documents submitted for this litigation showed that the author of the XYZ Report invoiced T&C for services rendered to T&C from September 2007 through October 2008. We will address invoices submitted by XYZ later in this report. What seems abundantly clear is that the president of XYZ is not independent and should not be given any credibility as an expert.

The same problems exist with the second report. Mr. Parker, the author of the second document, also provides opinions without documented support, data, or analysis. He also provides opinions that are clearly out of his area of expertise and, yet, the Opposing Expert Report relies on this information. We will address the Parker Report shortly. T&C invoiced ABC Labs for Mr. Parker's services from May 2007 through August 2008. His invoices appear as problematic as those from XYZ. Once again, the authors of the Opposing Expert Report relied on another report that lacks independence and credibility.

### Page 9

At the top of this page, the Opposing Expert Report states the following:

T&C has prepared a list of clients that were allegedly lost due to the actions of the defendants. The list is divided into two (2) groups: 1) Contract Stage and 2) Proposal Stage. The 'Contract Stage' group consist of clients who had approved of proposals made by T&C and were in the process of preparing contracts for T&C to execute marketing strategies on their behalf.

The Opposing Expert Report's lost income calculation is based on a level of revenues that is not only unsupported, but also unrealistic. The list of clients that were allegedly lost because of ABC Labs is nothing more than a list of proposals that were made to prospective clients for a variety of programs that were to be administered by T&C.

According to a document that references a "Preliminary Report from Opposing Expert Economics Group," prepared by or on behalf of T&C, discussing the DollarRewards Rewards Program, "For this program, which is relatively new to the marketplace, closure rate has been 20% (1 in 5)." Of course, there is no support provided that the closure rate is accurate. The same document discusses the fact that once an agreement is provided to the client, "Closure rate at this stage for all T&C programs has historically exceeded 90%." Here also, there was no support provided for the closure rate. Instead, the Opposing Expert Report blindly accepts these percentages and uses them to determine lost income based on the unsupported list provided to them of the proposals that T&C made during late 2007–2009. This was used as a basis to estimate lost revenues until 2015.

The same T&C document also discusses that "Another new property in development was QRS Program..." This new program was included in the proposals sent to prospective clients that the Opposing Expert Report blindly relies on to account for the lost revenues of the DollarRewards program. Despite there being no experience with this new "property" in the marketplace, the Opposing Expert Report uses the same unsupported closure percentages for a program that is speculative, at best, in accounting for about 14 percent of the quoted program dollars that were lost by T&C, despite not having anything to do with the DollarRewards program.

Furthermore, had the Opposing Expert Economics Group reviewed the back-up documents that were provided by T&C, they would have realized that the figures that were provided to them included the highest end of any proposal that either contained a range of fees (for example, \$75,000 to \$150,000 used \$150,000, T&C07900), or different alternatives for the client to consider (for example, Tier 1-\$464,800, Tier 2-\$550,750 or Tier 3-\$624,587 used \$624,587, T&C07855). The figures were purposely skewed to provide the highest estimate of damages that could be calculated without ever disclosing the truth about the alternatives.

In addition, the chronology of the documents provided by T&C indicates that many of these proposals were not going to occur in the time frame that was provided to Opposing Expert by T&C. Many of these proposals continued to have unanswered questions from the clients, clients that were too busy to set up quick appointments, multiple presentations to the same client, and budgetary constraints for the clients.

What is also clear is that the Opposing Expert Report is claiming lost profits for programs that have not been tested in the marketplace, as well as including programs, such as one for Big Diversified Co. (\$2,300,000) that is greater in size than the level of revenues reported by T&C during the last two decades. Even if they got lucky and hit the lottery on this assignment, what would be the likelihood that this would occur every year from 2009–2015 based on T&C's own historical experience? It is also worth noting that the \$2,300,000 figure that T&C provided to Opposing Expert was also based on an assortment of alternatives, with that being the highest figure.

Opposing Expert's lack of review of the T&C documents also did not let Opposing Expert know that after T&C provided a presentation prepared by OMC Company dated June 10, 2008, Jen Barber, from OMC, sent an email to Lisa Stern from T&C on June 11, 2008, that said "thanks for the info. (sic) the costs are too great for me to consider." This had nothing to do with T&C's reputation.

### EXHIBIT 26.5 Critique of An Expert's Report

In the T&C notes of its telephone conversation with Barbara Smith of Bottling Co, on June 25, 2008, the meeting review section included the following summary:

- Barbara presented the program to ABC Bottling Co. Their comments were: expensive, would have to squeeze in program, table it and put on calendar for holiday season.
- Barbara too felt the price was high and thought if we brought the value of the program down to \$15 or \$20 it would not be so top heavy.

What is really interesting about all the documents produced by T&C is the fact that there is only one mention about Pharmacy Co. not providing good feedback to Big Diversified Co. about its experience with T&C and, yet, Big Diversified Co. continued to have discussions with T&C and permitted T&C to do a presentation about one month later. There does not seem to be anything in the documents provided by T&C, including its own notes, that demonstrates not getting any of the proposals because of the ABC Benefits program issues. The Opposing Expert Report blindly includes the biased, unsupported data provided by T&C in its analysis. It appears that the Opposing Expert Report merely relied on T&C for this information without any due diligence about the likelihood that this business would have occurred *but for* the actions of the defendants.

The Opposing Expert Report states the following:

We assume, for the purpose of this analysis, that there is a high degree of probability that T&C would have secured business from 'Contract Stage' clients. We further assume T&C would have recognized 90% of the income from this group. This is consistent with the historical success rate T&C has reportedly experienced in securing clients in the 'Contract Stage.'

This statement further demonstrates that the Opposing Expert Report contains blind assumptions. Despite this statement, there is nothing contained in the Opposing Expert Report, as well as its files that were produced, that demonstrates that any statistical analysis was performed to support a "high degree of probability" that T&C would have secured this business. Claiming that there is a high degree of probability that something will occur should be based on a statistically valid analysis that is not mentioned in the Opposing Expert Report. The only reference that we see in the Opposing Expert Report, which originally had us wondering if anything was done, is the Opposing Expert Report's reference to "Preliminary Report from Opposing Expert Economics Group, undated." We had requested this document, but we had been informed that it does not exist. This document was finally produced, and we confirmed that it is a document that was created by T&C. Now we know that nothing was done by Opposing Expert other than blind acceptance.

Considering the fact that T&C only averaged \$424,897 in revenues from 2002–2006, before billing ABC Labs for the ABC Benefits Program in 2007 and 2008, T&C is a relatively small company. Even after adjusting the excess charges to ABC Labs for the amounts over and above the original contract amount, T&C still only had adjusted revenues of \$616,563 and \$554,921, for 2007 and 2008, respectively. The Opposing Expert Report reflects revenues that would make T&C a much larger business than it ever was in the recent past.

The Opposing Expert Report fails to support the premise that not only *would* T&C get this new level of business, but that T&C *could* have performed this level of business, with or without adding a considerable level of fixed costs to its operations. This entire analysis is speculative, at best.

The Opposing Expert Report provides no empirical support that 90 percent of the income from the "Contract Stage" clients would have been realized by T&C. Furthermore, there is no discussion about the time frame that this new work would have occurred over. There also is absolutely no proof provided that the reason for any of these contracts falling through had anything to do with the actions of the defendants in this matter. Considering the state of the economy, it appears just as likely that some of these major clients could have made business decisions to cut back on these programs due to the economy.

The Opposing Expert Report also provides no support for the statement that "This is consistent with the historical success rate T&C has **reportedly** experienced...." (Emphasis added). Where is the analysis that reflects T&C's historical success rate? We asked for documents regarding the historical proposals and were informed that they do not exist.

Addressing the possible revenues that were not at the "Contract Stage," the Opposing Expert Report states the following:

Therefore, we assume T&C would have secured approximately 20% of the revenue from these clients. This is consistent with the historical success rate T&C has reportedly experienced in securing clients in the 'Proposal Stage.'

(continued)

**EXHIBIT 26.5 Critique of An Expert's Report** *(continued)*

The Opposing Expert Report also provides no calculations, data, or analysis to support the conclusion that "...T&C would have secured approximately 20% of the revenue from these clients." It appears that the Opposing Expert Report merely relied on T&C for this information. This calculation requires a statistical analysis that is, once again, not mentioned in the Opposing Expert Report as having been performed. The fallacy of this assumption is that T&C has never had this many jobs going on at one time (based on its revenues), nor has it been at the level of revenues that the Opposing Expert Report now reflects for the damages calculations during the last two decades, if ever. With no historical track record to rely on, this is little more than mere speculation.

**Page 10**

One of the important elements of a damages analysis is the selection of an appropriate discount rate to discount the forecasted lost profits to present value because these monies will not be received until sometime in the future. The discount rate is supposed to reflect a risk-adjusted rate of return that considers the risk associated with the income stream that is being discounted to present value. The Opposing Expert Report contains several technical errors.

The Opposing Expert Report discusses the build-up method as being "regularly used in the field of business valuations." Although we completely agree with them on this point, the manner in which the discount rate was built up contains errors and violates proper business valuation practice and standards.

The first component that is discussed in the Opposing Expert Report is the determination of the risk-free rate. The Opposing Expert Report states "As of December 20, 2012, the rate of return on 20-year U.S. Treasury bonds is estimated at 2.57%."

Even though valuation theory, for a long time, suggested the use of U.S. government securities to measure these risk-free rates, the theory has changed over the past several years due to the distressed economy that has been experienced since late 2007. Roger Grabowski, a well-known authority and author regarding the cost of capital, discussed the problem with using these securities.

Although the use of the 20-year U.S. government bond has historically been the most widely used estimate of the risk-free rate, the assumption that this rate was the best estimate of the risk-free rate began to change beginning in September 2008, as the financial crisis started to unfold. Long-term U.S. government bond yields, the typical benchmark used in cost of equity models, became abnormally low for several months, resulting in unreasonably low estimates of the cost of equity capital (if the analyst used historical realized risk premiums as an estimated equity risk premium) as of the important valuation date, December 31, 2008.<sup>14</sup>

The valuation community recognizes the fact that with U.S. Treasury rates at an all-time low, plugging them into a build-up model understates the true cost of equity for most investors. Twenty-year Treasury rates have yielded about 5 percent historically. An increase in this component of the discount rate would reduce the damages calculated in the Opposing Expert Report.

The next component of a discount rate is known as the equity risk premium. This portion of the discount rate is supposed to represent the premium that an investor requires due to the added risk of investing in a portfolio of large stocks instead of U.S. Treasury securities. The theory behind this rate requires an analyst to properly match the appropriate time horizons of the stocks and Treasury securities. For example, when valuing a closely-held business because it is considered to be a long-term investment, the equity risk premium is measured by comparing the returns of stocks over a long time horizon to the returns of government bonds over the same time horizon. This time horizon could be anywhere from 20 to 80 years.

The Opposing Expert Report states the following:

The selected rate, 2.6%, is based upon the short-horizon expected equity risk premium as calculated by taking S&P total returns minus 30-day Treasury bill total returns for the years 2005–2011 as published in *Market Results for Stocks, Bonds, Bills and Inflation 1926–2011*, Morningstar, Inc. (p. 145). This rate represents the premium that common stockholders require in the public marketplace over investors in short-term government bills.

The teachings of all the leading business appraisal organizations agree that it is inappropriate to use an equity risk premium calculated from 30-day Treasury bills and add it to the yield on 20-year Treasury bonds. The risk-free rate used to determine the equity risk premium must match the risk-free rate to which the equity risk premium is applied. Equity risk premiums calculated from 30-day Treasury bills should only be added to the yield on 30-day Treasury bills. Likewise, when using 20-year Treasury bonds as the risk-free rate, the equity risk premium must be calculated using 20-year Treasury bonds. The data must be derived and applied using the same reference to a risk-free rate. In this instance, a longer term time horizon makes more sense.

<sup>14</sup> Roger J. Grabowski and Shannon P. Pratt, *Cost of Capital: Applications and Examples*, 4th ed., John Wiley & Sons, Inc. 2011.

### EXHIBIT 26.5 Critique of An Expert's Report

The Opposing Expert Report uses the phrase "...short-horizon expected equity risk premium..." (underline added for emphasis). Actually, the 2.6 percent rate used in the Opposing Expert Report was the short-horizon realized equity risk premium. We agree that the expected equity risk premium should be used to determine the discount rate, but that is not what was done in the Opposing Expert Report.

Another problem with the Opposing Expert Report is that the equity risk premium used is based on returns only during the period 2005–2011. Seven years is much too short a time period for determining the expected equity risk premium. The Opposing Expert Report referenced *Market Results for Stocks, Bonds, Bills and Inflation 1926–2011* for its cost of capital data. The following quote is from that publication:

The estimate of the equity risk premium depends on the length of the data series studied. A proper estimate of the equity risk premium requires a data series long enough to give a reliable average without being unduly influenced by very good and very poor short-term returns. When calculated using a long data series, the historical equity risk premium is relatively stable. Furthermore, **because an average of the realized equity premium is quite volatile when calculated using a short history, using a long series makes it less likely that the analyst can justify any number he or she wants.**<sup>15</sup> (Emphasis added).

To further illustrate the aberration in the data that occurs from using a shorter time period in the development of a discount rate, Morningstar includes the following table in its publication:

Length (Yrs.)	Period Dates	Large Company Stock Arithmetic Mean Total Return (%)	Long-Horizon Equity Risk Premium (%)
86	1926–2011	11.8	6.6
80	1932–2011	12.5	7.2
70	1942–2011	12.8	7.2
60	1952–2011	11.9	5.7
50	1962–2011	10.7	3.9
40	1972–2011	11.5	4.2
30	1982–2011	12.5	5.5
20	1992–2011	9.6	4.1
15	1997–2011	7.5	2.4
10	2002–2011	5.0	0.5
5	2007–2011	2.4	–1.7

Data from 1926–2011.

<sup>15</sup> *Market Results for Stocks, Bonds, Bills and Inflation 1926–2011 - 2012 Valuation Yearbook* (Chicago: Morningstar, Inc., 2012): 59.

(continued)

## EXHIBIT 26.5 Critique of An Expert's Report *(continued)*

Using only a seven-year period distorts the equity risk premium, regardless of whether a short-term or long-term horizon is used. The Opposing Expert Report contains a flawed methodology for its calculation of the discount rate.

During the period 1926–2011,<sup>16</sup> the short-horizon equity risk premium was 8.1 percent.<sup>17</sup> Thus, making this change, while holding all other things constant, would add 5.5 percent ( $5.5\% = 8.1\% - 2.6\%$ ) to the discount rate used in the Opposing Expert Report.

The Opposing Expert Report also incorrectly uses the short-horizon equity risk premium. The equity risk premium horizon should match the damages horizon as closely as possible. The alleged damages horizon in the Opposing Expert Report is seven years (2009–2015). Thus, the equity risk premium horizon that most closely matches the damages horizon is the intermediate-horizon of five years. “In theory, when determining the risk-free rate and the matching equity risk premium, an analyst should match the risk-free security and the equity risk premium with the period in which the investment cash flows are expected.”<sup>18</sup>

During the period 1926–2011, the intermediate-horizon equity risk premium was 7.1 percent.<sup>19</sup> Thus, making this change, and again, holding everything else constant, would add 4.5 percent ( $4.5\% = 7.1\% - 2.6\%$ ) to the Opposing Expert Report's discount rate.

Regardless of which corrected rate is used, the value of the lost profits calculated in the Opposing Expert Report will be reduced considerably. We will illustrate the error rate in the Opposing Expert Report at the end of this critique.

### Page 11

The next component of the build-up method is the *size premium*, also known as the *small company risk premium*. The Opposing Expert Report has made a technical error regarding this component, as well.

The Opposing Expert Report states “The micro-cap size premium from 2005 to 2011 has averaged 2.7%”. First, the Opposing Expert Report incorrectly uses the “micro-cap” size premium. The micro-cap size category represents returns from companies in the 9th and 10th deciles, or the lowest 20 percent, of the stock market. The size premium should be determined from returns of companies that are similar in size to T&C. Under a heading titled “Choosing the Right Size Premium,” Morningstar, Inc. states the following:

The process of selecting a size premium may lead you down paths with different outcomes. An example of this would be where the estimated equity value is close to the top breakpoint of the 10b category, toward the middle of the 10th decile, and toward the bottom of the Micro-cap. In this case, the statistically conservative choice is the 10th decile because it is in the middle. We need to balance the confidence that our subject firm actually falls within a particular size category with the need to tailor that size grouping as tight as possible to make the peers relevant to our analysis. **The Micro-cap category is too broad for this case, since the subject firm falls in the lower range of the category, and 10b is too narrow since our subject company would barely squeeze in under the top breakpoint before sliding into 10a. We can say with confidence that the 10th decile puts our company among the most peers of similar size.**<sup>20</sup> (Emphasis added).

The Opposing Expert Report uses the “micro-cap” size category, which includes companies that had equity values as great as \$422,811,000.<sup>21</sup> Obviously, these companies dwarf T&C when it comes to size. This is another serious error in the determination of the appropriate discount rate to be used for the damages analysis. Based on the manner in which Morningstar reports its size premium data, the size category that most closely matches T&C's size is the “10b” category (the lower half of the 10th decile), which still includes companies that have equity values as great as \$128,672,000,<sup>22</sup> which are far greater in size than T&C. However, if it is determined that T&C would best fit into this category, the “10b” size premium is 9.8 percent<sup>23</sup> and not 2.7 percent, as reflected in the Opposing Expert Report. This amounts to another error in the Opposing Expert Report of at least 7.1 percent ( $7.1\% = 9.8\% - 2.7\%$ ). Even using the entire 10th decile would result in a size premium of 6.7 percent and not 2.7 percent. Either way, the Opposing Expert Report is wrong.

<sup>16</sup> This is the period of time that most business valuation analysts use because it is the time period reflected in the equity risk premium calculated in the Morningstar publication. Sometimes an analyst may also use a supply-side equity risk premium reported by Morningstar. Either way, the Opposing Expert Report fails to use those rates that are more generally accepted in the valuation community.

### EXHIBIT 26.5 Critique of An Expert's Report

The Opposing Expert Report contains yet another technical error in the determination of the appropriate discount rate. The problem is that the small company risk premium used is based on returns during the period 2005–2011. Seven years is, once again, much too short a time period for determining the expected small company risk premium for the same reasons cited previously.

The final component of the build-up method in the Opposing Expert Report is the “Specific Company Risk Premium.” This is the component that is supposed to capture all the additional risk that relates to the subject company (T&C) from an investment perspective. The Opposing Expert Report includes a rate of 5 percent, which “is based upon our judgment of the company’s relative financial risk, diversification of operations, cash flow and other operational characteristics.” However, there is no analysis included in the Opposing Expert Report that allows the reader to understand how this figure is derived. This appears to be nothing more than a “trust me” statement that is not based on empirical evidence.

The Opposing Expert Report estimates that equity investors in a company the size of T&C had a required rate of return of 12.87 percent ( $12.87\% = 2.57\% + 2.6\% + 2.7\% + 5\%$ ) as of December 20, 2012. The Opposing Expert Report also states, “We note that this discount rate is based on rates of return on minority interest investments in publicly traded companies.” Once again, The Opposing Expert Report strays from generally accepted valuation theory. According to *Market Results for Stocks, Bonds, Bills and Inflation 1926–2011 - 2012 Valuation Yearbook*, the very publication that is cited in the Opposing Expert Report:

Since most companies in the S&P 500 and the NYSE are minority held, some assume that the risk premia derived from these return data represent minority returns and therefore have a minority discount implicit within them. However, **this assumption is not correct.** The returns that are generated by the S&P 500 and the NYSE represent returns to equity holders. While most of these companies are minority held, there is no evidence that higher rates of return could be earned if these companies were suddenly acquired by majority shareholders. The equity risk premium represents expected premiums that holders of securities of a similar nature can expect to achieve on average into the future. **There is no distinction between minority owners and controlling owners.**<sup>24</sup> (Emphasis added).

Not only is the Opposing Expert Report filled with technical errors, but by its own admission, the authors are comparing the rates of return for a small privately owned company, such as T&C, to “investments in publicly traded companies.” Clearly, this roughly \$500,000 *revenue* company (without ABC Labs revenues) should not be compared to these behemoth public companies with *equity* values in excess of \$100 million.

A required rate of return of 12.87 percent for companies as small as T&C is inconsistent with all available data. Historically, companies the size of T&C have had long-term annual returns of 22.82<sup>25</sup> percent. The largest companies, such as those in the S&P 500, have had long-term annual returns of 11.68 percent.<sup>26</sup> The required rate of return on an equity investment in a company as small as T&C must be considerably greater than the required rate of return on large public companies. In an earlier quote from Brian Brinig, JD, CPA, he said

In very small businesses, it is not unusual to conclude that an appropriate risk-adjusted discount rate is 40%, 50%, or even as high as 100%.<sup>27</sup>

Certainly, 13 percent makes no sense for as small a company as T&C. We will demonstrate the severity of this error in the Opposing Expert Report conclusion shortly.

At the bottom of this page, the Opposing Expert Report begins a new section titled “Calculation of Lost Profit.” As indicated earlier in this report, the first underlying premise raised in the Opposing Expert Report is incorrect when it states “In this section we calculate the **profit before management compensation** that T&C would have received but for the defendants’ actions.” (Emphasis added). Although the calculations provided in the Opposing Expert Report extend out for greater than a six-year period, the Opposing Expert Report indicates that the exact term of the loss will be “left to the trier-of-fact.”

(continued)

### EXHIBIT 26.5 Critique of An Expert's Report *(continued)*

The Opposing Expert Report also states the following:

We establish T&C's projected 2009 revenue at \$888,283, based on the 'Contract Stage' clients allegedly lost. We further assume that contracts acquired in 2009 would be renewed in 2010 and would provide revenue in addition to that associated with 'Proposal Stage' clients.

There are some incredible "leaps of faith" and speculation in these underlying assumptions. The Opposing Expert Report assumes that all the "contract stage" revenue would be received in 2009, as opposed to a portion being received in 2009 and portions being received in subsequent periods. It also assumes that all the same contracts received in 2009 would be renewed in all subsequent periods. This is contrary to history. On page 8 of the Opposing Expert Report, yearly revenues for T&C are shown as follows:

**TABLE 6 Revenues Per Opposing Expert Report**

Year	Revenue
2002	\$472,081
2003	291,196
2004	378,472
2005	542,278
2006	447,900

The information contained in the Opposing Expert Report contradicts its own assumption about the ability to renew contracts in subsequent periods. Revenues dropped considerably from 2002–2003 and again from 2005–2006. This undermines the unsupported assumption in the Opposing Expert Report that contracts would be renewed in subsequent years. This is part of the unsupported, speculative forecast that is the underlying premise in the Opposing Expert Report.

The Opposing Expert Report provides no data or analysis to support its conclusion that the entire amount of hypothetical "contract stage" revenue would be received in 2009. After adjusting T&C's revenues for the excess payments made by ABC Labs during 2007 and 2008, the maximum amount of T&C's revenues during 2002–2008 was \$616,563. The Opposing Expert Report assumes that T&C's revenues in 2009 will be more than 44 percent greater than T&C's best historical year.

The Opposing Expert Report continues by stating "We further assume that contracts acquired in 2009 would be renewed in 2010 and would provide revenue in addition to that associated with 'Proposal Stage' clients." Although T&C had never achieved the Opposing Expert Report's assumed level of 2009 revenues, the Opposing Expert Report also assumes that these 2009 revenues will recur in 2010 and provide a base onto which even more revenues will be added.

Adding to the speculation, the Opposing Expert Report states "Revenue in 2010 from 'Proposal Stage' clients allegedly lost are projected at \$2,655,631. Application of the aforementioned information yields total estimated revenue in 2010 of \$3,543,914 (\$888,283 + \$2,655,631)."

The Opposing Expert Report assumes that all the "proposal stage" revenues would be received in 2010 as opposed to a portion being received in 2010 and portions being received in subsequent years. The Opposing Expert Report provides no data or analysis to support its conclusion that the entire amount of hypothetical "proposal stage" revenues would be received in 2010. Again, this is speculative, at best.

After adjusting T&C's revenues for the excess payments made by ABC Labs during 2007 and 2008, the maximum amount of T&C's revenues during the period 2002–2008 was \$616,563. The Opposing Expert Report assumes that T&C's revenues in 2010 will be **more than 574 percent greater** than T&C's best historical year.

After creating a speculative revenue forecast, the Opposing Expert Report discusses its analysis to calculate the lost profits. The Opposing Expert Report states "Projected profit before management compensation is estimated at 44% of revenue." As previously discussed, T&C's actual net profit as a percentage of revenues averaged 10.5 percent during the period from 2002–2006. The Opposing Expert Report's assumption results in unsupported conclusions that lack reliability.

**EXHIBIT 26.5 Critique of An Expert's Report**

Page 12

The Opposing Expert Report includes the following table:

**TABLE 7 Present Value Per Opposing Expert Report**

Year	Projected Revenue	Profit Before Management Compensation	Present Value (@ 13%)	Cumulative Present Value
(1)	(2)	(3)	(4)	(5)
2009	\$ 888,283	\$ 390,844	\$ 340,035	\$ 340,035
2010	3,543,914	1,559,322	1,356,610	1,696,645
2011	3,543,914	1,559,322	1,356,610	3,053,255
2012	3,543,914	1,559,322	1,356,610	4,409,865
2013	3,543,914	1,559,322	1,356,610	5,766,475
2014	3,543,914	1,559,322	1,379,931	7,146,406
2015	3,543,914	1,559,322	1,221,178	8,367,584

There are several problems with the data presented in this table. The Opposing Expert Report incorrectly assumes that the extremely high level of revenues projected for 2010 will recur in each year from 2011–2015. The Opposing Expert Report provides no data or analysis to support this conclusion.

Illustrated in figure 2 is the speculative forecast contained in the Opposing Expert Report; it contrasts the Opposing Expert Report's projected revenues with T&C's historical revenues as adjusted for 2007 and 2008.

As indicated in figure 2, the forecast of revenues in the Opposing Expert Report has absolutely no relationship to historical revenues. This is nothing more than a “hockey stick” forecast based on nothing but speculation.

(continued)

**EXHIBIT 26.5 Critique of An Expert's Report** *(continued)*

The Opposing Expert Report also fails to account for the fact that many companies reduced marketing expenditures during the recession, as shown in the following:

2009 created a lot of tough financial situations for businesses all across the United States. Many of them, as a result, have decreased the size of their marketing budgets drastically. In fact, in 2008, businesses in the US had spent \$77 billion. In 2009 however, businesses only spent \$67 billion dollars.<sup>28</sup>

Our Q1 2009 Global CMO Recession Online Survey reveals marketing leaders under pressure to deliver results while enduring budget cuts in excess of 20%.<sup>29</sup>

The Opposing Expert Report fails to link the loss of revenues to the alleged actions of the defendants. Instead, the report is based on unsupported assumptions that ignore current economic conditions. The Opposing Expert Report overstates forecasted revenues and understates expenses, resulting in overstated lost profits. It then compounds the loss by using an understated discount rate to reduce the inflated lost profits to present value.

The Opposing Expert Report also contains errors in the calculation of the present value of the profit before management compensation. Because the Opposing Expert Report contains insufficient narrative to properly understand the intended calculations, we did not attempt to correct the figures. We know that they are wrong because the first line is discounted, the next four lines are the same, and 2014 goes up instead of down. The calculations in this table are wrong and cannot be relied on.

We are including the following tables to highlight the magnitude of the various errors in the Opposing Expert Report that we have discussed, particularly what is reflected in table 7. These tables are solely for illustration and should not be considered our opinion of damages that T&C has allegedly suffered as a result of the actions of the defendants. We were informed that many of the documents that we requested do not exist. However, these documents would be required to perform this analysis properly and provide an opportunity for an expert to opine on this matter within a reasonable degree of economic certainty.

**TABLE 8 Damages With Opposing Expert Speculative Revenues, Incorrect Profitability, And More Reasonable Discount Rate**

Year	Profit Before Management Compensation	×	Present Value Factors @ 25%	=	Present Values
2009	\$ 390,844		1.00000		\$ 390,844
2010	1,559,322		1.00000		1,559,322
2011	1,559,322		1.00000		1,559,322
2012	1,559,322		1.00000		1,559,322
2013	1,559,322		0.80000		1,247,458
2014	1,559,322		0.64000		997,966
2015	1,559,322		0.51200		798,373
<b>Adjusted Total</b>					<b>\$8,112,607</b>
<b>Margin of Error</b>					<b>3.1%</b>

<sup>28</sup> Prager Microsystems, Inc., "Marketing Budgets Feel the Pinch in 2009 Recession," [www.pragermicrosystems.com/blog/articles/marketing-budgets-feel-the-pinch-in-2009-recession](http://www.pragermicrosystems.com/blog/articles/marketing-budgets-feel-the-pinch-in-2009-recession) (accessed February 28, 2010).

<sup>29</sup> Forrester Research, "Marketing Budgets Suffer Significant Cuts," [www.forrester.com/rb/Research/marketing\\_budgets\\_suffer\\_significant\\_cuts/q/id/47951/t/2](http://www.forrester.com/rb/Research/marketing_budgets_suffer_significant_cuts/q/id/47951/t/2) (accessed February 28, 2010).

**EXHIBIT 26.5 Critique of An Expert's Report**

By only adjusting the discount rate to a more reasonable level, the Opposing Expert Report results provide a conclusion that is off by 3.1 percent. This is the best-case scenario but is still plagued with errors in the forecasted revenues and expenses, as well as the present value calculation.

**TABLE 9 Damages With Opposing Expert Speculative Revenues and Corrected Profitability and More Reasonable Discount Rate**

	Projected Revenue	×	T&C's Historical Profitability	=	Corrected Net Income	×	Present Value Factors @ 25%	=	Present Values
2009	\$ 888,283		10.5%		\$ 93,612		1.00000		\$ 93,612
2010	3,543,914		10.5%		373,476		1.00000		373,476
2011	3,543,914		10.5%		373,476		1.00000		373,476
2012	3,543,914		10.5%		373,476		1.00000		373,476
2013	3,543,914		10.5%		373,476		0.80000		298,781
2014	3,543,914		10.5%		373,476		0.64000		239,025
2015	3,543,914		10.5%		373,476		0.51200		191,220
<b>Adjusted Total</b>									<b>\$1,943,067</b>
<b>Margin of Error</b>									<b>330.6%</b>

Correcting the profitability and using a more reasonable discount rate demonstrates that the Opposing Expert Report results are off by a margin of 330.6 percent. This cannot be relied upon.

**TABLE 10 Damages With Historical Revenues, Profitability, and More Reasonable Discount Rate**

	Historical Revenues	×	T&C's Historical Profitability	=	Corrected Net Income	×	Present Value Factors @ 25%	=	Present Values
2009	\$554,921		10.5%		\$58,481		1.00000		\$ 58,481
2010	554,921		10.5%		58,481		1.00000		58,481
2011	554,921		10.5%		58,481		1.00000		58,481
2012	554,921		10.5%		58,481		1.00000		58,481
2013	554,921		10.5%		58,481		0.80000		46,784
2014	554,921		10.5%		58,481		0.64000		37,428
2015	554,921		10.5%		58,481		0.51200		29,942
<b>Adjusted Total</b>									<b>\$348,076</b>
<b>Margin of Error</b>									<b>2304.0%</b>

The final set of calculations use historical revenues, profitability, and a reasonable discount rate and truly show the absurdity of the conclusions reached in the Opposing Expert Report. The margin of error is so great that it proves that there cannot be any basis for relying on the Opposing Expert Report because it is too unreliable.

## Conclusion

If I did my job, the information provided in this chapter about economic damages should be somewhat clearer. Hopefully, the realization is now that a person with the same skills that allows him or her to perform business valuation assignments can also perform economic damages assignments. Although this chapter is not going to make anyone an expert in the field of economic damages, it should provide more of an understanding of what an expert does in performing these assignments by using the same skill set that was discussed in the first 25 chapters of this book. Good luck!

# Chapter 27

## My Favorite Court Cases

### Learning Objectives

In this chapter, I am going to discuss some of my favorite court cases. These include the following:

- *Estate of Joyce C. Hall v. Commissioner*
- *Estate of Samuel I. Newhouse v. IRS Commissioner*
- *Charles S. Foltz et al. v. U.S. News & World Report, Inc., et al.*
- *Bernard Mandelbaum v. IRS Commissioner*
- *Mad Auto Wrecking v. IRS Commissioner*
- *Delaware Open MRI Radiology Associates, P.A. v. Howard B. Kessler, et al.*

All of these cases were included in the last edition of this book. They are still my favorite cases when it comes to teaching important valuation concepts. I keep saying that “if it ain’t broke, don’t fix it.” This is certainly true with regard to these cases. Just remember that as with all case law, the valuation analyst needs to make sure that he or she is working with an attorney if he or she plans to apply legal concepts in the assignment.

### Introduction

In order to be successful as a valuation analyst, he or she must be hungry for guidance in the stuff that he or she does for a living. I keep reading everything that I can get my hands on in the hopes that I will get better at it. The one lesson that I have learned over the past almost 35 years of doing business valuations is that on occasion, a court ruling gets issued that is well thought out and well written. I’m not being critical of the judiciary, but most opinions do not really help me understand what they did to reach the opinion.

In all fairness to the judges, many expert reports, and much of the expert testimony rendered before the courts, quite frankly, stinks. These poor judges are being asked to rule, in many cases, using expert testimony and expert reports that are *anything but* expert work. I give the judges a lot of credit (no cash, but a lot of credit) for doing their jobs as well as they do. As valuation analysts, we read court cases and do not fully appreciate how little good information was presented to the court for it to rule on.

In this chapter, I am going to discuss some of the court cases that I have found to be very helpful in doing my job because they are instructional. I find that I keep going back to them in order to get some really good valuation guidance. Just keep in mind that a valuation analyst is usually not an attorney, so he or she should not be relying on these decisions without proper guidance from an attorney.

Although I am only going to cover certain aspects of these cases, you really should read the entire court opinion. Enough of the introduction, let’s do it!

## Estate of Joyce C. Hall v. Commissioner<sup>1</sup>

### Issue: What Makes a Guideline Company?

This case involves a well-known company, Hallmark Cards, Inc. (the greeting card company) and the determination of the decedent's interest in that privately held company. The main issue that I want to discuss is the treatment given to the guideline public company method, in particular, the search for guideline public companies. Revenue Ruling 59-60 states as number 8 on the hit parade that the valuation analyst should consider

the market price of stocks of corporations engaged in the same or similar line of business and having their stocks actively traded in a free and open market, either on an exchange or over the counter.<sup>2</sup>

If you reread this statement, the guideline companies are supposed to be in the *same or similar line of business* as the subject company. Notice the word *similar*. That's what this case is all about.

In the battle between the experts, all the experts agreed on one thing: There was only one good publicly traded *comparable* company, American Greetings Corporation. The petitioner's experts selected additional guideline public companies from other industries because they believed that using only one guideline public company could be misleading—sort of like taking a poll and asking only one person who will win an election. Not a very meaningful result!

The IRS's expert made his determination based only on American Greetings (surprise, surprise!). He also ended up with values per share of the three classes of stock at more than two times those of the other two experts.

The taxpayer's initial expert, from First Boston, selected five companies as guidelines in addition to American Greetings. They were as follows:

- A.T. Cross Co. (the pen and pencil people)
- Avon Products, Inc. (the world's largest manufacturer of cosmetics, fragrances, and fashion jewelry)
- Coca-Cola Co. (the soda people)
- Lenox Inc. (the fine china folks)
- Papercraft Corp. (a manufacturer of gift wrap items)

These companies did not sell greeting cards. However, First Boston felt that these would be good guideline companies because they

- produced brand-name consumer goods,
- were leading companies in their respective industries,
- had publicly traded stocks, and
- had business and financial characteristics similar to Hallmark.

The lesson to be learned from this is if the valuation analyst looks for an exact fit, he or she will probably never find one. However, to apply the guideline public company method, the valuation analyst needs to use some imagination to set parameters for a search other than the subject company's Standard Industrial Classification (SIC) code. Sometimes, better guideline public companies may exist in different industries.

The second expert for the estate, Shearson Lehman, believed that considering several guideline public companies reduced the probability that individual characteristics, temporary market inefficiencies, or aberrations relating to one company might bias the valuation analysis.

Despite American Greetings being Hallmark's closest publicly held competitor, Shearson looked for a broad group of companies that shared one or more of the following traits with Hallmark:

<sup>1</sup> *Estate of Joyce C. Hall v. Commissioner*, 92 TC 312(RIA) (1989).

<sup>2</sup> Revenue Ruling 59-60 (1959-1 C.B. 23).

- Sold low-cost, consumer, nondurable goods through channels similar to those used by greeting card companies
- Had a stable, high-profile, quality reputation with the consumer and a leading brand name
- Sold products in which the images of both the product and the company, and the product's function, were differentiable from those of its competitors
- Sold products that involved some element of social expression

In addition to companies that met the preceding criteria (the opinion does not tell us which companies), Shearson picked four other companies that they considered comparable to Hallmark in that they were leaders in their industries. They were as follows:

- McDonald's
- Anheuser Busch
- IBM
- Coca-Cola

Hamburgers, beer, computers, and soda! Many individuals could argue that these companies are not comparable to Hallmark. This is the reason that we now call them "guideline companies." The idea is to get guidance from the market about the investing public's perception of companies that have similar investment characteristics. These companies were highly regarded by the investment community for their quality management, leading market position, and excellent financial condition. Shearson Lehman also believed that if Hallmark was a public company, it would enjoy a similar reputation.

The lesson that comes out of this case can be highlighted through some of the sections of the court's ruling. These are as follows:

- "Moreover, it is inconceivable to us that a potential buyer of Hallmark stock would consider only one alternative 'comparable,' i.e., American Greetings stock."
- "Respondent argues that it is 'simply wrong as a matter of law' to look beyond the single, publicly held company engaged in the sale of greeting cards to other companies engaged in the sale of other types of consumer nondurable goods or having similar financial characteristics. Respondent's argument too narrowly construes the concept of comparability and ignores the use of 'similar' as well as 'same' in section 2031(b). Respondent relies on *Northern Trust Co., Transferee v. Commissioner*, 87 TC 349, 376 (1986), aff'd sub nom. *Citizens Bank & Trust Co., Transferee v. Commissioner*, 87 TC 349, 376 1249 (7th Cir. 1988). That case, however, rejected expert opinions based on companies that were found to be noncomparable and concluded that 'the market comparable approach is not available in this case.' 87 TC at 377. That opinion does not justify using a market comparable approach based on a single competitor."
- "Overall, we can only conclude that PCA [the IRS expert] was instructed to prepare and did prepare an analysis that led to an artificial and excessive value for the Hallmark stock. In contrast to PCA, petitioner's experts acted reasonably in selecting comparable companies in the similar business of consumer nondurable goods, in drawing conclusions based upon careful comparisons of Hallmark with individual comparables."

So, what does this tell us? Similar does not mean an exact fit. Using the guideline public company method requires the valuation analyst to look beyond the obvious in the search for companies that can provide guidance from the market. This case is excellent in reiterating the very essence of the market approach.

## ***Estate of Samuel I. Newhouse v. Commissioner*<sup>3</sup>**

### **Issue: Different Classes of Willing Buyers Result in Different Values**

This was in an earlier chapter, but it is worth repeating here. This case is another excellent learning tool. The theme that I am going to highlight is only a small, but important, part of the case. Valuations that are performed for estate tax purposes must use the fair market value standard of value. Valuation theory tells us that fair market value assumes a hypothetical transaction between a hypothetical willing buyer and a hypothetical willing seller. This case addresses the issue of fair market value "to whom."

<sup>3</sup> *Estate of Samuel I. Newhouse v. Commissioner*, 94 TC 193(RIA) (1990).

Fair market value deals with the hypothetical willing buyer and willing seller. This case addressed the issue of which class of willing buyer should be considered in the determination of fair market value. Valuation analysts frequently use terms such as strategic or synergistic buyer. We immediately respond by stating that if there is a strategic or synergistic buyer involved, the value determined would represent investment value and not fair market value. This is not always correct.

Part of the determination of fair market value requires the valuation analyst to determine the likely market for the property. Clearly, the willing seller, if prudent, will look to sell the property in the market that would bring him or her the greatest price.

The Newhouse case examined four classes of potential investors. They were as follows:

- Passive investor
- Active investor
- Control investor
- Public investor

Goldman Sachs analyzed these four categories of investors as all being valid willing buyers in the definition of *fair market value*. The court's opinion discusses the different types of investors. The subject company of the valuation is referred to as "Advance." Important descriptions from the opinion are excerpted in box 27.1.

#### **BOX 27.1**      **Classes of Potential Investors**

- A passive investor would not be interested in managing Advance and would not attempt to wrest control from management. Expecting to realize value from dividends and private resale, the passive investor would not expect to extract value from Advance through liquidation, merger, or public offering. The passive investor would consider that Advance's stock was not publicly traded, which would depress expectations of resale value. Due to this illiquidity, lack of control, and the uncertainties and constraints affecting the purchase, Goldman Sachs concluded that the passive investor would have offered 30 percent less than the public trading market value of the common stock and, thus, only \$141 million for the common stock.
- The active investor would be inclined to pursue action, short of seeking control, that would quickly maximize the return on his investment. One course of action would be to declare a dividend of Advance's excess cash and any funds that could be obtained through borrowing. Because of the high prevailing interest rate and planned capital expenditures, the common shareholder could extract no more than \$74 million of excess cash plus loan proceeds. Advance also had \$145 million of excess cash, which could be distributed with the loan proceeds. Because of the time and uncertainty involved in this plan of action, the active investor would pay no more than 85 percent of the amount he hoped to extract. This figure would be far less than the \$141 million the passive investor would be willing to pay.

Alternatively, the active investor might cause the excess cash to be distributed immediately and then cause Advance to pay dividends at the highest possible level. Assuming that the active investor would insist on an after-tax yield on his investment of about 13 percent or 14 percent, Goldman Sachs concluded that the active investor would be willing to pay \$150 million for the Advance common stock.

- A control investor would have purchased the Advance common stock with the goal of acquiring 100 percent of the equity ownership and control of the company. A control investor would hope to realize value from his purchase by dividend distributions, liquidation, or merger, but Advance's unusual capital structure would prevent the latter two courses of action without eliminating the preferred stock or securing their consent. The preferred had the right to block liquidation. Because the common's power to effect a merger adverse to the preferred's interests was so uncertain, Goldman Sachs concluded that any willing buyer, as a matter of sound business judgment, would analyze the value of the common as if that option were foreclosed. Goldman Sachs' analysis is persuasive.
- Goldman Sachs concluded that only another media company would be interested in acquiring Advance and that none of the major media companies would have considered buying the common stock without first eliminating the claims of the preferred shareholders. Because the control investor would assume that he could not receive anything except 22 percent of the highest level of dividends declared, he would be in the same position as the active investor and would pay no more than what the active investor would pay, that is, \$150 million.

*(Box continued)*

**BOX 27.1****Classes of Potential Investors** *(continued)*

- Goldman Sachs concluded that an underwritten public offering would be the best way to sell the Advance common stock, requiring the three different types of stock to be recapitalized into a single class. Goldman Sachs' research indicated that in approximately half of the transactions in which voting control was transferred, the buyers paid a premium for control. Goldman Sachs concluded that no control premium was warranted. Goldman Sachs then determined that, after exchanging the class A common stock 1 for 3, and the class B common and the preferred stock one for one, the offering price would be \$25 per share, subject to a 7 percent discount. The price for all the shares would be \$778 million, and for petitioner's shares, it would be \$176 million.
- Because the benchmark value for a public offering, \$176 million, was the highest value, Goldman Sachs concluded that the value of petitioner's Advance common stock was \$176 million on February 29, 1980.

In an older AICPA self-study program that is no longer being sold, *Business Valuation Methods*, Alan Zipp discussed the categories of investor. He stated the following:

***The Passive Investor***

A passive investor would not be interested in managing the business. He would expect to realize value from dividends and resale and not from liquidation, merger, or public offering. Although, the passive investor neither controls management, business operations, nor cash flow, he would expect to have some influence on management to increase dividends in the future. The passive investor would consider a depressed resale value because a closely held company is not publicly traded. Due to this illiquidity, lack of control, the uncertainties of future dividends, and constraints affecting a resale, a passive investor would be willing to purchase the business only at a substantial discount, of perhaps 30% or more.

***The Active Investor***

The active investor would be inclined to pursue action, short of seeking control, that would quickly maximize the return on his investment. One course of action would be to pressure the control interest to declare a dividend. Continuous pressure on management to promote business growth and to distribute dividends would be the role of the active investor. Because of the time and uncertainty involved in this plan of action, the active investor would pay no more than 85% of the amount he hoped to extract as dividend distributions.

***The Control Investor***

The control investor would purchase an interest in a business with the goal of acquiring 100% of the equity ownership and control of the company. A control investor would hope to realize value from his purchase through excess salary and fringe benefits, dividend distributions, liquidation, merger, or perhaps a public offering. A control investor, being in a position to determine the timing and amount of dividend distributions, salary and fringe benefits, and liquidation or sale prospects, would be willing to pay about 90% of the amount he expects to receive.

***The Public Investor***

The public investor would purchase a business interest with the full acceptance of being a minority stockholder and having no influence over business operations. The public investor would hope to realize value from his purchase in the appreciation in value of the investment, along with dividends received. The public investor would only consider historical dividends, even though the company had the ability to pay higher dividends, because the public investor is not inclined to seek larger distributions. The public investor, unlike the passive investor, would make the investment only if the company planned to make a public or private offering creating a market for the shares. Therefore,

in addition to a substantial discount for the lack of control and influence, illiquidity, uncertainty of future dividends, and risk of liquidation, the public investor would want a discount for the costs associated with the underwriting of a public or private offering, from 5% to 20%. Hence, the public investor in a closely held business would expect a discount from 35% to 55% or more.

The importance of this case is that it explicitly contends that the willing buyer of a company can be any number of possible buyers with varying intentions and return on investment requirements. The result of such a conclusion is the creation of an awareness that one type of buyer, based on his or her intentions, will pay a much different price than that of another buyer. As discussed previously, there are many different traits and factors that must be considered. The review of such issues is not relegated only to those mentioned within this case summary. The motivations for investment for the different classes of willing buyers can vary greatly. The difficult part of this exercise is to identify as many of the different classes of buyers as possible. Identifying the numerous reasons why one investor differs from another will support the existence of a difference in value even for the same company.

Although this portion of the willing buyer analysis is rational and sound, it is frequently overlooked. The process of valuation must consider all factors, regardless of whether they are used in the final conclusions of the report. Ensuring that all variables have been analyzed will justify conclusions better than by ignoring them.

The valuation analyst is faced with the challenge of defining the market for the subject interest being valued. Just keep in mind that the market should represent a rational, knowledgeable buyer and not the biggest fool who will pay the most for the property. Fools don't count!

## Charles S. Foltz v. U.S. News & World Report, Inc.<sup>4</sup>

### Issue: Excess Asset and the Minority Interest

These lawsuits are oldies but goodies. They were brought by retirees of *U.S. News & World Report* who felt they were underpaid at retirement because the stock of *U.S. News & World Report, Inc.*, a closely held company, was undervalued by the independent valuation analysts for the nine-year period from 1973–1981. I wonder why they woke up after nine years?

Well, this case got everyone sued, the company, certain directors, the profit-sharing plan that held the stock, and the valuation analyst. Not sure why anyone would really want to do this stuff.

Some quick background—*U.S. News* had a profit-sharing plan that worked like an employee stock ownership plan (ESOP). When employees retired, they were paid fair market value for their shares. As time went by, the company purchased real estate near its headquarters located in Washington, D.C. The value of this real estate started to climb during the 1970s. There were discussions about developing the real estate for alternative uses, but nothing was done about it until 1981.

In the court's opinion, Judge Barrington D. Parker stated that "the central issue requiring resolution in this litigation has always been the propriety of the methodology employed in appraising the *U.S. News* stock." The primary valuation issues in the case are outlined in box 27.2 and discussed in the following sections.

#### BOX 27.2

#### Case Issues

- Control versus minority valuation basis
- Discount for lack of marketability (DLOM)
- Importance of real estate and other assets
- Subsequent events

### Control Versus Minority Valuation Basis

The annual valuations valued the stock on a minority basis. Plaintiffs contended that the stock should have been valued on a control basis.

<sup>4</sup> *Charles S. Foltz, et al., v. U.S. News & World Report, Inc., et al., and David B. Richardson, et al., v. U.S. News & World Report, Inc., et al.* U.S. District Court, District of Columbia, Civil Actions No. 84-0447 and 85-2195, June 22, 1987. (The Foltz case, a class action, dealt with the years 1973–1980; the Richardson case, not a class action, covered 1981.)

## Discounts for Lack of Marketability

Almost all the annual valuations applied a 10 percent discount for lack of marketability (DLOM). The plaintiffs contended that no DLOM should have been applied. Unlike today's ESOPs, the stock had no put option. The company had a call option at the conclusion of value, which it exercised consistently to retire stock from the stock bonus plan when employees left. Most of the calls were for cash, but on occasion, the company exercised its option to purchase the stock on extended terms, at a low interest rate, which the call option permitted.

## Importance of Real Estate and Other Assets

The annual valuations placed various weights on the real estate values in different years, depending on the facts and circumstances at that time. In all valuations, the primary emphasis was on the earnings power of the company. Plaintiffs contended that more weight should have been given to the analysis and values of the real estate and other assets.

## Subsequent Events

The annual valuations valued the stock on a going concern basis, taking into consideration only facts and circumstances that were known or knowable as of the valuation date. Plaintiffs contended that prospects for future changes, such as a synergistic buyer of the company who might be willing to pay more for the company, should have been considered and reflected in the annual valuations. The company was sold in 1984 for a lot more than the conclusion of value.

Judge Parker's decision is good reading as a learning tool. The court concluded, "After consideration of the expert testimony presented, The Court is not persuaded that the per-share price arrived at each year by American Appraisal did not fall within a reasonable range of acceptable values." Let's hear it for the valuation analysts!

## Control Versus Minority

On this point, The Court stated the following:

Because the terms of the U.S. News plan did not contemplate anything other than a series of minority-interest transactions... the valuation of its stock on a minority basis does not offend ERISA...

Various individuals concurrently held undivided, minority interests in a control block of stock... The mere fact that Plan members' interests, if added together, amounted to a majority of the outstanding shares in the company, does not, standing alone, entitle them to a pro rata control value.

The judge not only discussed the control versus minority issue, but he also strongly supported the acceptance of valuation analysts' judgment when reasonable alternatives were available:

Clearly, in the absence of any statutory, administrative, or judicial authority for the proposition that a control value might have been indicated, defendants cannot be faulted for employing a minority valuation...ERISA does not require plan fiduciaries to maximize the benefits of departing employees...; it only requires them to make a reasonable choice from among possible alternatives.

The court also noted that the minority interest valuation was consistent with the valuation methodology used when the plan purchased its stock in 1962 and 1966. Consistency is the key in this business. With respect to the voting trust that was part of the profit-sharing plan, the court noted the following:

It is well recognized that, not only does the existence of a voting trust fail to make the underlying stock more valuable, it most often decreases the value of those shares... Defendants would have been justified in reducing the value of the company's stock to reflect the impediment that the trust placed against the full enjoyment of the rights that would ordinarily have attached to the stock.

## Discounts for Lack of Marketability

Here, The Court noted that

the Company was under no obligation to repurchase the stock. It had, rather, an option to call the stock... Moreover, ... the Company could—and from time to time did—exercise its option . . . to pay for the stock on terms that would not have been accepted gladly by an outside investor... The modest 10 percent marketability discount that American Appraisal applied generally to the U.S. News stock in the aggregate was perfectly appropriate.

## Real Estate and Other Assets

Judge Parker said the following:

In a minority valuation... assets may or may not play an important part in arriving at a per-share figure, because a minority shareholder cannot reach those assets... Generally speaking, if the valuation being undertaken is of a business, such as U.S. News, that produces goods or services, primary consideration will be given to the earnings of the company and the resultant return on a shareholder's investment.

## Subsequent Events

In this regard, The Court found that

the approach to be used is not retrospective, but prospective. One must look at the situation as of the time that each employee separated from the Company. Therefore, the appropriate inquiry is whether the Company was properly valued during the class period, not whether former employees become eligible for a greater share of benefits upon the contingency of a subsequent sale.

With respect to possible future development of the real estate holdings, Judge Parker cited testimony that

[a]ny realizable value should be attributed to the real estate only “if it was evident that the controlling interest had a firm and clear intent to dispose of the real estate within a very short or reasonable period of time [, that is,] absolute evidence... not mere development plans.”

Several valuable lessons can be learned from this case. One of the most important lessons is the concept that because a minority stockholder does not have the ability to reach the underlying assets of the corporation, only a minor amount of weight, if any, should be given to the value of these assets. Modern valuation theory addresses this as one of the prerogatives of control.

Another lesson is that valuation is a prospective process and not a retrospective process. I strongly urge you to read the entire case. We cite a portion of the opinion when we value minority interests (see exhibit 27.1).

### EXHIBIT 27.1 Partial Discussion—Minority Interest Report

**DESCRIPTION OF THE ASSIGNMENT.** Trugman Valuation Associates, Inc. was retained by Howard Bros., Inc. to determine the fair market value of Howard Bros., Inc., a New Jersey corporation, on a minority basis as of December 19, 2000. The purpose of this valuation is to determine the value of the shares for potential gifts that will be made.

**THE ASSET-BASED APPROACH.** The asset-based approach, sometimes referred to as the cost approach, is an asset-oriented approach, rather than a market-oriented approach. Each component of a business is valued separately and then summed up to derive the total value of the enterprise.

The valuation analyst estimates value, using this approach, by estimating the cost of duplicating or replacing the individual elements of the business property being appraised, item by item, asset by asset.

### EXHIBIT 27.1 Partial Discussion—Minority Interest Report

The tangible assets of the business are valued using this approach, although it cannot be used alone because many businesses have intangible value, as well, to which this approach cannot be applied.

This approach is generally inappropriate for a minority interest unless the shareholder has the right to liquidate or sell off the assets and liabilities of the company. Because minority shareholders cannot realize the value of the net assets, regardless of the amount of appreciation that may have taken place, it is inappropriate for the valuation analyst to apply this methodology for most minority stock valuations. This concept was discussed by The Court in *U.S. News & World Report, Inc.*,<sup>1</sup> in which the plaintiffs claimed that they were underpaid for the value of their shares of stock in the company.

The essence of the case was the fact that there was significantly appreciated real estate that had not been considered by the valuation analyst when the shares of stock were valued on a minority basis. In this matter, the court cited testimony that

Any realizable value should be attributed to the real estate only if it was evident that the controlling interest had a firm and clear intent to dispose of the real estate within a very short or reasonable period of time....

This same process applies to all balance sheet items because the minority shareholder cannot realize proceeds from an event that he or she cannot control.

<sup>1</sup> *Charles S. Foltz, et al., v. U.S. News & World Report, Inc., et al., and David B. Richardson, et al., v. U.S. News & World Report, Inc., et al.*, U.S. District Court, District of Columbia, Civil Actions No. 84-0447 and 85-2195, June 22, 1987.

## Bernard Mandelbaum, et al. v. IRS Commissioner<sup>5</sup>

### Issue: Discount for Lack of Marketability

Many court cases involve multiple issues. However, *Bernard Mandelbaum et al. v. Commissioner* relates to only one aspect of the valuation universe, namely the DLOM.

In discussing the DLOM and how it fits in with this case, let's first discuss some of the background regarding the opposing arguments. There were six dates in which shares of the valuation subject (Big M), were gifted from shareholders to other parties. These gifts required the filing of gift tax returns covering dates from 1986–1990.

One issue needs to be mentioned here. The Big M stock was subject to two shareholder agreements. The first agreement required that any positions on the board that became vacant be filled by current members and that the new directors be either current shareholders or their spouses. Upon death, the shares were to be sold to Big M, and the company had sole discretion over what period of time they would pay for the shares. The company also had a right of first refusal for live shareholders (as opposed to dead ones), and again, could determine the time period for the purchase. The company had 90 days to decide whether it would exercise its purchase option.

The second agreement was pretty similar to the first, but if someone wanted out, they had to offer their shares to family members before they could sell to outsiders. These types of agreements are not terribly unusual, except for the provision that allows the company to have sole discretion over the time period for the payout.

To support its determination of value and, therefore, calculation of the taxpayers' deficiency, the respondent's expert concluded an applicable DLOM of 30 percent for the gifted shares on the 6 dates in question. This discount level was calculated relying on three of the restricted stock studies discussed in chapter 15. These studies provided a range of DLOMs between 30 percent and 35 percent.

<sup>5</sup> *Bernard Mandelbaum et al. v. IRS Commissioner*, TC Memo 1995-255(RIA).

On the other side, the petitioner, Bernard Mandelbaum and family, utilized the services of another expert to support the values reported on their gift tax returns for the specified dates. To find an applicable DLOM, the petitioner's expert employed a similar analysis to that of the respondent's expert. However, the petitioner's expert used 10 studies, including the three used by the respondent's expert, to determine an acceptable range of DLOMs. Furthermore, the petitioner's expert also took into account the details of Big M's shareholder agreements and prior events involving the company and shareholders. Based upon these considerations, and the 10 studies that included seven restricted stock studies and three pre-IPO studies, the petitioner's expert concluded that a 75 percent DLOM applied for the valuation dates from 1986–1989, and a 70 percent DLOM was applicable for the dates in 1990.

The discounts that were concluded were substantially higher than the discounts included in the 10 studies analyzed because of the petitioner's expert's analysis of the restrictions placed upon the company's shares by the shareholders' agreements. Also, he interviewed employees of investment firms to determine the required rate of return of potential investors. These returns ranged from 25 percent to 40 percent. As a result of this, the petitioner's expert determined that a rate between 35 percent and 40 percent would be appropriate for Big M.

After listening to both experts, Judge David Laro gave no weight to either side's expert. First, the court discussed the respondent's expert, his determination of a DLOM, and the resulting value of the gifted shares for the subject dates. Judge Laro did not like the fact that the respondent's expert compared this private company's shares to restricted stocks of public companies, while choosing to ignore the shareholders' agreements.

Also, The Court found additional fault with the respondent's expert's conclusions because of his use of such a limited number of restricted stock studies when several others existed. Using the studies as the basis of a range without considering the inherent differences between the subject company and the companies included in the analyses did not conform to what The Court felt was a reasonable and justified comparison. To say the least, the judge did not seem impressed.

Analyzing the petitioner's expert, The Court found several faults with the basis of his conclusions. He was less impressed with the petitioner's expert. It was determined that the expert put too much weight on the shareholders' agreement within the conclusion of the DLOM. While Judge Laro stated that the respondent's expert's conclusions mistakenly left out the effect of the agreements, he felt that the petitioner's expert placed too much emphasis upon them.

The biggest problem that The Court found with the petitioner's expert's opinion is that his analysis did not look at both a willing seller and a willing buyer, it only considered the hypothetical buyer. Judge Laro felt that no shareholder would be willing to sell Big M stock at such a large discount. He was probably correct! The Court also was not too thrilled with the petitioner's expert's analysis that indicated that the shareholders would be stuck holding the stock for a 10- to 20-year period.

The second theme that Judge Laro discusses in his opinion is how closely the experts followed the valuation guidelines set forth by the definition of fair market value. In critiquing the petitioner's expert, The Court stated that his analysis lacked the consideration of a willing seller. The judge did not believe that a willing seller would have accepted such a large discount. Also, when trying to reflect the characteristics of a willing buyer, the petitioner's expert erred in developing a comparable group of possible investors. According to The Court, the group of investors that the petitioner's expert attempted to use as a surrogate did not reflect a good sample of willing buyers. For these reasons, Judge Laro did not hold either analysis in high regard and, for the most part, left them out of his resolution of the correct DLOM value.

Because Judge Laro did not find any value in either experts' analysis, he took on the responsibility of concluding a DLOM for application to the value of Big M's share price on each of the valuation dates. This is where I take my hat off to Judge Laro. Although I may not agree with all the factors that he discusses in his opinion, it is clear that he gave more thought to getting at a reasonable DLOM than either expert did. When you read this opinion, think of the 11 factors from the Moroney article that I discussed in chapter 15. Judge Laro attempted to do a similar analysis with some slightly different factors.

The reason that I like this opinion is not because of the conclusion. Reading this opinion provides me with a great idea of what the judge was thinking when pure mathematics would not allow him (or a valuation analyst) to quantify the DLOM. He looked at qualitative factors and elaborated on each regarding the impact on the DLOM. This is exactly what I suggested the valuation analyst do to support his or her opinion.

Before I tell you what I don't agree with (and why), let's look at the factors considered by Judge Laro (box 27.3) and discuss each item.

## Private Versus Public Sales of the Stock

This factor was used by the court because the studies reflect transactions of securities with similar attributes to that of privately held stock. *Restricted stock* is stock of a public corporation, but to avoid dilution and registration costs, is not registered for trading within the public market. However, these shares of stock can be traded privately, mirroring the transaction characteristics of a closely held company. Because these transactions were required to be registered with the SEC until 1990, analysis was permitted, resulting in the creation of the studies. As a result, Judge Laro started his analysis by using the 35 percent to 45 percent discounts from these studies as a benchmark.

### BOX 27.3

#### Factors Considered by Judge Laro

- Private versus public sales of stock
- Financial statement analysis
- Company's dividend policy
- Nature of the company, its history, its position in the industry, and its economic outlook
- Company's management
- Amount of control in transferred shares
- Restrictions on transferability of stock
- Holding period for stock
- Company's redemption policy
- Costs associated with making a public offering

## Financial Statement Analysis

The purpose of including this factor in the analysis was to reflect the notion that a company with favorable financial characteristics would be attractive to willing investors. This attractiveness will result in added marketability. On the other hand, if the company's financial position is weak, it would be less marketable.

Because companies are involved in their own respective industries, this analysis should be done according to publicly traded industry competitors that share similar operating characteristics so that the subject company can be rated accordingly. The purpose of using this factor is to rate and highlight the financial characteristics of a firm according to such items as income, liquidity, and debt. This sounds like a guideline public company analysis.

## Company's Dividend Policy

In determining a company's attractiveness, most investors will look to see what type of dividend-paying history the company has. Investors purchase a company's stock for one of three reasons:

1. To realize capital appreciation in the stock's price
2. To receive dividend payments over the course of owning the security
3. To realize a combination of reasons 1 and 2

The company's dividend policy, either payment history or capacity for payment, as in this case, will increase the attractiveness and, therefore, marketability of a firm's stock. If an investor can receive dividend payments on top of potential appreciation, there may be additional individuals who want to purchase the stock. This has the potential of increasing marketability, resulting in a decreasing effect upon a DLOM for a privately held stock.

## Nature of the Company, Its History, Its Position in the Industry, and Its Economic Outlook

In general, business performance varies in relationship to the economy. Businesses can be affected by global, national, and local events. For industry purposes, changes in regulatory environments and market forces will also have an impact upon the attractiveness of a company.

Investors will analyze a company's background, industry, and the economic factors that affect it, so that they will have a better idea of what to base future expectations on. This is done to determine where the company is heading and how that will affect its attractiveness to potential investors.

## Company's Management

Because the operations and goals of a company are determined by management, their experience and involvement are fundamental when assessing attractiveness. The management team is responsible for the company's performance. If investors lack confidence in a company's management, the organization will lose marketability because some investors will not be interested in stock ownership. Based upon the conclusion of the management team's effect upon operations and financial performance, according to Judge Laro, this factor's effect upon the DLOM can be determined.

## Amount of Control in Transferred Shares

When a company's stock is transferred in blocks, a block that represents control will have additional appeal over a block without such control. This is true because, as a block of stock has more control, a potential investor will have the ability to direct and run a company using his or her procedures and guidelines (or whims!).

This will affect the attractiveness of a company's stock, depending on the type of investor. In some, but not all occasions, investors will not address this factor in determining the attractiveness of a company because control is not an issue.

## Restrictions on Transferability of Stock

The more restrictive it is to transfer shares, the less marketable the shares will be. This is why we see so many attorneys who draft family limited partnership agreements put in these really stringent restrictions, for example, you cannot sell your shares unless the sky becomes pink with yellow polka dots. In this case, the judge felt that because the shareholder agreements did not fix a price, there was less of a restriction in selling to an outsider.

## Holding Period for Stock

In some instances, a company's stock may have to be held for a period of time so that the benefits of ownership can accumulate to create a sufficient profit for the investor. Such an event would cause the security to lose some of its marketability because of the need to maintain ownership. This increases market risk while marketability decreases. The holding period is essential for calculating marketability levels and the resulting DLOM because it is a direct determinant of how quickly an individual can purchase a stock and turn around and sell it in the future.

## Company's Redemption Policy

This factor is important because it will determine if the company can purchase shares from shareholders so that they can gain access to cash. This analysis will indicate how the company can aid in, or detract from, its stock's liquidity. This is especially important for privately held firms because of the nonexistence of a ready market. If a company readily buys back shares, this will increase the liquidity of those shares, thereby increasing marketability. However, if the opposite is true, then the stock of the company is less marketable because another option for sale is removed.

## Costs Associated With Making a Public Offering

When determining the value of a privately held stock, the cost to make a public offering is typically incorporated within the analysis. This is due to the need for determining which party is required to realize the costs of registering the security. In the case in which the buyer must bear the expense, marketability will decrease because some investors will not consider such a transaction as an option because of the cost. This event causes the pool of potential investors to decrease. If the investor does not have to absorb this cost when making the purchase, the marketability of the stock will be greater. This factor is directly related to economics because as the expense of purchases goes up, demand will decrease and vice-versa.

I mentioned before that I do not agree with everything in this case. In my humble opinion, I believe that Judge Laro mixed up some issues that affect risk and not liquidity. Although there may be a fine line, and possibly an overlap, I think that many of the factors discussed by Judge Laro affect the freely traded value of the stock, and liquidity, to a much lesser degree. The factors that bother me the most are as follows:

- Financial statement analysis
- Dividend capacity and growth prospects
- Nature of company, its history, its position in the industry, and its economic outlook
- Management

If you read Revenue Ruling 59-60, you'll recall that it indicates that eight factors assist us in the valuation of the closely held stock. The four factors that I have listed previously affect the underlying valuation. They should not affect both the freely traded value and liquidity. Although I fully agree that dividends will lower the DLOM due to the mitigation of the holding period risk, dividend-paying capacity is considered in valuing an interest in a company.

However, overall, I still think that this is a great case to read.

## **Mad Auto Wrecking Inc. v. Commissioner<sup>6</sup>**

### **Issue: Reasonable Compensation**

The case of *Mad Auto Wrecking Inc. v. Commissioner* deals with the subject of reasonable compensation for key personnel within a privately held business. Although this is not a business valuation case, I really like this one because as valuation analysts, we are always dealing with reasonable compensation. Before we begin, let me just make one comment. Reasonable compensation issues arise in a different context for income tax purposes than valuation matters do. Income tax cases generally address the reasonableness of the compensation based on the requirements for deductibility under IRC Section 162. The issue becomes one of a historical nature. Valuation, on the other hand, is prospective in nature. The issue that we generally deal with is what *will* be the cost of replacing the officers, rather than what should they have received in the past.

Despite it being an income tax case, *Mad Auto Wrecking* is a really good case because it gives valuation analysts great guidance about the factors to consider in assessing reasonable compensation. Just remember the context of the case.

Mad Auto Wrecking is a high volume, wholesale scrap business that purchases automobiles, removes usable parts, and offers the frames up for sale as scrap metal. The company then takes the reusable parts and sells them at wholesale prices.

As with the vast majority of small businesses, owners must put in a lot of time to ensure that the business remains productive and profitable. This situation was no different. The 2, equal owners worked between 60 and 70 hours per week, 52 weeks per year.

The issue in this case involved the reasonableness of the officers' compensation for the years 1989, 1990, and 1991. Mad Auto's compensation figures are shown in table 27.1 on the following page. As you can see from the data in table 27.1, officers' compensation was a pretty high percentage of gross receipts. The IRS was not happy with this and felt that less should be allowed, and the excess should be treated as a dividend. We accountants call that *double taxation*.

<sup>6</sup> *Mad Auto Wrecking Inc. v. Commissioner*, TC Memo 1995-153(RIA).

**TABLE 27.1 Mad Auto Wrecking Compensation Figures: 1989–1991**

	Gross Receipts	Taxable Net Income	Officers' Compensation
1989	\$2,554,942	\$67,690	\$856,000
1990	2,169,125	56,974	606,000
1991	1,884,853	(22,199)	711,000

The concept of reasonable compensation is something that depends on the facts and circumstances. Judge Laro (the *Mandelbaum* judge) wrote another really good opinion in this case. The judge was very methodical in the opinion and cites other good case law, and eventually concluded that the compensation paid was reasonable. The elements considered by the court are summarized in box 27.4.

**BOX 27.4 Factors Considered by the Court**

- The employee's qualifications
- The nature, extent, and scope of the employee's work
- The size and complexities of the employer's business
- A comparison of salaries paid with the employer's gross and net income
- The prevailing general economic conditions
- A comparison of salaries with distributions to shareholders and retained earnings
- The prevailing rates of compensation for comparable positions in comparable concerns
- The salary policy of the employer for all employees
- The amount of compensation paid to the particular employee in previous years
- The employer's financial condition
- Whether the employer and employee dealt at arm's length
- Whether the employee guaranteed the employer's debt
- Whether the employer offered a pension plan or profit-sharing plan to its employees
- Whether the employee was reimbursed by the employer for business expenses that the employee paid personally

To effectively understand how each of these factors aided the court in this decision, and how it helps valuation analysts, we will look at the summaries of each factor.

## Employee's Qualifications

The first pertinent factor that requires analysis is to determine whether an employee's background is applicable to the fiscal status of the company for which he or she works. This background includes several aspects of an employee's familiarity with various components of the type of business in which he or she is involved. These essential items include experience, training, and education in a field related to the operations at hand. As with the vast majority of business and organizational positions, these three fundamentals are the basis for a conclusion about the degree that a worker is qualified for the function in which he or she is delegated. This preliminary detail in the reasonableness of compensation analysis allows a valuation analyst to locate a foundation on which to create an opinion of an employee's value to the organization.

## Nature, Extent, and Scope of the Employee's Work

This factor is analyzed so that it can be seen how important and involved an employee is in relation to the operations of the business. To analyze this factor, the positions and responsibilities of those positions are looked at to determine the number and depth of tasks completed by the employee.

In addition to viewing the positions held by the employee, and the resulting obligations inherent with the positions, one must also look at the effects of the employee's activities on the business' bottom line, as well as

the consequences if the worker was to leave the organization. By completing these examinations, an analyst will be able to better estimate the employee's impact upon the company, both positive and negative. This will allow the forecast of various scenarios of the employee's employment status so that a clear explanation of the value of the employee can be given.

### Size and Complexities of the Employer's Business

This element of the overall inspection of reasonable compensation is utilized to further affect the previous two factors. A small, simple operation will require a less-experienced, less-involved employee than one on the opposite side of the spectrum. The degree of an employee's specialization is also affected by this element. The replaceability of an employee can be resolved through the analysis of this factor in relation to the earlier ones.

Also of note within this section of the analysis is how the employee, using his or her qualifications in tandem with the comprehensiveness of the employee's position, affected the actual procedures of the business. With regard to key employees, the skills and abilities they hold are typically not shared by those under their control. Therefore, it is advisable for one doing this analysis to consider how the employee has worked to implement his or her knowledge in creating efficient and simplified procedures so that other, lower-level employees can be quickly replaced to ensure that the time that operations are interrupted, as a result of an employee change, is minimal.

### Comparison of Salaries Paid to Net and Gross Income

This factor is included to determine whether these values can be considered excessive in light of the concluded status of the previously discussed elements of reasonable compensation. Had those factors necessitated a conclusion that a key employee was not as vital as specified by the company, the values seen in this portion of the analysis would be expected to be low. However, had the employee been favored by inspection of the prior factors, it would be expected that these percentages would be somewhat higher. Again, as with the previous factor, this analyzed component is based upon the conclusions reached earlier.

### General Economic Conditions

Examining whether the employee's involvement affected the operation is completed by reviewing the company's performance during varying economic conditions. Analyzing the results of the business processes will determine whether, based upon their degree of involvement, a key employee has important skills to buoy financial results. This factor is important within the analysis because it enables an analyst to find out how the existence of the employee within the organization can direct and dictate the success of a firm's operations during times of uncertainty.

### Comparison of Salaries With Distributions to Shareholders and Retained Earnings

This part of the reasonable compensation analysis is done to conclude whether some of the compensation paid is actually dividends. This may be done, especially when the key employees are the only shareholders.

This analysis must be done, keeping in mind the importance of the key employees in relation to the level of growth realized by the company. Its dividends are paid out of funds that could be kept for reinvestment and expansion. If growth of operations is absent, the conclusion that parts of compensation are really dividend payments may be viable when no dividend history exists.

### Prevailing Rates of Compensation for Comparable Positions in Comparable Companies

Over the course of this analysis, some weight must be given to the activities of competing comparative companies. This is done to resolve whether, in the specific situation at hand, the levels of compensation of the key employee are normal for the specific industry.

In completing this segment, one should look to find companies that are closest to the subject company in terms of several business characteristics deemed important in the operations, whether it be organizational traits, product type, customers, and so on.

Once this comparison is completed, it will be determined if the levels of compensation for the key employees are reasonable. However, adjustments to this comparison must be made to assess the differing characteristics between the guideline firms and the subject company. After these individual adjustments are completed, then a final conclusion can be made. This almost sounds like valuation, doesn't it?

## Employer's Salary Policy for All Employees

Regardless of the employee's involvement, qualifications or ownership status, he or she should be compensated on the same basis as other workers. It is expected that because of his or her key importance, he or she will be given a greater amount of compensation. However, the basis should be relatively the same for all workers. Employees overcompensated in relation to the provisions of their services and the salaries of other employees will be apparent upon completion of this analysis.

These individuals and their respective compensation should be viewed in a framework of substitution. This analysis requires the estimation of the reasonableness of the compensation in the event the position was filled by another individual with more generic attributes. Also, some consideration should be given to the determination of compensation if the employee in question is an owner and decides his or her salary. This characteristic should be removed to conclude whether a hypothetical owner would act in the same way.

## Compensation Paid in Prior Years

Analyzing the levels realized in previous time periods will allow for the development of a trend analysis. This is done to determine if any of the subject periods show up as exceptions to a developed pattern. If one does exist, it must somehow be related to the performance of the company because this will almost always affect a key employee's level of compensation. Changes in any of the employee's responsibilities should also be reviewed because this will also adversely affect the subject year's compensation value in relation to any developed trend.

Don't overlook whether payments for services are accrued according to services performed in the past or expected to be done in the future period. This event would constitute a normalization of compensation to correctly match the payment with the initiation and completion of the services.

## Employer's Past and Present Financial Condition

The company's fiscal performance will generally be attributable to the actions of a key employee. This consideration is important because the financial condition of the company will allow greater or lesser amounts of compensation to be paid.

Basically, as the performance and profitability of the subject company varies, so should the level of the key employee's salary and bonus. It is rather obvious if a poorly performing company is paying an exorbitant amount of money to a key employee that reasonable compensation is not being paid.

## Whether Employer and Employee Deal at Arm's Length

This factor is not always applicable because it usually applies only if the key employee is also a shareholder who determines his or her own level of compensation. If that is the case, a valuation analyst must use a substitute to determine if an independent owner would do the same for the same employee. This portion of the analysis can take into consideration levels seen in comparable companies, as well as the overall effect on the financial standing of the organization of making these payments.

## Whether Employee Guaranteed Employer's Debt

If an employee assesses the risk of personally guaranteeing his or her employer's debt, it is the general opinion of the courts that this employee does deserve compensation above what would normally have been paid. I certainly could not get my employees to guarantee my debt. If they would, I would pay them more.

## Absence of Pension Plan and Profit-Sharing Plan

Since World War II, benefits outside of normal salary and bonus considerations have become expected. Because of this, courts have typically opined that in the absence of such benefits as pension or profit-sharing plans, a certain level of additional payments would be considered normal compensation.

Again, like the previous factor, this element of the analysis will allow for some slack when such plans are non-existent. This is allowed by the courts primarily because it is understood that such measures must be taken by organizations to keep employees, as chances are, competitors will offer similar or alternative benefits.

## Lack of Reimbursement of Business Expenses

In the course of performing services for an employer, employees are sometimes required to pay expenses out of their own pocket. In such instances, it is normal for the employer to require a receipt and the employee to be reimbursed for the amount upon presentation of the documentation of payment. However, in some situations, employees and employers may have an agreement for the worker to receive a fixed amount of additional compensation instead of dealing with expense reimbursements. This is typical when the key employee is also an owner of the company.

As a result of using these factors to develop an analysis of whether a key employee's compensation is reasonable, a logical conclusion can be reached. The early steps form the basis for elements later in the analysis. A reasonable compensation analysis that we performed that addresses these issues is contained in exhibit 27.2.

### EXHIBIT 27.2 Reasonable Compensation

**DESCRIPTION OF ASSIGNMENT.** Trugman Valuation Associates, Inc. was retained by Decorative Stone Co., Inc. (hereafter referred to as Decorative Stone or the company) to determine if the level of compensation paid to Bob Richardson, president of the company, for the fiscal years ended December 31, 2002, 2003, and 2004, is reasonable. It is our understanding that this report will be used in regard to an audit of the company by the state taxing authority.

Section 162(a)(1) of the IRC allows a corporation to deduct "a reasonable allowance for salaries or other compensation for personal services actually rendered." In order for compensation to be deductible under Section 162(a)(1), there is a two-prong test that must be met. The first part is the amount of compensation must be reasonable. The second part of the test, which is more subjective in nature, is the payments must be purely for services. This means that it cannot be disguised as a return on equity or some other type of payment.

Many court cases have arisen in the area of reasonable compensation. Guidance can be obtained from the opinions in many of these cases. One of the best cases that can be used for guidance in the determination of reasonable compensation is *Mad Auto Wrecking, Inc. v. Commissioner*, TC Memo 1995-153. This well-thought out opinion by Judge Laro of the U.S. Tax Court provides the necessary guidance for factors to consider in the assessment of reasonable compensation. This case cited numerous other cases that support the judge's opinion. In particular, *Elliotts, Inc. v. Commissioner*, 52 AFTR 2d 83-5976 is cited in this opinion, another excellent case to be used for guidance in this area. In order to allow this report to follow in a logical sequence, the factors outlined in these cases will be addressed.

**FACTUAL HISTORY.** Decorative Stone Co., Inc. began business in about 1952. The company was incorporated in the State on June 25, 1956, and was started by Charles Brown and Bob Richardson. Mr. Brown and Mr. Richardson were stone mason contractors. They installed stone at schools, churches, and other such structures. At the inception of the business, and for several years thereafter, the company used to store materials at Mr. Richardson's home in City, State. After a while, these materials became too voluminous to store at Mr. Richardson's home, and as a result, the business was moved to 123 Main Street, City, State, its present location. At that time, Mr. Brown and Mr. Richardson began bringing in more materials and started to stock a greater amount of inventory. By the early 1960s, they needed trucks, forklifts, and other personnel in order to carry on the business.

For years, the company operated with no accounts receivable. Once they moved to their current location and began selling inventory, they started billing for their materials. The company got into financial trouble because of the slow collection of accounts receivable. In fact, the company almost went out of business. The only reason the company survived was because Mr. Brown and Mr. Richardson barely took any salary. Mr. Brown was single and only took enough money each week to survive. This included food money and money for rent, but not much more than that.

*(continued)*

**EXHIBIT 27.2 Reasonable Compensation** *(continued)*

Mr. Richardson remembers taking as little as \$100 per week for his compensation because he had no mortgage. He basically took enough at that time to cover groceries, taxes, and so on. Mr. Richardson remembers the lean years lasting well into the 1970s. In the early 1980s, Mr. Brown retired at age 65, leaving Mr. Richardson to take over his responsibilities, as well as continuing with his own. Mr. Brown had responsibility for being the yard supervisor, assisting with customer sales, and providing some dispatching. Mr. Richardson continues to operate the company today at age 79, working more than a full-time job. Decorative Stone, by his own admission, has been his passion in life. He has worked countless hours towards building this business and creating an exceptionally profitable company.

During the late 1980s and into the early 1990s, business was down, but through Mr. Richardson's efforts of making displays, having seminars, and opening up longer hours, he managed to keep the business going. Mr. Richardson's duties generally remained the same for a considerable number of years. Besides being the CEO and president of the company, he acts as the general manager, sales manager, purchasing manager, dispatcher, and foreman. Mr. Richardson opens the doors of the business at the start of the day and closes the doors at the end of the day. In addition, he performs all required paperwork and analysis at home in the evenings. Store hours are generally from 7:00 a.m. to 4:30 p.m., Monday through Friday, with Saturday hours in the winter months from 7:00 a.m. to 12:00 noon, and during the summer months from 7:00 a.m. to 3:00 p.m. During other times, store hours are frequently expanded to 8:00 or 9:00 p.m. during the week. On average, during the period under examination, store hours were approximately 52 hours per week. Besides the store hours, Mr. Richardson works at least one extra hour at the business each day and approximately two hours at home in the evenings. Because Mr. Richardson dispatches the trucks, he generally arrives prior to the actual retail store opening.

Mr. Richardson's commitment and management style has benefitted the company in that the company maintains long-term employees who work long hours resulting from the dedication of Mr. Richardson to his employees.

Counting Mr. Richardson, the employee count for the years under examination was as follows:

2002	23
2003	24
2004	26

Mr. Richardson works 70 hours per week on average. The company's growth has exceeded industry growth and the level of profitability is far beyond the industry. This will be discussed later in the report.

During the tax years in question, Mr. Richardson received the following levels of compensation from Decorative Stone:

2002	\$1,042,713
2003	1,243,912
2004	1,414,200

During the years in question, Mr. Richardson received compensation as follows:

	2002	2003	2004
Base Salary (paid weekly)	\$ 42,713	\$ 43,912	\$ 44,200
Bonus—May	300,000	200,000	300,000
Bonus—July	0	300,000	300,000
Bonus—September	300,000	300,000	300,000
Bonus—October	0	225050,000	0
Bonus—November	400,000	125,000	350,000
Bonus—December	0	25,000	120,000
<b>Total</b>	<b>\$1,042,713</b>	<b>\$1,243,912</b>	<b>\$1,414,200</b>

## EXHIBIT 27.2 Reasonable Compensation

In addition to salary, Mr. Richardson receives the same health insurance coverage as all other employees of Decorative Stone. He also receives the same three-week vacation as every other employee. He receives no pension benefits, life insurance, disability insurance, travel and entertainment allowances, or automobile allowances. Basically, his compensation is intended to include all forms of compensation that would customarily be paid to an executive of a company.

There are no other employees who have any managerial responsibilities for the company. As such, Mr. Richardson constitutes the entire management team, while continuing to also perform many of the functions in the daily operations of the company. At our visit to the business establishment, we observed the fact that Mr. Richardson does not have a private office and he conducts his sales, purchasing, dispatching, and other functions from a front counter in the retail storefront. In fact, when entering the business establishment, the first person visible from the entrance is Mr. Richardson.

**USING A JUDGE'S METHODOLOGY.** Judge Laro begins his opinion in *Mad Auto Salvage* with the following:

This is another case pertaining to whether amounts paid by a closely held corporation to its shareholders/employees are deductible compensation under section 162(a)(1). Inherently, there is a natural tension between: (1) Shareholders/employees who feel that they are entitled to be paid from a corporation's profits, even to the exhaustion thereof, of an amount that reflects their skills and efforts, and (2) a provision in the tax law that conditions the deductibility of compensation on the concept of reasonableness. What is reasonable to the entrepreneur/employee often may not be to the tax collector. Accordingly, this and other courts are repeatedly asked to examine the relevant facts and circumstances of the business and the underlying employment relationship in order to render an opinion as to whether the compensation paid was reasonable. **In so doing, we must be careful not to define the term "reasonable" too narrowly. The dynamic nature of business, the entrepreneurial spirit, and the dedication of purpose all play a role in the composition of reasonable compensation. We must not rigidly apply form over substance when we measure one's contribution to the success of his or her business.** Of course, it may be argued that when an individual chooses to conduct business in the corporate form, he or she is obligated to observe all of the corporate formalities inherent in that form, including the standard that to be deductible, the compensation paid must be reasonable. The term "reasonable," however, must reflect the intrinsic value of employees in the broadest and most comprehensive sense. [emphasis added]

Citing the tax law, Judge Laro points out that "Section 162(a)(1) allows a corporation to deduct 'a reasonable allowance for salaries or other compensation for personal services actually rendered' as an ordinary and necessary business expense. To be deductible under Section 162(a)(1), compensation must be both: (1) reasonable and, (2) paid purely for services rendered to the corporation."

### 1. Was the Compensation Paid Reasonable?

According to the judge, "Reasonable compensation is determined by comparing the compensation paid to an employee with the value of the services that he or she performed in return. Such a determination is made with respect to employees individually, rather than with respect to the compensation paid to all employees collectively. Such a determination is a question of fact."

In discussing the various cases concerning reasonable compensation, the judge indicates that there are many factors to be considered in making this factual determination. He indicated

The factors which may be considered, none of which is controlling in itself, include: (a) The employee's qualifications; (b) the nature, extent, and scope of the employee's work; (c) the size and complexities of the employer's business; (d) a comparison of salaries paid with the employer's gross and net income; (e) the prevailing general economic conditions; (f) a comparison of salaries with distributions to shareholders and retained earnings; (g) the prevailing rates of compensation for comparable positions in comparable concerns; (h) the salary policy of the employer as to all employees; (i) the amount of compensation paid to the particular employee in previous years; (j) the employer's financial condition; (k) whether the employer and employee dealt at arm's length; (l) whether the employee guaranteed the employer's debt; (m) whether the employer offered a pension plan or profit-sharing plan to its employees; and (n) whether the employee was reimbursed by the employer for business expenses that the employee paid personally.

#### a. *Employee's Qualifications*

Mr. Richardson is exceptionally qualified for Decorative Stone's business by virtue of his experience and dedication, as well as his understanding and control of every aspect of the operations. He is highly motivated and extremely productive as an employee and is clearly the primary reason for the company's success. His outstanding qualifications justify high compensation. Decorative Stone's profitability rests upon its sales, and Mr. Richardson's ambition, inventiveness during slow times, and energy (as opposed to his investment in capital) are the primary reasons for Decorative Stone's sales, growth, and success.

(continued)

**EXHIBIT 27.2 Reasonable Compensation** *(continued)***b. Nature, Extent, and Scope of the Employee's Work**

The nature, extent, and scope of the work performed by Mr. Richardson is fundamental, substantial, and all-encompassing. He performs all the company's executive and managerial functions and formerly performed, but now oversees all of its manual labor. Mr. Richardson also supervises the daily operations, including supervising and directing the other employees, and makes all of the business decisions. Given the vital role played by Mr. Richardson in Decorative Stone's operations and success, and the long hours that he has dedicated to the business, he is indispensable to the business. Decorative Stone's growth and prosperity are due directly to his skills, dedication, and creativity. If the business was to lose him, it would be in a rough situation until a suitable replacement (if any) could be found.

**c. Size and Complexities of the Employer's Business**

Decorative Stone is not necessarily the most complex business around, but because it primarily involves building and construction-type materials, its operations demand expertise to compensate for changing economies. The success and growth of the business even during poor economic periods demonstrates the value that has been added by Mr. Richardson. Based on data extracted from Integra Information's Business Profiler product for companies in the same Standard Industrial Classification (SIC) Code as Decorative Stone, the company has grown to be one of the larger businesses of this type. Integra data includes 3,501 companies broken down as follows:

Sales Range	Business Count	Percent of Total
All sales ranges	3,501	100.00%
Less than \$250,000	1,115	31.85%
\$250,000–\$499,999	728	20.79%
\$500,000–\$999,999	346	9.88%
\$1,000,000–\$2,499,999	540	15.42%
\$2,500,000–\$4,999,999	429	12.25%
\$5,000,000–\$9,999,999	207	5.91%
\$10,000,000–\$24,999,999	84	2.40%
\$25,000,000–\$49,999,999	27	0.78%
\$50,000,000–\$99,999,999	17	0.49%
\$100,000,000–\$249,999,999	1	0.03%
\$250,000,000–\$499,999,999	7	0.20%
More than \$500,000,000	0	0.00%

According to the Integra data, Decorative Stone, based on revenues, falls in the top 9.81 percent of its peer group.

**d. Comparison of Salaries Paid to Net and Gross Income**

The percentage of officers' salaries to gross receipts for 2002, 2003, and 2004 was 15.2, 17.0, and 17.5, respectively. The percentage of officers' salaries to book net income (before deducting officers' compensation) for 2002, 2003, and 2004 was 94.7, 100.65 and 92.08, respectively.

Based on the state tax returns reviewed, the entire net income before net operating loss deductions was \$58,218, \$7,236, and \$122,295, despite the deduction of officer's compensation. This means that the company would have been subject to tax and would have paid taxes based on net income had it not been for the net operating loss deduction that it used as an offset to the income. In addition, Mr. Richardson reported his compensation on his tax returns and paid taxes on these amounts.

## EXHIBIT 27.2 Reasonable Compensation

e. *General Economic Conditions*

During the years under audit, the economy was reasonably strong. Part of the company's growth during this period could be attributable to the economy. However, a good part of the success is also attributable to the solid foundation that Mr. Richardson has created for the business over the years. Mr. Richardson's financial commitment to this business has also allowed a substantial amount of inventory to be stocked by the company, assisting in the production of sales. If the product was not in inventory, the customer may have gone elsewhere.

f. *Comparison of Salaries with Distributions to Shareholders and Retained Earnings*

Quoting from another case, Judge Laro points out "The absence of a dividend history is a significant factor that may suggest that some of the amounts paid as compensation to a shareholder/employee is really a dividend." Although he also said, "Such an absence (and inference), however, does not automatically convert compensation that would otherwise be reasonable into a dividend. Corporations are not required to pay dividends."

Judge Laro went on to state the following:

Instead, an individual shareholder may participate in the success of a corporation through the appreciation in the value of his or her stock brought on by retained earnings and the possibility of a future return. Thus, a corporate employer with little or no dividend history may be able to pay and deduct large amounts of compensation if the court is convinced that a reasonable person would still have invested in the corporation. Courts sometimes apply a hypothetical investor test to determine whether a reasonable person would have invested in the corporation. Critical to this test is whether the shareholders of the corporation received a fair rate of return (without taking into account any compensation) from the total of their initial and subsequent investments.

This analysis was also discussed in detail in *Elliott, Inc. v. Commissioner*, which was referenced by Judge Laro. A financial analysis will be presented later in this report addressing the issue of a hypothetical investor. We believe that this further substantiates the level of compensation that should be deemed reasonable for Mr. Richardson.

g. *Prevailing Rates of Compensation for Comparable Positions in Comparable Companies*

In a perfect world, we could look at other companies that are similar to Decorative Stone to determine what rate of compensation is paid for comparable positions in these comparable companies. However, we do not believe that this is possible in this instance. First and foremost, closely held companies do not readily volunteer this information. Secondly, in order for a company to be comparable to Decorative Stone, we believe that consideration must also be given to the level of growth and profitability exhibited by the company. There can be no doubt that management is frequently compensated for success. Stock option plans and bonuses are regularly made available to key executives. In fact, there are many industries in which the stock option compensation or the bonuses are much greater than the executive's base pay.

Our review of the Integra industry composite data will be discussed in more detail as part of our financial analysis. It will become obvious that Decorative Stone is not really comparable to its industry peer group. We believe that it is unreasonable to try to compare Mr. Richardson's compensation to another executive in a privately owned company who either brings a different skill set, work ethic, level of expertise, or proven track record for success to that company. We do not believe that composite industry data adequately allows a meaningful analysis to be performed.

h. *Employer's Salary Policy Concerning All Employees*

There is no written salary policy concerning all the company's employees. Because there are also no other employees besides Mr. Richardson who participate in management, we could not determine whether Mr. Richardson was compensated differently than the other employees merely because of his status as a shareholder.

i. *Compensation Paid in Prior Years*

The compensation (including bonuses) paid by Decorative Stone to Mr. Richardson prior to the years in issue ranged from \$825,797 to \$1,192,713 from 1996–2001, with 1997 and 1998 dipping to \$649,203 and \$675,798, respectively. As the company has been growing, Mr. Richardson's compensation has been adjusted to compensate him for his success. During the downturn of the 1990s, Mr. Richardson took less salary.

j. *Employer's Past and Present Financial Condition*

Decorative Stone has grown and is very profitable. Its shareholder's equity has grown from \$1,457,497 in 2001 to \$1,628,841 in 2004. This will be discussed in the financial analysis later in this report.

k. *Whether Employer and Employee Dealt at Arm's Length*

Mr. Richardson was paid high compensation as the company's principal employee. Given his relationship to the company as its only shareholder, consideration should be given to whether an independent investor would have paid Mr. Richardson the amount of compensation that he received during the years in issue. This will be addressed as part of the financial analysis.

(continued)

**EXHIBIT 27.2 Reasonable Compensation** *(continued)*

An interesting quote from Mad Auto Salvage that was referenced by Judge Laro in his opinion was when one of the shareholders discussed the work habits of the other shareholder. The quote was as follows:

Dick [Andrews] is more like a workaholic. And anybody that works that hard has got to be compensated for the work that they do. If you don't do that, your business is going to suffer because the guy that is putting in more hours and not receiving any money—he is definitely going to reject the idea, not work as hard.

Substituting Mr. Richardson in the preceding quote accurately describes this situation as well.

**i. Whether Employee Guaranteed Employer's Debt**

According to Judge Laro, "Courts have considered whether an employee personally guaranteed his or her employer's debt, in determining whether the employee's compensation was reasonable. In certain situations, an employee's personal guarantee of his or her employer's debt may entitle the employer to pay a greater salary to the employee than the employer would otherwise have paid."

In this instance, Mr. Richardson does not guarantee any corporate debt. However, instead of using borrowed funds to provide an extraordinary balance sheet and financial condition, Mr. Richardson has actually loaned the Company over \$3 million, interest-free, which the company has used to take advantage of buying opportunities, favorable vendor pricing, and other such items that have significantly contributed to the success of Decorative Stone.

Over the past several years, had interest been paid to Mr. Richardson, his compensation would have been lower because he would have received interest payments instead. In fact, Mr. Richardson has foregone the following interest to the benefit of the company:

Year	Value of Stockholder	Two-Year Average Rate Loan	Balance	Prime Prime Rate + 2%	Interest Saved
2001	\$1,905,074				
2002	2,375,739	2,140,407	8.27%	10.27%	219,820
2003	2,681,945	2,528,842	8.44%	10.44%	264,011
2004	3,135,147	2,908,546	8.35%	10.35%	301,035

This illustrates the fact that Mr. Richardson's compensation should be considered to include at least these amounts because he has loaned this money to the company without interest being paid to him.

**m. Absence of Pension Plan and Profit-Sharing Plan**

Mr. Richardson was not a participant in any pension plan or profit-sharing plan offered by the company. Courts have considered the absence of a pension plan or a profit-sharing plan in determining reasonable compensation. These same court cases have indicated that "Such an absence may allow the employer to pay the employee more compensation than the employer would have paid had the employer offered the employee a pension plan or a profit-sharing plan."

**n. Lack of Reimbursement of Business Expenses**

Mr. Richardson does not really incur any material out-of-pocket expenses on behalf of Decorative Stone. This point is insignificant.

## 2. Was Compensation Paid for Services Rendered?

There can be no doubt that Mr. Richardson works long hours for the company. All of his services are rendered on behalf of Decorative Stone and no other entity.

**FINANCIAL ANALYSIS.** In order to determine whether a hypothetical investor could have received a comparable return on investment from Decorative Stone Co., Inc., a financial analysis of the company was performed. Because specific financial data could not be obtained about similar closely held companies, due to the privacy of the financial data, we turned to the Business Profiler CD-ROM product produced by Integra Information for comparative composite data.

Decorative Stone falls into SIC Code 5032, described as Wholesale Trade—Brick, Stone and Related Materials. Using the Business Profiler software, we searched for data for companies located in SIC Code 5032, with sales between \$5,000,000 and \$9,999,999 for use in our comparison. There were 207 companies included in this data.

## EXHIBIT 27.2 Reasonable Compensation

Historically, Decorative Stone's reported profitability has been as follows:

**TABLE 1 Historic Income Statement for the Years Ended December 31,**

	1996	1997	1998	1999	2000	2001	2002	2003	2004
Total Revenues	\$4,435,719	\$4,041,345	\$4,748,289	\$5,420,974	\$6,243,002	\$6,260,609	\$6,849,980	\$7,324,031	\$8,090,785
Total Cost of Sales	2,557,828	2,453,132	3,199,281	3,433,818	4,105,862	3,943,259	4,761,688	5,219,165	5,571,673
Gross Profit	\$1,877,891	\$1,588,213	\$1,549,008	\$1,987,156	\$2,137,140	\$2,317,350	\$2,088,292	\$2,104,866	\$2,519,112

Note: Figures may not add due to rounding.

(continued)

**EXHIBIT 27.2 Reasonable Compensation** *(continued)*

Based on the reported figures, Decorative Stone was slightly less profitable before taxes than the peer group. During the years under audit, Decorative Stone was weaker in 2002 and 2003, but stronger in 2004.

However, further analysis is required to properly determine the investment attributes of the company. Officer's compensation has been reported as follows:

		Growth
2001	\$1,192,713	
2002	1,042,713	-12.58%
2003	1,243,912	+19.30%
2004	1,414,200	+13.69%

During this same time period, stockholder's equity grew as follows:

		Growth
2001	\$1,457,497	
2002	1,515,279	+3.96%
2003	1,507,229	-0.53%
2004	1,628,841	+8.07%

Revenue growth for Decorative Stone surpassed the industry group during this same period as depicted in the following table:

	2002	2003	2004
Decorative Stone	9.41%	6.92%	10.47%
Integra	8.93%	2.38%	6.30%

On an unadjusted basis, Decorative Stone was compared to the Integra data in terms of key financial ratios. This is presented in table 3.

**TABLE 3 Historic Financial Ratios**

	2002	2003	2004
<b>LIQUIDITY / SOLVENCY</b>			
Quick Ratio	14.31	16.81	15.49
Quick Ratio—Integra	0.95	0.96	0.97
Current Ratio	21.52	23.90	21.46
Current Ratio—Integra	1.72	1.76	1.76

*(Table continued)*

**EXHIBIT 27.2 Reasonable Compensation****TABLE 3 Historic Financial Ratios** *(continued)*

	2002	2003	2004
<b>TURNOVER</b>			
Fixed Asset Turnover	51.44	45.03	41.53
Fixed Asset Turnover—Integra	17.82	18.06	18.51
Payables Turnover	29.55	29.21	28.03
Payables Turnover—Integra	12.71	12.57	13.22
<b>DEBT</b>			
Times Interest Earned	N/A	N/A	N/A
Times Interest Earned—Integra	2.71	2.65	2.58
Total Liabilities to Total Assets	0.63	0.65	0.67
Total Liabilities to Total Assets—Integra	0.64	0.64	0.64
Short-Term Debt to Equity	0.00	0.00	0.00
Short-Term Debt to Equity—Integra	0.43	0.42	0.43
<b>PROFITABILITY</b>			
Pretax Return on Assets	0.01	0.00	0.02
Pretax Return on Assets—Integra	0.03	0.03	0.03
Pretax Return on Equity	0.04	-0.01	0.07
Pretax Return on Equity—Integra	0.09	0.08	0.08
Pretax Return on Net Sales	0.01	0.00	0.02
Pretax Return on Net Sales—Integra	0.01	0.01	0.01

As demonstrated previously, Decorative Stone reflects substantially higher liquidity than its peer group. The company is turning over its fixed assets and payables much faster than the industry, as well. The debt ratios are solid, particularly because the only debt is financed interest free by Mr. Richardson. Profitability is relatively in line with the industry even after Mr. Richardson's compensation.

In order to provide a more meaningful analysis, or what we believe to be more helpful in the assessment of reasonable compensation, we have added back the officer's compensation in its entirety. Table 4 reflects the adjusted common size income statements for 2002–2004 for Decorative Stone.

*(continued)*

**EXHIBIT 27.2 Reasonable Compensation** *(continued)***TABLE 4 Common Size Income Statement with Officer's Compensation Removed**

	2002	2003	2004
Total Revenues	100.00%	100.00%	100.00%
Total Cost of Sales	69.51%	71.26%	68.86%
Gross Profit	30.49%	28.74%	31.14%
Total Operating Expenses	15.74%	13.77%	14.30%
Operating Income	14.75%	14.97%	16.84%
Total Other Income	1.32%	1.91%	2.14%
<b>Income Before Taxes</b>	<b>16.07%</b>	<b>16.87%</b>	<b>18.98</b>

In order to compare these figures with the Integra data, we have also added back the officer's compensation reflected by Integra. This appears in table 5.

**TABLE 5 Common Size Add-Back of Officer's Compensation**

	Decorative Stone	Integra
<b>2004</b>		
Pretax Income	1.50%	1.40%
<i>Add: Officer's Compensation</i>	17.48%	1.60%
<b>Adjusted Pretax Income</b>	<b>18.98%</b>	<b>3.00%</b>
<b>2003</b>		
Pretax Income	-0.11%	1.50%
<i>Add: Officer's Compensation</i>	16.98%	1.70%
<b>Adjusted Pretax Income</b>	<b>16.87%</b>	<b>3.20%</b>
<b>2002</b>		
Pretax Income	0.84%	1.50%
<i>Add: Officer's Compensation</i>	15.22%	1.70%
<b>Adjusted Pretax Income</b>	<b>16.06%</b>	<b>3.20%</b>

**EXHIBIT 27.2 Reasonable Compensation**

Officer's compensation, as a percentage, has been added back to both Decorative Stone and Integra. The Integra data provides a percentage for officer's compensation but cannot be used by itself to properly assess reasonable compensation. The reported data does not allow the analyst to answer many important questions about this percentage, for example, in what part of the country are these businesses located? Are there other individuals who performed various duties that may be reflected in other expense categories (for example, cost of sales or general and administrative) that should be added to officer's salary to be comparable?

After making the adjustment to both sets of data, it becomes obvious that Decorative Stone is substantially more profitable than the industry group. This demonstrates, in part, the effectiveness of Mr. Richardson in running this company. One test for reasonableness of compensation would be to determine how much compensation the company could afford to pay the officer, rewarding him for his efforts and performance, while continuing to produce a return on equity that would be consistent with the industry. This test is illustrated in table 6.

**TABLE 6 Income of Decorative Stone with Adjustments to Officer's Compensation Which Will Bring the Return on Equity of the Company in Line with the Integra Industry Estimate**

	2002	2003	2004
Historic Net Income (Table 1)	\$ 57,782	\$ (8,050)	\$ 121,612
Adjustments			
Officer's Compensation—Add-back	\$ 1,042,713	\$ 1,243,912	\$ 1,414,200
Officer's Compensation—Reasonable	(971,696)	(1,110,762)	(1,403,876)
<b>ADJUSTED PRETAX NET INCOME</b>	<b>\$ 128,799</b>	<b>\$ 125,100</b>	<b>\$ 131,936</b>
Decorative Stone Historic Return on Equity	3.81%	-0.53%	7.47%
Integra Return on Equity	8.50%	8.30%	8.10%
Decorative Stone Return on Equity with Compensation Adjustment	8.50%	8.30%	8.10%

Table 6 illustrates that an investor could get a comparable return on equity to the industry while compensating Mr. Richardson as follows:

2002	\$ 971,696
2003	1,110,762
2004	1,403,876

This would bring Decorative Stone's comparison to the industry as illustrated in table 7. Table 7 reflects the common size comparison to Integra after adjusting Decorative Stone's earnings for the level of officer's compensation that would allow a shareholder to receive a return on equity in line with the industry. After making this adjustment, Decorative Stone becomes more profitable than the industry group in all three years.

(continued)

**EXHIBIT 27.2 Reasonable Compensation** *(continued)***TABLE 7 Adjusted Common Size Income Statement with Compensation Adjusted to Match Company Return on Equity to Industry Figures**

	2002	2003	2004	Integra
Total Revenues	100.00%	100.00%	100.00%	100.00%
Total Cost of Sales	69.51%	71.26%	68.86%	82.79%
Gross Profit	30.49%	28.74%	31.14%	17.20%
Total Operating Expenses	29.92%	28.94%	31.65%	15.10%
Operating Income (Loss)	0.56%	-0.20%	-0.51%	2.10%
Interest Expense	0.00%	0.00%	0.00%	0.82%
Total Other Income	1.32%	1.91%	2.14%	0.16%
<b>Income Before Taxes</b>	<b>1.88%</b>	<b>1.71%</b>	<b>1.63%</b>	<b>1.46%</b>

**CONCLUSION.** After considering the facts and circumstances of Decorative Stone, using guidance from the U.S. Tax Court, we believe that reasonable compensation for Mr. Richardson is as follows:

2002	\$ 971,696
2003	1,110,762
2004	1,403,876

These levels of compensation would provide the shareholder of the company with the same return on equity as other shareholders in the industry, while compensating Mr. Richardson for his long hours, significant contribution to the growth and profitability of the company, as well as the \$200,000 to \$300,000 of foregone interest expense on the substantial loans made to the company over the years.

As you can see from exhibit 27.2, this court case provided great guidance in analyzing reasonable compensation. By the way—the taxing authority accepted our figures!

## **Delaware Open MRI Radiology Associates P.A. v. Howard B. Kessler, et al.<sup>7</sup>**

### **Issue: Treatment of S Corporation Taxes in Fair Value**

Among other things, this case deals with the issue of how to handle income taxes for a pass-through entity in a shareholder dispute. Personally, I think the judge did a great job in deciding this matter.

The issue is, should we tax the S corporation earnings, and if so, by what rate? Sound familiar? In the court's opinion, Chancellor Strine addressed the issue of "is it appropriate to tax affect the earnings of Delaware Radiology in order to determine its fair value?"

<sup>7</sup> *Delaware Open MRI Radiology Associates, P.A., Petitioner, v. Howard B. Kessler, et al., Respondents, and Howard B. Kessler, et al., Plaintiffs, v. George J. Broder, et al., Defendants*, in the Court of Chancery of the State of Delaware, in and for Newcastle County, Consolidated, C.A. No. 275-N.

The expert on one side of this litigation treated Delaware Radiology as if it were a regular tax-paying entity (a C corporation) when he performed the valuation that the Broder Group used to set the merger price. In fact, he applied a 40 percent tax rate. Not to be surprised, the expert on the other side asserted the position that because Delaware Radiology was an S corporation, it faced no corporate-level income taxes. Relying on this as Delaware Radiology's operative reality, the expert did not tax affect its earnings in performing his valuation. Any taxes, he reasoned, would be paid at the stockholder level and should not be considered in valuing Delaware Radiology as an entity.

Chancellor Strine opined the following:

This dispute raises an interesting question of valuation, which has elicited a fair amount of attention from judges, appraisers, and academics.<sup>8</sup> After careful consideration, I conclude that neither of the experts has taken the most reasonable approach to valuing Delaware Radiology.

The problem with Reed's approach of treating Delaware Radiology as a C corporation is obvious. Delaware Radiology is a very small entity. The record reveals no set of circumstances in which it is likely that Delaware Radiology will convert to C corporation status. It is a highly profitable entity that generates and distributes income well in excess of the stockholder level taxes its stockholders must pay. The S corporation tax status is a highly valuable attribute to the shareholders of Delaware Radiology, given its profitability and the affluent status of its physician stockholders, who face top marginal tax rates.

This starts to sound like the facts in the Gross case from the U.S. Tax Court. The court indicated that under Delaware law, an appraisal petitioner is "entitled to be paid for that which has been taken from him . . ."<sup>9</sup> In trying to reach a fair and equitable solution regarding the tax issue, Chancellor Strine reviewed the U.S. Tax Court cases and decided that an all or none situation, with regards to taxes, was wrong.

In this case, the departing group was involuntarily deprived of the benefits of continuing as stockholders in a profitable S corporation in which the benefits were comprised materially of the favorable tax treatment that accompanies S corporation status. As a matter of fairness, the merger price had to take into account these benefits and provide fair compensation for the Kessler Group's loss. The company analyst's approach denied the Kessler Group members the value they would have received as continuing S corporation stockholders in Delaware Radiology and, therefore, ensured that the merger price was lower than fair value.

However, Chancellor Strine also found that the Kessler Group's analysis was equally flawed and overstated the value fairly belonging to the Kessler Group. He said

[t]he value of the S corporation structure is one that is experienced at the stockholder level and that is easy to overstate. If an S corporation is to be sold, for example, it will receive no premium over a C corporation if the universe of buyers is principally comprised of C corporations.<sup>10</sup> There is an obvious reason for this: unless the buyer of the S corporation can retain and benefit from that tax status, then the buyer will value an S corporation at the value it would have as a C corporation. Therefore, it would be highly misleading to do a market-based comparable acquisition valuation of an S corporation using sales of comparable C corporations to C corporations, and then assume that the S corporation would be sold at a higher price because of its tax status. In other words, I am not trying to quantify the value at which Delaware Radiology would sell to a C corporation; **I am trying to quantify the value of Delaware Radiology as a going concern with an S corporation structure and award the Kessler Group their pro rata share of that value.** [Emphasis added.]

<sup>8</sup> See, for example, *In re Radiology Assocs.*, 611 A.2d 485 (Del. Ch. 1991); *Adams v. Commissioner of Internal Revenue*, 2002 WL 467235 (U.S. Tax Ct. Mar. 28, 2002); *Heck v. Commissioner of Internal Revenue*, 2002 WL 180879 (U.S. Tax Ct. Feb. 5, 2002); *Gross v. Commissioner of Internal Revenue*, 1999 WL 549463 (U.S. Tax Court. July 29, 1999); *Franklin M. Fisher et. al., The Sale of the Washington Redskins: Discounted Cash Flow Valuation of S-Corporations, Treatment of Personal Taxes, and Implications for Litigation*, 10 Stan. J.L. Bus. & Fin. 18 (2005) (hereinafter Fisher); Z. Christopher Mercer, *S Corporation Valuation Issues*, The American Society of Appraisers 22nd Annual Business Valuation Conference (Oct. 17, 2003) (hereinafter Mercer).

<sup>9</sup> *Tri-Continental Corp. v. Battye*, 74 A.2d 71, 72 (Del. 1950).

<sup>10</sup> See Mercer 9–14.

Consistent with today's thinking in the valuation community, Chancellor Strine indicated that

[t]o capture the precise advantage of the S corporation structure to the Kessler Group, it is necessary to use a method that considers the difference between the value that a stockholder of Delaware Radiology would receive in Delaware Radiology as a C corporation and the value that a stockholder would receive in Delaware Radiology as an S corporation. By using that method, I can make my best estimate of the value that is relevant in this case—the going concern value in an S corporation that was taken from the Kessler Group in the merger.

The Court not only discussed the reliance on the previous decisions of the Tax Court, but he also cites another Delaware fair value case. He said that

[i]n undertaking this analysis, I embrace the reasoning of prior decisional law that has recognized that an S corporation structure can produce a material increase in economic value for a stockholder and should be given weight in a proper valuation of the stockholder's interest.<sup>11</sup> That reasoning undergirds not only holdings of the *Adams*, *Heck*, and *Gross* cases in the U.S. Tax Court, but an appraisal decision of this court, which coincidentally also involved a radiology business.<sup>12</sup> The opinion in *In Re Radiology Associates* noted that “under an earnings valuation analysis, what is important to an investor is what the investor ultimately can keep in his pocket.”<sup>13</sup> In that case, on the record before it, the court held that the way to implement that insight was to ignore tax completely.<sup>14</sup> The *In Re Radiology Associates* decision comported with decisions of the U.S. Tax Court, which has given life to the advantages of S corporation status by refusing to tax affect the corporation's earnings at all.<sup>15</sup>

The difference in this case was at the level of implementation, rather than at the level of principle. In this context, the court found that when minority stockholders have been forcibly denied the future benefits of S corporation status, they should receive compensation for those expected benefits and not an artificially discounted value that disregards the favorable tax treatment available to them. However, the minority shareholders should not receive more than a fair S corporation valuation. It was determined that refusing to tax affect at all produces a windfall.

What can I say? This judge really got it. He truly addressed the tax issues like it was never done before. Rather than paraphrase bits and pieces of the balance of his opinion, this is what he said:

The Internal Revenue Code states that “[t]he taxable income of an S corporation shall be computed in the same manner as in the case of an individual...”<sup>16</sup> This tax, though assessed at individual rather than corporate tax rates, is dependent solely upon the corporation's net earnings. Even if Delaware Radiology were to retain 100% of its earnings annually, its stockholders still would owe taxes on Delaware Radiology's income even though they received no distributions. Affording a remedy to the Kessler Group that denies the reality that each shareholder owes taxes on his proportional interest in Delaware Radiology would result in the Kessler Group receiving a higher per share value from the court than it could ever have realized as a continuing shareholder.<sup>17</sup>

The amount that should be the basis for an appraisal or entire fairness award is the amount that estimates the company's value to the Kessler Group as S corporation stockholders paying individual income taxes at the highest rates—an amount that is materially more in this case than if

11 See *Adams*, 2002 WL 467235; *Heck*, 2002 WL 180879; *Gross*, 1999 WL 549463.

12 *In re Radiology Assocs.*, 611 A.2d at 495.

13 *Ibid.*

14 *Ibid.*

15 In this regard, the case of *Gross v. Commissioner* is a good example. In *Gross*, the Tax Court held that “[w]e believe that the principal benefit that shareholders expect from an S corporation election is a reduction in the total tax burden imposed on the enterprise. The owners expect to save money, and we see no reason why that savings ought to be ignored as a matter of course in valuing the S corporation.” *Gross*, 1999 WL 549463 (page reference unavailable on WL). The Tax Court refused to allow a “hypothetical corporate tax rate in excess of the zero-percent actual corporate tax rate” to be considered in valuing an S corporation and, instead, required that no corporate tax be applied to the S corporation's earnings. *Id.*

16 26 U.S.C.A. § 1363 (2005).

17 See, for example, *Fisher*.

Delaware Radiology was a C corporation. In coming to a determination of how the Kessler Group's interest in Delaware Radiology would be valued in a free market comprised of willing buyers and sellers of S corporations, acting without compulsion, it is essential to quantify the actual benefits of the S corporation status. That is also essential in order to determine the value of what was actually taken from the Kessler Group as continuing stockholders.

Assessing corporate taxes to the shareholder at a personal level does not affect the primary tax benefit associated with an S Corporation, which is the avoidance of a dividend tax in addition to a tax on corporate earnings.<sup>18</sup> This benefit can be captured fully while employing an economically rational approach to valuing an S corporation that is net of personal taxes.<sup>19</sup> To ignore personal taxes would overestimate the value of an S corporation and would lead to a value that no rational investor would be willing to pay to acquire control.<sup>20</sup> This is a simple premise—no one should be willing to pay for more than the value of what will actually end up in her pocket—that can best be firmly grasped through a concrete example.

Assume that Delaware Radiology receives \$100 in annual earnings. If Delaware Radiology was organized as a C corporation, its earnings after tax would be \$60, assuming, as is the usual custom, that the effective corporate tax rate is 40%. Then, assume that Delaware Radiology distributes all of its post-tax earnings to its shareholders in the form of a dividend. The shareholders would receive total post-tax distributions of \$51, after an assumed dividend tax of 15% is applied to the \$60 after-tax earnings. That is, a shareholder would experience an effective tax rate of 49% after corporate income and dividend taxes.

Now, consider the post-tax benefits of \$100 in income to Delaware Radiology's stockholders, using its actual status as an S corporation. In that scenario, the shareholders would receive all \$100 in earnings as distributions and be subject only to one shareholder-level tax. Thus, the shareholders would be responsible for paying taxes on the \$100 at their individual tax rates. I will also assume that rate to be 40% because the Broder and Kessler Groups are comprised of affluent physicians who pay at the highest marginal rate.<sup>21</sup>

Therefore, every dollar of Delaware Radiology's earnings would be taxable at the stockholder level at the highest marginal tax rate. The shareholders in Delaware Radiology, an S corporation, would be able to pocket \$60 after tax if all earnings were distributed. The difference is clear: Delaware Radiology's status as an S corporation allowed the shareholders to pocket \$60 of \$100, whereas if Delaware Radiology was a C corporation, the shareholders could pocket only \$51 of the \$100.<sup>22</sup>

Therefore, in valuing Delaware Radiology, it would overstate the value taken from the Kessler Group to require the Broder Group to pay the Kessler Group \$37.50 for its share of every \$100 of future pretax earnings. That cash flow, after the favorable S corporation tax treatment, would not be worth \$37.50 to the Broder Group,

18 See, for example, *Byrne v. Commissioner of Internal Revenue*, 361 F.2d 939, 942 (7th Cir. 1966) ("We agree with the observation of the Tax Court that the [S Corporation] statute is designed to permit a qualified corporation and its shareholders to avoid the double tax normally paid when a corporation distributes its earnings and profits as dividends and this is accomplished in a specified manner which does not involve ignoring the corporate entity."); Practising Law Institute, 546 PLI/Tax 249 *Organizing the Corporate Venture* § 1301 (2002) ("This reinversion of rates lessened the S corporation shareholder's advantage of being taxed directly on corporate income. Yet, the primary tax advantage of being an S corporation shareholder—i.e., the ability to receive corporate income with only a single level of tax imposed C remains intact. This must be compared to the double tax paid on a C corporation's income (i.e., once at the corporate level, and again at the shareholder level when distributed) in considering the tax benefit of using an S corporation, rather than a C corporation, for business operations."); Mercer, 9 ("The S election relieves one layer of taxation at the corporate level, providing the potential for greater cash flow at the shareholder level.")

19 *Fisher*, 22.

20 *Ibid.*, 18 ("[W]e demonstrate that ignoring taxes in a DCF analysis when valuing an S corporation potentially leads to an overestimation of value."); 22 ("A rational investor will only pay up to the present value of an investment's expected cash flows, net of personal taxes.")

21 Currently, at the federal level, the highest personal tax rate is 35 percent, and the highest corporate tax rate is 38 percent. Thus, taking into account state taxes, it is reasonable to assume a 40 percent personal tax rate.

22 This would not be the case if (1) no distributions were being paid by the S corporation to its shareholders or (2) distributions only sufficient to cover tax liability were being distributed to shareholders. The relative value of an S corporation, vis-à-vis a C corporation, to its shareholders is dependent upon the level of distributions paid. For a useful model and analysis, see, e.g., Chris Treharne, *et al.*, *Valuation of Pass-Through Entities*, American Society of Appraisers 23rd Annual Advanced Business Valuation Conference (Oct. 8, 2004). As recognition of the fact that their stockholders must pay taxes on non-distributed earnings, most, if not all, S corporations distribute a sufficient amount of their profits to cover shareholder tax obligations. Mercer, 17 ("S corporations who attempt to retain all earnings and not pass through the shareholders' tax distributions will likely find themselves C corporations again, as their shareholders arrange to become ineligible to hold S corporation stock.") This makes intuitive and commercial sense. If all earnings are retained, the S corporation's shareholders must dig into their own pockets to fund the tax liability. If all earnings are retained in a C corporation, the entity is responsible for the corporate level tax. If S corporation shareholders elect to receive no distributions, that can be viewed as a reinvestment of their tax savings in that enterprise.

but only \$22.50. The issue, though, is that tax affecting Delaware Radiology at a 40 percent level (or C corporation level) would not recognize any S corporation value that flowed to the Kessler Group or compensate the Kessler Group for its involuntarily removal as shareholders in a profitable S corporation. To be consistent with Delaware law, I must tax affect Delaware Radiology's future cash flows at a lower level that recognizes the full effect of the Kessler Group's ability to receive cash dividends that are not subject to dividend taxes.

In order to accurately capture the value to the Kessler Group of Delaware Radiology's S corporation status, I have estimated what an equivalent, hypothetical "pre-dividend" S corporation tax rate would be. The following table presents that calculation:

	C Corp.	S Corp.	S Corp. Valuation
Income Before Tax	\$100	\$100	\$100
Corporate Tax Rate	40%	—	29.4%
Available Earnings	\$ 60	\$100	\$ 71
Dividend or Personal Income Tax Rate	15%	40%	15%
Available After Dividends	\$ 51	\$ 60	\$ 60

This calculation allows me to treat the S corporation shareholder as receiving the full benefit of untaxed dividends by equating its after-tax return to the after-dividend return to a C corporation shareholder. I will, therefore, apply an effective tax rate of 29.4 percent to the earnings of Delaware Radiology to measure with the greatest practicable precision the fair value of the Kessler Group's interest in the going concern value of Delaware Radiology.

I have to commend Chancellor Strine for getting this opinion correct with respect to taxes. Most state court judges shy away from this very complex issue, and he really got it dead on. In fact, his opinion was so instructive that our firm has started following this very methodology. In fact, I really like the logic behind these calculations because it is simple and easy to explain. This is an actual excerpt from a report prepared for a shareholder dispute.

### EXHIBIT 27.3 S Corporation Taxes—Normalized

We have recalculated income taxes based on the fact that The Smith Entities are pass-through entities for income tax purposes. This means that The Smith Entities do not pay tax at the corporate level. Over the past several years, the business valuation community has acknowledged that the conventional wisdom of taxing these pass-through entities as if they were taxpaying C corporations is no longer an automatic thing to do. In fact, the U.S. Tax Court opened up this issue in several court cases.<sup>1</sup> Since that time, many authors have contributed to the valuation literature with ideas about how to treat these non-tax-paying enterprises. In one instance, it was stated

In valuing a controlling ownership interest in an S corporation, the analyst should assess the probability that the likely buyers of a controlling interest will be able to avail themselves of continuing the S corporation status. In other words, is the likely buyer a qualified S corporation shareholder who could continue S corporation status indefinitely? Or, is the likely buyer a C corporation? If the pool of likely buyers is made up of qualified S corporation shareholders, then those buyers of a controlling interest can realize all three of the above-listed economic benefits (i.e., no double taxation, pass-through basis adjustment, and increased proceeds upon sale of assets).<sup>2</sup>

<sup>1</sup> *Gross v. Commissioner*, TC Memo. 1999-254, affd. 272 F.3d 333 (6th Cir. 2001), *Heck v. Commissioner*, T.C. Memo. 2002-34, Filed February 5, 2002, and *Adams v. Commissioner*, T.C. Memo. 2002-80, Filed March 28, 2002.

<sup>2</sup> Roger J. Grabowski, and William P. McFadden, "Applying the Income Approach to S Corporation and Other Pass-Through Entity Valuations," *The Handbook of Business Valuation and Intellectual Property Analysis*, Robert F. Reilly and Robert P. Schweih, editors, (McGraw Hill: 2004): 97.

**EXHIBIT 27.3 S Corporation Taxes—Normalized**

In this valuation, we are valuing an interest in a going concern that is being taken from the departing shareholder. Fair value attempts to place a value on what is being taken from him. In this instance, the remaining shareholders will most likely continue the S status (and other pass-through status of the other entities within the group), particularly since the S election was recently made as of January 1, 1998. This means that the remaining shareholders will continue to enjoy the benefits of the S election. Furthermore, the remaining shareholders have not expressed any intention to sell the company. Therefore, we will proceed with the calculation of taxes based on the reality of the situation.

In many of the court cases that have addressed the issue of tax affecting an S corporation, the appraisers on opposite sides have taken an *all or none* position. They have either taxed the S corporation as if it was a regular tax-paying C corporation, or they have taken the position that because the S corporation does not pay taxes at the corporate level that no tax should be computed. We do not believe that an *all or none* position is always warranted. We will use a simple illustration to help demonstrate the appropriate level of tax to be applied to The Smith Companies.

Assume that The Smith Entities had a pretax profit of \$100. If 100 percent of the earnings was being distributed to the shareholders, the difference between being a C corporation and an S corporation can be explained by the following table.

	C Corporation		S Corporation	
Annual Earnings		\$100		\$ 100
Corporate Income Tax	40%	40	0%	0
Net Income Available to Shareholders		\$ 60		\$100
Dividends		\$ 60		\$100
Personal Income Tax	40%	24	40%	40
Net cash flow to Shareholders		\$ 36		\$ 60
<b>Benefit of being an S Corporation</b>				<b>\$ 24</b>

The preceding table reflects the fact that in a situation where all the after corporate tax profits are being distributed to the shareholders, the effective corporate tax rate for an S corporation is 0 percent. At the valuation date, the tax rates in effect would have required the shareholders of a C corporation to pay a 40 percent personal income tax after the corporation would have paid the same rate. The amount of money available to the shareholders after all taxes were paid would have been \$36.

As an S corporation, the shareholders avoid a corporate tax, but they pay personal taxes on the pass-through, regardless of the amount of dividends. Because only one, 40 percent tax is paid, the shareholders would end up with \$60 in their pockets after all taxes are paid.

Now we must deal with the realities of The Smith Entities. Historically, 100 percent of the earnings have not been paid to the owners each year. In fact, we had to analyze the deemed dividends and distributions in order to apply the same type of tax-affecting analysis as shown previously. Dividends and deemed distributions have been as follows:

(continued)

**EXHIBIT 27.3 S Corporation Taxes—Normalized** *(continued)*

	1996	1997	1998	1999	2000
	(In \$000)				
Financial Statement Dividends	\$ 0	\$ 3,500	\$ 3,500	\$ 5,750	\$ 5,000
Officers' Compensation—Add-back	4,364	9,614	10,637	8,779	2,114
Officers' Compensation—Reasonable	(927)	(956)	(985)	(1,016)	(1,047)
Shareholder and Partner Loan Movement: ABC	(662)	(3,959)	(3,669)	7,605	4,012
Unconsolidated Entities	1,141	360	1,518	1,897	6,225
<b>Total Distributions</b>	<b>\$ 3,916</b>	<b>\$ 8,559</b>	<b>\$ 11,001</b>	<b>\$ 23,015</b>	<b>\$ 16,304</b>
Adjusted Pretax Profits	\$ 8,776	\$ 12,219	\$ 19,090	\$ 19,308	\$ 15,375
<b>% Distributions to Pretax Profits</b>	<b>44.63%</b>	<b>70.05%</b>	<b>57.63%</b>	<b>119.20%</b>	<b>106.04%</b>

Note: Figures may not add due to rounding.

Dividends were included based on the amounts reflected on the financial statements for the consolidated entities. Excess officers' compensation was also considered to be a form of dividend for this analysis. In addition, we included the year-to-year movement in the shareholder and partner loan accounts for ABC and the unconsolidated entities. These monies flow to the owners. In reality, they are a form of distribution.

Comparing the total distributions to the adjusted pretax profits reflects the fact that distributions in any given year have ranged from 44.63 percent to 119.20 percent of the adjusted profit. The average for this five-year period was about 80 percent. This is the amount of distributions that we will now use to recalculate the effective tax rate as an S corporation. The result is as follows:

	C Corporation		S Corporation	
Annual Earnings		\$100		\$100
Corporate Income Tax	40%	40	0%	0
Net Income Available to Shareholders		<u>\$ 60</u>		<u>\$100</u>
Earnings Retained in Company		\$ 12		\$ 20
Dividends	80%	48	80%	80
Personal Income Tax	40%	19	40%	40
Net Cash Flow to Shareholders		<u>\$ 29</u>		<u>\$ 40</u>
<b>Benefit of being an S Corporation</b>				<b><u>\$ 11</u></b>

**EXHIBIT 27.3 S Corporation Taxes—Normalized**

	C Corp.	S. Corp.	S Corp. Valuation
Income Before Tax	\$100	\$100	\$100
Corporate Tax Rate	40%	0%	33.33%
Available Earnings For Distributions	\$60	\$100	\$80
Distributions	\$48	\$80	\$80
Personal Income Tax Rate	40%	40%	40%
Net Available After Dividends	\$29	\$40	\$40

Because only about 80 percent of the pretax earnings have been distributed historically, we used this amount in our model. Recalculating the net amount available to the shareholders after taxes considers the benefits of the S election.<sup>3</sup> For the purpose of this valuation, the shareholders should be placed in the same position that they would be in after paying tax as an S corporation shareholder. In the preceding example, they would end up with 40 cents on the dollar. The mathematical calculation to determine the implied S corporation tax rate is as follows:

$$[(1 - X) \times (1 - 40\%)] = 40\%$$

$$X = 33.33\%$$

In order for the shareholders of The Smith Entities to be placed in a neutral tax position, a 33.33 percent corporate tax rate is appropriate. This is the rate that we have used in the normalization process.

<sup>3</sup> This model does not take into consideration the added benefit that the shareholders will receive as a result of the undistributed income of the companies. Because income taxes are paid, and in this model, calculated on the available earnings, regardless of whether they are actually distributed, the shareholders of the S corporation can remove the undistributed profits without taxation in subsequent periods. If they do not remove the distributions, they receive a step-up in the basis of their investment and will pay less capital gains, if and when they sell their interest in the company.

## Conclusion

There are great lessons to be learned from reading court cases. A well-written judicial opinion can provide the valuation analyst with significant guidance on many topics, even when they are not necessarily valuation cases. Although it is not our intention to perform legal research, particularly for the purpose of taking a position in a litigation, the well-seasoned valuation analyst will be aware of how the court thinks.

**Gary R. Trugman** is a Certified Public Accountant licensed in the states of Florida, New Jersey, and New York (inactive). He holds the AICPA's Accredited in Business Valuation (ABV<sup>®</sup>) credential and is a Master Certified Business Appraiser (MCBA) as designated by The Institute of Business Appraisers Inc. He also is an Accredited Senior Appraiser (ASA) in Business Valuation by the American Society of Appraisers. Gary is regularly court-appointed and has served as an expert witness in federal and state courts throughout the United States, testifying on business valuation, matrimonial matters, business and economic damages and other types of litigation matters.

Gary is the chairman of the Constitution and Bylaws Committee, past-chair of the Ethics Committee, past-chair of the Business Valuation Education Subcommittee and a past elected member of the Business Valuation Committee of the American Society of Appraisers. Gary was formerly on the American Institute of CPAs' ABV Examinations Task Force, Subcommittee Working with the Judiciary, ABV Credentials Committee, Executive Committee of the Management Consulting Services Division and the Business Valuation Subcommittee. He is the former chairman of the Florida Institute of CPAs' Litigation, Forensic Accounting and Valuation Services Section and was formerly on the New Jersey Society of CPAs' Litigation Services Committee, Business Valuation Subcommittee (past-chairman) and Matrimonial Committee.

Gary is former chairman of the Ethics and Discipline Committee, and formerly served on the Qualifications Review Committee and is the former regional governor of the Mid-Atlantic Region of The Institute of Business Appraisers Inc. He has received a AFellow@ Award from The Institute of Business Appraisers Inc. for his many years of volunteer work in the profession. Gary has also received an AICPA AHall of Fame@ Award for his service to the accounting profession in assisting in the accreditation in business valuation process. Gary formerly served on the International Board of Examiners of the American Society of Appraisers. He is a faculty member of the National Judicial College, educating judges around the country.

Gary lectures nationally on business valuation topics. He is the author of a textbook entitled *Understanding Business Valuation: A Practical Guide to Valuing Small to Medium-Sized Businesses*, now in its 5th edition, and an e-book entitled *Essentials of Valuing a Closely-Held Business*, both published by the American Institute of CPAs. He also has developed numerous educational courses, including but not limited to, a six-day business valuation educational series and a seminar entitled *Understanding Business Valuation for the Practice of Law* for the Institute of Continuing Legal Education. Gary also serves as an editorial adviser for the *Journal of Accountancy*, *The CPA Expert*, *Business Valuation Update* and formerly for *National Litigation Consultants' Review* and the *CPA Litigation Service Counselor*. He has lectured in front of numerous groups and has been published in the *Journal of Accountancy*, *FairShare* and *The CPA Litigation Service Counselor*.

Gary was born in New York and received his undergraduate degree from The Bernard M. Baruch College of the City University of New York. He was the first business appraiser in the United States to earn a master's in Valuation Sciences from Lindenwood College. His master's thesis topic was "Equitable Distribution Value of Closely Held Businesses and Professional Practices." Gary's appraisal education also includes various courses The Institute of Business Appraisers, the American Society of Appraisers, the American Institute of CPAs and others offer. He has taught federal income taxation at Centenary College, financial statement analysis in the master's degree program at Lindenwood College, and several topics at the AICPA National Tax School in Champaign, Illinois. Gary was an adjunct professor teaching a valuation course at Florida International University. He is a member of The Institute of Business Appraisers Inc., the American Society of Appraisers, the American Institute of Certified Public Accountants, the Florida Institute of Certified Public Accountants and the New Jersey Society of Certified Public Accountants.
