

UNIVERSITAT POLITÈCNICA DE CATALUNYA
BARCELONATECH

Escola d'Enginyeria de Barcelona Est

FINAL BACHELOR THESIS

Bachelor's Degree in Biomedical Engineering

**SPIKE AND WAVE IDENTIFICATION ALGORITHM FOR THE
DETECTION OF EPILEPTIC SEIZURES**

Appendix

Autor: Clàudia Segalés Verdaguer
Director: Luca Mesin
Departament: ESAII
Co-Director: Raúl Benítez Iglesias
Convocatòria: Juny 2022

POLITECNICO DI TORINO

Dipartimento di Elettronica e Telecomunicazioni

Bachelor Degree in Biomedical Engineering

**Spike and Wave Identification Algorithm for
the Detection of Epileptic Seizures**

Appendix

Supervisor

Luca Mesin

Raúl Benítez Iglesias

Candidate

Clàudia Segalés Verdaguer

INDEX

Recordings with seizures	3
Patient results	10
chb01	10
chb02	22

Patient overview

Figure 1, 2. (1) Mean firing rate and (2) Max firing rate

Figure 3, 4. (3) Mean delay and (4) Max delay

As it can be seen on the graphs, there is some variation in the obtained values. Considering that the recordings with seizures are 3, 4, 15, 16, 18, 21 and 26, it can be studied the effects of the seizure regarding the mean and the maximum firing rate of each recording and the mean and maximum delay.

Considering the firing rates, the recording 15 (with seizures) contains the maximum firing rate overall, where the others have a similar value between them. The mean firing rate stays quite low between all the recordings.

As for the delays, the overall delay of each recording stays very low, especially during recordings with seizures. The difference can be clearly seen during the analysis of the mean delay of 18, 19, 20 and 21; where 19 and 20 do not contain any seizure, showing a higher delay, more concretely the recording 19. The maximum delays are seen on recording 8 (no seizure) and on recording 21 (seizure). The last one has to be closely studied, thus the maximum delay is at around 2000 seconds, being a post-seizure period and not during the seizure, where the delays are very low.

Patient overview

Figure 65, 66. (65) Mean firing rate and (66) Max firing rate

Figure 67, 68. (67) Mean delay and (68) Max delay

Analyzing the graphs, first of all, the mean firing rate stays quite low during all the recordings. It can be seen that during the 7th and the 15 it is low and on the 16 (containing seizure), 16+(containing seizure) and 17, the values increase and on 18 it decreases again. The recording 19, also a seizure recording, has again a high value and, surprisingly, the 20, with no seizure, gets even a higher mean firing rate.

Considering the delays, the values stay quite low when it is around seizure recordings, and the maximum delays are very varied during all recordings.

Patient overview

Figure 121, 122. (121) Mean firing rate and (122) Max firing rate

Figure 123, 124. (123) Mean delay and (124) Max delay

From the first recording to the 4th, there is an increase in the mean firing rate and after that it decreases and stays quite low during the rest of the recordings, where there are no seizures. The maximum firing rates are also higher during these first recordings and also stay generally lower on the others, except 7, 10, 11 and 12, which get a slightly higher value than the others with no recordings, due to the fact that there are some peaks of firings, although not very significant. Overall, the delay values are not very stable, but the mean delay during 1,2 and 3 stays low.

Patient overview

Figure 147, 148. (147) Mean firing rate and (148) Max firing rate

Figure 149, 150. (149) Mean delay and (150) Max delay

The mean firing rates stay generally around the same values, with a peak during the recording 6, which does not contain any seizure. But when we compare it to the maximum firing rate, the value is not the highest. The other recordings are quite varied.

The mean and maximum delays stay quite low during all the recordings, showing an increased tendency during the last recordings and a peak in the 5th.

Patient overview

Figure 171, 172. (171) Mean firing rate and (172) Max firing rate

Figure 173, 174. (173) Mean delay and (174) Max delay

The mean firing rates are local maximums in all the seizure recordings (6, 13, 16 and 17, and 22). As for the maximum firing rate, it is quite higher in the first recordings and it has a decreasing tendency.

Considering the mean delays, the seizure files are local minimums, showing that the delay between firings is higher when there are no seizures. Nonetheless, the maximum delays are quite random values.

CHB05	Mean(FR)	Max(FR)	Mean Delay	Max delay

Patient overview

Figure 237, 238. (237) Mean firing rate and (238) Max firing rate

Figure 239, 240. (239) Mean delay and (240) Max delay

Considering that the recordings with seizures are 12, 13 and 19, it can be seen that the tendency of the maximum firing rate is to increase with these. The same happens for the mean firing rate, although other recordings, such as the 10th, show a high mean firing rate value.

As for the delays, the 10, which does not contain any seizure event shows a similar mean delay with the 13 and 19, while the 12 is similar to the non-epileptic recordings.

CHB07	Mean(FR)	Max(FR)	Mean Delay	Max delay
10	0,0042	0,1347	0,8337	1,97E+03

Patient overview

Figure 253, 254. (253) Mean firing rate and (254) Max firing rate

Figure 255, 256. (255) Mean delay and (256) Max delay

Considering all recordings with seizures, all the studied results show diverse values, although with the mean firing rate and the mean delay of 11, 12 and 13, a similar tendency can be seen. Considering that the 2 and 5 are close together, as well as the 11, 12 and 13 and the recording 21 is after some time, it leads to understand that with different time periods the epileptic seizures can be slightly different.

CHB08	Mean(FR)	Max(FR)	Mean Delay	Max delay

Patient overview

Figure 269, 270. (269) Mean firing rate and (270) Max firing rate

Figure 271, 272. (271) Mean delay and (272) Max delay

As for the mean firing rates, it can clearly be seen a decrease after the recording 8, as the others do not contain any seizures, until the 19th. Nonetheless, when it is approximately one hour between seizures, as seen on recording 7, the mean firing rate maintains a similar value to the others, while the delay increases.

CHB09	Mean(FR)	Max(FR)	Mean Delay	Max delay
6	0,0002	0,6848	9,3912	2195,1000

Patient overview

Figure 377, 378. (377) Mean firing rate and (378) Max firing rate

Figure 379, 380. (379) Mean delay and (380) Max delay

Considering the mean firing rate, there can be seen two peaks in 15 and 46, while the maximum firing rates stay alike. Regarding the delays, the mean delay is greatest on 54, which contains 5 seizures, which could be the increased firing detection time between seizures.

CHB15	Mean(FR)	Max(FR)	Mean Delay	Max delay

Patient overview

Figure 411, 412. (411) Mean firing rate and (412) Max firing rate

Figure 413, 414. (413) Mean delay and (414) Max delay

Considering that all the recordings contain seizures, except 15, and are successive in time; there is not a very high divergence between them. Moreover, the 15 does not show any remarkable difference with the epileptic recordings, in exception of the maximum delay, which highly increases.

Control group

Bipolar montage (cm)

Patients overview

Figure 429, 430. (429) Mean firing rate and (430) Max Firing rate

Figure 431, 432. (431) Mean delay and (432) Max delay

The control group has been studied differentiating bipolar and monopolar montages. It needs to be remarked that the epileptic patients were large recordings and they were analyzed patient by patient, whereas in the control group each recording is a different subject. First of all, the bipolar montage is analyzed. As for the mean firing rates, the values stay fairly low, except with the 6th patient, where there is a peak up to 0,0188, although with the other analysis it shows similar values with the other patients.

CONTROL cm	Mean(FR)	Max(FR)	Mean Delay	Max delay

Monopolar montage (sm)

Patients overview

Figure 451, 452. (451) Mean firing rate and (452) Max firing rate

Figure 453, 454. (453) Mean delay and (454) Max delay

As for the control group with monopolar montage, it can be seen that the third patient shows a higher mean firing rate, whereas the 6th shows a lower value than when studied with bipolar montage. All in all, the patients show quite similar values to each other, with some slight variations, especially with the delays. Concretely, the last patient shows significantly higher mean and maximum delay values.

CONTROL sm	Mean(FR)	Max(FR)	Mean Delay	Max delay

ADHD

Patients overview

Figure 473, 474. (473) Mean firing rate and (474) Max firing rate

Figure 475, 476. (475) Mean delay and (476) Max delay

The patients with ADHD showed more noise in the signal, even after the filtering process was applied. Moreover, in most of the patients, a lot of the firings detected are seen on the 'status' channel, which could indicate a malfunctioning of the implemented code.

ADHD	Mean(FR)	Max(FR)	Mean Delay	Max delay

Firing location evaluation

Figure 493. Amount of firings by EEG channel

The first patient shows firings overall the whole scalp.

Figure 494. Amount of firings by EEG channel

The second patient also shows firings over all the scalp, with a greater amount on 'FP1-F7' and 'C4-P4'. Moreover there can be seen similar values in the region of 'F7-T7', 'T7-FT9', 'FT9-FT10', 'FT10-T8' and 'T8-P8'.

Figure 495. Amount of firings by EEG channel

The third patient shows a greater amount of firings in 'F7T7', 'C4-P4', 'P4-O2', 'T7-FT9' and 'FT10-T8'.

Figure 496. Amount of firings by EEG channel

As for chb04, the firing locations also stay around the same values, with a peak in 'FP1F7' and 'C4-P4'.

Figure 497. Amount of firings by EEG channel

The patient chb05 shows lower values on most channels in exception of 'FP1-F7', 'C4-P4', 'P4-O2', 'F7-T7', 'T7-FT9', 'FT9-FT10', 'FT10-T8' and 'T8-P8'.

Figure 498. Amount of firings by EEG channel

As for chb06, the amount of firings is relatively quite low in exception for a high peak in 'P8-O2' and higher values on 'FP1F7' and 'FP1-F3'.

Figure 499. Amount of firings by EEG channel

The patient chb07 shows higher amounts of detections (similarly as chb04), while the other patients have lower detections. Overall, the values are quite constant with the exception of some peaks in 'FP1F7', 'FZ-CZ' and 'C4-P4'.

Figure 500. Amount of firings by EEG channel

Likewise, chb08 has constant firing detection values with the exception of 'FP1F7' and 'C4-P4'.

Figure 501. Amount of firings by EEG channel

As for the patient chb09, the detection values are very low, with the clear exception of the channels 'FP1F7', 'C4-P4' and 'FT9-FT10'.

Figure 502. Amount of firings by EEG channel

Similarly, on chb10, the values are low, with clear peaks on 'T7-FT9', 'FT9-FT10', 'FT10-T8' and 'T8-P8'.

Figure 503. Amount of firings by EEG channel

In chb11, there are some channels like 'CZPZ', 'T8P8' and 'FT10T8' that have no firing detection, and some others with a greater amount like 'P802', 'C4P4', 'F3C3' and 'FP1F7'.

Figure 504. Amount of firings by EEG channel

Regarding the patient chb12, the values are also quite low with the exception of 'CZ-PZ'.

Figure 505. Amount of firings by EEG channel

On chb13, there can be seen some clear peaks on the channels 'FP1F7', 'FP1F3', 'CZPZ', 'F4C4', 'T8P8' and 'FT10T8'.

Figure 506. Amount of firings by EEG channel

Likewise, with the subject chb14, all the values are remarkably low, and the peaks are high on the channels 'FP1F3', 'CZPZ', 'F4C4', 'T8P8' and 'FT10T8'.

Figure 507. Amount of firings by EEG channel

chb15 also shows some clear peaks where there should not be any detection, so that could be because of a wrong algorithm functioning. But as it has already been mentioned, the same was applied for all the patients and to avoid such bad detections, it should have been done individually for each patient.

Figure 508. Amount of firings by EEG channel

The patient chb16 shows peaks on the non-specific channels, which could also be an algorithm error as previously seen on chb15.
