- Main challenge: vehicles operate in **open context**. [1]
- to prove their trustworthiness to potential users as well as regulation authorities it is necessary to show they **operate safely in all (relevant) environments and under all circumstances**
- established approaches (e.g., distance based testing) are no longer feasible

Scenario-based Verification & Validation of Driving Functions

- Main goals: (R. Galbas, VVM mid-term presentation, 2022. <https://www.vvm-projekt.de/midterm-docs>)
 - (i) Systematic control of the test space.
 - (ii) Consistent interfaces for systems and components.
 - (iii) Significant shift from real-world testing to simulation.

Scenario-based Verification & Validation of Driving Functions

- Main goals: (R. Galbas, VVM mid-term presentation, 2022. <https://www.vvm-projekt.de/midterm-docs>)
 - (i) Systematic control of the test space.
 - (ii) Consistent interfaces for systems and components.
 - (iii) Significant shift from real-world testing to simulation.

Scenario-based Verification & Validation of Driving Functions

- Main goals: (R. Galbas, VVM mid-term presentation, 2022. <https://www.vvm-projekt.de/midterm-docs>)
 - (i) Systematic control of the test space.
 - (ii) Consistent interfaces for systems and components.
 - (iii) Significant shift from real-world testing to simulation.

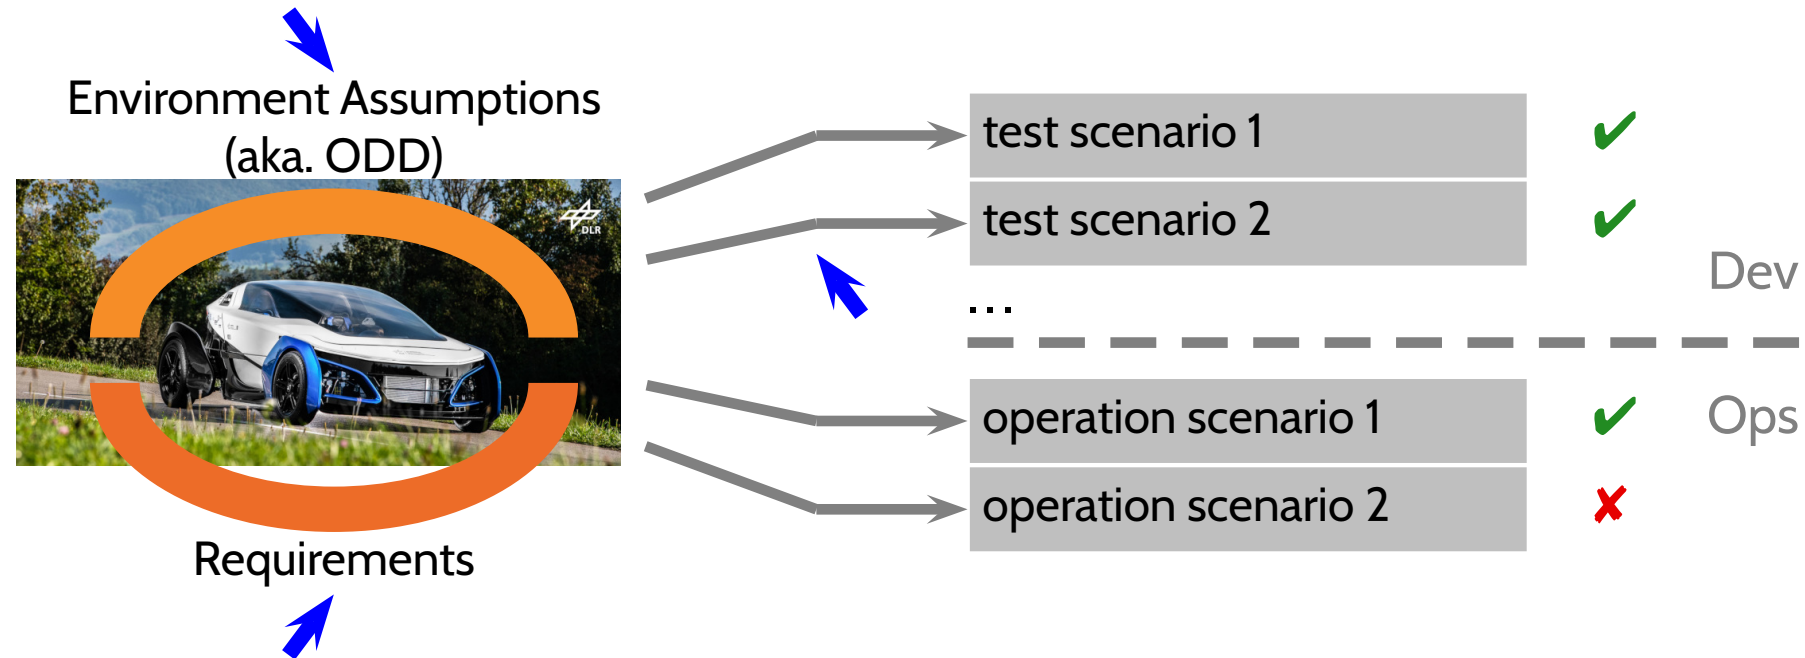

This talk:

- How do we **formally specify** scenarios for testing?
- How do we **formally specify** requirements and ODDs?

Overview

- How do we **formally specify** scenarios for testing?
- How do we **formally specify** requirements and ODDs?

Excursion: Traffic Sequence Charts — Syntax

Excursion: Traffic Sequence Charts — Syntax

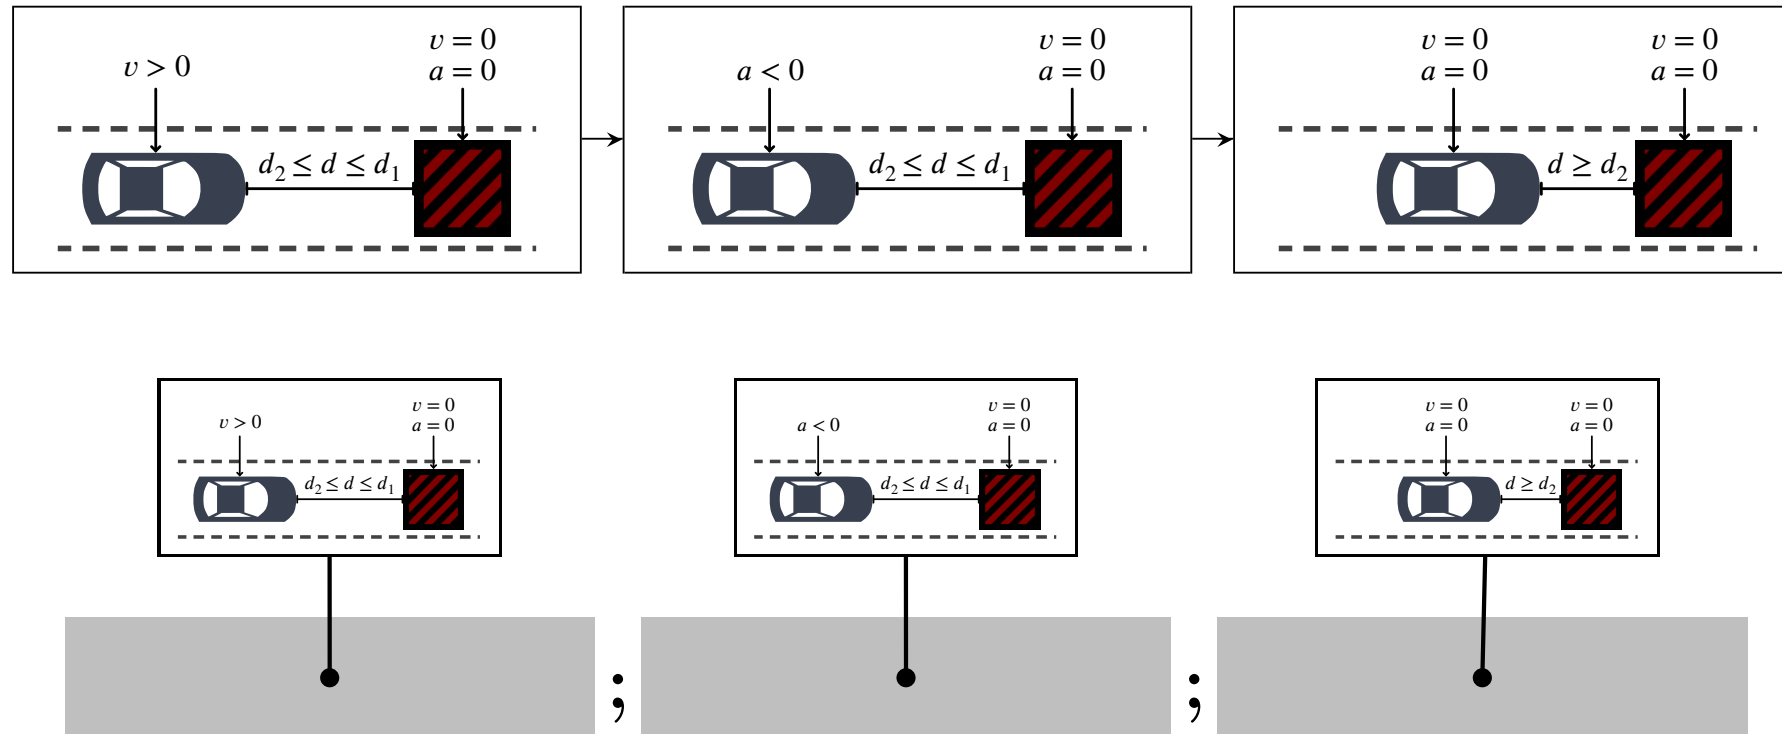

Excursion: Traffic Sequence Charts — Syntax

Excursion: Traffic Sequence Charts — Semantics

source: J. Hakemann, Automated Monitoring ..., MSc, 2022.

Excursion: Traffic Sequence Charts — Stop in Front of Obstacle

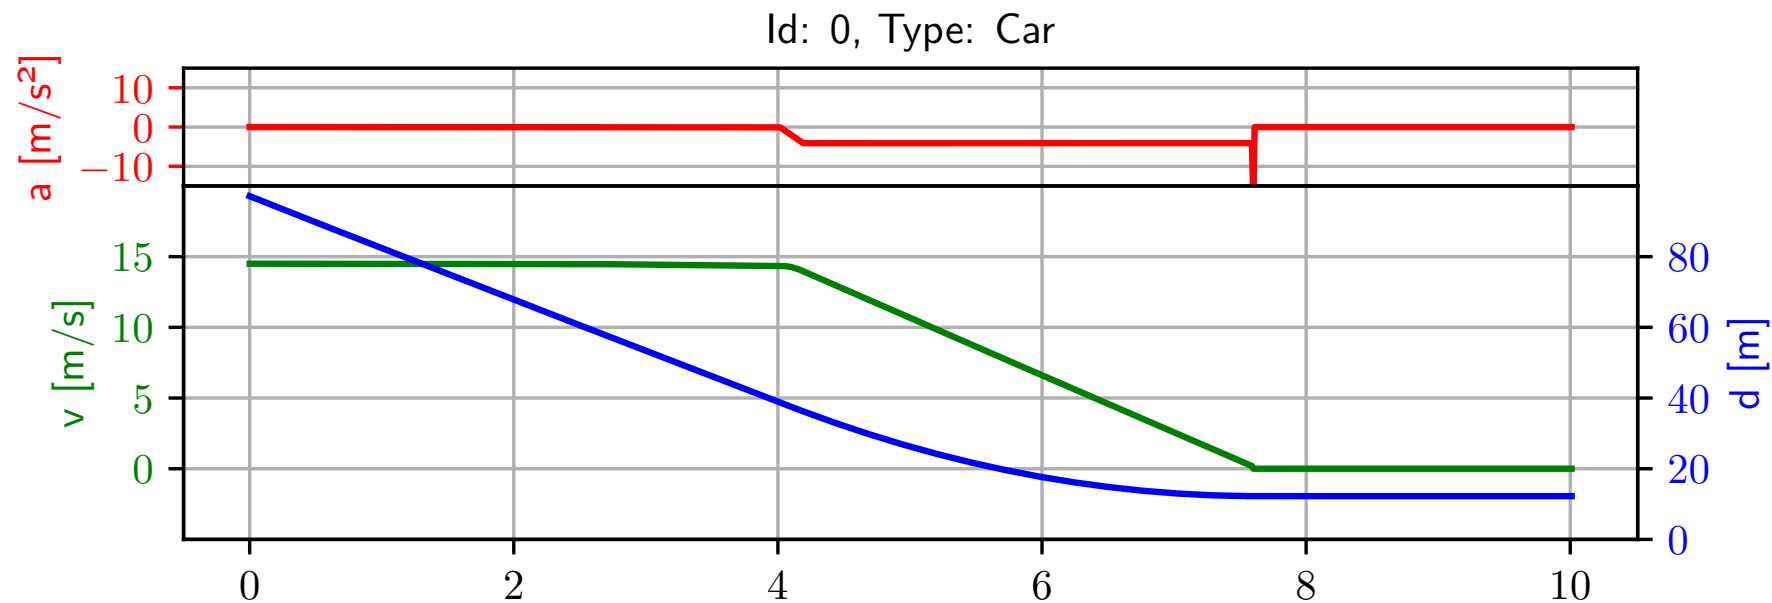

Excursion: Traffic Sequence Charts — Stop in Front of Obstacle

“does this evolution satisfy the TSC?”

“pls. synthesize an evolution that satisfies the TSC”

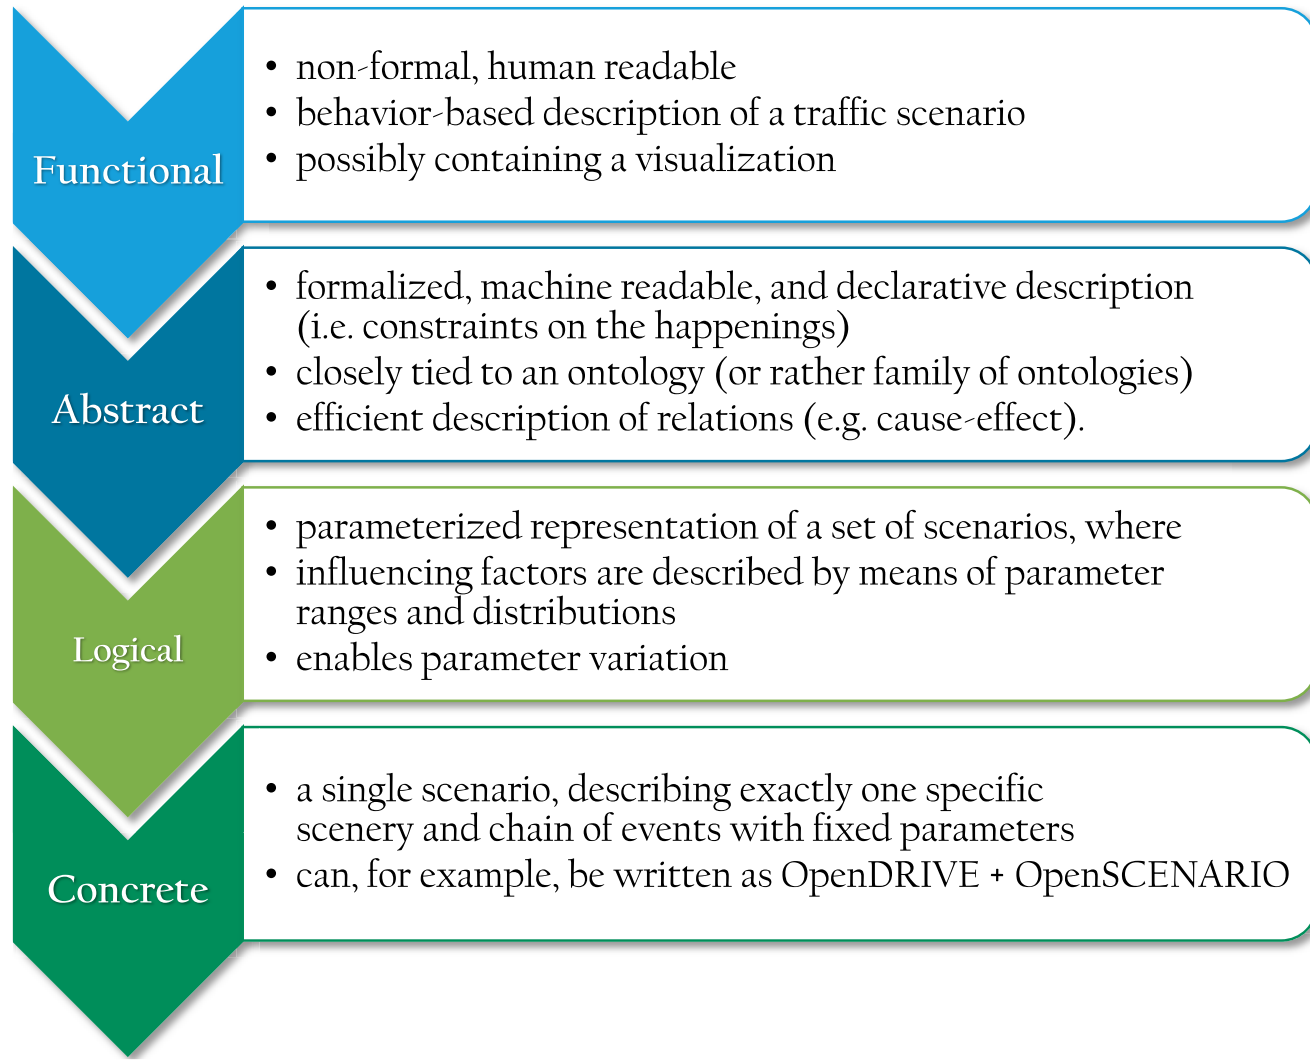

Overview

- How do we **formally specify** scenarios for testing?
- How do we **formally specify** requirements and ODDs?

Notions of Scenario Descriptions

Ch. Neurohr, L. Westhofen, M. Butz et al.: Criticality Analysis for the Verification and Validation of Automated Vehicles, IEEE Access, 9/2021.

“car stops in front of obstacle”

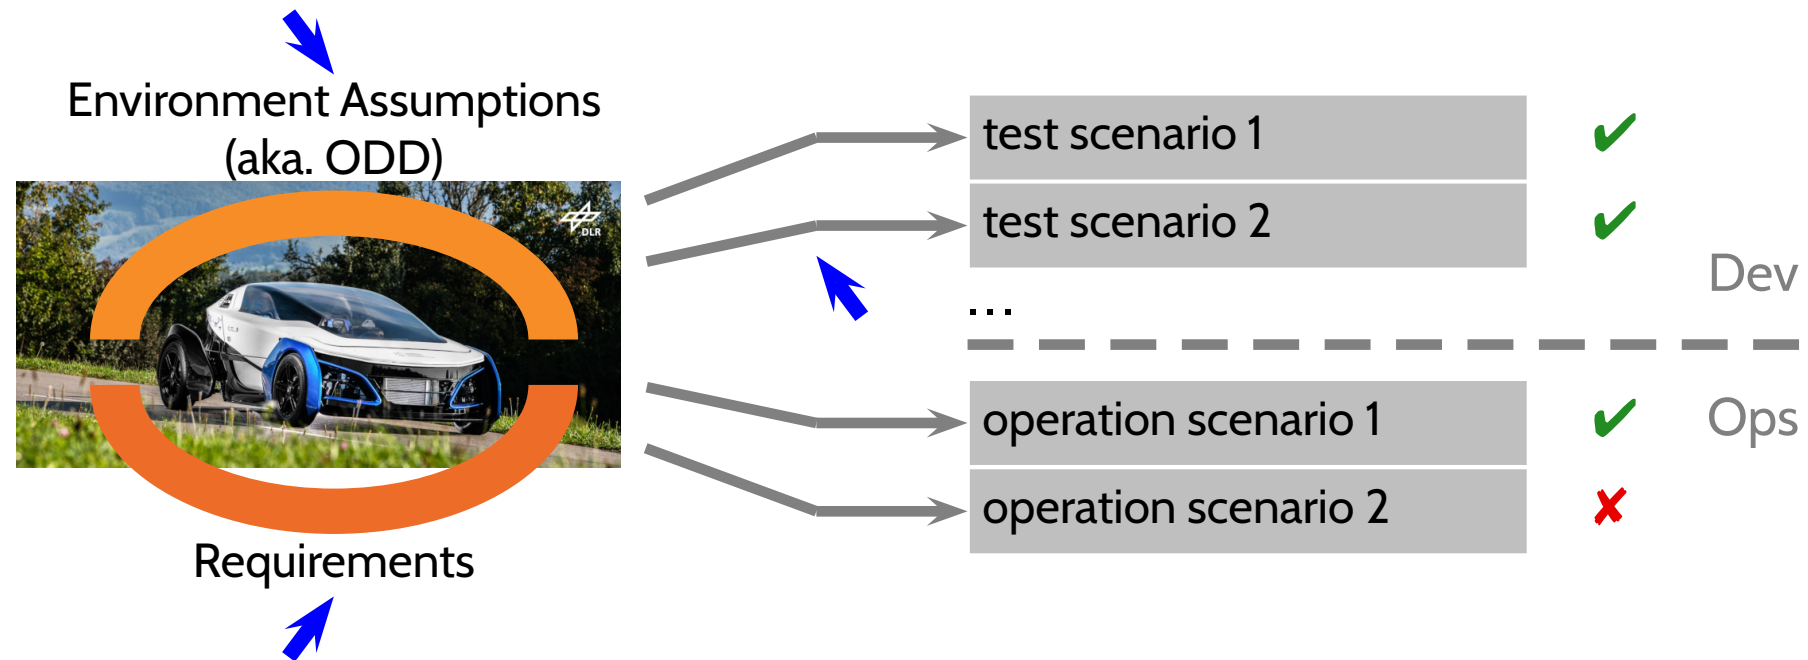

Automatic Generation of Concrete from Abstract Scenarios

- not mentioned so far: synthesis needs so-called **world model** — a formal model of car physics (“cars do not teleport”)
- concrete scenario shown here is **very concrete**: “these two cars drive these particular trajectories”
- useful for:
 - **validation** of formalisation
 - analysis of **criticality phenomena**
 - study of **certain** driving function aspects
- getting useful **test cases** is work in progress

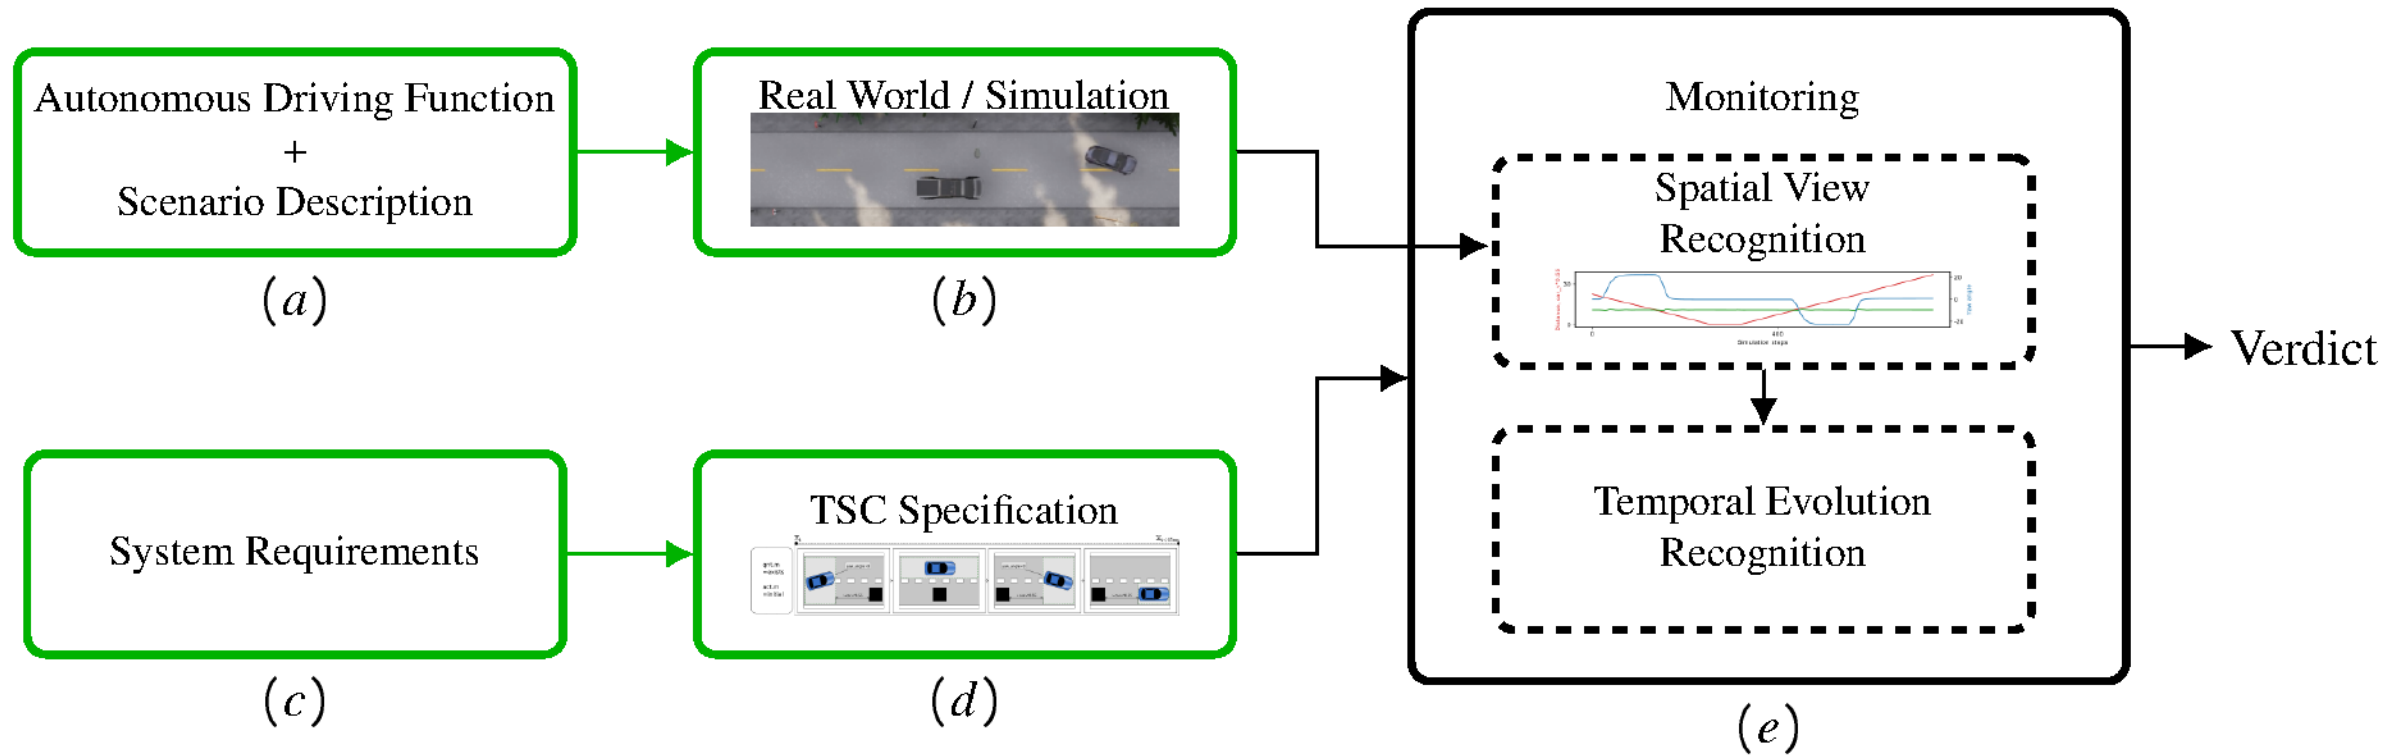

Overview

- How do we **formally specify** scenarios for testing?
- How do we **formally specify** requirements and ODDs?

Outlook: Dynamic ODD Aspects

- ODD (Operational Design Domain) ~ the environment conditions that a system was **designed** for, under which the system can be/is expected to provide its intended functionality. And what it will be certified/approved for.
- In driving functions for example:
 - Lighting conditions, rain vs. dryness, etc.
 - To me also: „healthiness“ of sub-systems.

Outlook: Dynamic ODD Aspects

- ODD (Operational Design Domain) ~ the environment conditions that a system was **designed** for, under which the system can be/is expected to provide its intended functionality. And what it will be certified/approved for.
- In driving functions for example:
 - Lighting conditions, rain vs. dryness, etc.
 - To me also: „healthiness“ of sub-systems.
- ODD may also refer to dynamic behaviour of other traffic participants, e.g., ALKS (Automated Lane Keeping System) in UN ECE 157 has the following illustration:
