Abstract

Based on the moment magnitude scale, a probabilistic model was developed to predict the occurrences of strong earthquakes in the seismoactive area of Zemmouri, Algeria. Firstly, the distributions of earthquake magnitudes M_i were described using the distribution function $F_0(m)$, which adjusts the magnitudes considered as independent random variables. Secondly, the obtained result, i.e., the distribution function $F_0(m)$ of the variables M_i was used to deduce the distribution functions $G(x)$ and $H(y)$ of the variables $Y_i = \log M_{0,i}$ and $Z_i = M_{0,i}$, where $(Y_i)_i$ and $(Z_i)_i$ are independent. Thirdly, some forecast for moments of the future earthquakes in the studied area is given. © 2012 Versita Warsaw and Springer-Verlag Wien.

Author keywords

prediction; probabilistic model; seismic magnitude scale; Zemmouri seismoactive area

Indexed keywords

Algeria; Earthquake magnitudes; Magnitude scale; Moment magnitudes; Probabilistic models; Zemmouri , Algeria; Zemmouri seismoactive area

Engineering controlled terms: Distribution functions; Earthquakes

Engineering main heading: Forecasting

GEOBASE Subject Index: earthquake magnitude; earthquake prediction; forecasting method; numerical model; probability

Regional Index: Algeria; Boumerdes; Zemmouri
